In the early part of the thirteenth century, when hope of further achievements in Syria had declined, the crusading order of the Teutonic Knights (q.v.) turned to the task of conquering and Christianizing by the sword the heathen of the countries on the southern and eastern shores of the Baltic. Remorselessly but with tremendous energy they spread their conquests over Prussia, Pomerania, Courland, Livonia, and Esthonia, establishing towns, colonizing, and enforcing conversion upon the conquered inhabitants. The Prussian nationality was gradually swallowed up in the tide of German colonization, and by the seventeenth century the Old Prussian language was extinct. Power and wealth brought a decline in the vigor of the Teutonic Order, and Poland after its union with Lithuania in the fourteenth century (see POLAND) turned its strength against the Knights, against whom war was waged until in 1466 the Peace of Thorn destroyed the independent sovereignty which the order had erected. West Prussia was annexed to the Polish Kingdom and East Prussia, much reduced, was retained by the Teutonic Knights as a fief of Poland. In 1511 Albert of the Ansbach branch of the Hohenzollern was elected grand master of the Teutonic Order under a pledge to refuse to do homage to Poland. Finding this impracticable and failing to find support from the members of the order who were residing elsewhere, he regarded himself as absolved from his pledge, and with most of the Prussian members became Protestant, secularized the state over which he ruled, and received it from Poland as hereditary Duke of Prussia (1525). By agreement with the elder line, upon the failure of heirs in the line of Duke Albert the Duchy of Prussia in 1618 was added to the domains of the Brandenburg Hohenzol-

lern. In the reign of John Sigismund also the beginnings were made of the dominion of Brandenburg in the region of the Rhine. In 1609 the ducal line of Jülich and Cleves became extinct, and in the succession contest which ensued Brandenburg was one of the claimants. In 1666 Cleves, Mark, and Ravensberg were definitively assigned to her.

During the Thirty Years' War (q.v.) Brandenburg was wasted by the contending armies, although the Elector George William (1619–40) temporized with both sides in a vain endeavor to follow the peaceable and thrifty policy of his predecessors. It was, therefore, a devastated and impoverished country to the sovereignty of which Frederick William I, the Great Elector (1640–88), succeeded. He was the first of the three creators of the greatness of modern Prussia. He saw the necessity of making Brandenburg a military state because of its central and exposed position. He brought a small army into existence, was able to command a hearing in the Westphalian peace negotiations, and secured for Brandenburg by his shrewd diplomacy Farther Pomerania, the sees of Halberstadt, Minden, and Kammin, and the succession to the see of Magdeburg (1648). In 1656 he joined Charles Gustavus of Sweden in his onslaught upon Poland, but in 1657 he changed sides, and for his espousal of the Polish cause he obtained from Poland in the Treaty of Wehlau, in the same year, a renunciation of her suzerainty over the Duchy of Prussia. In 1675, when the Swedes invaded Brandenburg while Frederick William was campaigning against France on the Rhine, he returned, totally defeated them at Fehrbellin, and drove them out of Pomerania. Although Swedish Pomerania had to be given up in 1679, a new power had demonstrated its claim to be heard in the affairs of the Baltic. When Louis XIV revoked the Edict of Nantes (q.v.), Frederick William replied by the Potsdam Decree, which made Brandenburg the hospitable asylum for persecuted Protestants and drew to it thousands of French Huguenots, who made most useful citizens. The Great Elector thus prepared the way, during his long reign, for the next great step in the development of his state under his son, Frederick III (1688–1713). The Margraviate of Brandenburg was a vassal state of the Holy Roman Empire; the Duchy of Prussia had been made an independent sovereignty, but its sovereign, as a duke, occupied an inferior rank. When the Emperor, Leopold I, entered upon the struggle of the Spanish Succession he was anxious to secure the support of the German princes, and he consented, against the advice of some of his shrewdest counselors, to allow his vassal, the Elector of Brandenburg, to erect ducal Prussia, which was outside the Empire, into a kingdom (Nov. 16, 1700). Frederick III of Brandenburg placed the royal crown upon his head at Königsberg on Jan. 18, 1701, and thus became King Frederick I of Prussia. As such he was placed on a level with the other independent sovereigns of Europe, and from this time Brandenburg-Prussia had to be reckoned with as a European power.

The reign of Frederick I, aside from this most important achievement, was uneventful. At his death in 1713 he was succeeded by his son, Frederick William I (1713–40), an eccentric monarch, who practiced the closest economies in administration, established the Prussian bureaucracy on a sound basis, and continued the military development of the country, raising the army to an effective strength of more than 80,000 men, the best-disciplined troops in Europe. By the Treaty of Stockholm (1720) he acquired a great part of Swedish Pomerania, including Stettin. He fought no wars and turned over to his son, Frederick II, the Great (1740–86), an efficient military machine and a well-filled treasury. Hitherto the house of Hohenzollern had been steadily loyal to that of Austria. The inevitable rivalry of Prussia and Austria for supremacy in the Germanic body had not made itself apparent. Frederick William saw it just before his death. Frederick clearly understood it, and thereafter it formed the keynote of Prussian policy. Immediately after his accession Frederick made war upon Austria for the possession of Silesia and secured most of that extensive province. The first 23 years of his reign were occupied in a great measure by wars in which the well-husbanded resources of the country were taxed to the utmost. (See SEVEN YEARS' WAR; SUCCESSION WARS.) The second period was devoted to the restoration of the country, the establishment of its prosperity on a permanent basis by the cultivation of its material resources, and the thorough organization of its government in all departments. The government was a despotism, although a benevolent one, in accordance with the prevailing ideas of the eighteenth century. The rise of Prussia to the rank of a first-rate power, representing as she did the Germanic spirit, stimulated German thought and patriotism and prepared the way for the new Germany. By the first partition of Poland the greater part of West Prussia was added to the Kingdom, thereby filling the gap between Brandenburg and East Prussia. Frederick's nephew and successor, Frederick William II (1786–97), took up arms against revolutionary France, and in the Treaty of Basel (1795) had to give up the Prussian territories west of the Rhine. He shared in the second and third partitions of Poland in 1793 and 1795. See POLAND.

Under Frederick William III (1797–1840) Prussia passed through a period of humiliation and then of reorganization. Napoleon (q.v.) saw in the independent Germanic Kingdom a menace to his plans and aimed to crush out its national life. The attempt of the King to play the old Brandenburg part of a neutral when no power in Europe could be neutral only made the misfortunes of the country greater. In 1806, after the campaign of Jena, Prussia found herself prostrate at the feet of Napoleon. The Treaty of Tilsit (July, 1807) tore away about half of the Kingdom—the territories west of the Elbe and the Polish territories acquired in 1793 and 1795. In this crisis the government, organized in a form fast becoming antiquated, had lost its efficiency and degenerated into a helpless bureaucracy under a vacillating king. Then came a great national awakening. Stein, Hardenberg, and Scharnhorst (qq.v.) came into the government as Ministers and completely reorganized the administration, civil and military, changing Prussia from a mere military monarchy to an armed and organized nation under a monarchical government. In 1809 the last remnants of serfdom, which had been in process of abolition since 1717, were done away with. In 1813, allied with Russia and Austria, Prussia entered upon the War of Liberation, and she was able to take an active and

effective part in the campaigns that brought about Napoleon's downfall. In 1815 the Congress of Vienna allowed Prussia (reinstated in most of her old German possessions) only the Province of Posen and the city of Danzig of her share of the second and third partitions of Poland, but in recompense awarded what was of much more value to her as a German state—large territories on the Rhine, half of Saxony, and what was left of Swedish Pomerania. From this time the history of Prussia and that of Germany are inseparable. It became the aim of Prussian statesmanship to unite Germany under Prussian leadership and oust Austria from her presidency of the new confederation. The Zollverein (q.v.), including all Germany except Austria, was a step in this direction; but the inherent jealousies of the German states prevented any further advance.

The years from 1840 to 1861, covering the reign of Frederick William IV (q.v.), formed a critical period for Prussia. All Europe was stirring with the liberal and constitutional agitation which culminated in the revolutions of 1848. The King of Prussia possessed cultivated tastes, but he proved to be a bigoted adherent of the old order of caste and privilege. He granted a legislative assembly in 1847, but the basis of representation was provincial, not popular. The revolutionary movement was severely felt in Prussia, especially in the great student centres. In Berlin serious rioting culminated in a pitched battle between the populace and the troops on March 18–19, 1848, in the course of which more than 200 men fell in the defense of the barricades. The King yielded, promising a democratic constitution, consented to the formation of a national guard, and summoned a Liberal ministry. On May 22 a constituent convention assembled in Berlin, but its character was so radical that the King, taking advantage of the reaction which had already set in at Vienna, transferred the convention from Berlin to Brandenburg, and on December 5 pronounced its dissolution, publishing at the same time a constitution based on semi-democratic principles. The old system of different estates was abandoned and a united bicameral legislature established. (See *Government*, above.) In April, 1849, the King refused the Imperial crown offered him by the Frankfort Parliament, on the ground that it did not proceed from the action of the German princes. (See GERMANY.) Frederick William IV thus destroyed the opportunity of bringing Prussia to the forefront in German affairs. In 1850 he showed, by convoking the Erfurt Parliament to consider anew plans for German unity, that his refusal was but half-hearted. At this time, however, Austria was in a better condition for action, and Schwarzenberg promptly brought about the dissolution of the Erfurt gathering. Prussia was on the verge of war with Austria over the situation in Hesse when the timidity and vacillation of the Prussian government again led to a drawing back, and at Olmütz (Nov. 28–29, 1850) Count Manteuffel met Prince Schwarzenberg, acceded to all of Austria's demands, and for the time being destroyed the prestige which Prussia had enjoyed since the days of Frederick the Great. This vacillation ceased when the Crown Prince William became Regent in 1858. Upon the latter's accession to the throne in 1861 Bismarck was called into his councils and speedily became the dominant personality in the German world. He rejected altogether the temporizing and timid policy of his predecessors and made it evident that the regeneration of Germany must be accomplished through Prussian agency and by a policy of force. In 1864 Prussia and Austria engaged in a joint war with Denmark, which resulted in the liberation of Schleswig-Holstein from Danish rule. The differences between the rival powers relative to the disposition to be made of the duchies gave Bismarck his opportunity to force a war with Austria. (See AUSTRIA-HUNGARY; GERMANY; SCHLESWIG-HOLSTEIN.) The Seven Weeks' War (q.v.) followed, in which Prussia had an ally in Italy. By it Austria was forced out of the Germanic body, and Hanover, Hesse-Cassel, Nassau, and Frankfort were annexed to Prussia, with which Schleswig and Holstein were at the same time incorporated. The North German Confederation was formed under Prussian leadership.

It now remained to bring the states of south Germany into the union. This result was brought about with the same certainty of action that had produced the struggle with Austria. The Franco-German War and the establishment of the German Empire followed. From 1870 the identification of the interests of Prussia with those of Germany is due for the most part to the peculiar organization of the Imperial government, which gives Prussia a controlling voice in the affairs of the Empire. See GERMANY, *Government*.

The system of administration, caste, and militarism tends to establish Prussian methods, to further Prussian interests, and to inculcate Prussian thought throughout the Empire. Thus it was that Prussia's compulsory military system was bequeathed to Germany. With the close of the Franco-German War the Prussian government was brought face to face with serious internal problems which have indirectly affected the policy of the Empire as a whole.

First of all there was the task of Prussianizing the newly acquired territories. In the provinces of Hanover, Hesse-Cassel, Hesse-Nassau, Frankfort, Lauenburg, and the duchies on the Elbe which contain a German population, there was but little opposition to this policy. But when it came to assimilating the Danes of Schleswig-Holstein and the Polish districts in the East, affairs took a more serious turn, and after a half century of efforts the problem still remains unsolved.

In Schleswig-Holstein the Prussian government, by prohibiting the use of the Danish language in the schools, in public meetings, and the like, finally succeeded in forcing the German language and institutions on the people. It was in Prussian Poland that this Prussianizing policy encountered the most powerful opposition. The quarrel with the Roman Catholic church (see KULTURKAMPF) did much to aggravate the hatred of Poles for Prussians; for almost to a man the Poles are Roman Catholics. As early as 1873 the government forbade the use of Polish in the elementary schools, but religious instruction in that language was permitted. Gradually even religious instruction in Polish was curtailed, and finally forbidden. The Prussian government continued the policy of "inner colonization," begun in 1885, the object of which was to substitute a German for a Polish population in Prussian Poland. Large sums were ap-

propriated by the government from time to time to purchase estates owned by Poles and to sell them to German settlers, at the same time preventing Poles from buying the land. This policy, however, proved to be ineffectual, for in the succeeding decade it was apparent that the Polish element was still in predominance in this region. In 1904 the Prussian Minister of Finance ordered all Prussian officials to withdraw their accounts from the Polish banks. The Poles responded by taking out their savings from Prussian and depositing them in Polish banks. In this way every move of Prussia has been met with a corresponding counterstroke by the Poles.

In 1907–08 the Prussian government voted £17,500,000 for the compulsory expropriation of the Polish settlers in Posen and the settlement of the land by Germans. The Polish landowners would have to sell if the government so desired, and at the price fixed by the Land Commission. This expulsion of Poles from the country districts not only caused great hatred among the Poles for the Prussians, but has resulted in their leaving the rural districts for the towns and in the Polonization of trade and industry. In all the large centres of industry in Eastern Prussia there is awakening a successful artisan class, and Poles are already markedly progressing in mercantile and industrial life. Bands of Slav laborers have begun a gradual yet systematic migration to the large industrial centres, the cities in the West. The German population is constantly decreasing in numbers in the country districts, while the Polish immigrants from across the frontier were flocking in such large numbers as to remove still further the possibility of ever very deeply implanting Prussian spirit in this race. A majority of Centre, Poles, and Socialists in the Imperial Reichstag brought up the matter of compulsory expropriation of Polish landowners, and finally passed a vote of censure on the government—the first vote of censure ever passed in the Reichstag. However, this had no effect on the policy of the government, and these measures did not in the least lessen the antagonism of the Poles.

Within the last half of the nineteenth century vast changes have gradually come over the social and economic conditions of the leading world powers, but in none has the change been so rapid nor so complete as in several sections in Prussia. In 1871 all Germany was still largely an agricultural country; a few decades have witnessed the appearance of those stupendous industries which have made Germany, through Prussia, one of the mightiest, wealthiest, and most highly industrialized of the world powers.

Within the last 25 years there has been a *Landflucht*, or general migration of the rural population, depopulating the country and overpopulating the towns. The reasons for this are low wages of the farm laborers, their miserable and unsanitary living conditions, the gradual curtailment of their civic rights, due first to their close dependence on the estate, debarring them from legal redress and forbidding protective combinations of any nature, and secondly to their exploitation by their employers.

In the middle of the nineteenth century the Agrarians were for free trade, because the supply of corn and foodstuffs was in excess of the needs of the population, hence there was no fear of foreign competition. But in the eighties there was a larger importation of foodstuffs from America, and this, together with an increase in population, showed the need of trade from abroad and the insufficient amount of home produce. The price of corn, etc., gradually decreased, the income from the land correspondingly decreased, and the landed proprietors were beginning to fear their own ruin. In 1892–94 Chancellor Von Caprivi concluded commercial treaties with Russia and Austria, providing reciprocally for the reduction of import duties on corn and for certain advantages extended to exports of German manufactures. The agricultural classes began an agitation in protest against these treaties and in 1893 formed a great agricultural league, Bund der Landwirte, which soon grew to amazing proportions and controlled the entire Conservative party. This Conservative Agrarian party gradually gained influence with the government and, beginning with the year 1902, effected the passage of a series of tariff laws which placed heavy duties on imported agricultural produce and exempted agricultural implements from duty.

In the years 1906–13 there were series of agitations by the masses of the people in the towns, representing the Socialist and Liberal parties, directed towards reform in the three-class system of voting. (See *Government.*) The reforms sought were: (1) abolition of the discriminations against the small taxpayer; (2) introduction of secret ballot; (3) replacing of indirect by direct taxes; (4) redistribution of seats, apportioned according to population. In 1906 a bill was passed by the House, but provided for only a very minor change in the redistribution of a few seats. In 1908 the resolution for universal suffrage was rejected by the majority. In both instances there were popular demonstrations in the cities and encounters with police and soldiers, attended by a remarkable strengthening of the Socialists, so that for the first time seven Socialists were elected to the 1909 session. In 1910, to quell the agitation, the government declared its intention of reforming the franchise. But when the nature of the bill was disclosed the opposition and indignation grew stronger. Although the bill, as finally passed by a coalition of Conservative and Catholic parties against the Socialists and approved by the government, did not touch upon the redistribution of seats, direct voting, or the three-class voting system, it merely put into the second class the educated, the professions, and those employed in the public service. This so-called reform did not divert the people, and the Berlin Socialists openly declared their disapproval in the May Day demonstrations. In view of this fact the Chancellor most emphatically defined the opposition of the state to the Socialists, and threatened to dispel any violence by employing all the resources of the state for the restoration of law and order.

In 1912, when the elections to the Imperial Diet gave 110 seats out of the total of 397 to the Socialists, the Socialists in Prussia met with disappointment in securing only six seats in the chamber that year. In the matter of extension of the franchise there were strong debates, and the resentment and opposition of Conservatives were strongly marked when, at their instigation, two Socialist members were

arrested for resistance to state authority. But, although popular voice was with the Socialists, the latter were helpless in inaugurating any reform. At the time when the agitation for reform was at its height and the popular unrest seemed to grow too strong for any palliative measures, the outbreak of the Great War of 1914 (see WAR IN EUROPE) diverted the issue of enfranchisement of the poorer classes. PRUSSIA, EAST. The northeasternmost province of Prussia, bounded by the Baltic Sea on the northwest, Russian Poland on the east and south, and the Province of West Prussia on the west (Map: Germany, J 1). Area, excluding the Frisches and Kurisches Haff, 14,287 square miles. It forms a part of the southern coast plateau of the Baltic Sea, and its surface, largely flat, is interspersed with marshy tracts in the northeast and south and with dunes along the coast. The southern part is remarkable for its numerous lakes, of which the largest are the Mauer, Spirding, and Löwentin. The chief rivers of the province are the Niemen (here called the Memel), the Pregel, the Passarge, and the Alle. The larger rivers are navigable, and many of the lakes are connected by canals. The climate is harsh. Agriculture is the principal occupation, and rye, oats, barley, wheat, and potatoes are grown. Stock raising is very important, and the horses of East Prussia are among the best in Germany, horse breeding being furthered by several large studs.

The forests belong mostly to the state and are exploited extensively. The manufacturing industries are as yet slightly developed, and most of them are in connection with agriculture, such as brewing, distilling, and the manufacture of beet sugar. Iron is produced in limited quantities, and the manufacturing of textiles is carried on as a house industry. The transportation facilities of the province are very good, there being, besides the extensive system of natural and artificial waterways, 1799 miles of railway, chiefly state lines, in 1912. For administrative purposes East Prussia is divided into the two districts of Königsberg and Gumbinnen, with Königsberg as the capital. The province is represented by 36 members in the Lower House and 24 in the Upper House of the Prussian Landtag and returns 17 deputies to the Reichstag. Pop., 1900, 1,996,626; 1910, 2,064,175. In 1910 the Evangelical population constituted 84.34 per cent of the whole; Roman Catholic, 14.09; other Christian, 0.84; Jewish, 0.63. See PRUSSIA.

PRUSSIA, WEST. A province of Prussia, bounded by the Baltic Sea on the north, East Prussia on the east, Russian Poland and the Province of Posen on the south, and the prov-

inces of Brandenburg and Pomerania on the west (Map: Germany, H 2). Area, 9867 square miles. The surface is mostly flat and in some parts lies below the level of the sea. It is traversed from west to east by a range of hills which reaches its greatest height in the Turmberg, 1080 feet. The chief indentation on the coast is the Gulf of Danzig, which is separated from the sea by the long spit known as Hela Peninsula. The southwestern part of the Frisches Haff also belongs to West Prussia. The province is watered principally by the Vistula and its tributaries and contains many small lakes. The climate is somewhat raw in the lower parts. Agriculture is the principal industry, and rye, potatoes, and oats are the chief products. Sugar beets and tobacco are produced on a large scale, and stock raising is also well developed, the province being noted for its fine horses. The manufacturing industries are as yet unimportant and are confined entirely to the cities. The principal industries are shipbuilding, notably at Danzig and Elbing, and lumber manufacturing in many of the cities along the Vistula. Linen and other textiles are produced in the rural districts. The chief article of commerce is lumber, which is imported extensively from Russia to Thorn and Danzig. In 1912 there were 1412 miles of railway. For purposes of administration the province is divided into the two districts of Danzig and Marienwerder, with the city of Danzig as the capital. It is represented by 22 members in the Lower House and 13 in the Upper House of the Prussian Landtag and returns 13 members to the Reichstag. Pop., 1900, 1,563,658; 1910, 1,703,474. In 1910 the Roman Catholic population constituted 51.82 per cent of the whole; Evangelical, 46.32; other Christian, 0.99; Jewish, 0.82. See PRUSSIA.

PRUSSIAN CARP. See GIBEL.

PRUSSIAN LANGUAGE, OLD. See OLD PRUSSIAN LANGUAGE.

PRUSSIC (prŭs'ĭk) **ACID.** See HYDROCYANIC ACID.

PRUTH, prōōt. An important tributary of the lower course of the Danube. It rises in the Carpathian Mountains, on the boundary of Galicia and Hungary, flows through the southeastern part of Galicia, and then forms the boundary line between Bessarabia (Russia) and Rumania, joining the Danube near Galatz (Map: Balkan Peninsula, G 2). Its total length is over 500 miles. Its course is very swift, and the river is used principally for floating timber, although it is navigable from Jassy downward for about 170 miles. The regulation of the river, which might be an important waterway, has been difficult because of its international character. In 1711 the army of Peter the Great was hemmed in on the bank of the Pruth, near Husi, by the Turks. They finally allowed the Czar to withdraw upon his consenting to give up Azov.

PRUTZ, prōōts, HANS (1843–). A German historian, born at Jena, son of the following. He studied in Jena and in Berlin, where he established himself as privatdocent in 1873. The results of an expedition into Syria, undertaken by order of the government in 1874, were embodied in the work *Aus Phönicien* (1876). In 1877 he became professor at the University of Königsberg, and after having resigned his chair, owing to a disease of the eye, settled in Munich in 1902. His principal works include: *Heinrich der Löwe* (1865); *Kaiser Friedrich I.* (1871–74); *Kulturgeschichte der Kreuzzüge* (1883); *Staatengeschichte des Abendlandes im Mittelalter* (1885–87); *Entwicklung und Untergang des Tempelherren-Ordens* (1888); *Aus des grossen Kurfürsten letzten Jahren* (1897); *Preussische Geschichte* (1899–1902), in which he placed himself in opposition to the delineation of Prussian history as inspired by patriotic tendencies; *Bismarcks Bildung, ihre Quellen und ihre Aeusserungen* (1904); *Die geistlichen Orden, ihre Stellung zur kirchlich-politischen Geschichte und wirtschaftlichen Entwicklung* (1907).

PRUTZ, ROBERT EDUARD (1816–72). A German poet and historian of literature. He was born at Stettin and studied philology, philosophy, and history in Berlin, Breslau, and Halle. Prutz boldly advocated liberal ideas in science, religion, and politics and incurred the dislike of the government in consequence. In 1849, however, mainly as a result of the popularity of his free lectures, he was appointed professor of literature at the University of Halle and soon had a large following of liberal-minded students, but was so harassed by the government that he resigned in 1859 and retired to his native place, where he devoted himself entirely to literary pursuits. Besides several volumes of poems, notably *Aus der Heimat* (1858), *Aus goldenen Tagen* (1861), *Herbstrosen* (1865), *Stimmen der Liebe* (1868), he wrote a sparkling aristophanic comedy, *Die politische Wochenstube* (1843), which involved him in political difficulties, several other dramas, and the novels *Das Engelchen* (3 vols., 1851), *Der Musikantenturm* (1855), *Oberndorf* (1862), and others. His writings on literary subjects, which are more important, include: *Der Göttinger Dichterbund* (1841); *Geschichte des deutschen Theaters* (1847); *Geschichte des deutschen Journalismus* (1845), incomplete; *Die deutsche Litteratur der Gegenwart* (1859); *Ludwig Holberg, sein Leben und seine Schriften* (1853); translations of Holberg's selected comedies (4 vols., 1868); *Menschen und Bücher, biographische Beiträge zur deutschen Litteratur und Sittengeschichte des 18. Jahrhunderts* (1862). Consult Gottschall, in *Unsere Zeit* (Leipzig, 1872), and the *Allgemeine deutsche Biographie*, vol. xxvi (ib., 1888).

PRYDZ, prŭdz, ALVILDE (1848–). A Norwegian novelist. She was born near Fredrikshald in southern Norway. In 1880 she gained some attention by the story *Agn og Agnar* (1880). After the publication of *I Moll* (1885) she received a government stipend and traveled in Denmark, Germany, Switzerland, and Italy. Mention should be made of *Undervejs* (1889); *Lykke* (1890); *Mennesker* (1892); *Arnak* (1892); *Drömm* (1893); *Bellis* (1895); *Gunvor Thorsdatter til Hæro* (1896; 6th ed., 1906; Ger. trans., 1897); *Sylvia* (1898); sketches of travel in the form of fiction, *Blade* (1898); *Aino* (1900), a drama; and the novels *Det lovede Land* (1902), *Barnene paa Hæro Gaard* (1906; 3 eds.), *I Ulvedalene* (1909), *Mens det var Sommer* (1911).

PRYMER. See HOURS, BOOK OF.

PRYNNE, prĭn, HESTER. The heroine of Hawthorne's *Scarlet Letter*, condemned for her sin to wear on her breast the badge which gives the title to the romance.

PRYNNE, WILLIAM (1600–69). An English political polemist and annalist. He was born

near Bath, where he received his early education; he took the degree of B.A. at Oriel College, Oxford, in 1621, subsequently studied law at Lincoln's Inn and was called to the bar in 1628. He early became involved in ecclesiastical controversy and speedily made himself heard as a champion of the Puritan party in various pamphlets directed against Arminianism. In 1633 appeared his *Histrio-Mastix, or a Scourge for Stageplayers*, an attack on the popular amusements of the period, which contained presumedly veiled attacks on the King and especially upon the Queen. He was imprisoned in the Tower, underwent prosecution in the Star Chamber, was sentenced to a fine of £5000, degradation from his degrees, and expulsion from Oxford and Lincoln's Inn, the loss of both his ears in the pillory, and to have his book burnt in public by the hangman. He was also condemned to perpetual imprisonment and was reimprisoned in the Tower. Three years after he found means to publish from his prison another pamphlet, in which he fiercely attacked the hierarchy and was unsparing in his abuse of Laud and other bishops. For this he was again prosecuted, another fine of £5000 was imposed, he was again pilloried, losing such stumps of ears as the executioner had before spared, and was branded on both cheeks with the letters S.L. (seditious libeler) which he ingeniously interpreted as "stigmata Laudis."

He remained a close prisoner till in 1640—the Long Parliament then sitting—he was released by a warrant of the House of Commons and was received in London with loud expressions of popular sympathy. Shortly afterward he went to Parliament as member for Newport, Cornwall, and in 1647 was elected recorder of Bath. For some years he was actively and at times prominently engaged on the popular side in the proceedings of the House of Commons. But he wrote against independency, and in the extreme measures leading to the deposition and death of the King he declined all share; and being one of those whom Cromwell shortly after expelled from the House of Commons, he proceeded to assail him in print with an asperity equal to that with which he had before made war upon the bishops, in return being again subjected to several years' imprisonment. On Cromwell's death he returned to his place in Parliament, zealously interesting himself in the royal cause; after the Restoration the office was bestowed on him of keeper of the records in the Tower. His passion for pamphleteering, however, again involved him in difficulties with the House of Commons, from which, on a charge of seditious libel, he escaped expulsion only by confession of error and recantation. Henceforth he busied himself chiefly as a compiler of matter illustrative of constitutional and parliamentary history. Of his works, which comprise nearly 200 volumes, the most valuable are the *Calendar of Parliamentary Writs* and his *Records*. He died at Lincoln's Inn, Oct. 24, 1669.

PRYOR, prī'or, ROGER ATKINSON (1828–). An American journalist and lawyer. He was born near Petersburg, Va., graduated at Hampden Sidney College in 1845 and at the University of Virginia in 1848, and studied law. He became editor of the *Southside Democrat* at Petersburg, and in 1854 he was called to Washington to edit the Washington *Union*, the principal organ of the Pierce administration in the capital. In 1855 he was sent to Greece on a special diplomatic mission, and in 1856 he became editor of the Richmond *Enquirer*, one of the most influential papers in the South. In 1857 he established at Richmond a paper called *The South*, in which his advocacy of extreme States-rights views brought him into national prominence. In 1858 he was elected to Congress and was reëlected in 1860. When Virginia seceded he returned South, where he was elected to the Provisional Confederate Congress and the first regular Confederate Congress. Appointed colonel of a Virginia regiment, he participated in the campaigns about Richmond, distinguished himself in the battles of Williamsburg and Sharpsburg, and was brevetted brigadier general, but resigned his commission in 1863 as a result of a quarrel with President Davis. He soon enlisted again as a private in Fitzhugh Lee's cavalry and was captured and confined for some months in Fort Lafayette. Returning South on parole, he advised the South to submit. After the war he settled in New York, where he engaged in newspaper work and studied law. Admitted to the bar, he rose rapidly to a prominent place in his profession, and in 1890 he was appointed by Governor Hill a judge of the Court of Common Pleas, in 1891 was elected to the same office for a 14-year term, and under the provisions of the new constitution of 1894 was transferred as a justice to the reorganized Supreme Court. He retired from the bench on account of age in 1899 and resumed law practice in New York City.

PRYTANES, prīt'ā-nēz. See EPISTATES.

PRYT'ANE'UM (Lat., from Gk. πρυτανεῖον, *prytaneion*, from πρύτανις, *prytanis*, Lesbian πρότανις, *protanis*, presiding officer, from πρό, *pro*, before). A public building in various Greek cities, especially one in ancient Athens, where the state extended the rites of hospitality to foreigners and citizens of distinction. Consult C. H. Weller, *Athens and its Monuments* (New York, 1913).

PRZASNYSZ, pshäs'nĭch. A city in the Government of Plock, Russia, 59 miles northeast of Plock. It has cloth and leather manufactories and is a cattle market. Pop., 1900, 9245. In the European War which began in 1914 this city and its region was the centre of much fighting during the tremendous German campaign against the Russians. The Germans took it by storm in February, 1915, but lost it in March. They recaptured the place in July, 1915. See WAR IN EUROPE.

PRZEMYŚL, pshĕ'mĭzl, or PEREMYSL. A fortified town in the Crownland of Galicia, Austria, situated on the San, 54 miles west of Lemberg (Map: Austria, H 2). It is the seat of a Roman Catholic and a Greek Orthodox bishop and has a number of old churches and monasteries, a higher Gymnasium, a seminary for teachers, etc. Its manufactures include machinery, spodium, liqueurs, flour, and naphtha. There is a considerable trade in wood, grain, leather, and linen. During the European War which began in 1914 Przemyśl was completely invested by the Russian forces. After withstanding an heroic siege lasting approximately five months, the Austrians were compelled to capitulate on March 22, 1915. The Russians held the town only until June 2, when they were compelled to evacuate it in the face of a strong Austrian army, supported by a large contingent of German troops. See WAR IN EUROPE. Pop., 1900, 46,349; 1910, 54,869.

PRZHEVALSKI, pzhā-vāl'y'-skē, NIKOLAI MIKHAILOVITCH (1839–88). A Russian explorer, born of Polish parents at Kimbrovo in the Government of Smolensk. He was educated at the Gymnasium of Smolensk, entered the military academy at St. Petersburg, and from 1864 to 1866 lectured on history and geography in the Warsaw Cadet School. In 1867 he volunteered for service in eastern Siberia, where he explored and botanized for two years in the valley of the Ussuri, publishing his *Notes on the Ussuri* on his return to St. Petersburg. This book gave much valuable information on northern Manchuria, and the Russian Geographical Society awarded him a medal for a paper written on the native population of that region. In 1870 he started on his first expedition to Central Asia and traveled for three years in the west-central part of the Chinese Empire. The results of his explorations were published in his *Travels in Mongolia,* which is the standard work on that part of the Empire. In 1876–77 he rediscovered the Lob-nor and traced the course of the great river Tarim, which enters that lake after draining the whole of Chinese Turkestan. He also reached the Altyn-Tagh Range, which forms one of the northern barriers of Tibet. This great journey is recorded in his book *From Kulja across the Tian-Shan to Lob-nor.* In his third expedition (1879–80) he explored the sources of the Hoang-ho and a part of eastern Tibet, and attempted to reach Lhasa from the north, but was unable to proceed farther than the region of the Kuku-nor, where he was deserted by his guide and suffered terrible hardships. His fourth journey (1883–85) extended from Kiakhta to the sources of the Hoang-ho, including the exploration of northern Tibet. He crossed the Gobi waste, discovered the water parting between the upper courses of the Hoang and Yang-tse rivers, and found the wild camel. Another attempt on this journey to reach Lhasa was unsuccessful. He was preparing for another journey into Tibet when he died of typhoid fever on the shores of Lake Issik-kul, at the town of Karakol, which was later renamed Przhevalsk in his honor.

PRZIBRAM. See PRIBRAM.

PRZIBRAM, pshē'bräm, HANS (1874–). An Austrian zoölogist, born at Vienna. He studied in the universities of Vienna (Ph.D.), Leipzig, and Strassburg and after 1903 was privatdocent at Vienna. He wrote extensively on experimental zoölogy, some of the results of this work having been collected in book form under the general title *Experimentale Zoölogie.* Of this series there have appeared *Embryogenese* (1907), *Regeneration* (1909), *Phylogenese* (1910). The first part was published in English translation in 1908 as *Experimental Embryology:* 1. *Embryogeny.*

PRZYBYSZEWSKI, pshē'bē-shēf'skē, STANISLAW (1868–). A German-Polish writer of the ultramodern school. He was born at Posnam (Prussian Poland), studied in Germany, and traveled in France, Spain, and the Scandinavian countries. His literary career began in 1892 with his impressive studies *Zur Psychologie des individuums* (consisting of the essays "Chopin and Nietzsche" and "Ola Hannson"). His *Die Todtenmesse* (1895) and *Homo Sapiens* (1895–98; Eng. trans., 1915), sex novels, gained him fame. He wrote other novels; verse, including the prose poems *De Profundis* (1900) and *Androgyne* (1901); and a number of dramas, including *Das grosse Glück* (1902) and the cycle *Tanz der Liebe und des Todtes* (1901–03). His poetry has lyrical excellence, but his novels and dramas lack action.

PSALM, GRADUAL. See GRADUAL PSALM.

PSALMANAZAR, săl'mă-nā'zĕr, GEORGE (1679–1763). An impostor, born probably in Languedoc. He received a good education from the Jesuits, but spent his youth in idly wandering over Europe. When about 20 he began to masquerade as a Japanese convert from Formosa, assumed the name of Psalmanazar, was brought to England, and introduced to the Bishop of London by the chaplain of a regiment whom he had met at Sluys. The Anglican church rejoiced in the rescued heathen and sent him to Oxford to pursue his studies. Psalmanazar published a fabulous geography of Formosa, as well as a Formosan grammar and dialect specially invented by himself, and also an account of the Formosan religion and customs. About 1710, however, he repented of his continued fraud, confessed his guilt, and became truly religious. By acting as editor and compiler he made a comfortable living and retained the esteem which he had gained under false pretenses. In 1764 appeared *Memoirs of . . . Commonly Known by the Name of George Psalmanazar.* These give no hint of his real name or birthplace.

PSALMODY, sĭm'ō-dĭ *or* săl'mō-dĭ (ML. *psalmodia,* from Gk. *ψαλμῳδία,* a singing of psalms, from *ψαλμός, psalmos,* psalm, hymn, song, from *ψάλλειν, psallein,* to play on a stringed instrument + *ἄδειν, adein, ἀείδειν, aeidein,* to sing). In its widest sense the singing of the Psalms of the Bible or other sacred songs in worship; often restricted, however, to the singing of metrical versions of the Psalms to short, simple airs. See HYMNOLOGY; HYMN TUNES; WORSHIP.

PSALM OF LIFE, A. A well-known short poem by Henry W. Longfellow, published in the *Knickerbocker Magazine,* October, 1838.

PSALM OF THE STEPS. See GRADUAL PSALM.

PSALMS (from Gk. *ψαλμός, psalmos,* psalm, hymn, song), BOOK OF. According to the Jewish canon, the first book of the third division of the Old Testament, known as *Kethūbīm* or Hagiographa. The Greek version placed the books of Job, Psalms, and Proverbs in what was supposed to be the chronological order of their composition, under the influence of the tradition ascribing the first to Moses, the second to David, and the third to Solomon; and this order has been followed in the English translation. The Hebrew title of the book is *Tĕhillīm* (songs of praise), the English "psalms" is from the Greek rendering of *Tĕhillīm, ψαλμοί.* The Book of Psalms is properly a collection of hymns which became a manual of the temple service at Jerusalem in the post-exilic period. The collection consists of 150 compositions, divided in the Hebrew Bible like the Pentateuch into five books: (1) Psalms i–xli, (2) xlii–lxxii, (3) lxxiii–lxxxix, (4) xc–cvi, (5) cvii–cl. The date of the final compilation, which, it must be borne in mind, is independent of the question of composition, is by many scholars brought down to the first century B.C.; but long ere this time there existed collections of psalms, and abundant remains of such collections are found in the book which has been preserved to our time.

Some interpreters divide the whole work into three parts: (1) i–xli, (2) xlii–lxxxix, (3) xc–cl. Of these divisions it is only the first, in which all psalms except the first two are ascribed to David (excluding the tenth, which is a continuation of the ninth, and the thirty-third, which the Greek version ascribes also to David), that may be said to constitute a uniform group. The second division has as a distinguishing mark the use of Elohim as the name of God instead of Yahwe, except in lxxxiv–lxxxix. Taking up these Elohim psalms, it is to be observed that they consist of (*a*) psalms ascribed to David and (*b*) psalms ascribed to Levitical circles, viz., to Asaph or to sons of Korah. The Davidic psalms are li–lxxi, placed between a single Asaphite psalm (l) and the main Asaphite collection (lxxiii–lxxxii), while the Korahite collection is represented by xlii–xlix. Psalms lxxxiv–lxxxix appear to be an appendix of a miscellaneous character, attached to the division. The third division includes Books IV and V, which have so many features in common as to give evidence of having once formed a single collection.

Of the three divisions, the first appears to be the oldest, and in the gradual formation of the Psalter we may distinguish the following steps: (1) a Davidic collection, Book I; (2) a second Davidic collection, li–lxxii (lxxii being an addition); (3) a twofold Levitical collection, (*a*) xlii–xlix, (*b*) l, lxxiii–lxxxiii; (4) a combination of the second Davidic with the Levitical collections; (5) a supplement to this collection, lxxxiv–lxxxix; (6) a third collection, xc–cl. The last step consisted in the combination of the three collections, to which the anonymous Psalms i and ii were prefixed; a division into five sections was then made in imitation of the "Books of Moses," each section provided with a doxology at the close. The purpose of the various collections is evident—to bring together religious hymns; the ascription of groups to members of the Levitical guilds may be regarded as sufficient evidence that the collections were to be used in the ritual. But while this may be admitted, it does not follow that all of the hymns included in the collections were composed for the temple ritual, nor do the considerations above set forth touch the core of the problem as to the date of composition of the hymns themselves.

The natural starting point for the investigation of this problem is the headings in the traditional Hebrew text and in the Greek translation. Although we are obliged to pass beyond the data furnished by these headings, they cannot be altogether set aside, even though their late origin admits no doubt. These headings appear to ascribe the authorship of 73 psalms to David; 49 are anonymous; and the remainder are divided among a variety of authors as follows: two are associated with Solomon, one with Moses, 11 with the sons of Korah, 12 with Asaph, one is attributed to Heman, one to Ethan. But the Hebrew preposition which is translated "to" is an ambiguous particle, and it by no means follows that the expression a "Psalm to David" means necessarily a psalm composed by David. It may mean that, but the same preposition would be used to convey the idea that the psalm was a "Davidic" composition, i.e., belonging to a class of compositions called for one reason or another after David. In such an instance as the psalms of "the sons of Korah" it is quite evident that the preposition "to" cannot indicate authorship, since it is highly improbable that an entire family or guild should have composed any particular hymn. The same conclusion follows from the occurrence of several names at the head of a psalm, as, e.g., xxxix and lxii, which have the names David and Jeduthun attached, or cxxxvii, which in the Greek version bears the heading David and Jeremiah; or cxxxviii, which has three names, David, Haggai, and Zechariah, attached to it in the Greek text. The assumption, therefore, is justified that when the headings were first attached to the psalms, it was not done exclusively with the purpose of indicating authorship, but also to specify the character of the collection to which they belong, and indeed this may very well have been the original meaning of the preposition in this connection. To be sure, only in the case of the series of psalms bearing the name "sons of Korah" can we be certain that we actually have a collection by several authors, but it is plausible to assume that there was also a "Davidic" collection designating not a series of hymns written by David, but for some reason called after him. It is natural that a later age which had created for itself a traditional David who differed largely from the historical one (see DAVID) should have seized upon the existence of a Davidic collection as a support for its traditions and converted David into the author of the 73 psalms bearing his name. It should also be noticed that many Psalms, not ascribed to David in the Masoretic text, are assigned to him in the Greek version, and that the Syriac version makes him the author of practically the whole Psalter. Evidently, therefore, there was no fixed tradition; editorial opinion was in a fluctuating state, and no reliance can be placed upon the superscriptions, so far as the authorship of the Psalms is concerned.

We are thrown back upon internal evidence and the careful study of the style and of the religious views reflected as a final means of determining the date of composition of any particular hymn, and if these methods fail the problem must be frankly declared insoluble. In this investigation it is further necessary to distinguish in the case of many of the psalms between older portions and modifications as well as additions introduced at a subsequent period in the process of editing, or for the purpose of adapting them to the religious aspirations of a later age. The analogy of other hymn books in this aspect is particularly significant. But this increases the difficulty of the investigation. In many of the psalms the references to political or social conditions are of so general or vague a character that agreement among scholars as to the period to which a particular psalm belongs is hardly to be expected; nor is the style in all cases so pronounced as to be of service in settling the date of composition.

Accepting the general order in the growth of the Psalter as above outlined, the most important question involved in a more detailed consideration of the composition of individual poems is whether any belong to the preëxilic period. While some critics are disposed to limit the preëxilic psalms to a very small number, others deny the preëxilic origin of all. To the former it seems quite improbable that after the Exile psalm composition should have as-

sumed such tremendous importance without any impulse from an earlier age. The example of Babylonia and Egypt, where hymns and psalms formed part of the ritual from a remote period, would have been sufficient to lead to the production of such compositions among the Hebrews after they had once established a large sanctuary in Jerusalem, and the religious views embodied in some, if not in many, of the psalms are sufficiently restricted to make them fit in with the conceptions held of Yahwe before the destruction of Jerusalem. Whether, however, one may go back as far as the days of David for the beginning of psalm composition is another question. But it should be borne in mind that many lyrics of great power, depth of feeling, variety of expression, and beauty of form are likely to belong to the period of the Judges and the age of David and Solomon. Among them are the Song of Heshbon, Deborah's Song, the Blessing of Jacob, the Blessing of Moses, the Prophecies of Balaam, and the Elegy over Saul and Jonathan. That the Elegy is purely secular does not necessarily show that David and his contemporaries may not have composed and sung religious hymns as well. But there is scarcely any criterion by which a single psalm in the Psalter can with any degree of assurance be ascribed to David. While Delitzsch accepted 44 psalms as Davidic, Ewald reduced the number to 17 and Baethgen admits only three, viz., the first, third, and fourth, and of these he feels certain about only the first. The number of psalms ascribed to the preëxilic period by this critic is above 30. On the other hand, Olshausen, Cheyne, and Duhm deny that there are any Davidic or preëxilic psalms. Coming to the postexilic period and including among these older psalms that have been worked over, the bulk is by some critics placed before the advent of Greek rule in Palestine. The psalms of the Persian period voice the hopes, struggles, and fears of the religious community in Jerusalem, and the frequent use of the first person in those psalms is perhaps not to be interpreted as representing the sentiments of the individual, but rather the community, and in some cases the people of Israel as a whole. The number of psalms that belong to the Greek period or the Maccabæan age cannot be determined with certainty. Olshausen placed the bulk of the Psalter in the Maccabæan age, and Duhm assigns most of the psalms to the Maccabæan and Hasmonæan periods. Cheyne places 25 psalms in this later period. On the other hand the latest commentator of note, Briggs, assigns seven psalms to David, a very large number to preëxilic times, and only a few to the Maccabæan period. The decision of the Biblical Commission of 1910 insists upon the existence of Davidic psalms, laying particular stress on the authorship by David of those psalms that are ascribed to him in the New Testament, but leaves it open for Catholics to believe that many psalms come from later times and that earlier psalms have been modified in course of transmission.

The Psalter forms, with Job, Canticles, Proverbs, Lamentations, certain oracles in the prophetic books, and lyrics inserted in the historical books, a rich treasury of ancient Hebrew poetry. The determining factor in Hebrew rhythm is the accent; its prevailing tendency is the ascending one; the rhythmic unity is the foot consisting of two parts, having a fixed ratio to each other; the thesis cannot be made up of more than three unaccented syllables; a secondary stress is likely to fall upon a long syllable in the thesis; the duration of the arsis is not measured, but the main stress of necessity causes a lengthening; the most current feet are iambics and anapæsts, feet of different nature may follow each other in the same distich and even in the same stichus. There was a quality in Hebrew verse that caused such men as Philo, Josephus, Origen, Eusebius, and Jerome, who had the opportunity of hearing it read and sung, to use in describing it the terms "tetrameter," "pentameter," and "hexameter," as well as the Greek designations of the feet. As it was not the regular recurrence of long and short syllables in a fixed ratio, it must have been the rhythm-producing stress that gave a similar impression. A distich of three beats in each stichus might often have sounded like an hexameter. But the distich does not possess quite the unity of the hexameter line, and the same foot is not uniformly used. Trochees and dactyls apparently do not occur. The preference for the ascending rhythm is not peculiar to Hebrew poetry, but characteristic of Semitic accentuation and somehow dependent upon certain racial or ethnic psychological tendencies. The rhythm of sentiment and thought was called by Lowth "parallelismus membrorum." It is produced by so arranging the material of a distich as to make the second line a repetition in varied form, a supplement, or a reënforcement of the fundamental ideas expressed in the first line. The thought does not move on continuously from line to line, but returns upon itself, varying, strengthening, and amplifying its contents before proceeding on its way. The sentiment does not flow on like a stream, but surges back and forth like the ebb and tide of the sea. This rhythmic movement of the thought is likewise found in Babylonian, Aramaic, and Arabic poetry, and also in the lyrics of ancient Egypt. As a monostich of two, three, or four beats would not suffice for the balancing of two expressions of the same thought, the distich became the rule. The most common type of the strophe in the Psalter is the tetrastich, but strophes of 6, 8, and even 12 lines are indicated by refrains. Assonance, alliteration, and rhyme are also occasionally found.

Bibliography. Of commentaries, translations, etc., mention may be made of those by Justus Olshausen (Leipzig, 1853); A. Hitzig (2d ed., ib., 1863–65); H. PSALTERY, sâl'tĕr-ĭ (OF. *psalterie*, from Lat. *psalterium*, from Gk. *ψαλτήριον*, stringed instrument, from *ψάλλειν*, *psallein*, to play on a stringed instrument). A sort of dulcimer (q.v.), played with the fingers instead of with hammers. It is of Greek origin and is related to the Persian *santir* and the Arabic *kanun*. It was a prototype of the pantaleon and so one of the large family out of which the pianoforte ultimately developed. It was especially important in this respect since in the fourteenth century a keyboard mechanism was attached to the horizontal psaltery, and this keyed psaltery became the direct parent of the spinet, harpsichord, and virginal (qq.v.). It was popular in the Middle Ages for its sweetness of tone and purity of intonation. The Hebrew *kinnor* is rendered "psaltery" in the Authorized Version of the Bible wherever it is used, except in a few passages in Isaiah and in Amos, where it is translated "viol."

PSAMMETICHUS, săm-mĕt'ĭ-kŭs (Lat., from Gk. *Ψαμμήτιχος*, Egypt. *Psemtek*). The name of three kings of Egypt of the twenty-sixth or Saitic dynasty.—PSAMMETICHUS I (663–609 B.C.), son of Necho, Prince of Memphis and Saïs, succeeded his father in 663 B.C. as a vassal of Asurbanipal, King of Assyria, but a few years later (perhaps about 660) he renounced his allegiance and, subduing the petty rulers who divided the country, made himself master of all Egypt. He strengthened his title to the throne by marrying a daughter of Queen Amenerdas and established his capital at Saïs in the delta. His military success was due to the aid of Greek and Carian mercenaries, furnished, it is said, by Gyges, King of Lydia, and he subsequently introduced considerable numbers of these troops into the Egyptian army. Psammetichus protected the country by establishing strong garrisons on the frontiers and promoted commerce by encouraging foreigners to settle in the delta. His flourishing reign was marked by a very extraordinary renaissance in art.—PSAMMETICHUS II (594–588 B.C.) was the son of King Necho and the grandson of Psammetichus I. It was during his reign that the remarkable inscriptions were written by Carian, Greek, and Phœnician mercenaries at Abu Symbel. During his reign much building was done on the temples of Egypt.—PSAMMETICHUS III (526–525 B.C.), the last King of this dynasty, was conquered by Cambyses in 525 B.C., and Egypt thus became a Persian province.

PSARA, psä'rȧ, or **IPSARA**. An island in the Ægean Sea belonging to Greece and situated 10 miles west of the north end of Chios (Map: Balkan Peninsula, E 5). Area, 34 square miles. Previous to the Greek War of Independence it had a population of nearly 30,000 and considerable commerce. In 1824 it was captured by the Turks after a stubborn resistance, and thereafter it steadily declined, until in 1914 it had a population of only 4500, chiefly Greeks. It was annexed to the Greek Kingdom as a result of the Balkan War (q.v.) of 1912–13.

PSCHUTT, pshut. A slang term which came into vogue in Paris about 1880 to designate the highest degree of the fashionable elegance which had been known as *chic* (q.v.).

PSEU'DEPIG'RAPHA. See APOCALYPTIC LITERATURE; APOCRYPHA; JOSEPH, PRAYER OF.

PSEUDO-CLEMENTINES, sū'dō-. See CLEMENTINA.

PSEUDODIPTERAL, sū'dō-dĭp'tĕr-al (Gk. *ψευδοδίπτερος*, *pseudodipteros*, from *ψευδής*, *pseudēs*, false + *δίπτερος*, *dipteros*, two-winged, dipteral). A term used to designate a form of temple or temple-like structure surrounded by a colonnade the distance of which from the side walls of the cella is equal to two of the front intercolumniations. The pteroma, in other words, has the same width as in a dipteral temple, but is without an intermediate row of columns between the side of the cella and the external peristyle.

PSEU'DO-IS'IDO'RIAN DECRE'TALS, or FALSE DECRETALS. A collection of decrees purporting to come from early popes and councils and to have been compiled by Isidore Mercator. The author probably meant to assign them to St. Isidore of Seville (q.v.), as whose work they passed in the Middle Ages. Both the real author and his place of abode are unknown. Early Protestant scholars assigned the collection to Rome, but it is certain that it originated in the Frankish Kingdom. Mainz has been suggested, but recent opinion favors either Rheims or Le Mans in Tours, where the historical conditions seem to make the work possible. The date is between 847 and 852, when Hincmar (q.v.) seems to cite the collection. Part of these documents are genuine, part taken from earlier forgeries, and part the forgery of the compiler. His purpose was to free the bishops from the civil power on the one hand and from the metropolitan and provincial synods on the other. He attempted to relieve the confused condition of the time, when the bishops had no civil redress from deposition and oppression, by bringing forward what purported to be ancient Church law. He exalted the papal powers, but his main aim seems to have been the defense of the bishops. This collection continued to be regarded as of unquestioned authority until the fifteenth century, when Cardinal Nicholas of Cusa first expressed doubts of their authenticity. A similar adverse judgment was rendered by scholars of the Reformation and has been confirmed by modern historical criticism. Closely connected with these Decretals are three other collections, also in large part forgeries and designed to exalt the position of the bishops: the *Hispana Gallica Augustoduriensis*, a cor-

rupt text of a Spanish collection of canons used by the Pseudo-Isidore and by some thought to be in their present form his work; the collection by "Benedicta Levita," purporting to be from the archives of Mainz and preceding the Pseudo-Isidore; and the *Capitula Angilramni*, 71 brief chapters, mostly concerning bishops, usually added as an appendix to the Pseudo-Isidorian Decretals. The critical edition of this collection is by Hinschius, *Decretales Pseudo-Isidorianæ et Capitula Angilramni* (Leipzig, 1863). There is also a partial English translation in the *Ante-Nicene Fathers*, vol. viii. Consult P. Fournier, *De l'origine des fausses décrétales* (St. Dizier, 1889); Schneider, *Die Lehre der Kirchenrechtsquellen* (Regensburg, 1892).

PSEUDOLEUCÆMIA, sū'dō-lū-sē'mĭ-à. See HODGKIN'S DISEASE.

PSEUDOLUS, sū'dō-lŭs (Lat., the liar). A comedy of Plautus, performed in 191 B.C.

PSEUDOMORPH, sū'dō-môrf. See CRYSTALLOGRAPHY.

PSEU'DONEUROP'TERA (Neo-Lat. nom. pl., from Gk. *ψευδής, pseudēs*, false + *νεῦρον, neuron*, nerve + *πτερόν, pteron*, wing). An order of insects including those groups of the older order Neuroptera of Linnæus in which the metamorphoses are incomplete. As an ordinal term it is not now in use. Erichson, who originally founded the group as a suborder, included in it the Termitidæ or white ants, the Psocidæ or book lice, the Ephemeridæ or May flies, and the Libellulidæ or dragon flies (qq.v.). These groups now form the orders Isoptera, Corrodentia, Ephemerida, and Odonata. Sharp retains the term Pseudoneuroptera as a division of the Neuroptera, and includes in it only the families Embiidæ, Termitidæ, and Psocidæ.

PSEU'DONYM (Fr. *pseudonyme*, from Gk. *ψευδώνυμος, pseudōnymos*, having a false name, from *ψευδής, pseudēs*, false + *ὄνυμα, onyma, ὄνομα, onoma*, name). A name assumed by an author for veiling his identity or for other reasons. A common equivalent is pen name. Nom de plume, an expression often used in English speech and writing, is not employed by the French. For contemporary pseudonyms, consult *Who's Who* (London, annually) and *Who's Who in America* (New York, annually). The standard works are Barbier, *Dictionnaire des ouvrages anonymes* (4 vols., Paris, 1872–79; supplement by Brunet, 1889); Halkett and Laing, *Dictionary of the Anonymous and Pseudonymous Literature of Great Britain* (4 vols., Edinburgh, 1882–88); Cushing and Frey, *Initials and Pseudonyms* (2 vols., New York; 1st series, 1885; 2d series, 1888); L. H. Dawson, *Nicknames and Pseudonyms* (ib., 1908). See ANONYMOUS.

PSEU'DOPERIP'TERAL (Gk. *ψευδής, pseudēs*, false + *peripteral*, from Fr. *périptère*, Lat. *peripteros*, Gk. *περίπτερος, peripteros*, having a single row of columns). A term used to designate a form of temple (consult *Vitruvius*, iv, 7) or temple-like structure in which the lateral colonnades of a peripteros are replaced by columns engaged in the walls.

PSEUDO-PHILO. See APOCRYPHA, *Old Testament*.

PSILOM'ELANE (from Gk. *ψιλός, psilos*, bare + *μέλας, melas*, black). A hydrous manganese manganate that is found massive, has a submetallic lustre, and is dark gray to black in color. Psilomelane is the commonest of the manganese minerals, with the possible exception of pyrolusite.

PSITTACI, sĭt'ă-sī (Lat., parrots). The order or suborder of birds to which belong the parrots, parrakeets, love birds, lorikeets, etc. (qq.v.). The Psittaci are easily recognized by the powerful hooked bill, cered at the base, the fleshy tongue, and the zygodactyl feet. The wings and tail are variable. The furculum is weak, defective, or wanting; the lower larynx is peculiarly constructed with three pairs of muscles; aftershafts are present on the feathers; and the pterylosis is remarkably falconiform. Cæcum, gall bladder, and sometimes the oil gland are wanting. The greatest diversity is shown in the arrangement of the carotid arteries and ambiens muscle. The classification of the Psittaci has proved a puzzle, but there are probably at least two well-marked families, Psittacidæ and Trichoglossidæ, with perhaps seven subfamilies.

PSKOV, pskôf. A western government of Russia (Map: Russia, C 3). Area, 17,070 square miles. The south part is somewhat hilly and undulating; the north is low, marshy, and thickly wooded. The chief rivers are the Lovat, which flows into Lake Ilmen; the Velikaya, a tributary of Lake Pskov; and the Düna, which drains the southeast part of the government. Pskov has a large number of lakes, of which Lake Pskov is the largest. The average annual temperature is about 41° F. Although the soil is mostly sandy and far from fertile, agriculture is the chief industry, with rye and oats as the principal crops. On the larger estates, as well as on the farms owned by colonists from the Baltic Provinces, modern agricultural methods are employed and cereals are raised for export. Flax is grown on a large scale for export. Next to agriculture lumbering is the most important industry in this government. The principal manufacturing industries are distilling, milling, and the production of lumber. The annual value of manufactures exceeds $5,000,000. Pop., 1912, 1,390,000. The bulk of the population is composed of Great Russians. Capital, Pskov (q.v.).

PSKOV. The capital of the government of the same name and one of the most ancient cities of Russia, situated at the confluence of the rivers Velikaya and Pskovâ, 171 miles southwest of St. Petersburg (Map: Russia, C 3). The town is divided into four distinct parts: (1) the Kremlin, together with the adjoining Dóvmont fortifications; (2) the town proper, dating from the middle of the fifteenth century and situated between the two rivers above mentioned; (3) the zâvelitché; that part which lies on the left bank of the river Velikaya and is connected with the main part of Pskov by two bridges; and (4) the zâpskové, a quarter situated on the right bank of the river Pskovâ and also connected by a bridge with the principal part of the town. Most of the town is still surrounded by its partly preserved ancient walls. In the old cathedral in the Kremlin, dating from the twelfth century, are the tombs of the princes of Pskov, while the church in the Spaso-Mirozhsky Monastery (twelfth century) contains well-preserved frescoes and mural paintings and a treasury with many precious relics. Noteworthy also are the cathedral of Sts. Peter and Paul with its ancient icons, the churches of the Old Ascension Convent, and the old palaces of the wealthy merchants. The modern town is devoid of special interest. The higher educational institutions of Pskov in-

clude two Gymnasia, a Realschule, a corps of cadets, a seminary for teachers, and one for priests. There is a considerable trade and some manufacturing. Pop., 1904, 31,227; 1913, 36,000.

Pskov, ancient Pleskov, was probably founded as early as 965. Threatened by the Lithuanians and the Germans, it was united with the city of Novgorod (q.v.) to form a bishopric in 992. With the growth of its commerce Pskov became more and more independent, and finally began to elect its own princes, who, however, were still considered as representatives of Novgorod. During the Mongolian invasions of Russia Pskov asserted its independence and attained complete independence (1348).

As a republic Pskov did not differ essentially in its internal organization from Novgorod. Commercially it was of the utmost importance, lying on the way between Riga and Novgorod. In the fourteenth century it became a member of the Hanseatic League. The aggressive policy of the princes of Moscow, however, soon put an end to the little republic. In the beginning of the fifteenth century Pskov committed the fatal blunder of appealing to the princes of Moscow in its struggles with Novgorod, thereby giving them an opportunity to interfere in its internal affairs. The internal conflicts between the masses and the upper classes afforded Moscow an additional pretext for interference, and Pskov was soon compelled to accept princes appointed by Moscow. The position of Pskov was further weakened by the fall of Novgorod, and the republic was finally abolished in 1510 by Prince Vasily III, its *vyetche* being suppressed, its leading merchants exiled to Moscow and replaced by settlers from that city. Since then the city has declined, and the only important event in its history is its long siege by the Poles under Stephen Báthory in 1581–82.

PSKOV, LAKE. A lake in Russia. See PEIPUS.

PSORA, sō′rȧ. See ITCH.

PSORALEA, sŏ-rā′lē-ȧ (Neo-Lat., from Gk. *ψωραλέος, psōraleos*, scabby, from *ψώρα, psōra*, itch, from *ψᾶν, psan*, to rub; so called from the dots sprinkled over the surface). A genus of plants of the family Leguminosæ, mostly natives of warm countries, with blue, purple, or white flowers and palmate or abruptly pinnate leaves. *Psoralea esculenta*, the breadroot of North America, and prairie apple, *pomme blanche* and *pomme de prairie* of the Canadian boatmen, is a perennial herb about a foot high, with a tuberous root, rich in starch and used as food, both boiled and raw. It abounds on the high plains from the Saskatchewan to Texas. *Psoralea hypogœa* and *Psoralea cuspidata* of the same region also have tuberous roots.

PSORIASIS, sŏ-rī′ȧ-sĭs (Neo-Lat., from Gk. *ψωρίασις*, itch, from *ψωριᾶν, psōrian*, to have the itch, from *ψώρα, psōra*, itch). A chronic skin disease characterized by inflammatory, dry, red, roundish patches covered with adherent silvery scales. It is distributed principally over the extensor sides of the extremities, especially about the elbows and knees, and the scalp, as also the trunk, but no part of the body is exempt. The disease is one of adult life, but may occur at any age. Its cause is still obscure. The treatment consists of the internal use of arsenic, iodide of potassium, thyroid extract, salicylates, quinine, and citrate of potash, together with the local use of alkaline baths, zinc oxide, mercurial ointments, thymol, beta naphthol, chrysarobin, etc. Sea-water injections and vaccine therapy have been used of late, but with questionable results. See LEPRA.

PSOVIE, psō′vĭ, or **BIRZON**, bĭr′zŏn. See GREYHOUND.

PSYCHANALYSIS, sīk′ȧ-năl′ĭ-sĭs. See PSYCHOANALYSIS; PSYCHOTHERAPY.

PSYCHE, sī′kē (Lat., from Gk. *ψυχή*, breath, life, soul, butterfly, from *ψύχειν, psychein*, to breathe). As a mythological character Psyche is a creation of the later Greek speculation and in literature is scarcely known before the story of Cupid and Psyche in the *Metamorphoses* of Apuleius (q.v.). Here Psyche appears as the youngest and most beautiful of three daughters of a king. She aroused the jealousy of Venus, who sent Cupid to inspire her with passion for the meanest of men. The god, however, loved her on sight, and caused her removal to a fairy palace, where he visited her in darkness, strictly forbidding her to see his face. Her jealous sisters persuaded her to disobey this injunction, but, when she approached the sleeping god with a lighted lamp, his unexpected beauty caused her to start, a drop of oil fell on the god, who woke and, after rebuking her curiosity, disappeared. Vainly Psyche sought him throughout the earth and finally came to the palace of Venus, who treated her as a slave and laid upon her tasks which she deemed impossible, but these the unseen aid of her lover enabled Psyche to accomplish. Finally even Venus's wrath was appeased, Jove gave her immortality, and she was united to Cupid. In this form a common folk tale has been adapted to the philosophy which taught the preëxistence of the soul in happiness, its hard service in the body, and its final immortality in bliss. Though there is no other literary testimony to this myth, the works of art show that as early as the second century B.C. the love of Eros and Psyche had engaged the Greek artists. One aspect of this story is found only on works of art of the Roman Imperial period—the torture of Psyche by Eros. Sometimes we see him holding the butterfly over a torch; at other times he binds and scourges the maiden Psyche, or with a torch singes the butterfly's wings which spring from her shoulders; again, Psyche lies prostrate before him in entreaty. The earlier groups show the lovers embracing. In the Pompeian wall paintings or on gems we also find Psyche or Psyches with Erotes engaged in various human occupations or amusements, especially in the famous Cupid frescoes in the House of the Vettii. On the Roman sarcophagi of the second and third centuries of our era the myth of Psyche is used with obvious reference to the life of the soul, and naturally the representations pass over into the early Christian symbolism. (See CUPID; CUPID AND PSYCHE.) The Psyche myth is the theme of decorations in the famous Villa Farnesina in Rome; these were designed by Raphael and executed by Giulio Romano and others.

Bibliography. The editions of the *Metamorphoses* of Apuleius cited under APULEIUS; an English version in Walter Pater, *Marius the Epicurean* (London, 1885; new ed., New York, 1902); Conze, *De Psyches Imaginibus Quibusdam* (Berlin, 1855); Collignon, *Essai sur les monuments relatifs au mythes de Psyche* (Paris, 1877); E. Rohde, *Psyche* (2d ed., 1890–94); the article "Psyche" in W. H. Roscher,

Lexikon der griechischen und römischen Mythologie, vol. iii (Leipzig, 1897–1909); Mau-Kelsey, *Pompeii: Its Life and Art* (2d ed., New York, 1902); C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911); R. Reitzenstein, *Das Märchen von Amor und Psyche bei Apuleius* (Leipzig, 1912).

PSYCHIATRY, sī-kī'à-trĭ (from Gk. *ψυχή, psychē*, breath, life, soul + *ἰατρεία, iatreia*, healing, from *ἰατρεύειν, iatreuein*, to heal, from *ἰατρός, iatros*, physician). The science that treats of the pathology, clinical conditions, progress, cause, and treatment of disease affecting the mind, whether it be as mild as a psychasthenia or as grave as an insanity. Whether diseases are within the domain of neurology or that of psychiatry is determined by a study of the symptoms and physical signs in the light of family and personal history. Many diseases affecting the mind present marked physical changes, such as tremors, alteration in tendon reflexes, pupillary anomalies, etc., as well as perversions of conduct or of action, such as exaltation, prodigality, suspicion, abulia, etc. See INSANITY; PSYCHOANALYSIS; PSYCHOTHERAPY.

PSY'CHICAL RESEARCH (from *psychic*, from Gk. *ψυχικός, psychikos*, relating to the soul or mind, from *ψυχή, psychē*, breath, life, soul). The term "psychical research" takes its meaning from the activities of the Society for Psychical Research (q.v.). The original programme of the society proposed a systematic investigation of "that large group of debatable phenomena designated by such terms as mesmeric, psychical, and spiritualistic." The work of investigation of these residual phenomena was intrusted to six committees, who were to inquire severally into "the nature and extent of any influence which may be exerted by one mind upon another apart from any generally recognized mode of perception"; into hypnotism, the so-called mesmeric trance, clairvoyance, and other allied phenomena; to investigate the reports of apparitions at the moment of death and of houses reputed to be haunted; to inquire into the causes and general laws of the phenomena of spiritualism; and to collect material relative to the history of these subjects. The group of inquiries thus circumscribed does not constitute a subdivision of an established body of knowledge, but contemplates an extension or revised interpretation of certain physical and psychical phenomena.

The most extensive investigations of psychical research have sought to establish or detect evidence for the transference of thought apart from the recognized channels of sense. The experimental evidence has been obtained by arranging that one person, called the agent, shall think intently of a definite mental (usually a visual) impression and shall attempt to transfer this impression to the mind of the percipient, who is supposed to be endowed with peculiar powers and who tries to read and record the impression transferred. Numbers, words, drawings of simple geometrical forms, sketches of familiar objects, colors, actions, simple calculations, or even sounds, tastes, and odors have been transferred in this way. The process of transference seems to be most effective when the percipient is in an hypnotic or trancelike condition. In such a state there is an increased sensitiveness to slight indications of sense (hyperæsthesia), which in turn suggests the functioning of an unusual degree of sensibility of the ordinary kind in cases of successful percipiency. The data needed to justify the assumption of a nonsensory mode of thought transference are difficult to collect: first, because the extreme delicacy of sensibility in a sensitive nervous system is itself responsible for much that passes for thought transference; secondly, because the precautions necessary to eliminate such possibilities have not as a rule been taken in the seemingly successful experiments, and proper conditions are often difficult to secure; thirdly, because the usual methods of performing such experiments leave the way open for unconscious exaggeration and misinterpretation, as well as for unconscious indication to the percipient. Recent experimenters have been alive to these difficulties. Yet, in the opinion of many whose judgment is entitled to great weight, the evidence does not yet justify, even provisionally, the entertainment of a telepathic hypothesis.

The telepathic hypothesis does not, however, rest its case upon experimental evidence alone. It presents an enormously extensive body of witnesses to the telepathic sending of hallucinations or presentiments, many of them having direct personal significance to those concerned, and an unusual number of them being connected with the moment of death or danger to one of the persons involved in the hallucination. The proportion of the recorded cases that contain a verifiable coincidence of event and presentiment is, on the whole, small. An elaborate census of hallucinations has been gathered by the society, and sets forth the relatively large occurrence of such hallucinations among normal persons in apparent good health. The doubtfulness of critics is increased by the consideration that an intense interest in presentiments may induce the habit of noticing and recording them, thus increasing their relative frequency and the opportunity for apparently unexplainable coincidence; further by the dominant tendency to note and be impressed by favorable instances and not to notice the vastly larger number of unfavorable ones. Other investigations of students in psychical research relate to asserted interest manifested by spirits of the departed in the affairs of this earth, mainly through individuals known as mediums. Here again the evidence falls into an experimental and an observational group. The experimental evidence is that of the physical phenomena of spiritualism, the moving of tables, appearance of forms, release of the medium from knots and bonds, reading of sealed messages, and so on. In this field so much fraud or sleight of hand has been discovered that the students in psychical research have as a rule recognized the weakness of such evidence. Yet some of the most eminent among them have been unwilling to consider the hypotheses of deception, conscious or unconscious, in certain instances, because of their personal faith in the honesty of the medium; and in such cases as that of Mrs. Piper, in which the subject in a trance state reveals to sitters knowledge of their private affairs apparently quite beyond the usual channels of information, the alternative is presented by the investigators that the information thus revealed is obtained by the coöperation of departed spirits or is suggestive of the action of some such unknown force as telepathy.

In many respects the field of psychical research and of psychology is the same, though

the methods and purpose of the investigators may be distinct. Hypnotism, unconscious nervous activity, alterations of personality, hysteria, mental automatisms, and related topics belong to both spheres. A type of such inquiry is crystal gazing, i.e., the alleged power to see in a crystal or other reflecting surface a visual projection of shifting scenes and images, which upon examination can be referred to experiences subconsciously assimilated. As illustrations of the exercise of the subconscious imagination, the record of such instances possesses a distinct value for psychology. To some observers they, like other experiences, suggest the working of supernormal mental processes. Equally deserving of mention are certain studies, pursued by persons interested in psychical research, that contribute to the psychology of deception. Such studies have shown how readily the reports of performances purporting to give evidence of supernormal powers are vitiated by defects of observation, by prejudice, by lack of technical knowledge, by lapses of memory, and the like.

Bibliography. The most important publications are those of the British Society for Psychical Research. The first American Society for Psychical Research (1884–90) published four volumes, then became a branch of the British Society, but after 1906 was again separate. Consult its *Proceedings*. Consult also: Frank Podmore, *Apparitions and Thought Transference* (London, 1894); Andrew Lang, *Cock Lane and Common Sense* (ib., 1894); R. O. Mason, *Telepathy and the Subliminal Self* (ib., 1897); Frank Podmore, *Studies in Psychical Research* (New York, 1897); id., *Modern Spiritualism* (2 vols., ib., 1902); T. J. Hudson, *Law of Psychic Phenomena* (Chicago, 1902); J. Maxwell, *Metaphysical Phenomena* (New York, 1905); J. H. Hyslop, *Science of a Future Life* (Boston, 1905); id., *Enigmas of Psychical Research* (N. Y., 1906); id., *Borderland of Psychical Research* (ib., 1906); Joseph Jastrow, *The Subconscious* (Boston, 1906); Sir Oliver Lodge, *The Survival of Man* (New York, 1909); W. F. Barrett, *Psychical Research*, in Home University Library (ib., 1911); J. H. Hyslop, *Psychical Research and Survival* (ib., 1913); Hereward Carrington, *Problems of Psychical Research* (ib., 1914); Henry Holt, *On the Cosmic Relations* (2 vols., ib., 1915); L. C. Graves, *Natural Order of Spirit* (Boston, 1915). D. P. Abbott, *Behind the Scenes with the Mediums* (Chicago, 1909), describes the methods used for deception. An illuminating case of supposed mind reading in an animal is recorded by Pfüngst, *Clever Hans, the Horse of Mr. Von Osten: A Contribution to Experimental Animal and Human Psychology*, translated by C. L. Rahn (New York, 1911). In Joseph Jastrow, *Fact and Fable in Psychology* (Boston, 1900), will be found a critical survey of certain problems and positions of psychical research.

PSYCHICAL RESEARCH, SOCIETIES (BRITISH AND AMERICAN) FOR. The British society was formed in London in 1882, as the result of a conference convoked by Prof. W. F. Barrett, for the purpose of making "an organized and systematic attempt to investigate that large group of debatable phenomena designated by such terms as mesmeric, psychical, and spiritualistic." Through the agency of committees the society has gathered and published a vast amount of material on the subjects involved, with many discussions thereon. (For a discussion of the results attained by the committees, see PSYCHICAL RESEARCH.) Among the most notable investigations of the society have been those conducted by Richard Hodgson, J. H. Hyslop, and others on the trance medium, Mrs. Leonora Piper, of Boston, Mass. The society's most conspicuous work was the census of hallucinations, which it carried on from April, 1889, to May, 1892, and which led its committee to announce one important deduction: that between the death of a person and the simultaneous apparition of that person to another person, at a distant spot, there is some connection (consult *Proceedings*). The first president of the society was Henry Sidgwick, who served in 1882–84 and also in 1888–92. Other prominent members have been A. J. Balfour, W. F. Barrett, J. R. Holland, R. H. Hutton, the Rev. W. Stainton Moses, Roden Noel, Balfour Stewart, Hensleigh Wedgewood, William James, Sir William Crookes, F. W. H. Myers, Sir Oliver Lodge, Edmund Gurney, Lord Rayleigh, Frank Podmore, Sir J. J. Thomson, Henri Bergson, and F. C. S. Schiller.

An American Society for Psychical Research was formed in 1884, in 1890–1906 was a branch of the British association, and thereafter was again separate. It publishes *Proceedings* (which consult) and also a monthly *Journal*. Consult also the NEW INTERNATIONAL YEAR BOOK articles on the subject.

PSYCHIC EPILEPSY. See EPILEPSY.

PSY'CHOANAL'YSIS (Neo-Lat., from Gk, *ψυχή, psychē*, breath, life, soul + *ἀνάλυσις, analysis*, a releasing, dissolution). The name originally given by Prof. Sigmund Freud, of Vienna, to a system of psychotherapy which he devised and developed. It is a method of psychological investigation designed for the purpose of discovering and exploring the unconscious psychic forces which are at the bases of normal and abnormal psychic manifestations. Psychoanalysis was originally designed for the cure of those border-line cases of mental diseases which are known as hysteria, neurasthenia, compulsion neurosis, etc. It assumes that there are definite reasons for all normal and abnormal mental activities, that no psychoneurotic symptoms are accidental or meaningless, but that they have always unconscious underlying causes which, if found and brought to the surface, become dissipated and cause the symptoms to disappear. With this assumption Professor Freud evolved his theory of repression, which is the main pillar upon which rests the edifice of psychoanalysis. In brief this theory states that the psychoneurotic symptom depends on past emotional experiences of a painful or disagreeable nature which were forgotten or repressed into a mental field called the unconscious.

When an effort is made to trace back the morbid symptoms of a neurotic to their life history, one meets with a resistance which opposes the analytic work by causing a failure of memory. The success of overcoming this resistance depends on the relation existing between the patient and the physician. This relation, or the transference as it is called, consists in the fact that during the treatment the patient continually applies to the physician tender and hostile emotions that have no foundation in the actual relation, but are derived from the patient's old unconscious wish fancies. These two

facts, resistance and transference, must be recognized and taken as starting points in every Freudian psychoanalysis.

The aim of psychoanalysis is to bring back into the field of conscious memory all the repressed unbearable ideas, to show the patient the connection between them and the symptoms, thus removing the latter. Because the patients' dreams invariably refer to the symptoms, Professor Freud has developed in his book *The Interpretation of Dreams* a most comprehensive dream psychology. He assumes that dreams are not foolish, that they are perfect psychic mechanisms, that they concern themselves with the most intimate part of the human psyche, and that they always represent, in a distorted form, the realization of a repressed wish. In analyzing dreams or psychoneurotic symptoms use is made of the method of free association. The patient, having focused his attention on a particular part of a dream or symptom, lets his mind drift and repeats to the physician every thought or memory picture that presents itself to his consciousness. The latter thus discovers the meaning of the dream or symptom and imparts the same to the patient.

As it was found that the associations thus produced were mostly made up of erotic material, Professor Freud formulated his theories on sex, and in his *Three Contributions to the Sexual Theory* he asserts that "in a normal sexual life no neurosis is possible." The term "sex," however, is used by him in the broad sense of love and is not limited to the gross sexual.

Besides occupying itself with morbid mental manifestations, psychoanalysis also invades other fields of research. Professor Freud's books, *Psychopathology of Everyday Life*, *Wit and Its Relation to the Unconscious*, *Totem and Taboo*, and the *Selected Papers on Hysteria*, throw new light on the problems of æsthetics, mythology, folklore, and on the origins of social customs and religious and moral ideas.

While psychoanalysis, in the hands of competent men, has undoubtedly been of great help in exploring subconscious states, some "wild" psychoanalysts have so thoroughly misinterpreted the sexual question that it endangers the science. In the United States A. A. Brill, J. J. Putnam, T. Burrow, S. E. Jelliffe, and W. A. White have been the foremost representatives of scientific psychoanalysis. For general discussion, see PSYCHOTHERAPY; see also DREAMING; FREUD, SIGMUND; HYSTERIA. Consult: I. H. Coriat, *Abnormal Psychology* (New York, 1914); Sigmund Freud, *Psychopathology of Everyday Life* (Eng. trans., ib., 1914); A. A. PSYCHOGRAPHY, sī-kŏg'rȧ-fī. See INDIVIDUAL PSYCHOLOGY.

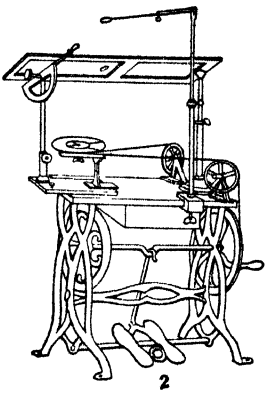
PSY'CHOLOG'ICAL APPARATUS. The apparatus employed in a well-equipped psychological laboratory falls into the following main divisions: (1) physiological models of the sense organs and the brain; (2) demonstration apparatus, for use in the lecture room before a large audience; (3) drill apparatus, for class work with students in the laboratory; and (4) research apparatus for the investigation of new problems, generally built, in part at least, within the laboratory. To these four classes may be added (5) certain anthropometrical instruments (see ANTHROPOMETRY), such as those which measure the diameter of the pupil, or the force and steadiness of muscular action; (6) apparatus for the observation of the habits and faculties of the lower animals, such as a microscope, with special attachments for work on the protozoa; mazes of wire or wood, to test the formation of habits in reptiles or small mammals; aquaria; cages whose fastenings are designed to test the intelligence of their occupants; and (7) simple instruments for use with children or defective persons, designed to test sensation, perception, feeling, action, attention.



Psychological instruments proper, i.e., the pieces included in classes (2), (3), and (4), have two purposes: first, to *produce* the physical stimuli which are correlates of definite mental processes, and, secondly, to *measure* and to *record* these stimulations and the physical processes, such as organic movements, which accompany or follow them. We distinguish two classes of such instruments, the qualitative and the quantitative. The former serve primarily to demonstrate a fact, the occurrence of a given mental process under such and such conditions. Quantitative instruments generally permit us to vary stimulation within wider limits, to control it more exactly, and to express it numerically in conventional units. As an instance of an instrument belonging to the first group, we may take the simple afterimage apparatus. It consists of a light placed within a black box, one of whose sides is a plate of ground glass. Behind the ground glass are a wooden shutter and a slide of colored glass. If the shutter is raised for (let us say) 30 seconds and then allowed to fall, an even patch of color is presented to the observer's eye and then replaced by a gray background on which the afterimage appears. If glasses of various colors are employed, the general law of complementary colors in the negative afterimage may be demonstrated. When, however, we wish to investigate the exact dependence of the afterimage upon wave length, intensity, extent, or duration of the inducing color, our problem becomes quantitative and this instrument is inadequate. We resort, therefore, to such instruments as the spectrophotometer, the tachistoscope, the chronoscope, which enable us to control these factors and to express them in exact numerical terms. If, instead, we desire to record the course of the fading image and the number of its recurrences, or if we are interested in its affective and organic accompaniments, we use the graphic method (described later in this article), whereby the changes may be continuously recorded in the form of a curve whose abscissæ are time units and whose ordinates represent the corresponding variations in the process under observation.

Psychological Acoustics. The least perceptible intensity of auditory sensation is determined by means of the *acoumeter*. In one form a tiny hammer drops upon a steel bar from a constant height and the distance of the instrument from the ear is varied; in others a ball of pitch or cork or metal falls upon a glass plate and the height of fall is varied until a point is reached where a sound can just be sensed. The discrimination of sound intensities is measured by the gravity *phonometer*, which is practically an enlarged acoumeter of the second type, or by the *sound pendulum*, in which the ball swings through an arc before striking the block instead of falling vertically upon it.

Approximately pure tones can be obtained from tuning forks mounted on resonance boxes, or from bottles across the mouth of which a stream of air is forced. *Stern's variators* are blown bottles whose bottoms are pistons which can be raised or lowered gradually and steadily by a system of cogs and a spiral disk. They make possible the production of a comparatively pure tone whose pitch can be quickly and continuously changed. Gasometers or pressure blowers, which furnish a steady current of air, are necessary in connection with blown bottles, since here pitch is partly dependent upon intensity of pressure. Absolutely pure tones are obtained by passing such sounds through *interference tubes* and thus eliminating overtones. The highest audible tone is determined by means of a series of tiny forks or steel cylinders or by the use of the *Galton whistle*, a piston whistle of small bore, whose length can be varied gradually from that which sounds a clear tone to that which gives the impression merely of continuous noise. The lowest audible tone may be found by use of a giant fork with riders, by tuning forks of wire weighted at the tips of the tines, by *Appunn's lamella*, a disk at the end of a steel blade whose pitch is altered between the limits of 4 and 24 v.d. per second by shift of the lower end in a vise, or finally by the production of deep difference tones. (See AUDITION.) For experiments in pitch discrimination and for studies of clang tint and tonal fusion (see FUSION), other sources of tone are useful. Besides many musical instruments we may mention reed boxes, organ pipes, sirens, and the sonometer. For the study of rhythm the metronome, or the cardboard disk pierced by holes and rotating across a tube conducting a tone, is employed. Localization of sound, i.e., judgment of the distance and direction of sounds without the aid of other senses, is studied by means of the *sound cage*. The observer sits with his head clamped at the centre of a sphere whose surface is generated by rotation of two semicircular arms, one of which carries a telephone receiver. He reports the apparent position of the click of the receiver, while its actual position is determined by the reading of two scales at the points of rotation of the separate arms.

Psychological Optics. Psychology borrows from the oculists their various tests of acuity of vision and from the physicists their manifold photometrical devices. Color mixture is studied by means of the *spectrophotometer*, which enables us to measure wave lengths and to mix spectral lights in variable proportions and at variable intensities, or (more usually) by means of disks of colored paper slit along one axis, fitted together to form a single compound disk, clamped at their centre upon an axle, and rotated with extreme rapidity by hand or by the electric motor. Under such conditions the colors cancel or blend according to their proportions and their sensory attributes. The color mixer may also be employed for sensible discrimination of lights and colors and for the measurement of contrast effects. The phenomena of indirect vision are investigated by the use of the *campimeter* or *perimeter*. The latter is a semicircular arm which can be rotated about its midpoint so as to generate a hemispherical field. The observer fixates the centre of the field, and colored disks are moved along the arm in its various positions. He reports their appearance as he thus (indirectly) sees them. When various colors have been shown at all points of the field, maps of the zones of retinal sensitivity may be platted. The campimeter serves the same purposes as the perimeter, but its field is plane instead of hemispherical. Color blindness is tested most simply by the matching of selected skeins of colored worsted (*Holmgren test*). More reliable results, however, are obtained by the use of Hering's instrument, which enables us to produce fine gradations of colors and lights by the mixture and occlusion of transmitted lights. The subject of color blindness has attracted much attention, and various forms of test, of all degrees of accuracy, have been employed. For the study of perception of space in the third dimension, the *stereoscope* and *pseudoscope* are indispensable. The latter is a converting stereoscope, i.e., a stereoscope whose lenses or prisms give us an illusion of inverted tridimensionality, hollows appearing in relief and conversely. This department of psychological inquiry is rich in research instruments, which expose threads, lines, or edges at different (and, of course, unknown) distances from the observing eye. There are also special instruments for the sudden brief exposure, on a dark field, of words or figures, which are to serve as the starting point of a train of association; others for the serial exposure of words or colors which are to be memorized; and yet others for the test and control of the visual imagination.

Haptics and Organic Sensation. The first requirement in the field of cutaneous sensation is a set of *pressure*, *temperature*, and *pain points*. These are of wood, metal, or hair. Various means have been devised for regulating the intensity of pressure, the temperature of the applied point, etc. One instrument for this purpose is the *kinesimeter* of Hall and Donaldson, which passes pressure or temperature points over a selected area of the skin, at a constant rate and intensity. The least noticeable pressure is determined by a series of small and accurately graded *touch weights*, or by a series of hair points, the area and bending weight of which are known. Discrimination for pressure is measured by weights, laid upon the resting skin; discrimination for lifted weights (in which pressure coöperates with the articular and tendinous sensations), by cylindrical weights of hard rubber, filled with shot, which are lifted successively in pairs and thus compared. Sensitivity to temperature and pain is determined by the application of *temperature cylinders* and of the *algometer* to a chosen portion of the skin. The algometer may be a needle or a rod covered at the exposed end with cloth or chamois leather and working against a spiral spring; the amount of pressure which evokes pain is read from a scale laid along the spring. The *æsthesiometer*, in simplest form, is a pair of ordinary drawing compasses, tipped at the ends with hard rubber. The object of the instrument is to show us how far apart two cutaneous pressures must lie if we are to perceive them as separate; and, again, what separation of the compass points at one part of the skin gives a separation, in perception, equal to that of a given separation of the points at another part of the skin. The least amount of movement that can arouse an articular sensation is given by the *arm board*, a hinged board upon which the observer lays his hand and arm (bringing the elbow over the

hinge), and which is then very gradually raised or lowered by the experimenter. Discrimination of kinæsthetic sensations may be tested by the finger-movement and the arm-movement apparatus of Cattell and Münsterberg. In both of these the finger is inserted in a car, which travels for a prescribed distance along a track; the observer then tries to reproduce the movement by memory. The static sense (sensation of dizziness) is studied by the *rotation table*, a flat bed or table upon which the observer is stretched, and which can be twirled round, in the horizontal plane, at constant rates. Perception of the movement and position of the whole body is investigated both by the rotation table and by the *tilt board*, a similar instrument, in which the table can be swung through approximately 180° in the vertical plane. The observer, strapped upon the table, estimates the extent and direction of movement, the true values of which can be read from a scale.

Taste and Smell. For the study of gustatory sensation we need very simple appliances: a magnifying glass or concave (enlarging) mirror, for bringing out clearly the separate papillæ of the tongue; fine camel's-hair brushes, for the application of stimulus; and sets of solutions, of varying strength—sweet (sugar), salt, sour (tartaric acid), and bitter (hydrochlorate of quinine). For the study of olfactory sensation, on the other hand, we need a special (and in some of its forms highly complicated) instrument, the *olfactometer* of Zwaardemaker. In principle, the olfactometer consists of a glass tube, bent up at right angles to enter the observer's nostril and passing through an odorless screen of wood or metal, which prevents the access of any foreign odor to the nose. Over the portion of the tube that projects behind the screen is slipped an "olfactory cylinder," a glass-cased tube of some odorous matter, such as rosewood or asafœtida. When the cylinder is pushed hard against the screen, its outer edge is flush with the end of the glass inhaling tube, so that nothing of its substance can be smelled. If, however, it be pulled out, say for 1 cm., then the current of air which reaches the observer's nostril must pass over this length of exposed odorous surface before it enters the inhaling tube. If the cylinder be pulled out still farther, then the incoming air current must pass over a still greater odorous surface. We have in this way a means of regulating quantitatively the stimulus that we are applying to the sense organ.

Affective Processes. Under this heading we must give a brief general account of the *graphic method*. The essentials of the method are three in number. We must have (1) a *recording surface*, on which the curve is to be traced. This generally takes the form of a brass drum, rotated by weight or motor or clockwork and covered with a sheet of smoked white paper. It is called a *kymograph*. We must have (2) a *time line*, i.e., a tracing marked off into divisions which represent known time units. We may, e.g., attach a little strip of parchment to one of the prongs of an electrically driven tuning fork and lay the tip of this strip tangentially against the revolving drum. As the drum moves and the fork vibrates, the movement of the strip will be drawn out into a sinuous curve, each wave of which represents the time unit of the vibrating tine. The curve shows white upon the drum surface, since the moving strip knocks off the soot at the point of contact. Finally (3), we must have special apparatus which shall write upon the drum, above the time line, the course of the process under investigation. Such apparatus are actuated, for the most part, either by a mechanical lever system or by air transmission. For example, in registering the course of breathing, we employ air transmission. We connect the stems of two little funnels by a piece of rubber tubing and stretch a sheet of thin rubber over their two heads. If we press the elastic covering of either head, the covering of the other will evidently bulge outward. Let us, then, apply the first head to the observer's chest and hinge a light lever (which we apply to the drum surface) to the other. As the chest rises and falls in respiration, the lever on the second funnel head will rise and fall correspondingly, and we have our curve traced upon the kymograph. The funnels are known as *Marey's tambours*. In the *sphygmograph*, or pulse recorder, the free tambour is laid over the radial artery of the wrist, and the pulsations of the artery are reproduced upon the drum. In the *pneumograph*, or breathing recorder, this tambour is replaced by an elastic girdle, passed round the thorax; this opens into the connecting rubber tube, and the curve is traced as before. In the *plethysmograph*, or volume recorder, the tambour is replaced by a glass vessel containing air or water. The hand or arm is inserted in the vessel, which is then hermetically closed, save for the tube connection to the writing tambour. As the inclosed member changes in volume, the writing point rises and falls upon the kymograph surface. Lastly, in the *dynamograph*, or strength recorder, the free tambour is replaced by a heavy steel spring, which is gripped by the hand; as the pressure increases or relaxes, puffs of air are sent along the connecting tube to the writing lever, and the fluctuations of muscular strength are correctly registered. It is also necessary to record the involuntary movements of arm and hand. For this purpose we use the *automatograph*, a scientific modification of the once popular planchette. The course of fatigue may be followed by means of the *ergograph*, which records the work done in a continuous pull against a spring or in the successive lifting of a constant weight.

Action. The simplest instrument for the performance of reaction experiments (see REACTION) is Sanford's *vernier chronoscope*. It consist of two pendulums, of slightly different lengths. The one is started by the opening of a key, simultaneously with the giving of the stimulus (the signal for movement); the other, by the opening of a second key, pressure upon the button of which constitutes the movement of reaction. The two pendulums swing together on the principle of the vernier; and the number of swings made, before coincidence is reached, gives the reaction time in fiftieths of a second. A more elaborate arrangement is the *Hipp chronoscope*, an electric clock, with a unit of a thousandth of a second. The clock is started by the giving of the reaction stimulus and arrested by the reaction movement. The stimulus may be given by the swing of a pendulum, which sends a ray of light or exposes a patch of color to the observer's eye; by the fall of a hammer upon a metal block; by a pressure upon the skin, etc. In every case the instrument employed is in electrical connection with the

chronoscope. The movement of reaction may be made by hand or foot, by voice, by lips, or eyelid. Whatever the form of "reaction key" employed, it too is always in electric connection with the chronoscope. Again, the time of reaction may be recorded directly, by time markers, upon the surface of the chronograph, a kind of kymograph, provided with tuning-fork controls that give an exceedingly accurate time line.

Attention. The fluctuations of attention are measured by very faint auditory or visual stimuli, e.g., by the ticking of a distant watch, the continuous fall of a little stream of sand, or the light gray rings on white ground produced by rotation on the color mixer of a disk of white cardboard, on which is drawn a broken black radius (*Masson's disk*). Distribution or distraction of attention is studied by the *complication pendulum*, an instrument which presents to the observer, at one and the same moment, impressions of sight, of sound, and of touch. The range of attention, i.e., the number of objects simultaneously apprehensible by a single attentive observation, is determined visually by the *tachistoscope* and auditorily by the metronome. The tachistoscope consists, in essentials, of a screen carrying words, figures, or letters, which can be displayed for a fraction of a second by a shutter, like the instantaneous shutter of a photographic camera.

Other Instruments. Apparatus employed in the study of the more complicated mental processes have, as a rule, the special form given them by individual investigators. There are several forms of *memory apparatus*, the essential feature of which is the serial exposure of words, letters, etc., to be memorized by the observer. In work upon recognition it is usual to adopt some one of the pieces given under the headings *Acoustics* and *Optics*. Something has been done, in the study of imagination, by aid of the symmetrical figures formed by folding upon itself a piece of paper upon which an ink blot has been made; recourse is also had to the suggestions aroused by words. Individual psychology has its own materials, of specially prepared proof sheets or pages of printer's pi, letter patterns upon ruled cards, etc. Finally, it may be said that the apparatus described in the body of the article above are, in general, the simplest of their kind; many more elaborate instruments have been devised, as, e.g., for the study of rhythm.

In the light of the above discussion the figures of the plates will be largely self-explanatory. The sound pendulum was first invented by Fechner; it is figured in the form given it by Wundt. The combined color mixer and campimeter was devised by Hering. Figures 2, 3, 4, 6, 7, 8 of this Plate are taken from Titchener's *Experimental Psychology*. The Appunn tonometer is a box containing reeds, differing by 4 v.d.; it is used for investigations of sensible discrimination, etc. The figure of Zwaardemaker's olfactometer shows the appliances used for the simultaneous record of the observer's breathing curve. The Deprez signal is a time marker, replacing the tuning fork referred to in the text. Figures 2, 4, 5, 9, 10 of this Plate are taken from Titchener's *Experimental Psychology;* Fig. 7 is from Sanford's *Laboratory Course.*

PSYCHOLOGICAL ASSOCIATION, AMERICAN. A learned society organized in New York, July 8, 1892. Its object is the advancement of psychology as a science, and it has a membership of 295. The society publishes an annual volume of *Proceedings*.

PSYCHOLOGICAL LABORATORIES. See this title under LABORATORY.

PSYCHOL'OGY (from Gk. ψυχή, *psychē*, breath, life, soul + -λογία, *-logia*, account, from λέγειν, *legein*, to say). Psychology may be defined as the science of mind. More exactly it is the science of mind considered for the sake of mental facts and processes alone, and apart from their values or consequences. It is thus distinguished from the other mental sciences: from logic, which is concerned with the truth or error of reasoning processes; from epistemology, which is concerned with the validity of perception; from metaphysics, which deals with the consistency and reference of fundamental conceptions; and from ethics, which is concerned with ideas in relation to their influence upon conduct. Psychology is distinguished from all these, while at the same time it necessarily covers the same territory in considering the mental facts with which they also deal. What distinguishes psychological science is its point of view, which is primarily the observation and analysis of the immediate psychical phenomenon whatever its nature.

The most important works which appeared before the advent of modern philosophy, works which the modern psychologist cannot afford to neglect, are Aristotle's treatise *De Anima* with its appendices, the *Parva Naturalia*, and the *Summa Theologiæ* of the scholastic philosopher Thomas Aquinas. For Aristotle's psychology, consult the works of Wallace (Cambridge, 1882) and Hammond (London, 1901). For general histories of Psychology, consult: Carus, *Geschichte der Psychologie* (Leipzig, 1808); Harms, *Geschichte der Psychologie* (Berlin, 1878); Siebeck, *Geschichte der Psychologie* (Gotha, 1880, 1884); Dessoir, *Geschichte der neueren deutschen Psychologie*, part i (2d ed., Berlin, 1897).

The principal stages in the development of modern psychology may be characterized as the philosophical or metaphysical and the empirical. The former conceived of mind as substance or as activity (see MIND), and sought to determine the nature of mind and its relation to matter (monism versus dualism, spiritualism versus materialism) and to classify the various activities of mind. It may be said to culminate in Hegel (Wallace, *Hegel's Philosophy of Mind*, Oxford, 1894), though it has continued in the purely introspective works of the Hebartian school. The term "philosophical psychology" is still employed at the present day for the discussion of such problems as the nature of mind (whether there is a mind substance or whether

the mental processes as given constitute mental reality—substantiality versus actuality), the ultimate elements of mental experience (intellectualism versus voluntarism), and the relation of mind to body (parallelism versus interaction).

Empirical psychology takes mental experience as its subject matter; but interpretations of mental experience are so numerous and conceptions of the end or aim of the science are so diverse that radically different systems result. In the rough we may distinguish descriptive, explanatory, and scientific or experimental psychology. The first two represent differences in aim and method, while the last is distinguished principally by a clearer and more scientific point of view and is both descriptive and explanatory. The first effort at a purely descriptive psychology began with the conceptions of popular psychology, i.e., with mind as thinking, feeling, remembering, judging, and the like, and attempted to force these conceptions into a logical system of faculties or powers. Ultimately the faculties themselves became explanatory. This faculty psychology (see FACULTY) had its beginnings in Aristotle, reached its climax in Wolff (*Psychologia empirica*, 1732; *Psychologia rationalis*, 1734), and was finally overthrown by Herbart. The second attempt at a descriptive psychology began with the division of the world of experience into two kinds, inner or mental and outer or physical phenomena. The former constituted the subject matter of psychology. At this stage psychology made the mistake of confusing the problem of knowledge with that of the description of experience itself; since we not only perceive but also know that we perceive, the observation of mental phenomena seemed to be different from that of physical phenomena. This belief led to a distinction between inner perception and outer perception; psychological observation was by means of inner perception or introspection, and the psychology which resulted is called inner-sense or introspective psychology. Its roots are again very old; its classical expression is found in Locke (*Essay Concerning Humane Understanding*, 1690); it is the basis of the descriptive psychology of Herbart (*Psychologie als Wissenschaft*, 1824–25); and it is still to be found in the works of those psychologists who have not divorced logic and epistemology from psychology, as, e.g., Brentano (*Psychologie vom empirischen Standpunkte*, i, 1874).

The psychology of inner sense had, however, one signal merit: it was analytical. And the analysis of mental phenomena into simpler processes led to the synthetic and explanatory problem of the connections and functions of these processes. The systems of empirical psychology which emphasized explanation rather than simple description are for convenience included under the term "explanatory psychology." Here belongs the associationist school of psychology (see ASSOCIATION OF IDEAS). It includes the great names of English philosophy from Thomas Hobbes down to John Stuart Mill and Alexander Bain. There is still a confusion of the logical or epistemological aspect with that of psychology proper, but in a different way from that of inner-sense psychology. The simplest elements of experience are now least bits of knowledge, and the complex processes, e.g., perceptions, are sums or aggregates of these elements. The associationist position has been largely transcended, though the epistemological reference still remains prominent in the English and American works of J. Ward, W. James, and G. F. Stout. In Germany the first important principle of explanation was Herbart's mechanics of ideas. Herbart's assumptions were metaphysical, but his attempt to represent mathematically the power of attraction and resistance of his ideas was a distinct advance. His influence is still to be found in Theodor Lipps, *Die Grundtatsachen des Seelenlebens* (1883), and in Wilhelm Volkmann, *Lehrbuch der Psychologie* (4th ed., 1894–95). A second principle, and one that led directly to modern scientific psychology, resulted from the striking developments of sense physiology about the middle of the nineteenth century. That mental phenomena are conditioned upon the body had long been recognized; but it was Lotze (*Medicinische Psychologie*, 1852) who first attempted to work out a thoroughgoing account of these conditions; and a few years later appeared G. Th. Fechner's *Elemente der Psychophysik* (1860), and the way was open to a scientific psychology See PSYCHOPHYSICS.

The one thing lacking before psychology could attain to the rank of a science was a properly scientific point of view. The inner-sense psychology had rid itself of metaphysics, but had substituted the problem of knowledge; the associationists had assumed least bits of knowledge as their starting point; and both Lotze and Fechner were caught between their interest in facts on the one hand and their philosophical tendencies on the other. W. M. Wundt, *Grundzüge der physiologischen Psychologie* (1874; 6th ed., 1908–11), introduces a new era. Psychology has no subject matter peculiar to itself; all science deals with the same world of experience, only from different points of view; mental sciences deal with experience in its immediate, physical sciences with experience in its mediate, aspect. The position was later worked out to logical consistency by E. Mach, *Beiträge zur Analyse der Empfindung* (1886), and R. Avenarius, *Kritik der reinen Erfahrung* (1886–90). Wundt is to be regarded as the father of modern psychology, because he defined its point of view and furnished it with an adequate method; because he continued and extended the experimental work of Fechner by the establishment of the first psychological laboratory in 1879 (see LABORATORY, *Psychological Laboratories;* PSYCHOLOGY, EXPERIMENTAL); and because he brought together and fused into a single system the psychological facts which had been gathered by previous psychologists or had been found as by-products in other sciences. The new movement thus begun in Germany spread first to America, thence throughout Europe, and ultimately to most of the important universities of the world.

The point of view, then, of scientific psychology is to regard as its subject matter all experience that is immediate (Wundt) or that is dependent upon the experiencing individual (Ward, Stout, Külpe, Titchener); and we may further define the experiencing individual as the functional nervous system. The method of psychology is the same as that of other sciences, i.e., observation; we attend to the experience in question and report it. But observation is best made under controlled conditions, so that the experience may be isolated and the observation be repeated and varied; and such an observation is an experiment. The problem of psychology is to describe immediate or de-

pendent experience; and description is analytic and synthetic and includes a statement of the nervous processes which condition the experience. Experience, moreover, may be regarded either as structural or as functional. As a consequence some authors lay more stress upon analysis of structure (Külpe, Titchener), others upon discrimination of function (Ward, James, Stout). The difference is mainly a matter of the psychologist's temperament and training, of the direction (scientific or philosophical) from which he approaches the psychological problem. The important thing is to keep the two lines of inquiry distinct; not to hypostatize function, to invent separate structures that shall carry its separate phases, as is done, e.g., by a psychology which speaks of memories and memory ideas as qualitatively unique processes; and not to translate structure directly into function, as is done, e.g., by a psychology which makes sensation the primary source of knowledge.

The programme thus outlined has proved adequate to the study, not only of the normal human adult, but also of dependent experience wherever it is found. The scope of psychology, therefore, extends from individual to social and racial, from human to animal, from infantile to senile, from normal to abnormal, experience. In one sense all experience is individual, and it is only because the nervous structure and the observations of a number of individuals are essentially alike that we can write a general psychology, the psychology of the textbooks. We may, however, take account of the differences between the experience of individuals and thus have a differential psychology. (See INDIVIDUAL PSYCHOLOGY.) Again, we may analyze the experience of a group of individuals of the same race and epoch who live together in a society in which they mutually influence one another. In such a case certain dispositions are the same; the situations in which the individuals are placed are common to all; and the collective experience which results finds its expression in language, myth, custom, religion, and law. We thus get material for a collective psychology (see SOCIAL PSYCHOLOGY), or, as the counterpart of individual psychology, we have a differential psychology of races. (See PSYCHOLOGY, ETHNIC.) Furthermore, not all dependent experience is normal; some minds are defective, others temporarily deranged, still others permanently disordered. The study of such experience furnishes problems for abnormal psychology. (See MENTAL PATHOLOGY.) Finally, not all dependent experience is that of the human adult. Animals have sense organs and nervous structures which in many cases are very like our own; we must therefore believe that they have dependent experience which finds expression in their behavior. On this basis of analogy we may construct an animal psychology (q.v.). Similarly we may analyze the individual experience of the infant, the child, and the adolescent. (See CHILD PSYCHOLOGY.) Or we may take a comparative and genetic point of view and seek to trace the development of mind ontogenetically from infancy to old age or phylogenetically from the lowest forms of animal life, through the animal scale, to mankind. See GENETIC PSYCHOLOGY.

If now, in the light of the above classification, we attempt to lay out a complete psychological programme, we shall arrive at some such result as the following. The psychologist will prepare himself for his work by a study of the nervous system at its various developmental levels. Entering upon psychology proper, he will seek to determine, on the structural side of mind, the number and nature of the mental elements, the patterns upon which they are arranged in the complex processes, and the gradual growth in intricacy of these patterns as mental development proceeds; on the functional side, the nature of the root functions of mentation, the mode of coöperation of these functions in the developed mind, and their gradual growth in complexity from the infant to the man. In his study of function he will be keen to note differences, individual variations as well as uniformities. He will, further, give some attention to the questions of classification and arrangement of the typical mental formations, keeping the genetic principle well in view. He will endeavor to extend his knowledge of mental function beyond civilized humanity to the animals and the lower races of man, and to trace the psychological laws underlying the great products of the collective mind. Here, too, his work will be informed by the genetic spirit. During his occupation with normal phenomena he will not neglect the observation of the abnormal. Finally, he may attack the questions that lie on the border line between science and philosophy, the questions of the appearance of mind in the evolution of the universe, of the criterion of mentality in the lowest animals, of the ultimate nature of mind, of the relation of mind to body; or he may turn the results of his scientific inquiries to immediate practical account, embodying them in some psychologically grounded system of ethics or of education. The programme is too large for any one man to cover; and the interests which it demands, philosophical, scientific, practical, would hardly appeal, in any case, to a single personality. But we can see that it is unitary and self-consistent.

PSYCHOLOGY, APPLIED. A popular term designating a body of facts of psychological nature, either obtained or selected and interpreted with a view to the guidance of practice. Applied psychology, whose ultimate concern is the establishment of practical rules, is thus contrasted with theoretical psychology (see PSYCHOLOGY; INDIVIDUAL PSYCHOLOGY), whose concern is the discovery of scientific truth. Extended applications have thus far been made in the fields of education (see CHILD PSYCHOLOGY; MENTAL TESTS), of law (see TESTIMONY, PSYCHOLOGY OF), of medicine (see PSYCHOTHERAPY), and of business. In the latter field special study has been made of the psychological factors in salesmanship and in advertising, and psychological methods have been used to investigate the influence upon work of lighting, ventilation, temperature, fatigue, monotony, etc., to determine the efficiency of movements, to ascertain aptitude for vocations and positions, and to test various modes of industrial training.

PSYCHOLOGY, ETHNIC, or ETHNOPSYCHOLOGY. A department of psychology as yet hardly susceptible of exact definition. We may describe it, provisionally, as the individual psychology of races, tribes, or peoples. While it seeks to analyze and depict the mental peculiarities of societies or communities, still it is not concerned, as is social psychology (q.v.), with the mental products of the common life of man; it seeks rather, by methods of statistical comparison and averaging, to construct the typical individual of the tribe or people under consideration and thus to make clear his resemblances to, and differences from, the typical individual of the textbooks of descriptive and experimental psychology. Ethnopsychology thus attempts the same problem in the sphere of racial types that ethology (in Mill's sense of the science of character) attempts in the sphere of the individual variations of human tendency and endowment (Wundt). It stands to the physical and physiological parts of ethnology (ethnogeography, anthropometry, etc.) as psychophysics stands to physiology. Ethnopsychology, as thus defined, forms, together with the histories of language, myth, and custom, the necessary propædeutic to social psychology. Under its province would fall, e.g., an investigation of the keenness of perception (sight, smell), or the æsthetic tastes, or the superstitious beliefs of the savage; a study of the relative parts played by reason and emotion in the Anglo-Saxon and the Latin minds; a comparison of the minds of the Oriental and of the Occidental —inquiries varying in scope from the cleanly formulated questions of normal psychology to the widest generalizations of which the science of mind is capable, but all aiming at a single end, the individual characterization of the mentality of a racial group. It must, however, be repeated that the term "ethnopsychology" has not hitherto found general acceptance, and that many authors discuss topics like those just mentioned under the headings of anthropology, ethnology, and sociology (qq.v.).

Adams, *Plateau Peoples of South America* (New York, 1915).

PSYCHOLOGY, EXPERIMENTAL. A comprehensive term for those phases of mental science which are variously called the new psychology, psychophysiology, physiological psychology, and psychophysics. It may be defined as the exact science of mind (see PSYCHOLOGY) and as such is not a department of psychology, coördinate with other departments, but rather a psychology dominated by a certain method. Kant said, in his *Metaphysische Anfangsgründe der Naturwissenschaft*, that psychology could never be a science, (1) because mental process has but one dimension (time), and where you have but one dimension you cannot apply mathematics to your subject matter, i.e., cannot handle it scientifically; (2) because no sane person would submit himself to your psychological experiments, even if you devised them; and (3) because the employment of psychological method, or introspection (q.v.), changes the objects upon which it is directed and so precludes the possibility of uniform results. Kant was, however, blinded by his a priori assumptions; he shared with the great German philosophers since Leibnitz (q.v.) a hearty contempt for the "lower faculty of knowledge" or sense perception (see FACULTY); and he was unduly impressed by the worthlessness for science of the "empirical" psychologies of his own day. Hence he could not see, as we do, that, wherever in the past there had been scientific discussion of the facts and laws of perception and of the physics and physiology of voluntary action, important contributions had been made to a future science of experimental psychology. Indeed, it is only in the latter half of the nineteenth century that the three Kantian objections have been finally answered and that psychology has taken rank as a science among the sciences.

The argument that mathematics is inapplicable to mental processes was brilliantly met by Herbart (q.v.), who pointed out that our inner experience shows differences not only of duration, but also of intensity, and expressed the course of ideation, as a function of these two variables, in a series of mathematical formulæ. Herbart's "mathematical psychology" is now out of date; the method that he, as a pioneer, followed has not stood the test of time. But his service to the cause of mental science is none the less real and enduring. The second and third objections have been overcome by the work of Fechner and Wundt (qq.v.), whose *Elemente der Psychophysik* (Leipzig, 1860) and *Grundzüge der physiologischen Psychologie* (6th ed., ib., 1908–11) mark epochs in the development of the new psychology. No one could urge, after the publication of the *Psychophysik*, that psychological experimentation with human subjects is impossible. Fechner experimented, systematically and successfully, with himself and with others, upon a long list of special problems; and the methods which he prescribed are those employed to-day in psychophysical investigations. Wundt put the matter beyond the reach of controversy by his foundation of the first psychological laboratory (see LABORATORY, *Psychological Laboratories*) at Leipzig in 1879. Wundt appears, further, to have been the first to use the phrase "experimental psychology," which occurs in his *Beiträge zur Theorie der Sinneswahrnehmung* (1862). His services both to psychology proper and to psychophysics can hardly be overestimated. We have to note here, in particular, his insistence that the psychological experiment consists simply in a carefully guided and rigidly controlled introspection; i.e., his refutation of Kant's third objection. A single instance must suffice. "The sensation," says Wundt, "contains in it no reference to the organs by whose external or internal stimulation it has been aroused; it tells us nothing of the character of its stimuli; it comes to us as a simple quality, giving no hint of any means whereby we might define that quality more nearly." In other words, the sensation is its bare qualitative self, devoid of all objective reference. When we remember that the sensation of the faculty psychology, as of the English empirical psychologists, has always been a bit of sense knowledge, a mental state or process that informs us of something in the outside world, we see what an advance in insight and scientific method is implied in Wundt's formulation.

The sources from which experimental psychology has drawn are manifold. It is especially indebted, for fact and for inspiration, to physics, astronomy, and the physiology of the organs of sense. Until psychology has laboratories upon the scale of those devoted to physics and physiology, it must be in large measure dependent for exact investigations upon the representatives of these older disciplines; while, in any case, the labors of men trained in general scientific method cannot fail to be of high value in this particular field.

What, now, we may ask, are the provinces of mind which the new psychology has made peculiarly its own? In principle there is no psychological problem that cannot be experimentally attacked. In actual fact, owing to the youth of the science, its lack of material means and of trained workers, and the extreme difficulty of its subject matter, there are very many problems that still await the experimenter. If we are to attempt a catalogue of what has been accomplished, we must begin (1) with the fields of sensation and of sense perception. The literature of these subjects—of vision, audition, and the rest of the sense qualities, of spatial and temporal perception (see DURATION; EXTENSION), and of qualitative perception (see FUSION)—has already attained very considerable proportions. When Helmholtz published, in 1867, his great work on physiological optics, it seemed that he had exhausted the subject, that its difficulties were resolved once and for all. But what was judged to be the end has proved to be only the beginning; the work of many men has accumulated and is still accumulating, bringing new facts and new questions. And as here, so elsewhere: experiment is taking us toward an exact doctrine of sensation and perception, whose complexity had, before its advent, been not so much as guessed at. (2) The psychology of attention (q.v.) may almost be termed a positive creation of the experimental method. It is strange and instructive to turn from a modern system of psychology, in which the doctrine of attention looms so large and important, to a German eighteenth-century work, or a volume of English associationism, where (except for a few scattered hints) we find no mention of it whatsoever. (3) The same thing may be said of the psychology of action. When F. C. Donders, in 1866, proposed to use the method of reaction for the measurement of mental acts like choice, discrimination, and judgment, he was building better than he knew; for the laboratory reaction, the exact type of a voluntary action,

has been the chief aid towards a final analysis of the active consciousness. (4) H. Ebbinghaus' *Das Gedächtnis* (1884) brought the function of memory under experimental control and has been followed by many monographs upon recognition and the various conditions of the reproductory consciousness. (5) Finally, the feelings are gradually submitting themselves to experimental treatment. Fechner himself laid the foundations of an exact science of experimental æsthetics (q.v.); and Mosso's researches into the bodily symptoms of affective processes have borne rich fruit. If we cannot say that experiment has given us a settled psychology of feeling, we can at least assert that the issues are more clearly marked and the problems more definitely formulated than ever before; and this means that it is only a matter of time until our questions are adequately answered. See ÆSTHETICS, EXPERIMENTAL.

There has been some dispute as to whether certain results of animal psychology (q.v.), of physiological experimentation on the brain cortex, of the treatment of brain disease, and of tests made upon hypnotized subjects (see HYPNOTISM) should be included under the phrase "experimental psychology." Such inclusion depends partly upon our definition of the word "experiment"—experiments on animals and on hypnotic subjects are of a different order from those described above—and partly on the extensibility of the word "psychology," upon the point, i.e., whether all that furthers or contributes to a science is necessarily itself a part of the science. It is, however, more important to note that psychology has gained or may gain from all these four sources than to find a single name for them.

Myers, *Textbook of Experimental Psychology* (2d ed., 2 vols., London, 1911); Binet and Simon, *Method of Measuring the Development of the Intelligence of Young Children* (Chicago, 1915).

PSY'CHOPATHOL'OGY (from Gk. *ψυχή, psychē*, breath, life, soul + *πάθος, pathos*, disease + *-λογία, -logia*, account, from *λέγειν, legein*, to say). A synonym for mental pathology. The term is wider than psychiatry (q.v.), since it covers all study of the mental symptoms of disease, without special reference to therapeutics. It is narrower than abnormal psychology, since (at least in current usage) it deals only with serious mental derangement, and not with such slight and transient abnormalities as dreaming and hypnosis.

PSY'CHOPHYS'ICS (from Gk. *ψυχή, psychē*, breath, life, soul + *φυσικός, physikos*, physical, from *φύσις, physis*, nature, from *φύειν, phyein*, to produce; connected with Lat. *fui*, I was, Skt. *bhū*, to become, and ultimately with Eng. *be*). The science of the interrelations of mind and body. The term was coined by Fechner to designate an exact science of the relations of dependence between the physical and psychical worlds. He discriminated an internal and an external psychophysics: in the former, sensation is considered in its direct relation to the brain and nervous system; in the latter, sensation is indirectly studied in its dependence upon external physical stimuli. No definition could be more general. We have to ascertain the facts and laws of mind and the physiological facts and laws (of brain or of sense organs) with which they are connected; we have to parallel the two series of events, noting how variation in the one is related to variation in the other; we have to express the functional interdependences exactly, i.e., in terms of measurement, of mathematical formulæ; and from our whole inquiry we shall attain a "philosophical" standpoint, a theory of the general relation between the physical and psychical worlds.

Fechner was concerned, primarily, with the problem of mental measurement. And when we turn to his *Elemente der Psychophysik*, we find that he is occupied, for the most part, with the relation of intensity of stimulus to intensity of sensation which is formulated in Weber's law. (See INTENSITY OF SENSATION; WEBER'S LAW.) In the quantitative expression of this relation he saw a fundamental psychophysical uniformity. There is no longer reason, however, for thus narrowing the scope of the science. If we hold to Fechner's own definition, it is evident that psychophysics includes not only measurements of all the attributes of sensation, but also measurements of feelings and their physical accompaniments as well as of the higher mental functions. The percentages of correct associates in memory experiments and the time measurements of the reaction experiment are exact physical data, which express the relation of physical to mental processes as really as measurements of objects which are lifted and arouse kinæsthesis, or which fall and produce sounds.

A word must be said of mental measurement itself and of the methods whereby it is accomplished. We cannot measure mental processes in the same way in which we measure physical magnitudes. A mental process, sensation or other, does not contain within it so-and-so many lesser processes. But we can measure function, sensible discrimination, or the function of memory; and we can measure the differences or distances that separate term from term within a sensation scale. In this case of sensation Fechner himself gave us our units and a number of methods for measuring them. The units are the just noticeable difference or difference limen (see LIMEN) and the supraliminal distance. In Fechner's hands the methods took relatively simple forms; two of them may be described as typical. In what is known as the method of limits a standard and a comparison stimulus are presented. The observer knows that an approach towards equality is being made by a gradual stepwise change, and his task is to say when equality is reached. Then, starting from equality, a series is taken in the opposite direction; and the point is noted at which a difference first becomes apparent. The average of the values obtained from a number of such series is taken as the value of the limen. In the method of constant stimuli a selected number of stimuli are presented many times over in haphazard and unknown order, and the percentage of judgments of "greater," "equal," and "less" is computed for every comparison value. A mathematical treatment of the percentages gives the required value of the limens both above and below the standard. In their simpler Fechnerian forms these methods furnished results whose compari-

son was difficult, chiefly because of the different psychological conditions (e.g., the knowledge or ignorance of the observer), and the different mathematical principles involved (e.g., the simple average, the law of chance). After Fechner, the methods entered upon a stage of development characterized by critical amendment and extension, especially upon the psychological side; this development found its climax in the work of Müller and Titchener in 1904–05. Since then a new phase has begun, under the leadership of Wirth and Urban, and the establishment of the methods upon the single mathematical basis of the laws of probability seems about to be accomplished.

Titchener, new ed., London, 1909); W. Wirth, *Psychophysik* (Leipzig, 1912).

PSYCHO'SIS (from Gk. *ψυχή, psychē*, breath, life, soul + *-ωσις, -ōsis*). A mental disturbance caused by an active pathological, or disease, process and not an expression of a fixed change in the mind. Psychoses develop from toxins, and the term includes fever delirium, infection delirium independent of fever, chronic nervous exhaustion, collapse delirium (such as rarely occurs after childbirth), alcoholic intoxication, etc.

While neurology, strictly construed, includes psychiatry, the term "neuroses" is commonly used to denote diseases that affect nerve structure and function without producing any mental change; while the term "psychoses" is used to indicate an affection showing mental disorder.

PSY'CHOTHER'APY, or PSYCHOTHERAPEUTICS (from Gk. *ψυχή, psychē*, breath, life, soul + *θεραπεύειν*, to treat medically). Speaking in a general way, psychotherapy includes all of those measures or methods of treatment of bodily or social ills which are based upon the fundamental facts (*a*) that the disorders or diseases to be treated are due to psychical factors and (*b*) that the remedies applied can have some definite effect upon them.

Much psychotherapy is shrouded in conjecture and pretense, in which respect it has evolved like other modes of treatment of bodily ills, but also, like other forms of therapy, it too has come to occupy an important place in legitimate medicine.

To present an historical résumé of the evolution of psychotherapy would take one back to the time of primitive man. From there one would have to trace step by step the gradual advances made in the comprehension of many illnesses, which are based upon the fact that the final product of the evolution of the nervous system, the human brain, has come to deal with the realities of nature by a masterly symbolism, which psychologists term mental action. These mental or psychical activities constituting the mind, as the old-style psychology would term them, have a twofold function, one negative and one positive.

The human body is a gigantic energy transformer. It receives its impulses from the external world through the sense organs, the receptors. The simple a b c physiology of the nursery speaks of these as the five senses, but in reality there are many more than five senses; modern physiology recognizes an enormous number. Take touch as an illustration, which in the naïve physiology of the layman is called one of the five senses. In reality touch is highly complex. It can recognize, first, heat and cold and has special nervous endorgans in the skin and mucous membranes. These endorgans are able to distinguish extremes as separate from minute differences of heat and cold. These latter are a later development in evolution, and the nerve fibres from the skin that carry the impressions to the brain travel in different paths from those which carry the knowledge of extremes of heat and cold. Again touch is separated into pain and pressure. It recognizes two objects lying at different distances and also is able to distinguish the sensations of vibrations, of muscular strains, and of the sense of position.

Thus we see that touch instead of being one sense is more than a dozen different ones. This is also true for sight and taste and sound. There are chemical senses, that recognize the presence or absence of oxygen; that pick out the grades of acidity of the gastric juice; that can tell of the amount of sugar needed in a muscle, or the need for chemicals, such as calcium, to regulate the proper electrical pressures in the "jump sparks" of the nervous system, scattered all up and down the spinal cord and brain.

We therefore have come to recognize that the human machine is played upon by millions of incoming energy stimuli. These are received by the various senses, just spoken of, and are responded to by the human animal in what is known as living and doing. A large group of the incoming energy stimuli are exclusively used to keep the machine alive. They are spoken of in physiology as nutritive. Others offer occasion for the body to seek pleasure and to avoid pain. They cause motion and striving. This striving, reduced to its simplest terms, consists in satisfying the instinct of self-preservation, through the nutritive channels first spoken of, and that of self-perpetuation. For living matter, whether it be a weed or a man, tries not to die, but to live forever. The way that this problem of living forever has been solved by living plants and animals is termed reproduction.

Thus, man, as an energy transformer, takes in energy in order to keep the machine alive and to keep it alive forever—not individually alive, but socially alive, i.e., it builds a social structure.

If one looks with the eyes of the physiologist at this human energy transformer, it can be roughly separated into three periods of evolution. Each of these has its own nervous mechanisms. The physical-chemical needs of the machine are taken care of by the oldest of these; it is called the vegetative nervous system. Man, as a feeling-moving animal, is so by virtue of a sensory-motor system. All of the physical-chemical activities are automatic and unconscious; the sensory-motor activities are voluntary and conscious. The human machine is thus like an automobile standing still with its engine running. The second nervous system throws in the clutch, and man moves; but we still need to consider the third system of nervous activities, i.e., the psychical. They are the directing forces

for the others in attaining the two ends already spoken of, self preservation and race perpetuation.

Thus we come to the negative and the positive functions. It is the function of the cerebral mechanism, that is the psyche, i.e., the mind, to direct the automatic nervous system and the conscious sensory-motor system to do useful work. It must prevent anything that threatens to interfere with the proper discharge of life energy in useful work, useful meaning individually and socially valuable.

A psychic disturbance, therefore, and one which needs psychotherapy, is one which is due to a failure to adjust these two functions—the one unconscious, seeking for an outlet in any way, having no reference to social good, and the other conscious, which seeks to direct it, as guided by the training of civilization, to some useful end. Any incomplete or inadequate result is spoken of as a psychical disorder (a psychoneurosis) and results in individual illness and social crippling.

It follows that the manifestations of this inadequacy may show themselves at any of the levels which have been mentioned. Thus at the lowest, i.e., the vegetative level, an emotional shock may cause rapid heart beat, it may turn the hair gray, it may cause sugar to appear in the urine, produce great fatigue, etc. The emotional shock may be acute and simple, such as the death of a husband or a child, or it may be slowly acting and hidden, such as a constant temptation to dishonesty, a continued series of deceptions, or a constant living in a false position, a living down of a social wrong, etc.

At the level of the sensory-motor nervous system the results may be a loss of sensation, a blindness, a deafness, a constipation, or, on the motor side, a paralysis, a muscular weakness.

Finally, at the purely psychical level, the reaction may be a pure mental disturbance, i.e., a psychosis, or a mental disease (incorrectly called an insanity), and still further, socially speaking, these misfits produce many of the social difficulties concerning which agitators talk a great deal because many are too lazy to study them carefully. The psychiatrist, however, is becoming an indispensable ally to the social psychologist in the analysis of these difficulties. In social lines, psychotherapy has thus far been developed only by the great leader, the demagogue, the walking delegate, and the agitator. We shall therefore limit this discussion to that form of individual psychotherapy which makes up a part of legitimate medicine.

We have roughly sketched what a psychic disturbance is. Needless to say, it may mimic any other type of disturbance due to other than psychic causes. It is because of this that legitimate medicine says that only the trained observer is able to say whether the paralyzed limb, let us say, or the blindness, or the sugar in the urine is due to a mental or psychical factor, or to a blood clot in the brain, a syphilis, or a liver disease respectively. Only the trained observer is able to tell this. Any society which by its protective devices, called laws, fails to support trained observers and demand better and better ones and which does not try to prevent the activities of the mountebank, is destined to be undermined and lose its opportunities for highest development. It is as dangerous for a state or nation to permit pseudo-science to treat its most important mental ills as for an individual to neglect a tuberculosis or a syphilis. Psychotherapy therefore becomes one of the most important divisions of medical practice to scrutinize, to aid, and to limit.

Psychotherapy is applicable only to psychical ills, and, as has been said, psychical ills can mimic almost every known form of malady. It is estimated that 50 per cent of all illness is of a psychical origin, but in saying this it should further be emphasized that every bit of it, practically without exception, has some somatic or bodily basis. The road to recovery, however, is chiefly through the psyche and secondarily through the body. To deny the importance of the latter is to shut one's eyes to reality.

Psychotherapy includes all mental influences, from the use of the cheapest charlatanism to that of the highest pragmatic philosophies. That which may be accomplished by a cheap trick for the ignorant coal heaver may have to be worked out with much labor by means of the most tactful dialectics with an educated college professor. A word, a command, may relieve a child of a neurotic paralysis, but it may require years of careful psychoanalysis to eradicate the same in a woman of intellectual and refined cultivation. The use of the command and harsh method for the latter would be as ridiculous as the psychoanalytical method for the former.

Psychotherapeutics is so wide that it is no wonder that it finds its practitioners in all spheres of life. Such have come into existence as a more or less direct outgrowth of the social milieu, and their teachings are more or less adapted to individual needs and ignorance. General laws are inapplicable, but there must be a fundamental principle of moral reëducation in order to obtain permanent results. One may have to run the gamut of bullying and cajoling, of hypnotic procedure, and appeal to social or religious prejudices; one must learn to play upon conceit and vanity, on family pride and desire for social prestige; the entire armamentarium of suggestive influences will be found necessary if one would conquer all cases, and the man is rare who can command them all. Hence in practice one follows his or her natural bent and invariably develops a one-sided or many-sided psychotherapy according to his natural endowment and acquired method.

Such positive psychotherapeutic treatment falls naturally into a few large groups, for the exclusive use of which one finds many special pleaders. The most important of these may be conveniently grouped as *hypnosis*, *suggestion*, *reëducation*, and *psychoanalysis*. In using these categories it is evident that they are not to be understood as different things or as mutually exclusive, nor as exhausting the subdivisions of the subject. They simply indicate general tendencies rather than separate methods.

The concept of *hypnosis* has changed considerably since the early days of Liébault, Charcot, and Bernheim; yet the word is still frequently understood in the sense of an appeal to the miraculous, the superhuman, or the subconscious. Under its modern definition, as only a form of suggestion, it loses much of its significance. As used here, it is understood as a mode of impressing certain ideas on an individual's mind after having, by trick methods, induced a condition of modified consciousness, known as hypnotic sleep, the hypnoidal state, etc.

First, as to its applicability in psychical disturbances, it is generally known that some patients are refractory. They cannot be hypnotized; they usually represent a higher level of

intelligence than those who may be hypnotized. In such its efficacy is nil. Among those who are most readily hypnotized one finds the weak-minded and the mental inferiors. The appeal to the marvelous and the apparently supernatural has a great hold upon these, but, since their psychical disturbance is due to their real constitutional mental inferiority, the hypnotic suggestions are of very little permanent value; they simply reënforce and repeat the type of suggestibility that is an essential feature of the disorder.

Another type responds to hypnotic suggestions, not on a basis of weakmindedness, at least not in the sense of general averages, but rather as a pure expression of the neurotic personality. How numerous are the patients who comprise this group it is difficult to decide. To obtain a foothold with these patients it may be necessary to start them with hypnosis, but, with hypnosis alone one rarely cures a severe psychical disturbance. It may be of advantage as an entering wedge, but if continued it only perpetuates the type of reaction the physician is trying to eradicate. Hypnosis, like conversion, seems to make some startling cures, but alone it does not modify the real personality; in fact it renders the neurotic personality more susceptible. It therefore does harm as an exclusive mode of treatment, even when most carefully guarded. One is making real progress in the treatment of a psychical disturbance when the patient has learned to be uninfluenced by hypnotic passes.

In the hands of the unscrupulous or the unpracticed a great deal of damage can be done. The fancied influence for absolute evil that hypnotists are believed to exert on their subjects can in reality be accomplished only in the weak-minded. Such individuals do not need any particular pressing of hands or looking into mirrors to produce their lack of will.

It is a striking commentary on the value of hypnosis in the treatment of a psychical disturbance to find it practically rejected by its warmest advocates of 20 years ago. With the limitation thus outlined, however, it will always persist as a useful adjunct in the beginning stages of treatment for some patients.

A definition of *suggestion* as used in psychotherapy is as unsatisfactory as that of hypnosis. For the restricted purposes of this presentation, suggestion consists in bringing about an emotional state by influences the import of which is not apparent to the individual. It consists in inducing mental associations leading to the modifications of the patient's emotional and therefore psychical state that will make for a better adjustment. Suggestions enter consciousness—either perceived, on the threshold of consciousness, or on its margin—awaken ideas, associations, and in a manner similar to an endless chain bring about what a celebrated Spanish neurologist, Cajal, has well termed "avalanche" action, which has a compelling force on the individual, who may be and usually is unmindful of the origin of the influences. The wise suggester knows how, by little hints and side remarks, by appeal to fear, to jealousy, or to praise, to cause a summation of impulses which have an impelling force far exceeding that of a command. Such suggestions may thus have a very extended action; they may govern the activity of the glands of the heart, or of the vasomotors; they may split definite idea complexes and may so affect the senses that illusions and positive and negative hallucinations may take place.

Suggestion used in this sense, then, is different from command or direct action, and it also differs from persuasion. A loose application of the word "suggestion" confuses these three procedures. Perhaps, after all, the distinctions are superfluous in practice, and the resourceful therapeutist makes use of all three. One may command a patient with a psychic arm paralysis to raise his arm; if the command is uttered suddenly and in emphatic tones, success may crown the effort. One may urge and urge a patient day by day to walk, telling him he is getting stronger and stronger and will soon be well; this is persuasion or mediate suggestion. The neurotic bedridden paraplegic may suddenly get up and run in response to the cry of a child who is in danger; this is a result of suggestion (indirect suggestion). The child's cry, its helplessness, the need for relief, make a continual emotional appeal of such power that the forces of inhibition are stampeded, as it were, and effective action results. By casually commenting on the erect carriage and graceful, easy walk of a fellow patient, an astasic-abasic may be immensely helped, provided the praise and commendation be wisely apportioned and carefully administered. The vanity, the desire for praise, the egotism, the ideals of a patient must be correctly estimated in order to bring about corrective suggestions. Such suggestive treatment is usually combined with a purposeful neglect of the chief appearance in the disease, so far as direct attention or questioning is concerned, and, later, persuasion or complete discussion of the disorder can be added to reënforce the advance started by the suggestive ideas.

Command, suggestion, or persuasion are only symptomatic remedies; they do not change the chief factor which is responsible, viz., the psychical character disturbance. Following the opening which they afford, a more fundamental method is necessary in order permanently to modify the personality and to make a recurrence of the manifestation less probable or impossible.

Reeducation is the ideal psychotherapeutic goal. Psychotherapy aims to reconstruct the individual on a firm basis of reasonable and helpful philosophy that permits him to understand his weakness and his strength, his limitations and his powers. Mills has well summarized a part of its aims in saying: "This method contemplates teaching the patient what he has, what he has not, what he seems to have, what he can do, what he cannot do, and what he simply believes he cannot do." But it is more than this. It concerns itself less with the patient's illness than it does with the steady cultivation within him of that individual mental and moral stability that makes true men and women and not mollusks.

The exposition of the aims to be accomplished needs a short summary of the methods to supplement it. In a quick review of the individual patients one is struck at once with the fact that they are very dissimilar and require quite different treatment. One recognizes that for the imbecile and weak-minded types, for whom perhaps only a cure of symptoms can be hoped for, hypnotism may be justifiable. An appeal to the miraculous relieves for a time, but the patients usually go on their way with ever-changing symptoms. Reëducation for such is a waste of

effort, of time, and may squander a pittance which might better be utilized to keep the patient isolated and away from those particular parasites who feed upon the credulity of this type. The manifold fads, cults, and quasi religions derive their followers and endowments largely from this class. Psychoanalysis is the most fundamental form of reëducation. No therapeutic consideration of a psychical disturbance can claim completeness without definite mention of the method originally termed the cathartic method by Breuer and later amplified by Freud as the psychoanalytic method. In its rough form it may be termed the "talking it out" procedure in psychotherapy, and the usefulness of the confessional in Church practice is due in large part to the same principles. Freud's claim that the analytical method is one which acts most penetratingly and carries farthest is undoubtedly well justified, but unquestionably its application has its limitations. Although at first practiced with partial hypnotic additions, psychoanalysts abandon such methods. Freud quotes Leonardo da Vinci as saying: "The art of painting consists in placing little heaps of paint on uncolored canvas where before there have been none, while sculpturing, on the other hand, takes away from the stone as much as covers the surface of the statue contained therein." The method of suggestion acts like the former, that of analysis like the latter.

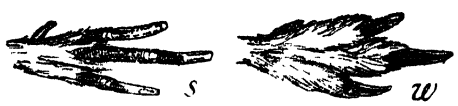
Freud's technique has slowly evolved, and a presentation that is valid for the present may change in the near future. His general procedure is to place the patient in the recumbent position, the physician sitting behind the patient's head at the end of the lounge. The physician thus remains practically out of sight of the patient, who is then asked to give a detailed account of his troubles and to say everything that comes to the mind, irrespective of its seeming logic or sense and apart from disturbing, mortifying, or unpleasant suggestions. In all such histories gaps are inevitable. These the patient is urged to fill in by thinking closely of the attendant circumstances, speaking aloud all of the floating thoughts that pass during this search ("free association"). All the thoughts are requested to be uttered, notwithstanding their disagreeable nature. The patient must exercise no critique and remain passive. It will be found that the disagreeable thoughts are pushed back with the greatest resistance. This is made all the more striking since the neurotic reaction, i.e., the symptom, is the symbolic expression of the realization of a repressed wish and gives the patient some unconscious gratification. A great effort is made by the patient to retain the symptom, especially as its origin is not really perceived, and since it represents in symbol the individual's former conscious strivings. In psychoanalysis one attempts to overcome all of these resistances and by a series of judicious and tactful probings reconduct into the patient's consciousness the hidden thoughts which underlie these symptoms. Every symptom has some meaning; behind it there lies some associated mechanism, the origin of which the patient unconsciously or partly consciously represses. In the psychoneurotic symbol may be read the cryptic expression of the original thought driven back and hidden.

Slowly to separate and pick apart the mechanism is the object of the analytical method. One needs not only special tact for such excursions into the subtleties of the mental life of some individuals, but also a developed method of interpretation. Every act, every symbolic expression or action, every lapse in speech, every mannerism, needs to be carefully noted, and its bearing must be coördinated. Freud lays particular emphasis on the analysis of dreams, since he believes that in the dream the unconscious or the "repressed conscious" is more apt to reveal itself. Hence a careful reading of Freud's *Interpretation of Dreams* is of the greatest value in this study, also his *Psychopathology of Everyday Life.* In his work on dreams he has developed to the full the chief directions along which his mind has traveled in the psychoanalytical method. It is of the utmost importance to trace back into the earliest years the striking emotional influences that have come into experience, for, for psychoanalysis, the neurotic reaction consists in a perverted type of reaction to these experiences. As is shown, the blurring or loss of an emotional influence—an affect, in short—is due to a number of factors. In normal life forgetting is the commonest type of a corrective adaptation, and forgetting is carried out with special ease if the emotional stress has not been excessive. Forgetting, however, is only a secondary phenomenon and usually is more successful if the immediate reaction has been an adequate one. Such immediate reactions express themselves as tears, as anger, as impulsive acts, etc., and in such reaction the emotion is discharged. In everyday life one calls it giving vent to one's feelings. If, however, the action is repressed, the emotion becomes united to the memory of the experience and an emotional complex results. Freud uses the term "ab-react" (*abreagieren*) to signify the adequate reaction or discharge of such affects or their resulting complexes. Talking the whole thing over, giving vent to one's secrets and confessions, are well-known forms for obtaining relief.

In a psychical disturbance certain of these complexes remain prominent; they are neither reacted too promptly, nor is their unpleasant-feeling tone diminished by the blurring process of forgetting, although it is characteristic of the psychoanalytic point of view that the actual experience which gives rise to them becomes forgotten and the cause of the emotional disturbance which becomes later converted, it may be into physical signs, remains apparently unknown to the patient. It must be dug out by psychoanalysis, and when once discovered catharsis takes place and the patient becomes cured.

It is, further, of importance to realize that abreaction is impossible for certain types of psychical shock or trauma. The inevitable, in the loss of a beloved person, is not overcome by frank discussions; social relations may make it impossible to mention the shock; or, again, it may be that it may concern itself with things which the person wishes to forget and which were intentionally inhibited and perhaps repressed from conscious memory.

In a limited space the full value of the psychoanalytic method cannot be presented. The original writings of Freud must be consulted. Most of the critics of psychoanalysis apparently have not taken the trouble to read them. If truth be often stranger than fiction, certainly the charge of their being romances does not preclude their value. That the psychoanalytic method is very valuable for certain types of cases, especially in a class of the well-educated



and cultivated, admits of no controversy, but its application is as yet comparatively undeveloped. This defect is rapidly being overcome. For further discussion, see PSYCHOANALYSIS.

PTARMIGAN, tär'mĭ-gan (with inorganic initial *p*, from Gael. *tarmachan*, Ir. *tarmochan*, *tarmonach*, ptarmigan). A kind of grouse, differing from true grouse (q.v.) chiefly in having the tarsi and toes thickly clothed with short feathers. The species are natives of northern or greatly elevated regions. They are not polygamous like the true grouse, nor do the males strut with erected and expanded tail. Most of the species change color on the approach of winter, assuming at the autumn molt a white or nearly white plumage in place of the mottled reddish brown of summer. At this season also the shanks and feet acquire longer and denser

SEASONAL CHANGE IN PTARMIGAN'S CLAWS.

s, summer condition: foot of willow ptarmigan, drawn June 10, just before the change to the short, summer claw; *w*, winter condition the same, drawn October 18, showing full-feathered preparation for winter.

feathering, and the short summer claws are shed and replaced by a growth of longer, stronger claws, of service in scratching away the snow to get at buried food; and the diversities of color have caused much confusion and difficulty. All are highly esteemed as food and are valued as game birds. Less often seen in Great Britain, but widespread, and numerous in Scandinavia and northern Russia, whence great numbers are sent to market in winter, is a grayer species (*Lagopus mutus*). Two closely allied species, the rock and the willow ptarmigans, range throughout Arctic America, but do not extend southward to the United States. Along the summits of the Rocky Mountains is to be found another species (*Lagopus leucurus*) in which the tail remains white all the year round and which is therefore called the white-tailed ptarmigan, or mountain quail. All make their nests on the ground among the heather or thickets in which they pass their lives and find their food (buds, berries, leaves, and insects), and lay brown eggs very heavily blotched with brownish black. For bibliography, see GROUSE. See Plate of GROUSE, ETC.; and of EGGS OF WATER AND GAME BIRDS.

PTERANODON, tĕr-ăn'ō-dŏn (Neo-Lat., from Gk. *πτερόν, pteron*, feather, wing + *ἀνόδους, anodous*, toothless, from *ἀν-, an-*, negative prefix + *ὀδούς, odous*, tooth). A large fossil flying lizard, in fact the greatest known flying creature; found in the Cretaceous rocks of Kansas. See PTERODACTYL.

PTERASPIS, tĕr-ăs'pĭs (Neo-Lat., from Gk. *πτερόν, pteron*, feather, wing + *ἀσπίς, aspis*, shield). One of the most primitive fossil fishes of the subclass Ostracodermi, found in the Silurian and Devonian rocks. The front part of the body was covered by dorsal and ventral shields which were made up of several heavy bony plates united by fusion of their joints. The orbits are small and are placed well forward at the very margin of the head shield. The general form of the body was sharklike, its length about 4 or 5 inches; the posterior portion was covered by small polygonal scales. See OSTRACODERMI.

PTERIA, tē'rĭ-ȧ. An ancient city of Cappadocia (q.v.), the capital of the White Syrians, which, according to Herodotus (i, 76), was captured and destroyed by Crœsus (q.v.). The city seems to have been a very important centre of the Hittites (q.v.). The ruins near Boghaz-Kieul (q.v.) are thought to be those of Pteria. As the result of excavations in 1906–07 H. Winckler found, besides important remains of the walls, gates, the citadel, temples, etc., many tablets in cuneiform script, some written in Babylonian, others in a language not yet deciphered; those translatable include diplomatic correspondence with Egypt and the East, dating from the fourteenth and thirteenth centuries B.C. Consult the commentary of How and Wells on Herodotus, i, 95 (Oxford, 1912); H. Winckler, in *Mitteilungen der deutschen Orient-Gesellschaft* (Leipzig, 1909); O. Puchstein, *Archäologischer Anzeiger* (Berlin, 1909); Baedeker, *Konstantinopel, Balkanstaaten, Kleinasien, Archipel, Cypern* (2d ed., Leipzig, 1914).

PTERICHTHYS, tĕ-rĭk'thĭs (Neo-Lat., from Gk. *πτερόν, pteron*, feather, wing + *ἰχθύς, ichthys*, fish). A genus of primitive fossil fishes of the subclass Ostracodermi, found in Devonian rocks in Great Britain and Germany. The body was from 4 to 8 inches long, broad and high in front, with flattened ventral surface and short tapering tail. The anterior portion is inclosed in large tuberculated bony plates which are firmly united to each other, those of the head shield being articulated by a hinge with those of the body shield. The orbits are placed near together on the forward slope of the head and are separated by a small plate which has on its undersurface a pit for the pineal body. A cleft between the lower margin of the head shield and the front margin of the ventral body shield represents the mouth, and there have been found indistinct traces of bones that are supposed to represent the jaws. At the sides of the front of the body shield are attached two paddle-shaped jointed appendages made up of small closely fitted plates which resemble the pectoral fins of the fishes. The tail portion, which is shorter than the armored portion of the trunk, is covered by small rounded or hexagonal scales, and has a small triangular dorsal fin and an upturned tip on the ventral side of which is a small caudal fin. A close ally of *Pterichthys* is *Bothriolepis*, found in the Upper Devonian of North America and Europe. See OSTRACODERMI.

PTERIDOPHYTES, tĕr'ĭd-ō-fīts (Neo-Lat. nom. pl., from Gk. *πτερίς, pteris*, fern + *φυτόν, phyton*, plant). The fern plants, one of the four great divisions of the plant kingdom, next in order of rank to the highest group, the flowering or seed plants (spermatophytes). In our present flora there are three conspicuous divisions of pteridophytes: (1) ferns (Filicales), (2) horsetails (Equisetales), and (3) club mosses

(Lycopodiales). The pteridophytes have a well-developed vascular system, which is entirely absent in the bryophytes, the next group below

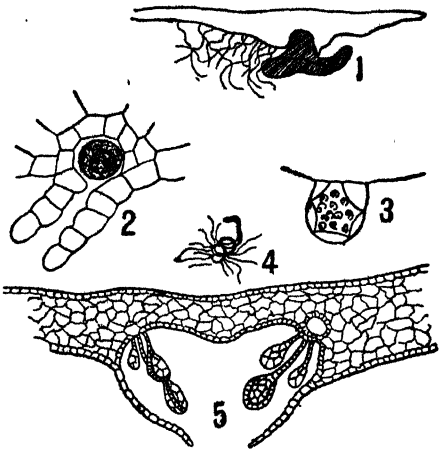

FIG. 1. STRUCTURE OF A FERN.

them. This system of conducting and strengthening tissues is correlated with the attainment of much greater size and larger foliage display by the fern plants than by the moss plants. It associates them with the seed plants (spermatophytes). Since plants below the seed plants are often called cryptogams, pteridophytes are often called vascular cryptogams. There is also a well-marked alternation of generations (q.v.), which may be illustrated by the life history of a common fern. When a fern spore germinates it produces a green, flat, usually heart-shaped body (prothallium), so small that it escapes ordinary observation. This body bears the sex organs (antheridia and archegonia, Figs. 1, 2, 3). It is

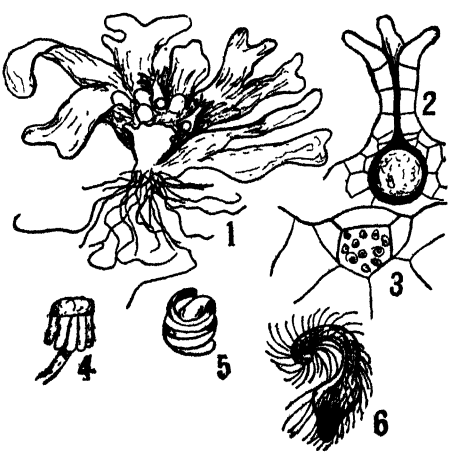

FIG. 2. STRUCTURE OF EQUISETUM.

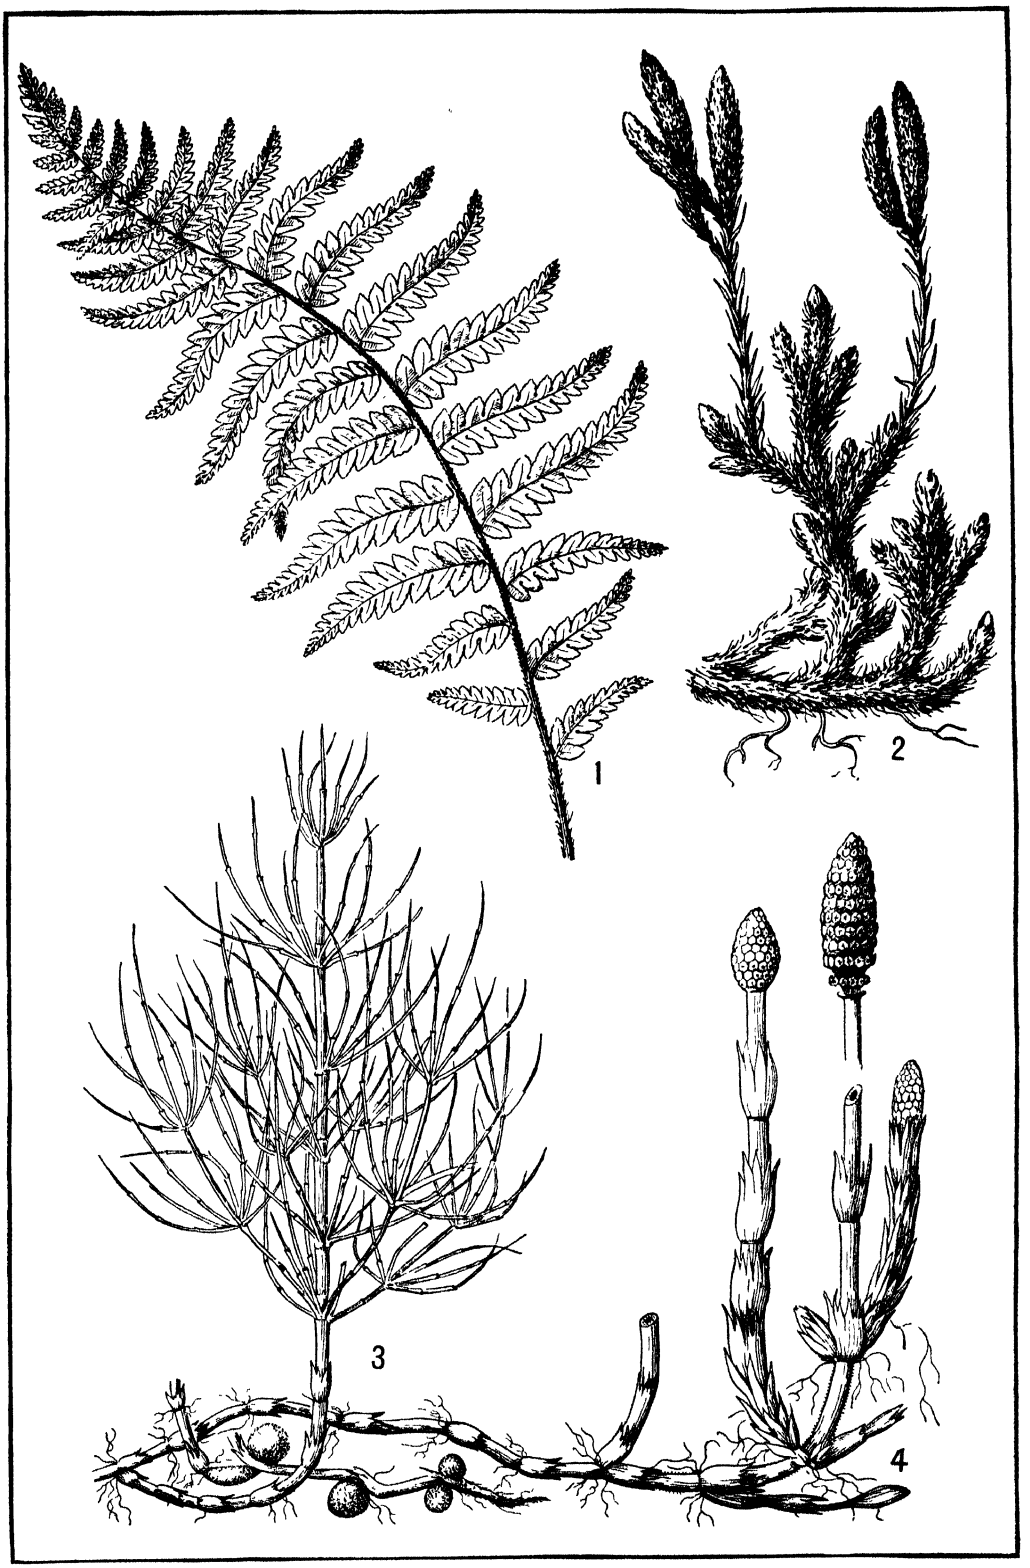
1, prothallium; 2, longitudinal section of an archegonium; 3, section of an antheridium; 4, a sporophyll with 5 sporangia visible; 5, a spore, showing elaters; 6, a sperm.

therefore the sexual plant or gametophyte and is entirely independent. The egg produced and fertilized upon this prothallium (gametophyte) germinates and produces the conspicuous but sexless fern plant or sporophyte (Fig. 1), upon the undersurface of the leaves of which asexual spores are produced (Figs. 1, 5). When these fall to the ground and germinate they produce prothallia and thus complete the cycle. Pteridophytes differ from bryophytes (q.v.) especially in that their gametophytes are leafless and inconspicuous, and the sporophytes are prominent, leafy, and nutritively independent of the gametophyte. Further, the sperms of pteridophytes are very large, spirally coiled, and bear numerous cilia for swimming (Figs. 1, 4).

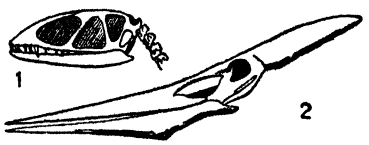


The ferns (Filicales) are the most prominent pteridophytes in the present flora, numbering about 4500 species, chiefly tropical. In habit they are mainly terrestrial, but some tropical forms are epiphytic (perching) and one aberrant group, the water ferns, float or are rooted in water. The peculiar characters are the horizontal subterranean stem, which sends to the surface comparatively few large leaves (fronds), dichotomously veined, usually compound, which bear on the undersurface very numerous spore cases (sporangia) and uncoil from the bud (circinate). The horsetails (Equisetales), which were formerly very abundant and included large trees, now comprise only about 25 small or straggling forms, well marked by their jointed and fluted stems, the absence of foliage leaves, and the terminal conical structure (strobilus), consisting of spore-bearing leaves (sporophylls, q.v.), each of which bears 5 to 10 spore cases (sporangia) on its lower surface (Fig. 2). The club mosses (Lycopodiales), which comprise about 500 species and were formerly much more abundant and conspicuous, are characterized by their slender, trailing, branched stems, thickly covered by small foliage leaves, and by a strobilus consisting of sporophylls, each bearing a single sporangium upon the upper side. The most important feature of the group is that *Selaginella*, the largest genus, is heterosporous. See HETEROSPORY.

The two problems of greatest interest to the morphologist in connection with the pteridophytes are their origin and their relationship to the origin of seed plants (spermatophytes, q.v.). There has been much discussion as to the most primitive pteridophytes, but the weight of evidence at present is in favor of the club mosses (Lycopodiales). It is evident that the greatest gap in the history of the plant kingdom is that between bryophytes and pteridophytes, and for this reason the origin of pteridophytes may remain an unsettled question. The origin of seed plants, on the other hand, has become a settled question since the discovery and investigation of the fernlike gymnosperms (q.v.) of the Paleozoic, forms which were thought to be ferns until they were discovered bearing seeds. Many features of the vascular structure of seed plants also indicate the same origin, so that the fern origin of spermatophytes has become the generally accepted view.

Campbell, *Structure and Development of Mosses and Ferns* (2d ed., ib., 1905); Coulter, Barnes, and Cowles, *Textbook of Botany*, vol. i (ib., 1910); also references under MORPHOLOGY. For works on classification, see under TAXONOMY. See DISTRIBUTION OF PLANTS; EQUISETUM; FERN; LYCOPODIALES.

PTERIS, tĕ'rĭs (Neo-Lat., from Gk. πτερίς, *pteris*, a kind of fern, from πτερόν, *pteron*,

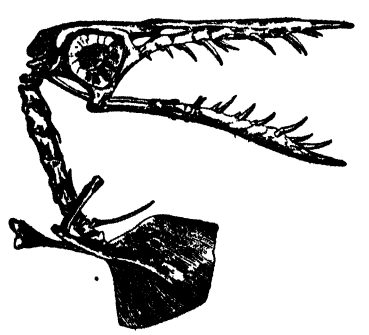


PTERIDOPHYTES

1. FERN 2. CLUB MOSS
3 and 4. HORSETAIL (Equisetum), showing sterile (3) and fertile (4) shoots.

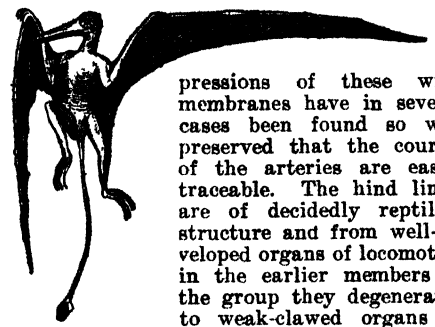
feather). A genus of ferns which includes the common brake or bracken (*P. aquilina*), one of the most cosmopolitan of ferns. It is the original genus of ferns and has given name to the great group Pteridophytes.

PTERODACTYL, tĕr'ô-dăk'tĭl (Neo-Lat., from Gk. *πτερόν, pteron*, feather, wing + *δάκτυλος, daktylos*, finger). The common name for any one of the flying lizards, remains of which are found in the Mesozoic rocks. There are about 20 different genera of pterodactyls, all included in the order Pterosauria (wing lizards), also



1, *Dimorphodon macronyx;* 2, *Pteranodon*, the toothless, birdlike type of jaws.

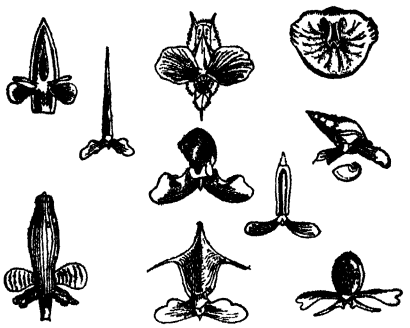
called Ornithosauria (bird lizards). All the members of this order show a remarkable adaptation of the lizard body to birdlike habits, though in structure they remain essentially reptilian. They cannot be considered as ancestral to the birds, for they constitute a wholly independent line of descent, probably derived from common dinosaurian ancestors, and they present an instructive example of parallelism of evolution due to adoption by two separate races of similar modes of life. The pterodactyls have skeletons of light but firm construction, with hollow bones. The earlier forms had strong, spreading teeth which gradually disappeared in successively later members of the group, and the loss of the teeth was accompanied by a corresponding increase in length and sharpness of the jaws until in the latest genera (*Pteranodon*, etc.) the jaws are dagger-like. The large eyes, surrounded by a ring of sclerotic plates, are placed well back and



PTERODACTYLUS SPECTABILIS.

RHAMPHORHYNCHUS GENUMINGI (LITHOGRAPHIC STONE OF BAVARIA).

on the sides of the skull. The body was short and rather stout, the limbs long and slender, and in the earlier forms there was a long slender tail. The wings resembled in general those of the bats rather than those of birds, for they consisted of thin but strong membranes stretched along the sides of the body and supported by the fore and hind limbs and the tail. The structure of the fore limb is quite different, however, from that seen in bats and birds, and presents equally interesting modifications of the parts of the arm in the adaptation of the latter from a walking leg to a winglike organ. The long bones are considerably lengthened, the first, second, and third fingers are small and slender and furnished with sharp-hooked claws, and the fourth is greatly elongated and strengthened to form the framework along which the anterior edge of the wing membrane is attached. Impressions of these wing membranes have in several cases been found so well preserved that the courses of the arteries are easily traceable. The hind limbs are of decidedly reptilian structure and from well-developed organs of locomotion in the earlier members of the group they degenerated to weak-clawed organs of prehension by which the later, more highly specialized pterodactyls probably suspended themselves from points of rocks or from the limbs of trees after the manner of the modern bats.



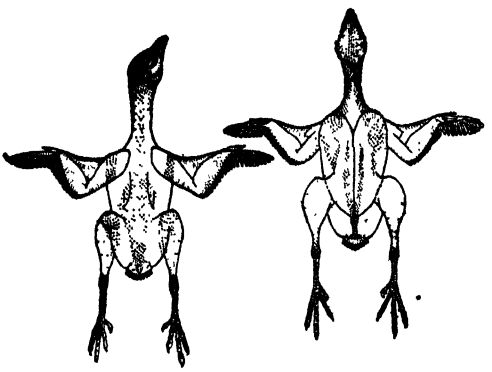
PTERODACTYL OF THE GENUS RHAMPHORHYNCHUS (RESTORED).

The various genera range in size from less than 12 inches to about 20 feet in spread of wings. Some of them were evidently able to do little more than sail on leaping through the air, as does the flying squirrel, by means of the stretched membranes; while others were among the most powerful flying creatures that have ever lived. The principal genera are *Dimorphodon, Rhamphorhynchus, Pterodactylus*, and *Pteranoden*, or *Ornithostoma*.

A. Lucas, "The Greatest Flying Creature, the Great Pterodactyl, *Ornithostoma*," in *Annual Report of the Smithsonian Institution*, 1901 (Washington, 1902).

PTEROPODA, tĕ-rŏp'ô-dà (Neo-Lat. nom. pl., from Gk. *πτερόπους, pteropous*, wing-footed, from *πτερόν, pteron*, feather, wing + *πούς, pous*, foot). An order of gastropod mollusks, agreeing in most of their features with the tectibranch forms like *Bulla*, etc. The head, eyes, and tentacles are usually wanting or vestigial, while on each side of the mouth are winglike appendages, apparently a pair of greatly developed parapodia, giving the peculiar butterfly appearance to these beautiful pelagic mollusks. The shell is conical or helix-like. The species are hermaphroditic. *Limacina arctica* is of the size of, and looks like, a sweet-pea blossom, moving up and down in the

water. It is common from Labrador to the polar regions. The largest form on the eastern coast of North America is the beautiful *Clione papillionacea*, which has a head and lingual ribbon. It is an inch long, the body fleshy, with no



FORMS OF PTEROPODS.

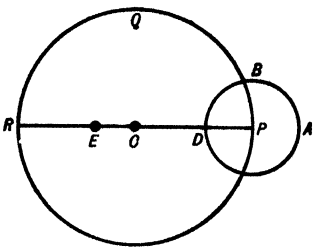
shell, the wings being rather small. It is likely to occur in vast numbers, and forms the food of whales and other large surface feeders. (See OOZE.) The larvæ of the pteropods pass through a trochosphere stage, spherical with a ciliated crown, and afterward assume a veliger form. (See MOLLUSCA.) The pteropods are in some degree a generalized type. They have a wide geographical distribution and a high antiquity. Consult Von Zittel and Eastman, *Text-Book of Palæontology*, vol. i (New York, 1900), and authorities cited under GASTROPODA.

PTEROSAURIA, tĕr'ō-są'rĭ-ȧ (Neo-Lat. nom. pl., from Gk. *πτερόν*, *pteron*, feather, wing + *σαῦρος*, *sauros*, lizard) An order of extinct birdlike reptiles with hollow bones, well-formed joints, and with the fore limbs modified for use as wings. See PTERODACTYL; ORNITHOSAURIA.

PTERYGOTUS, tĕr'ĭ-gō'tŭs (Neo-Lat., from Gk. *πτέρυξ*, *pteryx*, wing, fin). A genus of Eurypterida, of which some species attained gigantic size, notably *Pterygotus buffaloensis* from the Bertie water lime of New York with a length of at least 10 feet. The genus first appears in the Ordovician, culminates in the Silurian, and extends into the Devonian system. It is characterized by the enormous length of the preoral appendages; these are long pincer-like arms, prehensile in function. The lateral eyes are marginal and distinctly faceted, and the telson is developed into a flat, oval, rudder-like plate. See EURYPTERIDA.

PTER'YLO'SIS (Neo-Lat., from *pteryla*, feather tract, from Gk. *πτερόν*, *pteron*, feather, wing + *ὕλη*, *hylē*, wood). The method of growth of feathers in birds. The bodies of most birds are not uniformly covered with feathers, such a condition being found only among the Ratitæ and the penguins. In all other birds the feathers are grouped in clearly defined areas or tracts (pterylæ) with bare spaces (apteria) between them. To this condition, which has high taxonomic value, Nitzsch (*System der Pterylographie*, Halle, 1840) gave the name "pterylosis," and to the aspect of the tracts "pterylography." These tracts are different in the various groups, both in extent and position; but in general it may be said that feather growth is fairly continuous over the head and throat; along the sides of the neck; on the shoulders, wings, tail, and lower part of the thighs, occasionally extending to the toes; in a band of varying breadth and shape down the centre of the back; and in two bands down the lower side of the body, where the central line from the throat to the vent is invariably free. It is believed that pterylosis was not present in ancient birds, which primitively were feathered all over, but is an acquired trait conceived to be advantageous in economy of energy and in making the feathers fit more snugly and lie better with reference to wind and rain. Consult a

PTERYLOSIS.



Dorsal and ventral views of the body of a quail, showing feather tracts.

translation of Nitzsch's work, edited by Sclater and published by the Ray Society (London, 1867); also Hans Gadow, "Pterylosis" in Newton, *Dictionary of Birds* (New York, 1893–96).

PTINIDÆ, tĭn'ĭ-dē. A family of small beetles. See DEATHWATCH.

PTOLEMAIC (tŏl'ē-mā'ĭk) **SYSTEM.** In astronomy, a planetary theory expounded by Ptolemy (q.v.), the astronomer. It was an attempt to reduce to a scientific form primitive notions concerning the motions of the heavenly bodies. The primary and fundamental doctrines of this system are that the earth is the centre of the universe and that the heavenly bodies revolve round it in circles and at a uniform rate. In the Ptolemaic system the earth, the most stable of the elements, held the lowest place, and supported water, the second in order; above water was placed air, and then fire, ether being supposed to extend indefinitely above the others. In or beyond the ether element were certain zones or heavens, each heaven containing an immense crystalline spherical shell, the smallest inclosing the earth and its superincumbent elements and the larger spheres inclosing the smaller. To each of those spheres was attached a heavenly body, which, by the revolution of the crystalline, was made to move round the earth. The first or innermost sphere was that of the moon, and after it in order came those of Mercury, Venus, the sun, Mars, Jupiter, Saturn, and the fixed stars, eight in all. To this system later astronomers added a ninth sphere, the motion of which should produce the precession (q.v.) of the equinoxes, and a tenth, to cause the alternation of day and night. This tenth sphere, or *primum mobile*, was supposed to revolve from east to west in 24 hours and to carry the others along with it in its motion; but the Ptolemaic astronomers did not venture to explain how this was done, although, since the axis of motion of the *primum mobile* was that of the equator, its extremities being the poles

of the heavens, while that of the ninth sphere was the axis of the ecliptic, some explanation was certainly necessary. As observations of the heavens increased in accuracy it was found that the heavenly motions were apparently not uniform, and this was explained as follows: The acceleration of the sun on one side and retardation on the other side of his orbit is only apparent, and results from the earth not being in the centre of his sphere, *C* (see figure), but at *E*, and consequently his motion appears to be

PTOLEMAIC SYSTEM.

slowest at *P* and quickest at *R*. The alternate progression and regression of the planets was accounted for by supposing them to move, not directly with their crystallines, but in a small circle, whose centre was a fixed point in the crystalline and which revolved on its axis as it was carried round with the latter, thus (figure) the planet was carried round the small circle *ABD* as that circle was carried round *PQR* (now supposed to represent the planetary crystalline). The planet while in the outer portion of its small circle would thus have a forward, and in the inner portion a backward, motion. The larger circle was called an eccentric and the smaller an epicycle (q.v.). This theory of eccentrics and epicycles satisfied the early astronomers; but further investigation showed its incompleteness, and in later times it was found necessary to explain newly discovered discrepancies by heaping epicycle upon epicycle. When astronomers came to test the Copernican system the Ptolemaic was discarded. Consult J. L. E. Dreyer, *History of the Planetary Systems from Thales to Kepler* (Cambridge, 1906). See COPERNICAN SYSTEM; GALILEO.

PTOLEMAIS, tŏl'ĕ-mā'ĭs. The Roman name of a seaport of Syria, now known as Acre (q.v.).

PTOLEMY, tŏl'ĕ-mĭ (Lat. *Ptolemæus*, from Gk. Πτολεμαῖος, *Ptolemaios*). The name of 16 kings of Egypt forming the thirty-first or Macedonian dynasty, which ruled from 323 to 30 B.C.

PTOLEMY I (c.367–283 B.C.), surnamed SOTER (the preserver), was a Macedonian, the reputed son of Lagus. He displayed marked ability as a soldier and was one of Alexander the Great's favorite generals in his Eastern campaigns. On the death of Alexander (323 B.C.) and the division of his possessions, Egypt and Libya fell to the share of Ptolemy and, while nominally only satrap of these provinces, he was from the first virtually an independent ruler. From this time until about the close of the century he was engaged almost continuously in wars with the various successors of Alexander the Great, in defense of his Kingdom or province. In 306 B.C. he became King in name as well as in fact. Under his able rule Egypt became a power of the first rank. Palestine and southern Phœnicia, Cyprus, Libya, and Cyrene were included in her possessions, and Egyptian influence was paramount in the Mediterranean. The new capital, Alexandria, soon became the foremost city of the world. The famous museum and library founded by Ptolemy I attracted scholars to Alexandria from all parts of the Hellenistic world. The King himself was the author of a history of Alexander the Great, used by Arrian (about 134 A.D.) in the composition of his *Anabasis*. Ptolemy was a wise administrator and skillfully reconciled the opposing interests of his Greek and Egyptian subjects. In 285 B.C., after a successful reign, he passed over the head of his eldest (legitimate) son, Ptolemy Ceraunus, by Eurydice, whom he had repudiated, and abdicated in favor of his son, Ptolemy II.

PTOLEMY II (308–247 B.C.), surnamed PHILADELPHUS, the son of Ptolemy I by Berenice, the grandniece of Antipater, reigned from 285 to 247 B.C. He first married Arsinoë, the daughter of Lysimachus, King of Thrace, but eventually banished her and, after the ancient Egyptian custom, married his own sister, Arsinoë. Philadelphus undertook no great wars, and under his peaceful reign Egypt prospered greatly. The security afforded by her maritime supremacy stimulated her Mediterranean commerce, and a great trade developed on the Red Sea with Arabia and the Somali coast. This trade was encouraged by the establishment of new ports, by reopening the old route through the Wadi Hammâmât to the Red Sea, and by planting a colony, Ptolemais Epitheras, on the African coast near the site of the modern Suakin. A canal was also opened from the upper end of the Red Sea to the Nile. An important work, undertaken in the reign of Philadelphus, was the famous lighthouse erected on the island of Pharos, at the mouth of the harbor of Alexandria, by Sostratus the Cnidian. The Egyptian history of Manetho is reported to have been compiled at the suggestion of Philadelphus, and tradition alleges that the King caused the Hebrew scriptures to be translated into Greek by 70 (or 72) elders sent from Jerusalem for the purpose. See SEPTUAGINT.

PTOLEMY III (c.282–222 B.C.), surnamed EUERGETES (the benefactor), the son of Ptolemy II by his first wife, succeeded his father in 247 B.C. and reigned until 222 B.C. He married Berenice, daughter of Magas, the stepson of Ptolemy I, who brought Cyrene as her dowry. In the beginning of his reign he avenged the murder of his sister Berenice, widow of Antiochus Theos, and overran the Seleucid dominions as far as Babylon and Susa. After an absence of three years he was called home by the news of domestic disturbances. He brought with him an immense booty, which included the images of the Egyptian gods carried away by Cambyses. It was the restoration of these images to their proper temples that won him his title Euergetes and furnished the motive for the Decree of Canopus passed in his honor by the Egyptian priesthood in 238 B.C. The war placed Ptolemy in possession of all Cœle-Syria, together with Damascus and the port of Antioch, and gave him the control of the sea up to the Hellespont and the coasts of Thrace. He wisely made no attempt to hold the more distant Asiatic possessions of the Seleucid Empire. Euergetes was a liberal patron of the arts and of literature, and added considerably to the collections of the Alexandrian library.

The splendid temple of Edfu (q.v.) was begun by him, and he also built at Karnak, Philæ, Esne, Canopus, and other places. Under him Egypt reached the highest point of military glory, prosperity, and wealth.

PTOLEMY IV (c.244–205 B.C.), surnamed PHILOPATOR, the son of Ptolemy III by his wife Berenice, reigned from 222 to 205 B.C. He married his sister Arsinoë, about 212 B.C. Philopator, who is said by Polybius to have been addicted to drunkenness and debauchery, was throughout his reign under the influence of unscrupulous favorites. The murder of his mother, Berenice, and of his brother Magas, shortly after his accession, was due to the machinations of his minister Sosibius, and later he fell under the influence of his mistress Agathoclea and her brother Agathocles, who caused the murder of his wife Arsinoë. In the early part of Philopator's reign Antiochus III seized many of the Egyptian possessions in Syria and in 218 B.C. defeated an Egyptian army sent against him. The following year Ptolemy took the field in person and signally defeated Antiochus at Raphia. Although he allowed his defeated antagonist easy terms, he secured the quiet possession of the Syrian provinces for the rest of his life. Philopator, like most of his family, had strong literary tastes. He wrote a tragedy called *Adonis* and built a temple to Homer as the king of poets. The beautiful temple of Deir-el-Medîneh is his work, and he also built at Assuan, Edfu, and other places.

PTOLEMY V (210–181 B.C.), surnamed EPIPHANES (the illustrious), who reigned from 205 to 181 B.C., was only five years old when he succeeded his father, Philopator. Antiochus the Great of Syria and Philip V of Macedon took advantage of his minority to seize upon the foreign possessions of Egypt, and Antiochus actually made himself master of Cœle-Syria and Palestine and threatened Egypt itself. Through the intervention of Rome, however, the war was stopped, and Antiochus betrothed his daughter Cleopatra to the young Ptolemy (198 B.C.). Epiphanes was declared of age in 196 B.C., and his coronation was celebrated with unusual splendor. It was on this occasion that the Egyptian priesthood published the decree which forms the inscription on the famous Rosetta Stone (q.v.). In 193 Epiphanes married Cleopatra, and the revenues of Cœle-Syria and Palestine were given as her dowry, but her father garrisoned these provinces with his own troops and they were practically lost to Egypt. In 181 B.C. Epiphanes was poisoned by some of his followers while he was making preparations for a war against Seleucus IV, the son and successor of Antiochus the Great, in order to recover Cœle-Syria.

PTOLEMY VI (c.191–181 B.C.), surnamed EUPATOR, the eldest son of Epiphanes, seems to have reigned for a few months, at most, after his father's death, but nothing is known in regard to him.

PTOLEMY VII (c.188–146 B.C.), surnamed PHILOMETOR, was the son of Epiphanes and his Syrian wife, Cleopatra, and reigned from 181 to 146 B.C. He was a mere child at the time of his accession, and his mother, a woman of remarkable ability, ruled the country during his minority. She died in 173 B.C., the year of her son's coronation, and a quarrel arose about her dowry. In the war which ensued Antiochus IV invaded Egypt, defeated the Egyptian forces near Pelusium, and had himself proclaimed King at Memphis. The young King was made prisoner, but his brother, afterward Ptolemy IX, gathered an army, assumed the royal title, and successfully defended Alexandria. Antiochus retired to Syria, but soon invaded Egypt again, and would probably have made himself master of the country had not the Roman envoy, M. Popilius Lænas, ordered him back to his Kingdom. The two Ptolemies ruled together until 163 B.C., when they quarreled and Philometor was obliged to flee to Rome for protection. By arrangement the government of Egypt proper was restored to him, and his brother was made King of Cyrene. In 146 B.C. Philometor was killed in battle against the Syrian usurper Alexander Balas.

PTOLEMY VIII (c.148–146 B.C.), surnamed EUPATOR II or NEOS PHILOPATOR, was the son of Ptolemy VII and, although a child at his father's death, was proclaimed King by his mother. The claim was resisted by his uncle, Ptolemy IX, who marched upon Alexandria with an army, but the dispute was settled by agreement. Ptolemy IX obtained the throne and married his brother's widow, and the young King was murdered after a nominal reign of a few months.

PTOLEMY IX (c.184–117 B.C.), surnamed EUERGETES II and nicknamed Physcon (fat paunch), is reported by Greek writers to have been a monster of cruelty and licentiousness, but the charges against him seem to have been exaggerated. His reign (146–117 B.C.) was, on the whole, able. His marriage with his brother's widow, Cleopatra, was a political necessity, and not long afterward he married his niece, also named Cleopatra, daughter of Ptolemy VII. In 130 B.C. he was expelled from Egypt by a revolution headed by his wife, the elder Cleopatra, but two years later he returned to Alexandria and resumed the rule of the country. He exhibited great activity in repairing and restoring the temples of Egypt, and maintained the great library of Alexandria in a worthy manner. He possessed some literary ability and wrote a collection of memoirs in 24 books.

PTOLEMY X (?–81 B.C.), surnamed SOTER II or LATHYRUS, was the son of Ptolemy IX. He ruled jointly with his mother, Cleopatra, from 117 to 106 B.C., when he was driven from Egypt by a revolution and took up his abode in Cyprus. Cleopatra, to whose influence his expulsion was due, summoned her younger son, Ptolemy XI, to Egypt and appointed him coregent. In the meantime Ptolemy X made himself master of Cyprus and ruled there until recalled to Egypt in the year 88. The latter part of his reign was marked by a serious rebellion at Thebes which lasted for nearly three years and was put down with great difficulty. He died in 81 B.C. Soter II before his accession to the throne had married his sister, Cleopatra, but was forced by his mother to put her away and marry his younger sister, Selene.

PTOLEMY XI (?–88 B.C.), surnamed ALEXANDER I, was the brother of Ptolemy X and was placed on the throne by his mother, Cleopatra, in 106 B.C., after the expulsion of her elder son. In 101 B.C., fearing that his mother was planning his death, he caused her to be murdered. In 88 B.C. he was driven from Egypt by a revolution and was killed in an unsuccessful attack on Cyprus.

PTOLEMY XII (c.105–80 B.C.), surnamed ALEXANDER II, was the son of Ptolemy XI by an un-

known mother. He was living at Rome at the time of the death of his uncle, Ptolemy X. The latter's daughter, Cleopatra-Berenice, widow of her uncle, Ptolemy XI, and stepmother of Alexander II, succeeded to her father's throne, and Sulla advised Alexander II to marry his stepmother and thus make himself King of Egypt. The marriage was arranged, but when the King and his wife had reigned together for 19 days the Queen was murdered by her husband. This cruel deed so enraged the army that they rose against Alexander II and put him to death. With him the legitimate line of the Ptolemies came to an end.

PTOLEMY XIII (c.95–51 B.C.), surnamed PHILOPATOR NEOS DIONYSUS and nicknamed Auletes (the piper), was a natural son of Ptolemy X, and after the death of Ptolemy XII possessed himself of the throne without opposition. He reigned from 80 to 51 B.C. He was addicted to every kind of vice and debauchery. He was a skilled performer on the flute and frequently competed for the prize in musical contests with professionals. He maintained friendly relations with Rome; when he died he left his Kingdom to his daughter, Cleopatra, and his elder son, Ptolemy XIV, who was to marry his sister, and appointed the Roman people his executors.

PTOLEMY XIV (c.61–47 B.C.), surnamed DIONYSUS, married his sister, the famous Cleopatra (q.v.), and ruled jointly with her from 51 to 47 B.C., when a dispute arose and the Queen was obliged to leave Egypt. In 47 B.C. Cæsar sent troops to support her cause and Ptolemy was defeated. He was accidentally drowned while trying to escape.

PTOLEMY XV (c.58–45 B.C.), the younger son of Auletes, became the nominal husband of his sister Cleopatra in 47 B.C., and was coregent with her for two years, when she murdered him to make room for her son Cæsarion.

PTOLEMY XVI (47–30 B.C.), PHILOPATOR PHILOMETOR CÆSAR, called CÆSARION, was the son of Cleopatra by Julius Cæsar and was nominally coregent with his mother from 45 B.C. until her death. After the battle of Actium Cleopatra endeavored to secure his safety by sending him out of the country, but he was betrayed to Octavius, who caused him to be put to death.

See also EGYPT, *Ancient History*.

PTOLEMY (CLAUDIUS PTOLEMÆUS). An ancient astronomer and geographer. He was a native of Egypt, though it is uncertain whether he was born at Pelusium or at Ptolemais Hermii in the Thebaid. Nothing is known of his personal history except that he flourished in Alexandria in 139 A.D. and there is probable evidence of his having been alive in 161 A.D. Both as an astronomer and as a geographer Ptolemy held supreme sway over the minds of almost all the scientific men from his own time down to the close of the Middle Ages; but, in astronomy especially, he seems to have been not so much an independent investigator as a corrector and improver of the work of his predecessors. In astronomy he had the labors of Hipparchus to guide him, and, indeed, he scrupulously distinguishes between those of Hipparchus and his own. To Ptolemy belongs the invention of a planetary theory, the discovery of the moon's evection (q.v.), and the singular distinction of being the sole existing authority on the subject of ancient astronomy. From this last-mentioned fact the system of astronomy which he sets forth in the *Μεγάλη Σύνταξις τῆς Ἀστρονομίας*, commonly known by the mediæval title *Almagest* (q.v.), received his name and, as the Ptolemaic system (q.v.), obtained the homage of succeeding generations till the time of Copernicus.

The *Almagest* is divided into 13 books, and the trigonometry of the Greeks is known almost entirely through this work of the second century. It shows that the Greeks were then confined to the sexagesimal system and used tables of whole chords instead of half chords. Book i contains all that can be regarded as pure theory. The further mathematical work of the *Almagest* consists of applications of the geometry and trigonometry of Book i.

As a geographer Ptolemy appears as the corrector and improver of the works of a predecessor, Marinus of Tyre, about whom, except from Ptolemy's writings, little is known. His *Γεωγραφικὴ Ὑφήγησις* is divided into eight books, all of which, with the exception of the first, eighth, and a portion of the seventh, are nothing more than a catalogue of places, with their latitude and longitude (to twelfths of a degree), with a brief general description prefixed to each continent and country or tribe, and interspersed here and there with remarks of a miscellaneous character on any point of interest. The rest of the work contains details regarding his mode of noting the positions of places, by latitude (*μῆκος*) and longitude (*πλάτος*), with the calculation of the size of the sphere of the earth and of the extent of surface then known. He also describes the mode adopted by him of projecting the surface of a hemisphere on a flat surface, and shows its superiority over the projections of Eratosthenes, Hipparchus, and Marinus. He constructed a series of 26 maps, together with a general map of the world, in illustration of his work.

The chief of his writings, besides those already mentioned, are: *Τετράβιβλος Σύνταξις*, with which is combined another work, called *Karpos* or *Centiloquium*, from its containing 100 aphorisms, both works treating of astrological subjects and held by some on this account to be of doubtful genuineness; *Φάσεις Ἀπλανῶν Ἀστέρων καὶ Συναγωγὴ Ἐπισημασειῶν*, a treatise on the phenomena of the fixed stars, or a species of almanac. The rest of his works are of inferior importance and consist of descriptions of various kinds of projections (q.v.), the theory of the musical scale, chronological and metaphysical treatises, and a summary of the hypotheses employed in his great work, the *Almagest*. Others of Ptolemy's works have been lost, and it is still a moot point whether or not they contained a treatise on optics, as a Latin version of what is said to have been an Arabic translation of Ptolemy's original treatise on that subject is still in existence.

The *Almagest* and the *Geography* were the standard textbooks to succeeding ages, the first

till the time of Copernicus, the second till the great maritime discoveries of the fifteenth century showed its deficiencies. They have passed through numerous editions, the best of which are, for the *Almagest* and most of Ptolemy's minor works, those by Halma (Paris, 1813–20) and by Heiberg (2 vols. in 3 parts, Leipzig, 1898–1907). Of the *Geography* the principal early editions are the Latin versions of 1482 and 1490, published at Rome, the editio princeps of the Greek text by Erasmus (Basel, 1533), and the Elzevir edition (Leyden, 1619). The best modern editions are that of C. F. A. Nobbe (3 vols., Leipzig, 1843) and the annotated edition (not yet complete) by Carl Müller and C. T. Fischer, contained in Didot's *Bibliotheca Græcorum Scriptorum* (vol. i, 2 parts, Paris, 1883, 1901). The catalogue of stars has been frequently reprinted separately, the last and best edition being that of Francis Baily, vol. xiii of the *Memoirs of the Royal Astronomical Society* (London, 1843). Consult: J. B. J. Delambre, *Histoire de l'astronomie ancienne* (vol. ii, Paris, 1819); P. Tannery, *Recherches sur l'histoire de l'astronomie ancienne* (ib., 1893); T. G. Rylands, *Geography of Ptolemy Elucidated* (Dublin, 1893).

PTOMAINE (tō'mâ-în; *colloq.* tō'mān) **POISONING.** A severe gastrointestinal toxæmia caused by eating decomposed food. Ptomaines are basic, nitrogenous compounds, akin to alkaloids, produced by the action of bacteria on organic matter. Not all ptomaines are poisonous and each ptomaine is derived from the vital activity of a particular microörganism. Ptomaine poisoning is always brought on by the ingestion of contaminated food and is manifested by severe gastrointestinal irritation and profound prostration. The patient suffers from chilliness, headache, vertigo, extreme thirst, and abdominal and muscular pains; vomiting and purging show nature's attempts to rid the system of the offending material; and in very severe or fatal cases twitching of the muscles, ocular disturbances, dyspnœa, convulsions, and coma supervene before death. The treatment is to empty the gastrointestinal tract by the use of the stomach tube and by bowel irrigations, if nature has not already done this. Pain is controlled preferably by morphine, and in threatened collapse stimulation is secured by the application of heat to the abdomen and extremities, by giving whisky, or by administering atropine by hypodermic injection. The acute symptoms having passed, castor oil and intestinal antiseptics are given to keep the bowels empty and to limit bacterial growth. *Botulism* (q.v.) is a distinct type of meat poisoning which follows the eating of decomposing sausage, spoiled canned meats, and similar products.

PTOMAINES, tō'mâ-înz; *colloq.* tō'mānz (from Gk. *πτῶμα, ptōma,* corpse, from *πίπτειν, piptein,* to fall; connected with *πέτεσθαι, petesthai,* to fly, Lat. *petere,* to attack, seek, Skt. *pat,* to fly, fall). A name applied to a class of poisonous organic substances of animal origin, extremely similar in their chemical and physical properties and physiological action to the vegetable alkaloids. The effects that often follow from using bad fish or canned meat are probably due to the action of ptomaines. There is also increasing evidence that the symptoms of many diseases are caused, not by the specific microörganisms themselves, but by the ptomaines produced by them, as, e.g., the typhotoxine produced by typhoid bacilli. Chemically the ptomaines are amines; i.e., they contain one or more NH_2 groups attached to hydrocarbon radicals. Following are a few of the more important ptomaines known:

Isophenylethylamine, $C_6H_5CH\begin{matrix}CH_2\\ \diagdown\\ \diagup\\ NH_2\end{matrix}$,

one of the products of the pancreatic putrefaction of gelatin, was isolated by Nencki in 1876.

Cadaverine, penta-methylene-diamine, $NH_2(CH_2)_5NH_2$, is found in corpses during the earlier stages of putrefactive decomposition; it is a liquid solidifying to a crystalline mass at low temperatures and forming crystalline compounds with acids and with certain salts.

Putrescine, tetra-methylene-diamine, $NH_2(CH_2)_4NH_2$, is found in considerable quantities in putrid herrings and in corpses during the later stages of putrefactive decomposition; it is, like cadaverine, a liquid crystallizing in the cold and combining with acids and certain salts to form crystalline compounds.

Choline, trimethyl-oxyethyl-ammonium hydroxide, $(CH_3)_3N(OH)CH_2CH_2OH$, is found among the products of decomposition of pig's or ox bile; it is a thick, colorless liquid readily decomposing if mixed with water and heated; it acts as a strong base, forming deliquescent salts with acid and also crystalline compounds with certain salts. It may be prepared from the yolk of eggs by decomposing the lecithin of the latter as follows: the yolk is carefully extracted with alcohol and ether and the residue is boiled with caustic baryta; on precipitating the barium with carbonic acid and filtering, the solution is evaporated and the residue extracted with absolute alcohol, from which the choline is precipitated in the form of its platinum-chloride salt and the latter is decomposed with sulphureted hydrogen. Wurtz succeeded in preparing choline synthetically.

Neurine, trimethyl-vinyl-ammonium hydroxide, $(CH_3)_3N(OH)CH=CH_2$, is chemically similar to choline, from which it may be prepared; it is a highly poisonous liquid ptomaine, forming crystalline compounds with acids and with certain salts; it is a common product of the putrefaction of meat.

PTOSIS, tō'sĭs (Neo-Lat., from Gk. *πτῶσις,* fall, from *πίπτειν, piptein,* to fall). A falling; a prolapse. Ptosis is the term commonly used of a falling of the eyelid. (See EYE, DISEASES OF THE.) Enteroptosis is a prolapse of the intestines into a lower plane than normal, owing to laxity of the abdominal walls. Gastroptosis is a falling of the stomach, which occurs in cases of retention of food in that organ, whereby it is weighted heavily, and also in cases in which the walls of the viscus are weak.

PTYALIN, tĭ'ă-lĭn. See DIASTASE.

PTY'ALISM. See HORSE, *Diseases of the Horse;* SALIVATION.

PU'BERTY (Lat. *pubertas,* from *puber, pubes,* mature). The period of human life at which the generative organs of the male or female become capable of exercising the function of reproduction. The term is applied also to the changes in the special organs and the general system that accompany the onset of this period. Sexual maturity is reached earlier in warm climates than in cold or temperate ones. The

age at which puberty is established in temperate zones is, in males, between 14 and 16; in females, between 13 and 15; but it cannot be reckoned by age alone, and is influenced by national or hereditary peculiarities and by some diseases. The changes noted in the male at puberty are a development of the larynx with the breaking and deepening of the voice; a growth of hair about the face, pubes, and other parts of the body; the fuller development of the sexual apparatus, with secretion of the seminal and accessory fluids; and finally the appearance of sexual instincts and inclinations. In the female physical and functional maturity are almost contemporaneous, and functional womanhood ceases suddenly at the menopause or climacteric. The change most characteristic of puberty in the female is the appearance of the menses, but besides this there are development of the breasts, ovaries, uterus, and external genital organs, and changes in the bony pelvis. In both sexes there is a rapid increase in size and weight. See ADOLESCENCE, and references there given.

PUBLICA'NI (Lat., men concerned with the *publicum*, the state and its interests, especially the taxes, and so taxgatherers). In ancient Rome, the farmers of the public revenues (*vectigalia*). These revenues were put up at auction by the censors (see CENSOR) and were sold for a period of five years. They were derived chiefly from tolls, tithes, harbor duties, *scriptura* (the tax paid for the use of public pasture lands), mining and salt duties. As the state required the publicani to give security for the sum at which they had purchased the right to collect the taxes, and as this sum was usually much greater than the wealth of any single individual, companies were formed, the members of which were enabled to carry on conjointly undertakings far beyond the capabilities of the separate shareholders. Their contract with the Roman government was made in the name of a single person, who was called *manceps* and who was held responsible for his *socii* (fellow members) to the state. Only Roman citizens could serve as publicani. As in France before the Revolution, the farming of revenues resulted in great injustice and peculation, especially in outlying provinces; and the publicans were a bitterly hated class, as appears in numerous passages of the New Testament. Consult: Cicero, *De Imperio Gnæi Pompei*, passim; Livy, xxiii 48 ff.; the article "Publicani," in William Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1891); A. H. J. Greenidge, *Roman Public Life* (ib., 1901).

PUBLIC BATHS. See BATH HOUSES, MUNICIPAL.

PUBLIC CALLING. Any trade or calling carried on by a private individual or private corporation which, because of its quasi-public character, has certain privileges as well as legal obligations which do not attach to an ordinary private trade or calling. The business of common carriers and that of innkeepers are examples of public callings. The essential characteristics of public callings are that those engaged in them hold themselves out as engaged in the business of serving the public indiscriminately.

From the earliest time the common law held that the businesses carried on by common carriers, innkeepers, truckmen, ferrymen, bakers, millers, and wharfingers were, or under proper conditions might be, public callings. And in later times the courts have held that the businesses of telegraph and telephone companies, elevator companies, and warehousemen were public callings. In general it may be said that all who engage in a public calling must serve the public without discrimination for reasonable compensation and with a high degree of care for the persons and property of those who engage their services. This rule, however, is subject to the limitation that the person claiming the public service must be a proper person to receive it. Those engaged in public callings in return for their obligation to serve all persons properly entitled to service have the compensating advantage that they either have a lien for their services or may claim payment or compensation in advance. They also have the right to make and enforce reasonable regulations governing the conduct of their business.

When a business is affected with a public interest and thus becomes a public calling, it ceases to be *juris privati* only and is subject, within reasonable limits, to the right of the state to regulate it. See CARRIER, COMMON; CONSTITUTIONAL LAW; INNKEEPER.

PUBLIC COMFORT STATIONS. These conveniences, including lavatories and water closets, have long been numerous in European cities and are gradually being provided in American cities. In Europe a slight charge is usually made for their use, though in many cases they are absolutely free. Boston, New York, and San Francisco were the first American cities to have public comfort stations.

Consult: "Public Baths and Water-Closets" in M. N. Baker, *Municipal Engineering and Sanitation* (New York, 1902); also the report on *Public Baths and Public Comfort Stations* (ib., 1897), and *Comfort Stations in New York City and elsewhere*, published by the New York Association for Improving the Condition of the Poor (ib., 1914).

PUBLIC DOMAIN OF THE UNITED STATES. For a discussion of the surveys made upon the national domain, see SURVEYING. See also ALASKA, *History;* LANDS, PUBLIC.

PUBLIC FUND. In the United States, the money in the hands of an officer or department of the government to be employed for governmental purposes. Public funds are raised by taxation in various forms and the accumulation of public revenues from any source. A State treasurer may have the public money credited to different funds, as the school fund, etc., and usually has no authority to transfer money from a fund raised for a certain purpose to another fund to be employed for an entirely different purpose.

In England public funds are funded securities, such as consols, annuities, etc., which are guaranteed by the government. See TAX, and the authorities there referred to.

PUBLIC HEALTH SERVICE. A bureau in the Treasury Department of the United States, formerly called the Marine Hospital Service. It is charged with the management of marine hospitals and relief stations for the cure of sick and disabled seamen of the American merchant marine. It has also under its supervision the national quarantine stations, the supervision of local quarantines, the investigation and suppression of epidemics and plagues, the collection and dissemination of mortality statistics and sanitary information, the scientific investigation of sanitary problems, and

the examination of immigrants under the laws excluding those affected with contagious diseases. In 1913 the service distributed 1,487,015 pieces of health literature of a popular character. In 1914 there were 23 marine hospitals, a sanitarium for consumptive seamen in New Mexico, and 120 relief stations. The Public Health Service of the United States owes its origin to an Act of Congress of July 16, 1798. For a long time the service consisted mainly of independent hospitals built as necessity arose and placed under charge of a surgeon appointed by the Secretary of the Treasury. In 1871 the service was reorganized and placed under the charge of a supervising surgeon-general with an office in Washington. In 1914 the commissioned corps consisted of the surgeon-general, 10 senior surgeons, 66 surgeons, 43 passed assistant surgeons, and 47 assistant surgeons. There were, besides, 239 acting assistant surgeons appointed by the Secretary of the Treasury. The marine hospitals are located on both the Atlantic and Pacific seaboards, on the Gulf of Mexico, on the Great Lakes, in several of the larger river cities, and in Alaska, while relief stations exist in the new insular possessions. Consult the annual reports and public addresses of the surgeon-general.

PUBLIC LANDS. See LANDS, PUBLIC.

PUBLIC LAW. That branch of the law which defines and protects the rights which subsist between state and subject, as distinguished from that which deals with the rights that subsist between subject and subject. In public law the state, which defines and protects the right, is a party interested in or affected by the right and may therefore uphold or extinguish it. The conception of public as opposed to private law is due to the Roman jurisprudence, in which the law of crime was included under the same head. The civil law of the continent of Europe retains the same classification.

The topics under which public law is most commonly treated are: constitutional law, or that which defines the form of government and the powers of the several departments thereof; administrative law, or that branch which prescribes the manner in which the various political powers of the state shall be exercised within the constitution; criminal law, or that branch which contains the rules concerning injuries to the government or to the public at large and disobedience to the rules laid down for the common welfare, and the penalties to be inflicted for violations of the same; and criminal procedure. Besides these usual subdivisions of public law two other important divisions have been made comprising the rights and duties of the state as a juristic or artificial person against or in favor of natural persons, and the body of law prescribing the mode in which the state may sue and be sued. These rights of the state are irrespective of and in addition to those which belong to the right of eminent domain and are those which govern it, as, e.g., a landed proprietor, the owner of personal property used in or about public buildings or of manufacturing establishments, a contractor in engineering operation, a banker issuing promissory notes, a legatee under a will, etc. Its rights and liabilities under many of these heads are different from those of individuals or other artificial persons, especially with reference to liabilities for injuries done by its servants and as to the barring of its rights by prescription. The procedure provided for when the state is a party is not essentially the same for both the parties, as in private law, but is relatively abnormal and takes different forms according to whether the suit is against the subject by the state, or vice versa.

See JURISPRUDENCE; LAW; and for a discussion of the various branches of public law, see ADMINISTRATIVE LAW; CONSTITUTIONAL LAW; COURT; CRIMINAL LAW; PLEADING; PROCEDURE; ETC., and consult the authorities referred to under those titles.

PUBLIC'OLA, PUBLIUS VALERIUS (?–503 B.C.). A Roman consul, described by Livy and Plutarch as a magnanimous patriot. He bore a chief part in expelling the Tarquins. After the death of his colleague, Junius Brutus, having heard of the suspicions of the people that he was aiming at a despotic power, he demolished in the night a palatial edifice which he had reared and ordered that the fasces which were carried before him as the emblem of power should be lowered when he came before the people. By his efforts stringent laws were enacted to protect the liberties of the citizens. The surname of *Publicola,* or, in its older form, *Poplicola* (friend of the people), was conferred upon him and his descendants. He was thrice elected consul.

PUBLIC POLICY. In general, those considerations of public interest and morality which the community enforces by legislation or judicial action. In this sense of the term is found the justification for that great body of modern legislation, of which the Sherman Antitrust Law and the laws restricting hours of labor and conditions of industry may be taken as illustrations, in which the freedom of action of the individual is restrained in the public interest. The term is, however, more commonly employed in English and American law in a more restricted sense, as the ground or basis for refusing to enforce certain classes of contracts, as contracts in restraint of trade, gambling contracts, usurious agreements, and the like. The earliest trace of this principle in English law reports is found in a case decided in the second year of the reign of Henry V (1414). A dyer had contracted not to use his art within a certain town for six months. He did, in fact, practice his calling there within the time limit and was sued for breach of his contract. When the case came before the court, Mr. Justice Hull is reported to have been uncommonly angry at the plaintiff for daring to restrain the liberty of the defendant. He went upon the principle that it was not good for the realm—that it was against public policy—for men to bind themselves not to exercise their trade. Two hundred years later Mr. Justice Anderson cited this decision in holding a similar contract void, declaring such a contract to be "against the law, against the liberty of the freeman, and against the commonwealth." About the same time a contract by a landowner that he would not sow his land for a certain period was adjudged void as "tending to the inconvenience and prejudice of the state." The principle announced in these early cases has never since been repudiated, although its application to particular contracts in *restraint of trade* (q.v.) has varied with changing business conditions and public opinion.

Contracts promotive of immorality have always been deemed subversive of public policy and hence void. Agreements in restraint of

marriage, wagers that one will not marry, and marriage brokerage contracts, or agreements to bring about the marriage of a particular person, have been held void because against sound public policy. This principle has been applied, also, in avoiding agreements for the sale of offices and for the assignment of officers' salaries, as tending to injure the public service; in avoiding agreements with an alien enemy as well as those which are hostile to a friendly country, such contracts having a tendency either to harm our country directly or to embroil us with other nations. Most frequently of all, perhaps, it is applied in avoiding contracts for the stifling of criminal prosecutions, or the perversion of justice in civil suits, or for services in lobbying with legislators, or improperly influencing administrative officers. Combinations between business houses or corporations entered into for the purpose of preventing honest competition or the creation of monopolies are void as against public policy. Consult: Elisha Greenhood, *Doctrine of Public Policy in the Law of Contracts* (Chicago, 1886); Sir Frederick Pollock, *Principles of Contracts* (London, 1902); Sir W. R. Anson, *Principles of the English Law of Contract* (12th ed., Oxford, 1910).

PUBLIC RECORD OFFICE. See RECORDS, PUBLIC.

PUBLIC RECORDS. See RECORDS, PUBLIC.

PUBLIC SCHOOLS. A term usually applied in the United States to the institutions maintained at public expense for the formal education of children. The idea of organizing schools where rich and poor might obtain efficient free instruction did not take firm root in the minds of the people of the several States until the early part of the nineteenth century, although even the earliest settlers of the Colonies were not unmindful of their duty with respect to the education of the young. In 1647 a law was passed in Massachusetts requiring every town of 50 householders to maintain a master to teach reading and writing, and every town of 100 householders to maintain a grammar school, the wages of such master to be paid by parents whose children took advantage of the instruction. A somewhat similar law was passed in Connecticut in 1650. In most of the New England Colonies education was considered a public responsibility. New York, on the contrary, owing to the wrangling between the Dutch and the English, was rather late in recognizing the necessity for a public-school system; comparatively little attention, in fact, having been paid to the subject before the close of the Revolution. The same is true of Pennsylvania, which depended mostly on private benefactions for the establishment of schools. New Jersey, on the other hand, passed a law in 1693 looking to the establishment of schools. In the South there were no school systems previous to the Revolution. What was done in the way of education was chiefly the result of private enterprise. The four decades following the Revolution form the transitional period. Local autonomy gradually gave way to centralization and State supervision, this process varying, of course, with local conditions. From the very beginning the Federal government was doing much by means of land grants and other aid to encourage the several States in the establishment of school systems, setting aside in 1785 and 1787 one thirty-sixth of all the public land in the several States for school purposes. In 1795, at the instance of Governor Clinton, a law was enacted in New York providing for local school supervision, and in 1812 the office of State Superintendent of Common Schools was created, Gideon Hawley holding it until 1821, when the office was unfortunately abolished and the Secretary of State was nominally left to carry out the duties of superintending schools. It was not until 1854 that the office was revived. In Massachusetts the Board of Education was organized in 1837 and the various school organizations were united and correlated, the moving spirit in this work being Horace Mann (q.v.). The other States followed the example of New York and Massachusetts. Connecticut and Rhode Island found a leader in Henry Barnard. In this successful movement for public schools no little credit is to be assigned to the efforts of the various educational associations, particularly the National Education Association.

The three main types of public schools in the United States are: (1) the city elementary and high schools; (2) the town union school, which includes a high-school department; (3) the district school, so called from its usually being established in certain rural districts and offering elementary instruction. As a rule, little attention is paid to grading in these district schools. The general tendency is growing now towards the establishment of public institutions for dependent children, truants, and incorrigibles, where, in connection with industrial training, the elementary branches are taught. In 1912 the attendance of the elementary schools was about 17,077,577, about 1,505,637 attending private schools. The term "public schools" is anomalously used in England to denote the several famous preparatory schools, as Eton, Harrow, and Rugby (q.v.). For details of the various systems of public instruction in the United States and the principal European countries, see COMMON SCHOOLS; EDUCATION; EVENING SCHOOLS; GRAMMAR SCHOOLS; NATIONAL EDUCATION, SYSTEMS OF; SCHOOLS.

PUBLIC SERVICE, PUBLIC SERVICE COMMISSIONS. See PUBLIC UTILITIES, REGULATION OF.

PUBLIC UTILITIES, REGULATION OF. Since 1900 the term "public utilities" has come into wide use to denote either a service or a servant which supplies for profit certain common wants of the public. The service rendered is of the common-carrier type and requires the use of more or less specific routes by land, water, or air. This makes or tends to make the service a natural monopoly. The servant, whether an individual, a private corporation, or a public or governmental corporation acting in a private capacity, exists and operates under direct or implied governmental grants of power. Besides control through the police power, public utilities are subject to a wide range of government regulation because they are creatures of the State and also because their actions vitally affect the public welfare at many points, such as notably the character of service rendered, the fairness of the rates charged, and the safety of public-utility securities as investments. Included in the utilities now subject to regulation in many States are steam and electric railways, water transportation lines, express service, the telegraph and telephone, light, heat, and power in various forms, and public water supply. The tendency still is to increase the list.

While there has been some regulation of public utilities or services ever since they came into existence, anything like effective control was rare indeed until well towards the close of the nineteenth century, and even that was limited to the railroads engaged in interstate commerce or operating within one or two States, and to the gas and electric light service in the single State of Massachusetts. This condition of little or no effective public control of utilities was naturally incident to a rapidly developing country more intent on getting public utilities than on regulating them. The early regulation was chiefly a paper or potential but unused control through legislative provisions of charters, franchises, and contracts, unaccompanied by any means of enforcement except through the slow and uncertain action of the courts—an agency legally but not practically open to all. To make good these deficiencies, reliance was for a long time placed in still more legislation. Where this legislation was general in character, it usually failed through lack of provision for its enforcement, and where the legislatures attempted to deal with the specific abuses of single companies, their knowledge and time alike were too limited to cover more than a few cases a year. Gradually the necessity for administrative bodies charged with the enforcement of specific laws or themselves endowed with regulatory and judicial powers became evident. It was a long time before these bodies were given power to do more than investigate and advise. In 1915, however, the Interstate Commerce Commission as regards interstate railroads, Pullman, express, water-transportation, and telegraph and telephone companies, and many State commissions as regards these and other public utilities within their own borders, had a large measure of public control, while every State in the Union except Delaware and Utah exercised some degree of regulation by public-utility or public-service commission. As a rule, full power of review of State utility commission orders is vested in the courts, but in practice the major part of the decisions of the commissions are final—the main exceptions centring around constitutional provisions against taking property without compensation or without due process of law.

Aside from more or less superficial commission control of railways extending backward for many decades, public-utility regulation in the United States dates from the establishment of the Massachusetts Gas and Electric Light Commission in 1885 and the Interstate Commerce Commission in 1887. Both commissions had relatively little power at the outset, but were materially strengthened before the close of the century. Meanwhile and up to 1907 numerous railway commissions had been created, some of which were vested with considerable regulatory power. The first public-utility commissions of wide scope and power dated from the enlargement of the powers and duties of the Wisconsin Railroad Commission, and the establishment of the public-service commissions (first and second districts) of New York State, both in 1907, under the leadership of Governor La Follette and Governor Hughes respectively.

The example set by these two States and the success attained by their commissions led other States to create new commissions or to enlarge the powers of old ones. It should also be noted that from the nineties on many cities tried more or less effectively to regulate the public utilities which served their citizens. Rarely did these attempts go beyond franchises or contract provisions. As a rule, the only means of enforcing these provisions were court actions, which of course could not go beyond the specific provisions of the franchises or contracts. In California (see close of article) and Iowa cities were long ago empowered to fix rates charged for water and light, and in a very few cities local public-utility commissions have been established. Public utilities under municipal ownership are often in sore need of regulation to insure good service and fair rates. Massachusetts and Wisconsin are the chief, if not the only, examples of State regulation of municipally owned utilities, except that many of the States exercise considerable control of the purity of city water supplies regardless of whether these supplies are publicly or privately owned.

In few if any of the States has the regulation of all public utilities been reduced to a thoroughly consistent basis with the elimination of overlapping and conflicting jurisdictions. For example, in some of the States with the strongest public-utility commissions, water works may be subject to regulation by a public-utility commission as regards capitalization, rates and character of service, by the State board or department of health in the matter of purity of the supply, and by a State water-supply or conservation commission as regards water rights and the rival claims of two or more municipalities to the same source of supply. Beyond this there may be still further control of municipal water works in the matter of uniform accounts and reports through a State department of municipal audit.

In some parts of the country there has been strong objection to State regulation of public utilities on the ground that it is against the municipal home-rule principle of which so much has been made in recent years. This objection cannot hold good except where the very extreme of the municipal home-rule principle is admitted as valid. So long as the State remains sovereign over municipalities it is bound to exercise a greater or less degree of control over local services, whether these are rendered by private corporations or the municipality itself. Reason and experience both point to the superiority of State administrative rather than State legislative control of local affairs, once the governing policy has been determined by the legislative body. There is therefore not only less interference, but such interference as arises is of a less irritating character, when exercised by a body of trained administrators far more permanent in character than a State legislature and more likely to follow a consistent policy. Another and strong argument for utility control through the State rather than the municipality is that only a few of the very large cities can command the necessary engineering, legal, and administrative staff for effective control, whereas this can be done readily by a State commission, which at the same time accumulates many valuable data and a broad and varied experience, both of which are essential for efficient regulation.

In general, the State utility commissions have a small membership appointed by the Governor and confirmed by the Senate. The commissions are provided with engineering, legal, and clerical staffs, the members of which are, or soon

become, experts in their respective lines. A large part of the work of the commissions consists of adjusting utility rates. This involves extensive investigations to determine the legitimate capital investment, or at least to establish a valuation on which a fair rate of earnings shall be allowed. In the fixing of rates for such services as water supply and lighting it is necessary to go into careful studies of the relative investment and operating costs and the service rendered to private consumers and to the public at large. One of the most important functions of some utility commissions is to govern the issue of securities by public-service corporations in order to safeguard the investing public and to prevent unduly high charges to consumers for service rendered on the ground that the companies have to earn a fair return on their capitalization.

Interstate Commerce Commission. The Interstate Commerce Act of 1887 was passed under the leadership of Representative Reagan, of Texas, and Senator Cullom, of Illinois. The influence of this and later Federal control of railways on subsequent general utility regulation is manifested by the resemblance of the various pieces of State legislation to the Federal acts. The Act of 1887 prohibited unjust and unreasonable charges, rebates, and discriminations by the railroads and required public files of rates and detailed financial reports. Greater charges for short haul than for a long one over the same line were interdicted. The orders of the commission were to be enforced by the Federal courts.

In 1890 the Supreme Court upheld the right of witnesses to refuse to testify in the absence of immunity from prosecution. Congress promptly amended the law, and in 1896 the court upheld the revised statute. In 1897 the Supreme Court ruled that the commission could not fix rates in the absence of unmistakable delegation of this function by Congress. In the same year the Supreme Court killed the long-and-short-haul section of the Interstate Commerce Act by denying the right of the commission to establish the relative reasonableness of rates between cities.

Under the leadership of President Roosevelt the powers of the commission were restored to their original height. An Act of 1906 conferred upon the commission the power to determine and prescribe fair rates and regulations. Power to suspend the commission's orders was lodged in the United States circuit courts, with appeals going directly to the Supreme Court, and the burden of proof was put upon the railroads. Passes were cut off; transportation companies were compelled to give up allied businesses, like coal mining. Standardized operating and financial reports were required from the roads. In 1910 the commission was authorized to suspend rate increases prior to their taking effect and pending determination of their reasonableness. The determinations of mere fact by the commission were removed from review of the courts and a special court established to review appealed orders. The long-and-short-haul clause was reëstablished. The authority of the commission was extended to cover telegraph, telephone, and cable companies and to institute inquiries on its own initiative. The duties imposed upon the Interstate Commission have continually increased in scope. The enforcement of the Safety Appliances Act of 1893 was given to it. This statute required drive-wheel power brakes and train-brake control apparatus on all locomotives; trains were required to have enough power-braked cars to give the engineman control of train speeds; cars were required to have automatic couplers. In 1910 running boards were specified for freight cars, all common carriers were required to report accidents monthly, and the commission was given authority to investigate accidents thus reported. In 1911 safe and inspected locomotive boilers were required.

State Regulation. Massachusetts, Wisconsin, and New York have led the way in efficient State regulation. The Massachusetts regulation is a growth of many years. It vests control of gas and electric light service, both private and municipal, in a Gas and Electric Light Commission; steam and street railways, steamship lines, and all other common carriers, in the Railroad Commission; telephone and telegraph companies in the Highway Commission; and a limited control of water-supply utilities in the State Board of Health. New York has two public-service commissions. The one for the first district is confined to New York City, and, besides regulating all privately owned public utilities (except the telephone and the telegraph), the commission is charged with the building of a vast subway system, inheriting this task from the Rapid Transit Commission. The commission for the second district controls utility companies outside of New York City and telephone and telegraph service throughout the entire State. The Wisconsin laws will next be summarized, because Wisconsin was the pioneer in comprehensive scientific public-utility control and because its laws are still typical of the advanced regulation of the whole country.

WISCONSIN LEGISLATION

Commission. The Railroad Commission, consisting of three commissioners appointed by the Governor for six years, has jurisdiction over all railways and common carriers, light, power, heat, gas, telephone, telegraph, and water companies, and similar municipal departments. The commission also administers the State Dam Act, governing the development of navigable waters, water powers, and the construction, maintenance, and use of dams.

Expenses. Salaries and expenses are paid by the State, but the expenses of cases are assessed on companies adjudged to be giving unreasonable rates, inadequate service, or undue preference. There are fees for authorizing bonds, notes, etc.

Rates. All utility charges must be just and reasonable; the commission must consider fair return on property used and useful and must provide for depreciation. Dividing scales are permitted to divide excess profits and encourage efficiency. The commission may order joint service and fix joint rates for common carriers, street railways, and telephone and telegraph utilities. It may temporarily suspend, amend, or alter railway rates for the public good in emergencies. On complaint it may suspend rates pending investigation. All rates fixed by the commission are prima facie reasonable until changed.

Discrimination. No railroad or public utility may discriminate in charges for like or contemporaneous service. Railways may handle

freight free for governments, charities, fairs, expositions, and for its own and other railways' employees and may give free or reduced fares to ministers, college agents, charity bureaus, officials, land agents, and to its own and other roads' employees, but to no public officer. No private or municipal utility may give any political committee or public officer or officer elect any free service.

Service. Every public utility is required to furnish adequate facilities and service. Every utility is required on reasonable compensation to permit the use of fixed equipment on, over, or under streets and highways by any other utility where such use does not result in irreparable damage.

Meters. The commission may establish rules and standards for securing accuracy of all utility meters and may provide for the testing of all meters. Any consumer may have his meter tested at a reasonable fee, to be paid by the utility company if the meter is too fast.

Safety. Before being put in operation each new railroad or extension must be examined and approved by the commission. The commission may establish rules and specifications for the installation and use of safety appliances. Every railroad must report service accidents resulting in injury to persons or property, and every other utility must give notice of accidents resulting in loss of life. The commission may investigate any accident.

Accounts. The commission may prescribe uniform accounts for railways, common car-

SUMMARY OF PUBLIC UTILITY COMMISSIONS

(From the New York *Evening Post*, of March 31, 1915)

COMMISSIONS HAVING FULL JURISDICTION OVER ALL PUBLIC UTILITIES

STATE	Title	Years of formation	Scope of power
Arizona	Corporation Commission	1891–1912	C
California	Railroad Commission of the State of	1876–1911	C
Connecticut	Public Utilities Commission	1853–1911	
District of Columbia	Public Utilities Commission of the	1913	C
Georgia	Railroad Commission of	1879–1907	C
Idaho	Public Utilities Commission	1913	
Illinois	Public Utilities Commission of	1871–1914	C
Indiana	Public Service Commission of	1905–1913	C
Maryland	Public Service Commission	1910	C
Massachusetts	Public Service Commission	1869–1913	C
Massachusetts	Board of Gas and Electric Light Commissioners	1885–1902	C
Michigan	Railroad Commission	1873–1913	C
Missouri	Public Service Commission	1875–1913	C
Montana	Railroad Commission of	1907–1913	
Nevada	Public Service Commission (electric railways excluded)	1907–1911	
New Hampshire	Public Service Commission	1844–1911	C
New Jersey	Board of Public Utility Commissioners for the State of	1911	C
New York	Public Service Commissioners (1st and 2d districts)	1855–1907	C
Ohio	Public Utilities Commission of	1867–1911	C
Oklahoma	Corporation Commission of	1908	
Oregon	Railroad Commission of	1887–1912	
Pennsylvania	Public Service Commission of Commonwealth of	1907–1914	C
Rhode Island	Public Utilities Commission	1844–1912	
Vermont	Public Service Commission	1855–1908	C
Washington	The Public Service Commission of	1905–1911	
West Virginia	Public Service Commission	1913	
Wisconsin	Railroad Commission of	1874–1907	C

COMMISSIONS EXERCISING JURISDICTION OVER RATES AND SERVICE OF TRANSPORTATION COMPANIES AND IN SOME CASES OVER OTHER UTILITIES

Alabama	Railroad Commissions	1881–1907	I T
Arkansas	Railroad Commission of	1899	
Colorado†	Railroad Commission of	1885–1913	I

South Carolina	Railroad Commission	1878–1910	T R
South Dakota	Railroad Commission	1885–1911	T
Texas	Railroad Commission of	1891–1897	C
Virginia	State Corporation Commission	1877–1904	T R L
Wyoming	Public Service Commission	1915	

COMMISSIONS EXERCISING LIMITED SUPERVISION OVER CARRIERS ONLY

Kentucky	Railroad Commission	1880–1909
Tennessee	Railroad Commission	1883–1897

STATES HAVING NO COMMISSIONS

Delaware Utah

* Outside corporate limits only. † Modern utility law awaiting referendum (capitalization to be controlled).
I indicates interurban railways. R indicates street railways. T indicates telegraph and telephone systems.
L indicates lighting companies (electric and gas). C indicates control of capitalization.

riers, and utilities. No concern may keep any books not prescribed by the commission.

Certificate of Convenience. Before any railway may exercise its powers or begin construction the commission may make surveys and examinations and enter on any lands to select the best route. If a certificate is refused, application may be made after two years. The company may appeal to the Circuit Court. Before work is started the road must file specifications of construction, which the commission may change or approve.

Municipalities, Powers. Every municipal council has power to determine the quality, character, and extensions of utility service to be rendered within its own limits, and the terms and conditions under which utilities may occupy streets and highways. Municipal ordinances in these matters are prima facie reasonable, but on complaint the commission may judge of their reasonableness.

Franchises. No utility license or franchise may be granted to any concern in a municipality where an existing utility has an indeterminate permit without first securing from the commission a declaration of public convenience and necessity. Construction of municipal plants is similarly restricted, but an existing utility may be condemned or purchased. Every license or franchise granted to any utility is subject to municipal purchase, as with indeterminate franchises. A concern accepting an indeterminate permit agrees to the purchase of its property used and useful in the public service on conditions determined by the commission, and it waives the ordinary rights and remedies of condemnation. The Circuit Court may judge of the necessity of a municipality's taking over a plant, whereupon the commission may proceed to hearings on value. Dissatisfied parties may appeal and attack in the Circuit Court the value established by the commission.

Financing. Right to liens in corporate property is declared a special privilege the control of which is vested in the State. No corporation may issue stocks, bonds, or notes except for money, labor, or property actually received equal to par value. No utility may issue stocks, bonds, or notes exceeding reasonable necessity for the purposes of issue. Securities must be issued at not less than 75 per cent of par value. The ratio of bonds and notes to stock must be reasonable.

Enforcement. The commission has the power, and it is its duty, to enforce the utility laws and to report violations to the Attorney-General. On request district attorneys or county prosecutors must aid the commission. Any utility or person dissatisfied with the demands of the commission may appeal within 90 days to the Circuit Court.

Municipal Authority in California. The provisions of the California constitution and statutes giving municipal authorities the choice between continuing their old powers of regulation of privately owned utilities and transferring to the State commission are of interest. All regulative powers previously vested in local governments ceased on the adoption of the constitutional amendment and passage of the Utilities Act, except where political subdivisions voted to retain such authority. Local governments may at any later time surrender their powers of utility regulation to the commission or they may by the same means resume powers previously surrendered. Such transfers, one way or the other, may apply to a part or all of the utilities operating in the municipality.

Bibliography. "Public Utility Legislation in the United States, including the Interstate Commerce Act and Amendments thereto," fills 1165 closely printed quarto pages following the report of the *Proceedings of the National Association of Railway Commissioners* for 1911 (Chicago, 1912). *Commission Regulation of Public Utilities* (New York, 1913) is an analysis by a committee of the National Civic Federation of the "laws of the 43 States which in 1912 had central commissions for the regulations of utilities." See also Henry Floy, *Valuation of Public Utility Properties* (New York, 1912); H. A. Foster, *Engineering Valuation of Public Utilities and Factories* (ib., 1912); C. L. King (ed.), *Regulation of Municipal Utilities* (ib., 1912); O. L. Pond, *A Treatise on the Law of Public Utilities Operating in Cities and Towns* (2d ed., Indianapolis, 1913); R. H. Whitten, *Valuation of Public Service Corporations for Rate Making and Public Purchase* (New York, 1913); id., "Regulation of Public Service Companies in Great Britain" (reprint from *Report of the Public Service Commission First District of New York* (ib., 1913); Hayes, *Public Utilities: Their Fair Present Value and Returns* (ib., 1915). Decisions of the various public-service commissions and of State and Federal courts in utility cases are published regularly in *Public Utilities Reports, Annotated* (Rochester, N. Y., 1915 et seq.).

PUBLIC WASHHOUSES. See WASHHOUSES, PUBLIC.

PUBLIL'IUS SYRUS. A Roman writer of mimes. He was a native of Syria. He was brought to Rome when a boy as a slave; but his master was kind, educated him, and finally gave him his freedom. His works are lost, but some of his moral apothegms, which have been preserved by Seneca and other ancient writers, are remarkable for their laconic precision and justness of sense. These have been gathered under the title, *Publili Syri Mimi Sententiæ*, edited by Meyer (Leipzig, 1880), Friedrich (Berlin, 1880), and Bickford-Smith (Cambridge, 1895). Consult: W. S. Teuffel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1909); J. W. Duff, *A Literary History of Rome* (London, 1909); Martin Schanz, *Geschichte der römischen Litteratur*, vol. ii, part i (3d ed., Munich, 1911).

PUBLISHING. See PRINTING.

PUB'LIUS. The signature used by Hamilton, Jay, and Madison in their papers contributed to the *Federalist*. Papers 2–5 and 64 were written by Jay; 10, 14, 18–20, 37–63 by Madison; and the remainder by Hamilton.

PUCCINI, pōōt-chē'nē, GIACOMO (1858–). An Italian operatic composer, born at Lucca, Dec. 23, 1858. Beginning with his great-great-grandfather Giacomo (born 1712) all his male ancestors in the direct line were musicians of prominence—Antonio (born 1747), Domenico (born 1771), Michele (born 1813). Young Giacomo received his first instruction from a local teacher, Angeloni, and then entered the conservatory at Milan, where his teachers were Bazzini (q.v.) and especially Ponchielli (q.v.). His first opera, *Le Villi* (1884), attracted considerable attention in Italy, but Puccini waited five years before coming out with his second work, *Edgar*. Though musically an advance over the first opera, it failed because of its ab-

surd and impossible libretto. The tremendous success of *Manon Lescaut* (1893) was even surpassed three years later by that of *La Bohème*, which immediately found its way into all the opera houses of the world. *Tosca* (1900) proved a distinct disappointment, chiefly because of its disgusting libretto. With *Madama Butterfly* (1904) he scored his greatest triumph. When it was produced at the Metropolitan Opera House in 1907, the composer was invited by the management to superintend the rehearsals. Many now regarded Puccini as the legitimate successor of Verdi, and unquestionably he was by far the greatest of contemporary Italian dramatic composers. His next work, *The Girl of the Golden West* (*La Fanciulla del West*), on a typical American subject, was commissioned by the Metropolitan Opera House and produced there for the first time in 1910. Although a seeming success at its première (chiefly owing to the composer's presence), this work could not maintain itself either in America or subsequently in Europe. Owing to the outbreak of the Great European War his two operas, *La Rondine* and *I Due Zoccoletti* (both completed in 1915), were not performed in that year.

Without doubt Puccini became the most popular and most successful Italian dramatic composer of the early twentieth century. He surpasses all his contemporaries in fertility and power of melodic invention. His technical equipment is ample, his treatment of the orchestra masterly, his sense of dramatic characterization strongly developed. His musical inspiration is almost invariably conditioned by the dramatic situation: whenever the text is effective the music is truly inspired; when the text becomes prosy the music also becomes dull and labored. *Madama Butterfly* is Puccini's masterpiece, because here the composer had an excellent libretto (from the novel by John Luther Long, q.v.). He failed signally in *The Girl of the Golden West* because the subject was not fitted for musical setting. Consult R. A. Streatfield, *Masters of Italian Music* (London, 1895); Wakeling Dry, *Giacomo Puccini* (New York, 1906).

PUCCINIA GRAMINIS, pŭk-sĭn'ĭ-ȧ grăm'-ĭ-nĭs. See RUST.

PUCCOON' (from the North American Indian name). A name for various plants or their colored juices. In the South it is applied to *Sanguinaria* (q.v.); in the Southwest to *Lithospermum gmelini* (hairy puccoon) and *Lithospermum canescens* (hoary puccoon or alkanet). *Hydrastis canadensis*, golden seal, is often called yellow puccoon. See HYDRASTIS.

PUCHTA, pŭK'tȧ, GEORG FRIEDRICH (1798–1846). A German jurist who systematized the theories of the historical school of law. He was born at Kadolzburg, was educated at Erlangen, taught there (1820–28), was professor at Munich until 1835, then in Marburg, in Leipzig (1837–42), and for the last three years of his life in Berlin. Puchta was a profound thinker and clear stylist. His more important works are: *Civilistische Abhandlungen* (1823); *Lehrbuch der Pandekten* (1838; 12th ed., 1877); *Einleitung in das Recht der Kirche* (1840); *Kursus der Institutionen* (1841–47; 10th ed., 1893); *Vorlesungen über das heutige römische Recht* (1847–48, ed. by Rudorff; 6th ed., 1873–74).

PUCK. In folk lore, a certain elf or fairy. It is he who plays an important part in Shakespeare's *Midsummer Night's Dream.*

Puck is also the name for the rubber disk substituted for a ball in the modern game of hockey (q.v.).

PÜCKLER-MUSKAU, pŭK'lĕr-mŭs'kou, HERMANN LUDWIG HEINRICH, PRINCE (1785–1871). A German author, and authority on gardening. He was born in Muskau, Lusatia, and was educated at Halle and Leipzig. He entered the army in 1803, served with much distinction, and in 1822, after his retirement, was made prince by the King of Prussia. He traveled much in the Orient and in England, where he developed a love for landscape gardening. Gardens on his own estate at Muskau, in Weimar, and elsewhere were laid out after the plans described in his *Landschaftsgärtnerei* (1834; new ed., 1903). His books of travel, especially *The Travels of a German Prince in England* (trans. by Sarah Austin, 1832), *Tutti Frutti* (trans. by Spencer, 1834), and *Mehemet Ali and Egypt* (1848), made a strong impression on account of their brilliant style. His first work, *Briefe eines Verstorbenen* (1830), a diary descriptive of manners and customs of the aristocracy of many lands, is still read. Consult: L. Assing, *Fürst H. von Pückler-Muskau* (Hamburg, 1873); Petzold, *Fürst Pückler Muskau in seiner Bedeutung für die bildende Gartenkunst* (Leipzig, 1874); L. Assing, *Briefwechsel und Tagebucher* (9 vols., Berlin, 1873–76).

PUCRAS, pŭk'rȧs (East Indian name), or KOKLASS. A pheasant of the Himalayan genus *Pucrasia*, recognizable by the long crests and still longer ear tufts of the cocks.

PUDDING STONE. See CONGLOMERATE.

PUDDLING. See IRON AND STEEL, METALLURGY OF.

PUDICITIA, pū'dĭ-sĭsh'ĭ-ȧ (Lat., modesty). The goddess of chastity and modesty, at first worshiped only by patrician Roman matrons, but later by plebeians as well. She corresponds to the Greek goddess *Aïdṓs*.

PUDSEY, pŭd'zĭ. A woolen-manufacturing town in the West Riding of Yorkshire, England, 3 miles east of Bradford. It was incorporated in 1899, and has shown much municipal activity and improvement. Pop., 1901, 14,900; 1911, 14,027.

PUDSEY, HUGH DE. See PUISET, HUGH DE.

PUDU, pōō'dōō (South American name). A very small white-tailed, stout-limbed deer of the Chilean Andes (*Pudua humilis*), which has antlers in the form of minute simple spikes and has no upper canine teeth. It is restricted to the high mountains of Chile. See Plate of FALLOW DEER, MUSK, ETC., with the article DEER.

PUEBLA, pwā'blȧ. An inland state of Mexico (Map: Mexico, K 8). Area, 12,204 square miles. The state includes one of the most elevated portions of Mexico. On the west frontier rise the volcanic peaks of Popocatepetl and Iztaccihuatl and on the east boundary the great cone of Orizaba. The northern part is traversed by the Sierra Madre, and the extreme north slopes towards the low coast region. The central portion belongs to the plateau of Anahuac (q.v.), while in the south deep valleys are the most prominent features. The chief river is the Apoyac, or upper course of the Mescala, which traverses the south portion. The climate varies considerably according to the elevation, and the soil is generally fertile in the valleys, where sugar, coffee, rice, and cotton are cultivated. The more elevated regions are devoted chiefly to the raising of cereals. Grazing is carried on ex-

tensively in some parts of the state. The mineral deposits are believed to be considerable, but mining is chiefly confined to working of copper, with some gold and silver, and quarrying of marble. The manufacture of cotton thread and cloth is the most important industry, and the state produces about one-half the total output of the Republic. The other manufactures include liquors, beds, biscuits, cigarettes, candles, glass, cement, ornamental ironwork, tiles, etc. The state is crossed by several railroad lines. Pop., 1900, 1,021,133; 1910, 1,101,600, including a large number of civilized Indians. Capital, Puebla (q.v.).

PUEBLA, or PUEBLA DE ZARAGOZA, formerly PUEBLA DE LOS ANGELES. The capital of the State of Puebla, Mexico, and the third city in size and importance in the Republic. It is situated on the Atoyac River, 60 miles southeast of Mexico City, at an elevation of 7200 feet above the sea, and between the bases of Mounts Malinche and Popocatepetl (Map: Mexico, K 8). It is a very pleasant and well-built city, regularly laid out with broad streets and spacious squares. The uniform slope of the ground gives it a good natural drainage, which is further reenforced by a good artificial system, so that it is a very healthful city. Among its many handsome buildings the most prominent is the cathedral, which rivals that of Mexico and whose two fine towers dominate the view of the city. Other notable buildings and institutions are the Palace of Justice, the Alhóndiga, a large and handsome building occupied by the State Legislature, the State College with a large library, the School of Medicine, the Palafoxiana Library containing over 100,000 volumes, the Academy of Fine Arts, and several theatres and hospitals. The city is an important commercial and industrial centre. It has several cotton and woolen mills, foundries, and glass factories, and is connected by rail with Mexico, Vera Cruz, Orizaba, and Oaxaca. It is the residence of a United States consular agent. Pop., 1910, 96,121.

Puebla was founded as a mission station in 1530 by Toribio de Benaventa. In 1847, during the war with the United States, it was occupied for some time by the American forces. In 1862 it was attacked by the French army, which was repulsed by General Zaragoza, in whose honor the city received its present name. The French, however, captured it in the following year. In November, 1914, Carranza set up his government here, but the city was soon captured by the Villistas and Zapatistas. It was recaptured by Obregon in January, 1915.

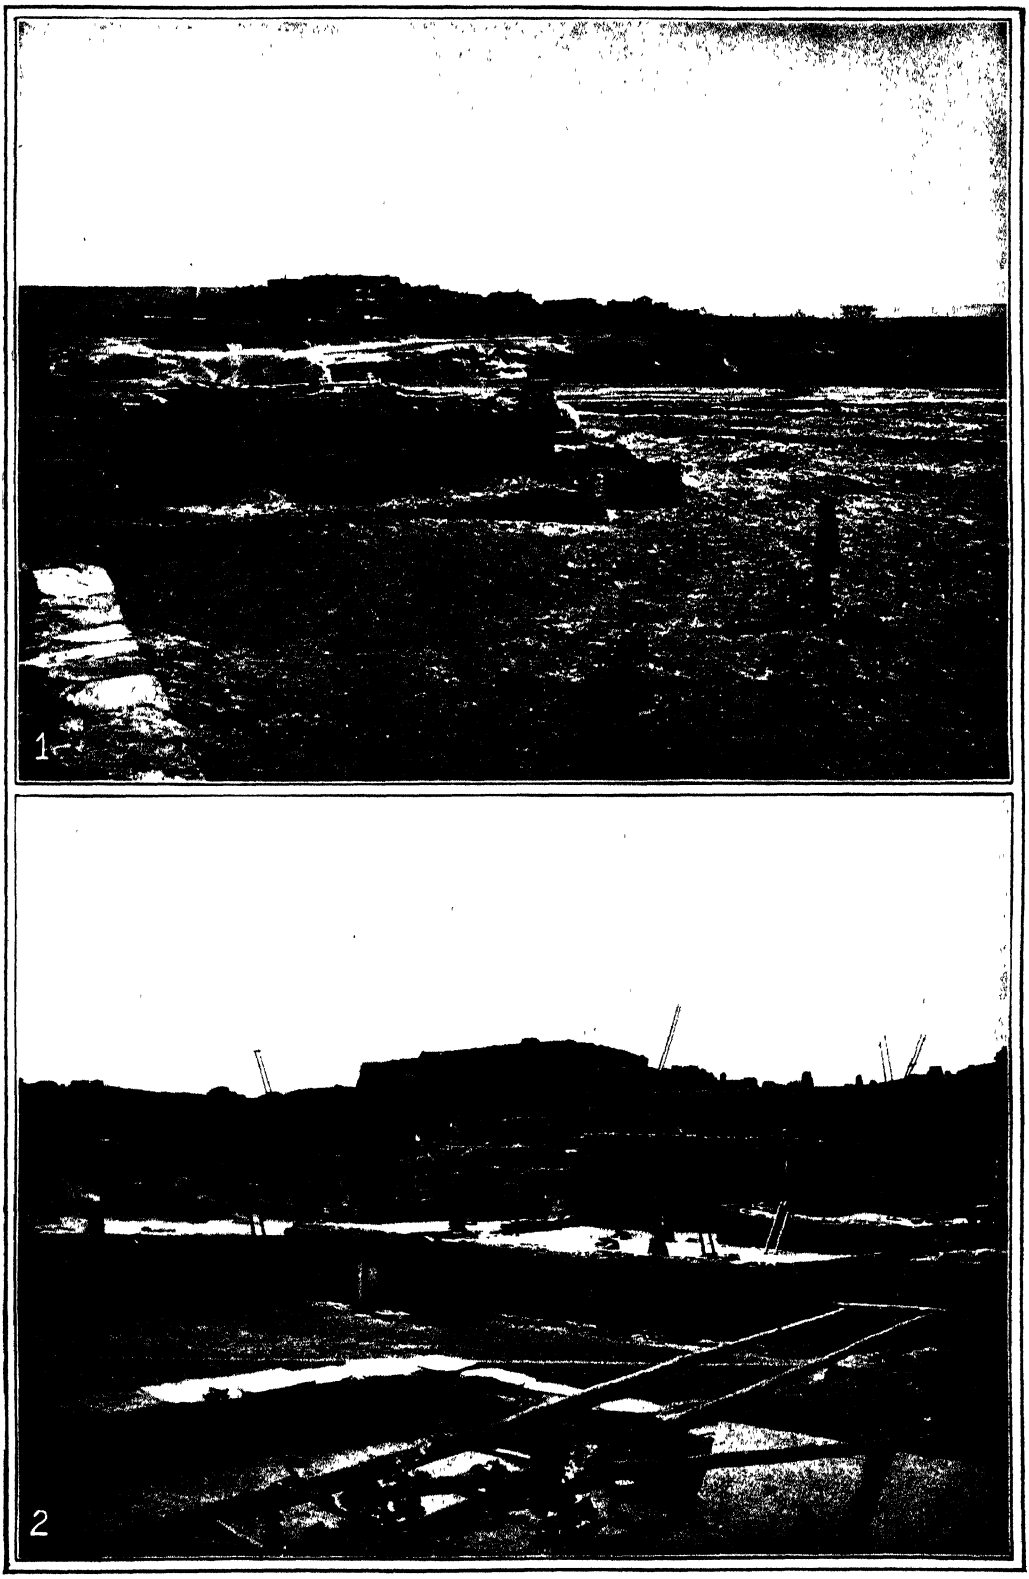
PUEBLO, pwĕb'lō (Sp., village). A name first used by the Spaniards, and later adopted by the Americans, to designate the semicivilized agricultural and sedentary Indians dwelling in adobe or stone-built communal houses in the arid region of the southwestern United States, chiefly along the Rio Grande and its tributaries. The term "village Indians" was used in distinction from the ruder wandering tribes without reference to political or linguistic affiliations. The existing pueblos, or settlements, now number 27, besides the Mexicanized colonies of Isleta in Texas and Senecú in Mexico, together with several subpueblos, representing in all four distinct stocks, with about twice as many languages and several additional dialects. With the exception of Zuñi, the seven Moki villages in Arizona, and the two Pueblo colonies below El Paso, all the existing pueblos are within a limited area of north-central New Mexico, but the hundreds of ruins, together with traditional and historical evidence, prove that the area of Pueblo culture formerly comprised the whole region from the Pecos to the middle Gila and from central Colorado and Utah southward into Mexico. This does not mean that all of the ruins were occupied at the same time, but that at one time or another every part of the region in question was within the sphere of Pueblo culture. There seems to have been a gradual withdrawal from the northern and other more exposed sections and a concentration upon central points, due to the invasion of the savage Apache and Navaho. Some Pueblo tribes have distinct traditions of their former occupancy of particular ruins, frequently remote from their existing villages.

The recorded history of the Pueblos begins with their discovery by Father Marcos de Niza in 1539, followed up by the expedition of Coronado (q.v.) the following year. The occupation and conquest of the country was not begun in earnest until 1598. By 1630 missions were established in nearly every pueblo, and the whole country was mapped out into districts and held in subjection by Spanish garrisons. The persons of Spanish birth formed only a small per cent of the population of the region. The nomadic tribes became unruly and made desperate raids to obtain horses. Several pueblos had to be abandoned on this account. The priests attempted to stamp out the native religion, but gained only the smoldering enmity of the native medicine men. In 1680, under the leadership of Popé, a medicine man of the Tewa, there was a simultaneous rising of all the Pueblos, so sudden and complete in its surprise that priests, soldiers, and civilians were everywhere butchered, and the survivors after holding out for a time under Governor Otermin at Santa Fé fled to El Paso, leaving not a single Spaniard in New Mexico. A few of the Piro and Tigua tribes who adhered to the Spaniards followed them in their retreat and were afterward colonized respectively at Senecú and Isleta, below El Paso. The Spaniards made several attempts to reconquer the colony, but it was not until Diego de Vargas was put in charge of the forces in 1692 that they were successful. The missions, however, were not all reëstablished, and most of the tribes relapsed into their primitive religion and ceremonial. At Awatobi, one of the Hopi towns, the people were supposed to favor the return of the priests. In 1700 the village was burned and its inhabitants massacred by their neighbors of Walpi. As a result of the rebellion nearly all the villages changed their sites. Their history from that period until the Mexican War brought them under American jurisdiction is of little outside importance. By the Treaty with Mexico they were declared American citizens on the same terms as their Mexican neighbors, but the new territorial administration refused to admit them to equal rights, and they continue to be treated as Indians under government control according to the regular agency system. They are entirely self-supporting, however, and ask and receive little beyond schools and recognition of certain village and farming reservations.

Physically the Pueblo Indians are small in stature, but very strong, being able to walk or even run long distances, or climb steep or difficult mountain trails, under burdens that would

tax the strongest white man. They are darker than the Plains Indians, with mild and friendly countenances, indicative of their disposition. They are not aggressive warriors, fighting usually only in self-defense and preferring rather to avoid trouble with the wild Apache and Navaho by building their settlements upon the tops of high cliffs, to be ascended only by narrow and easily defended trails. Hence the name Cliff Dwellers frequently applied to them and more particularly to the extinct inhabitants of the northern cañon ruins. Since the government has interfered to restrain the predatory tribes, most of the Pueblos have come down upon the plain, but the Hopi of Arizona still have their villages upon mesas several hundred feet above the surrounding level. Their houses are solidly built communal structures of adobe or stone set in clay mortar, with square rooms and flat roofs, through which trapdoors with ladders give access to the interior, the outer walls being frequently without door or window as a precaution against attack. Rooms are added to the original structure as needed, and a whole village frequently forms one compact building, with stories in terrace style, one above another. An important feature of each pueblo is the *kiva* or underground chamber for the use of the various ceremonial societies.

Their dress is of buckskin or of cotton or woolen fabrics of their native weaving. In some tribes, as the Hopi, the unmarried women are distinguished by a peculiar arrangement of the hair. They are all basket makers, each pueblo having its own method or design. In variety of pattern and beauty of decoration they have developed the pottery art to a higher stage than was found anywhere else in the United States. Their men are also skillful wood carvers, particularly in the shaping of ceremonial figurines. Their main dependence is agriculture, each pueblo cultivating its fields in common, usually by aid of irrigation from an adjoining stream, and producing corn and beans in many native varieties, with melons, squashes, chile, tobacco, as well as peaches, introduced by the early Franciscan missionaries. The grinding of the meal upon stone metates and the baking of the bread upon heated slabs of stone occupy a large share of the woman's indoor time, while pottery making and the field occupy her attention outside. The men, besides their field work, do the weaving and procure firewood, which must generally be brought from long distances on the backs of burros. The interval between crop seasons is given to a succession of elaborate and spectacular ceremonials, one of which, the snake dance (q.v.) of the Hopi, has achieved a national reputation. Most of these ceremonials are of a sacred character, being either invocations or thanksgiving for the rain and the crops, and each is in the keeping of a special secret society.



Family life is based upon the clan system, the number of clans being very large in proportion to the population. The position of woman is high. The marriage ceremonial is elaborate, including feasting, processions, and dances, and only one wife is allowed. The government is by villages rather than by tribes, each pueblo having a peace chief or governor, assisted by councilors, together with a war chief.

In 1915 the number of the Pueblos was about 10,000. Excluding the seven Hopi (Moki) villages in Arizona, with 1941 souls, and the two Mexicanized pueblos of Isleta and Senecú below El Paso, the existing inhabited pueblos number 18, all in New Mexico, as follows: Acoma, 691; Cochiti, 237; Isleta, 910; Jemez, 499; Laguna, with subpueblos of Pahuate, Paraje, Casa Blanca, and others, 1441; Nambe, 68; Picuris, 104; Sandia, 73; San Felipe, 490; San Ildefonso, 123; San Juan, 384; Santa Ana, 211; Santa Clara, 277; Santo Domingo, 817; Sia, 109; Taos, 517; Tesuque, 77; Zuñi, 1664. They are classified by linguistic stocks as follows: Shoshonean: Mashongnivi, Shumopovi, Shupaulovi, Sichumovi, Oraibi, Walpi. Tañoan: Isleta (New Mexico), Isleta (Texas), Jemez, Nambe, Pecos (extinct), Picuris, Pojoaque (extinct), Sandia, San Ildefonso, San Juan, Santa Clara, Senecú (Chihuahua, Mexico), Taos, Tesuque, Tewa or Hano (with Hopi, Arizona). These are grouped under cognate languages as follows: *Tano* or *Tigua* (Isleta, New Mexico; Isleta, Texas; Sandia); *Taos* (Taos, Picuris); *Jemez* (Jemez, Pecos); *Tewa* or *Tegua* (Nambe, Pojoaque, San Juan, San Ildefonso, Santa Clara, Tesuque, Tewa or Hano); *Piro* (Senecú); *Keresan* (Acoma, Cochiti, Laguna, San Felipe, Santa Ana, Santo Domingo, Sia); *Zuñian* (Zuñi). Consult S. D. Peet, *Cliff Dwellers and Pueblos* (Chicago, 1901), and J. W. Fewkes, "Two Summers' Work in Pueblo Ruins," in *Bureau of American Ethnology, Twenty-second Annual Report* (Washington, 1903). See Colored Plate of AMERICAN INDIANS, under INDIANS; also the accompanying Plate showing a Zuñi pueblo, and Plate of POTTERY.

PUEBLO. The second largest city of Colorado, the county seat of Pueblo County, and an important commercial and industrial centre, 120 miles south by east of Denver (Map: Colorado, E 3). Situated in a large basin at the east foothills of the Rocky Mountains and on both sides of the Arkansas River, at the junction of the Fontaine qui Bouille, Pueblo enjoys a natural location for a great railway and business centre. Its transportation facilities comprise the Denver and Rio Grande, the Atchison, Topeka, and Santa Fe, the Missouri Pacific, the Colorado-Kansas, the Chicago, Rock Island, and Pacific, and the Colorado and Southern railroads. In the centre of a vast irrigated district, extending 250 miles along the Arkansas River, the city is interested to a large extent in stock raising and farming, the chief products being alfalfa and sugar beets. Near the city are deposits of coal, limestone, oil, glass sand, and clay, and the tributary region includes very highly productive mineral districts. Pueblo is the great distributing and receiving point for this section of vast natural wealth. It has become known as the Pittsburgh of the West, being famous for its iron and steel and smelting industries. There are in the city several smelters producing lead, silver, and gold, zinc, and copper; the immense plant of the Colorado Fuel and Iron Company, which manufactures various iron and steel products; foundries and machine shops, including railroad car shops; manufactories of fire brick, furniture, etc.; and large stockyards. According to the census of 1909, an aggregate capital of $4,137,000 was invested in these industries, which had a production valued at $3,345,000.

Pueblo has the McClelland Public Library, law libraries, the State Insane Asylum and several other charitable institutions, a county courthouse costing $1,000,000, and the State Mineral Palace and Park. In the building last mentioned

PUEBLO OF ZUÑI INDIANS

1. ZUÑI PUEBLO FROM THE SOUTH

2. VIEW IN THE PUEBLO

is a complete collection of the minerals of Colorado. There are 330 acres of public parks and playgrounds. Educational institutions include two fine high schools, Benedictine College, Loretta Academy, Gulliford Academy, 18 grade schools, and two business colleges. The government, under a charter of 1911, is vested in three commissioners. Fire department officials, the police judge, and city physician are chosen by civil-service examination. A few Mormons settled temporarily on the site of Pueblo in 1846, and about 1850 a trading post was established here, the inhabitants of which, however, were massacred by the Ute Indians in 1854. The present city was laid out in 1859 and was chartered in 1873. In 1887 Pueblo, South Pueblo, and Central Pueblo consolidated. Pop., 1900 28,157; 1910, 44,395; 1914 (U. S. est.), 51,218.

PUEBLO INDIANS. See INDIANS; HOPI.

PUEBLO PLAN. See PEDAGOGY.

PUECH, pēsh, DENYS (1854–). A French sculptor. He was born at Gavernac (Aveyron) and studied chiefly in Paris at the Beaux-Arts under Jouffroy, Falguière, Chapu, and Dubois, and in 1884 he won the Prix de Rome. Puech's art is realistic, graceful, delicate, and restrained. He is especially celebrated for his busts, which have an eighteenth-century elegance and charm —Madame Cauvin (Luxembourg), Mademoiselle Rosita Mauri, Madame Bartet, Mrs. Lytton, President Loubet (Louvre), Sainte-Beuve (Luxembourg Gardens), and Jules Claretie. Among his graceful and imaginative ideal works are "The Seine," "The Muse of André Chenier," and "The Siren," all in the Luxembourg. Also to be mentioned are his monuments to Chaplin, Leconte de l'Isle, Garnier, Gavarni, and Jules Simon, all in Paris. He received the Grand Prix at the Paris Exposition (1900), and became a member of the Institute in 1905. Consult the monograph by Jaudon (Rodez, 1908).

PUELCHE, pōō-ĕl'chȧ (eastern people). A people of Araucan stock roving over the pampas region of the Río Negro, southern Argentina. They are so called in distinction from the cognate Moluche (western people), in and west of the Andes. Those living in the foothills of the Andes are frequently also distinguished as Pehuenche (pine forest people). In language and general characteristics they differ but slightly from the others of the same stock, but are rather wilder than those of Chile, spending much of their time on horseback and seldom staying long in one place. They carry on a considerable trade in cattle, salt, and tobacco with the tribes west of the mountains. They have large herds of cattle and horses, are expert with the bolas, and fond of gambling and music. They wear their hair flowing or gathered behind into a queue decked with silver beads, with a bright turban about the head and a blanket wrapped about the waist and held in place by a belt. Physically they are of medium stature, broad-chested, and inclined to corpulency. They pluck out the beard and eyebrows, and the women paint their faces in red and black. For Puelchean dialect, consult D. G. Brinton, *Studies in South American Languages* (Philadelphia, 1892), and A. F. Chamberlain, in *American Anthropologist*, N. S., vol. xiii (Lancaster, Pa., 1911).

PUENTE DE CALDERÓN, pwān'tȧ dȧ kȧl'dȧ-rōn' (Sp., bridge of Calderón). A bridge over the Río Grande de Santiago, about 30 miles from the city of Guadalajara, Mexico, noted as the scene of the defeat of the revolutionary forces under Hidalgo, about 80,000 poorly armed, by Calleja, with 6000 well-equipped troops, Jan. 17, 1811.

PUENTE GENIL, hȧ-nēl'. A town of south Spain in the Province of Córdoba, situated 32 miles south of Córdoba, on the river Genil, which is here crossed by a stone bridge, and on the railroad to Malaga (Map: Spain, C 4). It has a secondary college and a public library; it is surrounded by olive orchards, and its principal industry is the manufacture of olive oil. Pop., 1900, 12,959; 1910, 14,230.

PUENTES (pwān'tȧs) **DAM,** FAILURE OF. See DAMS AND RESERVOIRS, *Failures of Dams.*

PUERPERAL (pū-ĕr'pĕr-*al*) **FEVER** (from Lat. *puerpera*, parturient woman, from *puer*, child + *parere*, to bear), PUERPERAL SEPSIS, CHILDBED FEVER. A fever appearing in puerperal women within a week after labor, usually from the third to the fifth day, attended with septic infection of the blood and acute inflammation of one or more of the reproductive organs or the loose cellular tissues connected with them, and often characterized by severe and widespread complications. This fever was long considered specific, and under the names childbed fever, lying-in fever, etc., was a fatal and frequent complication of the puerperium, particularly in lying-in hospitals. It is now known that the disease is due to infection from pus-producing microörganisms (the streptococcus in 80 to 95 per cent of the cases) introduced into the genital tract by contact with unclean hands, instruments, dressings, clothing, or bedding. The credit of pointing out the true origin of this disease belongs to Dr. Oliver Wendell Holmes, who in 1843 promulgated the doctrine of extra-genital infection. In 1847 Semmelweiss (q.v.) proclaimed the same teachings in Europe. Since modern antiseptic midwifery has caused the hands, instruments, and the materials used in the lying-in room to be sterilized, puerperal fever has become a comparatively rare occurrence, and a better knowledge of its pathology and prompt treatment of its earliest symptoms make it a much less dangerous and severe sequel of labor.

The complications that may arise in puerperal fever are both grave and numerous. The large uterine vessels readily absorb infection and distribute it to all parts of the body. Pericarditis, pleurisy, endocarditis, peritonitis, pneumonia, and inflammation of the joints may occur, and the liver, kidneys, bladder, or spleen may be secondarily infected. The disease is usually ushered in with a chill, followed by an irregular fever, nausea, extreme general depression, with a rapid, feeble pulse, and shallow respiration. The expression is anxious, the tongue heavily coated, and the urine scanty and albuminous. Severe cases run a rapid course and often terminate fatally within a week.

The prevention of puerperal infection by the exercise of rigid cleanliness in every labor case, particularly when instrumental interference is demanded, is now one of the most important duties of the obstetrician. (See ANTISEPTIC.) When, however, infection has taken place, on the appearance of the initial symptoms the genital tract should be irrigated at frequent intervals with warm antiseptic solution. If this measure does not prove efficient in abating the fever in a short time, it is necessary to explore the uterine cavity and remove by means of a blunt curette the decomposing material that is almost

certain to be found there. Frequent douching is continued until convalescence sets in. The general treatment is stimulating and supportive.

PUERPERAL INSANITY. A term applied to mental derangement occurring during the first six weeks of the puerperal state. The great changes comprised in the onset of labor and the beginning of uterine involution, with the nerve drain, the rapid metabolism of tissue, and the necessity for sudden adjustment to a new order of life combine to produce a condition in which the agencies that cause insanity may more easily operate. The term does not denote any one form or even any one group of psychoses. The disorder may be caused by the action of a toxin produced within the body (an autointoxication) or by infection from material retained within the uterus or introduced during delivery of the child, or by grave anæmia following a hemorrhage. All three of these causes may operate simultaneously. The clinical picture is most frequently that of primary mental confusion or of dementia precox. In some cases the exhaustion of the puerperium allows the development of a latent psychosis as of hysterical insanity. The onset of an attack of puerperal insanity is usually sudden, but is sometimes preceded by nerve fag, insomnia, restlessness and garrulity, fickle fancy, unreasonable likes or dislikes, and perverted tastes and emotions. Suspicion and obstinacy, violent hatred of husband or infant follow. Delusions and hallucinations of a terrifying kind may occur, and there may be constant excitement, perpetual talking in an incoherent way, impulsive action, obscenity in speech and conduct, and even homicidal or suicidal impulse.

Moral shock has some influence in the production of this insanity, for over 25 per cent of the cases occur in mothers of illegitimate children. However, it must be remembered that a fair proportion of unmarried mothers are mildly demented or feeble-minded. It more often occurs in primiparæ. Eighty per cent of the cases recover.

Treatment must be instituted according to the causes operating, and attention must be given to the genital apparatus, the digestive tract, the capacity for sleep, and the necessity for hydrotherapy. Custodial care is, in the vast majority of the cases, necessary; for others removal from familiar home surroundings is valuable. Consult W. B. Lewis, *Text-Book of Mental Diseases* (2d ed., Philadelphia, 1899), and Joseph Rogues de Fursac, *Manual of Psychiatry*, translated and edited by A. J. Rosanoff (New York, 1914).

PUERTA, MARQUIS DE LA. See MORILLO, PABLO.

PUERTO CABALLOS, pwâr'tō kȧ-bȧ'yōs. A town of Honduras. See PUERTO CORTÉS.

PUERTO CABELLO, kȧ-bȧ'yō. A seaport in the State of Carabobo, Venezuela, situated on the Golfo Triste, 55 miles west of Caracas, with which it is connected by rail (Map: Venezuela, D 1). It has a hot and unhealthful climate, but an excellent harbor protected by a chain of islands and fortified. In 1912 it was the second port of Venezuela in exports and third in imports. Exports include coffee, cocoa, hides, rubber, divi-divi, sugar, and cattle; imports, textiles, foodstuffs, and other manufactured articles. It is the seat of a United States consul. Pop. (est.), 18,282. In the eighteenth century Puerto Cabello was an important Venezuelan town. In 1743 it repulsed the attack of an English squadron. The last battle of the war of independence was fought here in 1823. It was an important point during the English-German blockade of 1903.

PUERTO CORTÉS, kōr-tās', or PUERTO CABALLOS. A port of Honduras, situated on a bay of the Gulf of Honduras (Map: Central America, D 2). It is the best harbor on the north coast of the Republic and is the terminus of a railroad connecting with the interior. It exports mahogany, cedar, vanilla, and hides. In 1911–12 it ranked as the second port of the Republic. It is the seat of a United States consul. Pop. (est.), 2500.

PUERTO DE SANTA MARÍA, dȧ sän'tȧ mȧ-rē'ȧ, commonly known as EL PUERTO. A town of Spain, in the Province of Cadiz, situated on the Bay of Cadiz, at the mouth of the Guadalete, 5 miles northeast of Cadiz (Map: Spain, B 4). The town lies amid pleasant surroundings and is well built, with a fine, large main street. There are several old convents, a well-equipped Jesuit college, a modern theatre, and a large bull ring. A characteristic feature of the town is the *bodegas*, or wine stores—large buildings with thick walls and narrow windows. El Puerto is the principal port for the exportation of sherry wines, since it is the nearest port to Jérez de la Frontera (q.v.), with which it is directly connected by rail. Other industries include the manufacture of brandies, starch, flour, soap, and glass. There are exports of fish. Pop., 1900, 19,373; 1910, 17,984.

PUERTO LA MAR, lȧ mär. A seaport of Chile. See CORIJA.

PUERTO MEXICO. A Mexican seaport. See COATZACOALCOS.

PUERTO MONTT, mônt. The capital of the Province of Llanquihue (q.v.), Chile (Map: Chile, E 6).

PUERTO PLATA, plä'tȧ. A port of the Dominican Republic, situated on the north coast of the island (Map: West Indies, E 3). The town has a well-protected harbor and considerable export trade, chiefly in tobacco. It has steamship communication with the United States and Europe and is connected with the interior by rail. It is the seat of a United States consul. Pop. (est.), 10,000.

PUERTO PRINCESA, prĕn-thā'sȧ. A town in the Province of Paragua, Philippine Islands, situated on the east coast of the island of Palawan, 80 miles southwest of Taytay (Map: Philippine Islands, B 6). It was formerly a Spanish penal colony. Pop., 1903, 1208. It was the capital of Paragua Sur while that province existed.

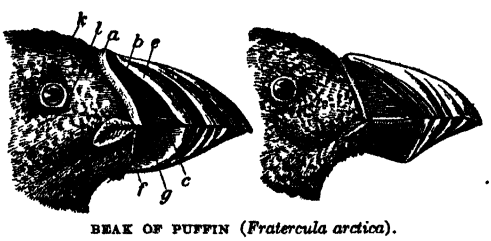
PUERTO PRÍNCIPE, prĕn'thē-pȧ, or CAMAGÜEY. A province of Cuba, occupying the east central portion of the island (Map: Cuba, H 5). Area, 10,500 square miles. It is the largest province of the Republic next to Santiago. The north coast is lined with a chain of large islands, and innumerable islets lie off the south coast. The surface is an undulating plain, with some detached groups of hills in the north part. The most extensive forests of the island are found in this province, and lumbering, copper mining, and cattle raising are the chief industries. Agriculture is here less developed than in the other provinces, and sugar and tobacco plantations are confined chiefly to the district around the capital, Puerto Príncipe (q.v.). The province is by far the most thinly populated in the island. Pop., 1899, 88,234; 1907, 118,269; 1914, 154,647.

PUERTO PRÍNCIPE, or CAMAGÜEY. Capital of the Province of Puerto Príncipe (Camagüey), Cuba (Map: Cuba, H 5). It lies in a broad, sandy, and elevated savanna region, 25 miles from the north and 45 miles from the south coast of the island. It is very antiquated in appearance, with narrow, winding streets and old houses built of brick and stone. It has three plazas, numerous churches, an institute of secondary instruction, and a hospital. The chief industries are connected with cattle raising, for which the surrounding country is well adapted, and cattle products are the chief exports, though some sugar is also produced. The city is connected by rail with its port, Nuevitas, on the north coast, and it is a station on the Cuban main trunk railroad, completed in 1902, which connects it with Havana and Santiago. Pop., 1899, 25,102; 1907, 26,616. Puerto Príncipe was an important military post during the Spanish régime and was surrounded by an extensive system of trenches, stockades, and small forts. The surrounding country was the centre of insurgent operations during the revolution, and only 16 miles north of the city lies Cubitas, the capital of the revolutionary government from 1896 to 1898.

PUERTO REAL, rā-ăl′. A town of southwest Spain, in the Province of Cadiz, situated at the head of the Bay of Cadiz, 5 miles east of the city of that name. It is a well-built modern town, founded in 1488 on the site of the old Roman Portus Gaditanus. It has a harbor with a steamship pier and a dry dock, and manufactures textiles, cements, and salt. Pop., 1900, 9683; 1910, 8360.

PUERTO RICO, rē′kō. See PORTO RICO.

PUFENDORF, pụf′en-dōrf, SAMUEL, BARON (1632–94). A German publicist, born at Chemnitz in Saxony. He began the study of theology at Leipzig, but speedily turned to the subject of public law, which he pursued at Jena till 1657. In 1658 he became tutor in the family of Petrus Coyet, Swedish Minister at Copenhagen, and in 1660 went with his patron to The Hague, where he published his *Elementa Jurisprudentiæ Universalis* (1660). This led to his being summoned to the University of Heidelberg, where the first chair of the law of nature and of nations was created for him. In 1667 he published, under the pseudonym of Severinus de Mozambano, *De Statu Imperii Germanici*, a merciless analysis of the anachronisms and absurdities of the Imperial constitution. This work aroused great attention and brought the author much fame and many enemies. In 1670 Pufendorf followed a call to the Swedish University of Lund. There he wrote the valuable *De Jure Naturæ et Gentium* (1672) and *De Officio Hominis et Civis* (1673). In 1677 he became Councilor of State and royal historiographer to the King of Sweden. There followed a number of important works: *Einleitung zur Historie der vornehmsten Reiche und Staaten* (1682); *De Rebus Suecicis* (1686); *De Rebus a Carolo Gustavo Gestis* (1688). In *De Habitu Christianæ Religionis ad Vitam Civilem* (1687) he upheld the right of the state as against the church. He went to Berlin in 1686, summoned by the Great Elector of Brandenburg, and after the latter's death in 1688 was made by his successor Privy Councilor. He died in Berlin Oct. 26, 1694. The *De Rebus Gestis Friderici Wilhelmi Magni* and *De Rebus Gestis Friderici III* appeared the year after his death. Consult H. von Treitschke, "Samuel von Pufendorf," in *Preussische Jahrbücher* (Berlin, 1875), and Droysen, "Zur Kritik Pufendorfs," in *Abhandlungen zur neueren Geschichte* (ib., 1876).



PUFF ADDER. An African viper (*Bitis*, or *Clotho, arietans*), which takes its name from its habit of lifting its head when approached and menacing the enemy by hissing loudly with a puffing sound. It is a typical viper, but has an unusually broad, triangular head, due to the excessive size of its poison sacs, and its bite is very dangerous. It attains a length of 4 to 5 feet and is often as thick as a man's arm. Its color is yellowish brown, checkered with reddish brown and white, making it very difficult to see as it lies on the ground. Its movements are generally slow and its habits are those of vipers generally. It is found all over Africa except along the Mediterranean coast. Consult C. C. Hopley, *Snakes* (London, 1882), and especially F. W. FitzSimons, *The Snakes of South Africa* (Cape Town, 1912). See Colored Plate of FOREIGN VENOMOUS SERPENTS under SNAKE.

PUFFBALLS. The common name of a species of *Lycoperdon*, referring to the characteristic globular spore-producing bodies, which sometimes reach 20 inches in diameter. These bodies arise from an extensively branching mycelium (q.v.), and when young are white and fleshy within, in this condition being included among the edible mushrooms. When mature the covering (peridium) becomes dry and parchment-like, and the innumerable minute spores are discharged in clouds through an opening in the apex. See BASIDIOMYCETES; MUSHROOM.

PUFF BIRD. A member of the family Bucconidæ. These take their name from their habit of sitting motionless on a perch for hours at a time with their feathers raised until the bird looks like a puffball. At the first alarm the feathers flatten instantly. See BARBET, and Plate of TROGON, HOOPOE, ETC.

PUFFER. See GLOBEFISH, and Plate of PLECTOGNATH FISHES.

PUFFIN (so called from its puffed-out beak). An auk of the genus *Fratercula*, characterized by the high, compressed form of the beak. The best known is the common one (*Fratercula arctica*) of the Arctic and north temperate regions generally, which migrates southward in winter as far as Spain and Long Island. It is a little larger than a pigeon; the forehead,

BEAK OF PUFFIN (*Fratercula arctica*).

The left-hand figure shows the appearance of the beak of the male in the breeding season, at the close of which all the parts lettered are separately molted. The appearance of the beak in the non-breeding season (winter) is shown in the right-hand figure.

crown, back of the head, a collar round the neck, the back, wings, and tail are black, the other parts of the plumage white. The puffin lays only a single egg in a burrow or some natural hole in a cliff face, where great numbers congregate and behave like auks and guillemots (qq.v.). The eggs and young birds are sought

after by fowlers for food. Other species are found in the Arctic and North Pacific oceans, coming to California in winter. Among the most notable are the crested puffin (*Lunda cirrhata*), which has a long tuft of feathers on each side of the head, and the tufted puffin (*Fratercula corniculata*). This might more suitably be called horned puffin, as each of its upper eyelids bears a slender, upright, acute horn (see Plate of AUKS, ALBATROSS, ETC.), which, however, is only an appendage of the male in the breeding season and drops off at its close, just as the special coatings and appendages of the beak and eyes in some other puffins are acquired in the spring and molted in the fall.

PUG (variant of *puck*, from Ir. *puca*, Welsh *pwca, pwci*, goblin, sprite). A small, smooth, short-nosed house dog, introduced into England probably from Holland, to which country it seems to have come, according to general testimony, from the East Indies. The breed was well established in England by the year 1700, and continued so from the reign of William II to George II. By the first quarter of the nineteenth century pugs had nearly or quite disappeared from Great Britain. The fawn variety was reintroduced from Holland, and now there are two recognized strains—the fawn and the black (the latter brought from China about 1875 by Lady Brassey). An inferior quality has long been bred in Italy and in France, where they were called carlins, after a celebrated Harlequin. The pug is essentially a house dog and a very good one, and for that purpose a smaller dog than the standard allowed in competition (13 to 17 pounds) is the better. The general appearance is that of a large-headed, smooth-coated, black-faced, pug-nosed, bright little dog, compact in form, with well-knit proportions and well-developed muscles. In color he is (in the ordinary variety) fawn all over, except on the muzzle or mask, the ears, the moles on his cheeks, the thumb mark or diamond on his forehead, and his back trace, which should all be as black as possible. His face is deeply wrinkled, and he carries his tail curled as tightly as possible over his hips. His coat must be short, smooth, soft, and glossy, neither hard nor woolly.

The black pug differs only in color; he is entirely black.

PUGAREE. See PUGREE.

PUGATCHEV, pōō'gȧ-chĕf', EMELYAN IVANOVITCH (c.1726–75). A leader of a great popular uprising in Russia, known as Pugatchevshtchina. He was a Cossack of the Don and fought against the Prussians in the Seven Years' War and in the campaign against Turkey in 1769. On his return he was arrested for helping his brother-in-law to escape across the Don. Fearing punishment, he ran away to the Cossacks of the Terek, where he heard persistent rumors that Peter III was still alive. Strikingly resembling the murdered Czar in personal appearance, he pretended to be that sovereign and declared his purpose of reasserting his right to the crown and of dethroning Catharine II. He issued a proclamation in the name of Peter III in 1773, and in the same year the rebellion began. He attached the Raskolniks to his cause and won over several Finnish and Tatar tribes and a large number of the peasantry. After the capture of many fortresses on the Ural and the Don, Orenburg among them, he marched against Moscow, but was sold by some of his companions. After trial he was executed in Moscow. His insurrection, which is said to have cost 100,000 lives, has been described by the poet Pushkin and by Dubrovin.

PUGET, pụ'zhȧ', PIERRE (1622–94). A French sculptor, painter, and architect. He was born at Marseilles, Oct. 31, 1622. At the age of 14 he was apprenticed to a wood carver, employed in the decoration of ships, and at about 18 he went to Florence and to Rome. He became an assistant of Pietro da Cortona (q.v.). From the first Puget was subjected to the powerful influence of the Italian baroque. From 1650 to 1665 he devoted himself principally to painting pictures, some for the churches of Marseilles and other cities of southern France. There is record of 56 pictures by him, 19 of which are still in existence, including three portraits of himself.

His first important works in stone are the famous pair of male caryatids (1657) on the portal of the façade of the hôtel de ville at Toulon. In 1659 he went to Paris and made three fine figures for the château of Vaudreuil in Normandy. Fouquet engaged him to assist in the decoration of his new château at Vaux-le-Vicomte. In 1660 he went to Genoa and made for Fouquet his celebrated statue "The Gallic Hercules," now in the Louvre. The next seven years in Genoa were the most successful of his entire career. For Francesco Sauli he carved statues of St. Ambrose and St. Sebastian in the church of Santa Maria di Carignano, the former being especially fine. He carved also a statue of the "Conception" in the Albergo de' Poveri (1664), the great altar of the church of the Theatines (finished 1670), and probably assisted J. B. Carlone in painting the dome of this church. After 1668 Puget divided his time between Marseilles, Toulon, and Genoa. The French government employed him in the decoration of ships. In Marseilles Puget helped to reconstruct the old city. His reputation rests chiefly upon two powerful works executed during this period—the statue of Milo of Crotona and the great bas-relief of Alexander and Diogenes, both in the Louvre.

Consult the biographies by Léon Lagrange (Paris, 1868), Charles Ginoux (ib., 1894), and Philippe Auquier (ib., 1903). For his decorative work, consult Auquier, *Pierre Puget, décorateur naval et mariniste* (ib., n. d.).

PUGET (pū'jĕt) **SOUND.** A large, irregular, and many-branched inlet extending into the northwestern part of the State of Washington from the head of the Strait of Juan de Fuca (Map: Washington, C 3). From the south end of Whidbey Island, at its mouth, it extends southward for about 35 miles and then southwestward for about 30 miles. This main arm (on the east) is called Admiralty Inlet. From the same point another inlet, called Hood Canal, extends southward for 44 miles and then turns abruptly northeastward for 11 miles. The east shore of Admiralty Inlet has few considerable indentations; the principal ones are Elliott Bay, the port of Seattle, and Commencement Bay, the port of Tacoma. On the west shore is Port Orchard (opposite Seattle), which is the site of the Puget Sound Navy Yard. The south extremity expands into a maze of inlets and passages, the southernmost of which, Budd Inlet, is the approach to Olympia (q.v.). Port Townsend is at the west entrance to the

sound. The shores of Hood Canal are abrupt, high, and wooded, and afford some very picturesque scenery. Throughout the sound the water generally is deep, and in places exceedingly so, while the tides are erratic and complex. Consult E. S. Meany, *Vancouver's Discovery of Puget Sound* (New York, 1915).

PUGET SOUND, COLLEGE OF. An institution for higher education at Tacoma, Wash., founded in 1903 as the University of Puget Sound. In 1914 it was given its present title, and it was reorganized to harmonize with the name. There is a college grade, with an affiliated college preparatory. There is also offered an advanced normal-school course, which is accredited by the State Board of Education. The total enrollment in 1914–15 was about 400. The faculty in the college and preparatory school numbered 22. The total valuation of the grounds and equipment in 1915 was $139,842, and the yearly income was about $40,000. During 1915 a campaign for raising $250,000 for an endowment was in progress. The library contains about 7000 volumes. The president in 1915 was Edward H. Todd.

PU'GILISM. See BOXING.

PUGIN, pū'jin, AUGUSTUS (1762–1832). An English architect and writer on architecture. He was born in Normandy, but during the French Revolution went to London, where he was educated at the Royal Academy. He is known chiefly by his works on mediæval architecture. He published: *Microcosm of London* (1808; reissue, 3 vols., 1904), with T. Rowlandson; *Specimens of Gothic Architecture* (1821–23); *Architectural Illustrations of the Buildings of London* (1825), with John Britton; *Examples of Gothic Architecture* and *Gothic Ornaments* (1831). In *Specimens of the Architectural Antiquities of Normandy* (1827), his best work, as also in his *Gothic Ornaments*, he was assisted by his son, A. W. N. Pugin.

PUGIN, AUGUSTUS WELBY NORTHMORE (1812–52). An English architect and designer, born in London. He was a pupil of his father, Augustus Pugin. After he became a Roman Catholic, A. W. N. Pugin designed a large number of buildings for his church in England, including the Roman Catholic cathedral, London. He is probably the most important of the architects connected with the revival of Gothic architecture in England during the nineteenth century, which he promoted as much by his books as by his buildings. Among his writings are: *Contrasts: A Parallel between the Noble Edifices of the Fourteenth and Fifteenth Centuries and the Present Day* (1836); *True Principles of Pointed or Christian Architecture* (1841); *Apology for the Revival of Ecclesiastical Architecture in England* (1843). His son, EDWIN WELBY PUGIN (1834–75), completed a number of his father's designs and buildings.

PUGLIA, pōō'lyà, LA. The modern Italian form of the name of Apulia (q.v.), Italy.

PUG MILL. See CLAY.

PUGNO, pu'nyō', RAOUL (1852–1914). A French pianist, born at Montrouge, near Paris. He received the rudiments of his musical education from his father, a music teacher. At the age of six Raoul competed with a large class of boys for entrance into the Paris Conservatory and headed the list of successful competitors. He graduated, taking the first prize, and also first prize in harmony, in the counterpoint and fugue class of Ambroise Thomas. In 1896 he was appointed professor of piano at the Conservatory, and in 1897–98 he toured the United States with Ysaye (q.v.), showing himself an ensemble player of the first rank. His subsequent tours, when he appeared as soloist with orchestra and in recitals, proved that he was among the greatest masters of his instrument. His compositions include an oratorio, *La résurrection de Lazare* (1879); the comic operas *Ninetta* (1882) and *Le Sosie* (1887); *Le retour d'Ulisse* (1889); operetta, *La petite Poucette* (1891); and many pianoforte pieces, vocal music, and chamber music.

PUGREE, pŭg'rē, or **PUG'AREE** (Hind. *pagri*, turban). A long, light-weight, silk or muslin cloth wound round the headgear, or helmet, in tropical countries. As its origin indicates it was first used by British soldiers serving in India, but is now part of the clothing equipment of all British soldiers serving abroad, and likewise of soldiers of other nationalities serving in tropical climates.

PUINAVIAN, pwē-nā'vi-an. The language of the tribe of Puinavis who live on the Inirida River, an affluent of the Guaviare River in Colombia, South America. The language appears to be without affinities. A vocabulary of 53 words collected by Crivaux and one by Montolieu of 60 words will be found in *American Anthropologist*, vol. viii (Washington, 1895). Consult also D. G. Brinton, *The American Race* (New York, 1891).

PUISET, pwē-zā', or **PUDSEY,** HUGH DE (c.1125–95). An English Bishop of Durham and Earl of Northumberland, born in France, a nephew of King Stephen. He came to England in his teens, became archdeacon to his uncle, Henry of Blois, and in 1143, being appointed treasurer of York, entered his long career in the ecclesiastical politics of the North. In it he was greatly assisted by Adelaide de Percy, long his mistress. In 1153, after a bitter struggle, Hugh became Bishop of Durham; but in temporal politics he took little part until 1174, when he attempted to join the rebellion against Henry II. With the accession of Richard I he came into new prominence because of his opposition to the King's nomination of Geoffrey for the archiepiscopate of York and because of his purchase of the earldom of Northumberland. With Longchamps he had a long quarrel as to who should be chief justiciar and was finally worsted. Gradually he fell out with Richard also, and in 1194 found it good policy to surrender his earldom. Puiset died on his way to negotiate with the King for his lost offices. It was under his orders that the *Boldon Buke*, or Durham Domesday Book, edited by Greenwell (1832), was drawn up.

PUISEUX, pu'ē-zē', PIERRE HENRI (1855–1912). A French astronomer, born in Paris. He attended the Ecole Normale Supérieure and became a doctor of science in 1879, offering a remarkable thesis on *L'Accélération séculaire du mouvement de la lune*. Afterward he lectured at the Sorbonne and was appointed professor in the Faculty of Sciences. From 1907 to the time of his death he was in charge, at the Paris Observatory, of charting the sky. He wrote the standard *Cours de Cinématique*, and the important treatise, *La terre et la lune*. With Loewy he collaborated on *L'Atlas photographique de la lune*.

PUISNE (pū'nē) **JUDGES** (OF. *puisne*, Fr. *puîne*, junior, from ML. *posinatus*, later-born,

from Lat. *post*, after + *natus*, born, p.p. of *nasci*, to be born). Associate judges of the King's Bench Division of the High Court of Justice of England and other divisions of the High Court in Great Britain and associate judges in India and other British colonies. The term "puisne" was first employed, on the permanent establishment of the Court of Common Pleas at Westminster, to designate the associate judges as distinguished from the Chief Justice, who presided over the court. Later the term was applied to the associate justices of the other courts, as the "puisne judges of Queen's Bench Division" and "puisne Barons of Exchequer." At present in England the Lord Chief Justice presides over the King's Bench Division, and serving with him are 14 puisne judges. In India puisne judges preside in the courts of various cities and districts. See COURT.

PUJO, pū'zhō', ARSÈNE PAULIN (1861–). An American legislator, born at Lake Charles, La. He studied law privately, was admitted to the bar in 1886, and entered politics as a Democrat, serving as a member of the Louisiana Constitutional Convention in 1898. Elected to the National House of Representatives in 1902, he served therein continuously until 1913. In Congress probably his most important activity was in connection with the Committee on Banking and Currency, of which he was chairman from 1911 to 1913. This committee was empowered to make an investigation of the banking and financial systems of the country, the inquiry being known as the Pujo or Money Trust investigation. The results of its efforts had important effects upon the Glass-Owen Currency Act and the Clayton Anti-Trust Law. Although much criticized as being partisan and political in nature, the report in 1913 pointed out the evils of interlocking directorates and the fact of the increasing concentration of the control of money in the hands of a few men. In 1912 Pujo was unsuccessful as a candidate for the Democratic nomination for Senator from Louisiana.

PUKET, pōō'kĕt', or TONKA. A Siamese port on Salang or Junkseylon Island, off the west coast of the Malay Peninsula (Map: Siam, C 5). It is noted principally for its tin mines, the annual production being estimated at more than 3500 tons. Pop., about 20,000.

PUKHTU, pųk-tōō'. See AFGHAN.

PULANGUI, pų-läng'gē, or RÍO GRANDE DE MINDANAO. The largest river of the Philippine Archipelago. It rises near the north coast of Mindanao and flows southward as far as Lake Liguasan, whence it turns northwest and empties into the Bay of Illana at Cotabato (Map: Philippine Islands, E 7). It is over 200 miles long, navigable 70 miles for vessels drawing 3½ feet.

PULASKI, pū-läs'kī. A town and the county seat of Giles Co., Tenn., 78 miles by rail south by west of Nashville, on the Louisville and Nashville Railroad (Map: Tennessee, C 4). It has the Martin Female College and the Massey School for Boys. Pulaski is situated in a productive agricultural and stock-raising district and has important lumber, trucking, poultry, and egg interests. Pop., 1900, 2838; 1910, 2928.

PULASKI, pū-läs'kī. A town and the county seat of Pulaski Co., Va., 59 miles west of Roanoke, on the Norfolk and Western Railroad (Map: Virginia, D 4). The town is an attractive mountain resort and has a fine high-school building. The chief business is the smelting of zinc and iron ores from the surrounding region. There are several zinc furnaces, iron furnaces, and a large sulphuric acid plant. Pop., 1900, 2813; 1910, 4807.

PULASKI, pōō-läs'kē (Pol. *Pulawski*, pōō-läv'skē), CASIMIR (1748–79). A Polish soldier in the American Revolution. He was born in Podolia, Poland, the son of Count Joseph Pulawski. Casimir joined enthusiastically in the movement to liberate his country and fought heroically in the unequal struggle against the Russians, rising to the rank of commander in chief of the patriot forces. He was accused unjustly of complicity in the plot to abduct King Stanislas Poniatowski from Warsaw (1771), was outlawed and deprived of his estates. Escaping to Turkey, he passed thence to France, where he was induced by Franklin and the French ministry to assist the Americans against England. He arrived in Philadelphia in 1777, served first as a volunteer, and then, for his gallantry at the battle of Brandywine, was appointed chief of dragoons with the rank of brigadier general. In 1778, with the sanction of Congress, he organized an independent corps of cavalry and light infantry. With this body, called Pulaski's Legion, he was ordered to South Carolina. He reached Charleston on May 9, 1779, and soon afterward led an unsuccessful sortie against the British, under Prevost, before the city. Later in the same year he commanded the French and American cavalry at the siege of Savannah and during the attack of October 9 was mortally wounded. Consult Jared Sparks, "Life of Count Pulaski," in *American Biography*, vol. iv (new ed., New York, 1902); M. I. J. Griffin, *General Count Casimir Pulaski* (Philadelphia, 1910).

PULCHERIA, pūl-kē'rī-ȧ, SAINT (c.399–453). A Byzantine empress, the oldest daughter of the Emperor Arcadius. In 414 she became coruler with her brother, Theodosius, who was content to leave the management of affairs in her hands. She governed wisely, was active in condemning the Nestorian and Eutychian heresies, and promoted virtue and piety. About 446 she withdrew from the court, but after the death of Theodosius (450) she resumed the direction of the government. Early in life she took a vow of virginity, but now, having been absolved from her vow for state reasons, she married the general Marcian. Her feast is September 10 in the Latin church, but August 7 in some of the Oriental calendars. Consult A. Güldenpennig, *Geschichte des oströmischen Reichs unter Arkadius* (Halle, 1885).

PULCI, pųl'chē, LUCA (1431–70). An Italian poet, elder brother of Luigi Pulci. He wrote the *Pistole*, love letters in tercets; the *Driadeo d'amore*, a mythological poem in octaves, its material an Ovidian fable, and began the *Ciriffo Calvaneo*, a chivalrous poem in octaves, which was continued by Luigi. Consult the *Pistole* in the edition of Florence, 1481; the *Driadeo* in Torraca's *Poemetti mitologici* (Leghorn, 1888); the *Ciriffo* in the edition of Florence, 1834.

PULCI, LUIGI (1432–84). An Italian poet, born at Florence of a family once wealthy and noted in the fifteenth century for its literary attainments. Both Cosimo and Piero de' Medici were his patrons and friends, and he was on

terms of intimacy with Lorenzo the Magnificent. Pulci's chief work is the romantic, chivalrous poem called by him the Morgante when he published 23 cantos of it at Venice in 1482 and known as the *Morgante maggiore* since the appearance of the second and complete edition of it at Florence in 1483 (28 cantos). The great value of the *Morgante* consists in the fact that it was the first artistic treatment in Italian of the chivalrous stories of Charlemagne and his peers so long before imported from France. It takes its name from the giant Morgante, who is converted to Christianity and accompanies Orlando (Roland) on some of his expeditions. The first canto of his poem was translated into English octaves by Byron. Pulci's other poetical works comprise the *Confessions*, which has somewhat the air of a parody on the Scriptures; the *Beca di Dicomano*, a burlesque imitation of the *Nencia da Barberino* of Lorenzo the Magnificent; his revision of the *Ciriffo Calvaneo* of his brother Luca, and the *Giostra* ascribed to Lorenzo de' Medici; some *Strambotti*, some satirical and jocose sonnets, and other shorter lyrics. In prose he wrote the *Lettere a Lorenzo il Magnifico* (Lucca, 1886) and a novel. There are several editions of the *Morgante*, one of 1900–04 edited by Volpi (Florence); the *Confessione*, the *Beca*, and the sonnets may be found in the editions of Lucca, 1759. Consult Volpi, "Luigi Pulci, studio biografico," in the *Giornale storico della letteratura italiana*, vol. xxii (Turin, 1893), and the *Life* prefacing Bongi's edition of the *Lettere* (Lucca, 1886); F. Foffano, *Il Morgante di L. Pulci* (Turin, 1891).

PULILAN, pụ-lē'län. A town of Luzon, Philippines, in the Province of Bulacán, situated 5 miles north of Malolos. Pop., 1903, 9665.

PU'LITZER, JOSEPH (1847–1911). An American journalist, born in Budapest, Hungary, April 10, 1847. His father was a Jew and his mother a Roman Catholic. In his boyhood he had only such education as could be gained within a short period from a private tutor. At 17 he emigrated to the United States, where in the same year (1864) he enlisted in the First New York Cavalry to serve in the Civil War. At the close of the war, unable to get work in New York, he managed to reach St. Louis. Here he became successful as a reporter on Carl Schurz's *Westliche Post*, a German Republican paper. Of this he later (1871) became managing editor and part owner. He also studied law and was admitted to the Missouri bar. In 1869 he had been elected to the State Legislature, and he was a member of the Missouri Constitutional Convention of 1874. In national politics Pulitzer gained a name when as a delegate to the Liberal Republican convention in 1872 he vigorously supported the nomination of Horace Greeley for the presidency. But later he allied himself definitely with the Democratic party, and as a consequence severed his connection with the *Westliche Post*. In 1876–77 he was in Washington as correspondent of the New York *Sun*, Charles A. Dana having selected him to report the proceedings of the Electoral Commission, and soon afterward he went to Europe as a special correspondent of the same paper. In 1879 he bought the St. Louis *Evening Dispatch* and *Evening Post*, combined them as the *Post-Dispatch*, and built up a flourishing plant. But although he continued to control this paper, Pulitzer's great work was in the development of the New York *World*, which he acquired from Jay Gould in 1883. From then until the presidential election of 1884 he championed Grover Cleveland's candidacy, proving himself an important factor in the Democratic success. In 1884 he was elected to Congress, but he resigned after three months. The *World* under his direction struck out on pioneer lines of appeal to popular taste. Crisply and ably written news columns, straightforward, purposeful, and unacademic editorials, and a frank policy of featuring, for the sake of "human interest," stories of a sensational character, built up a circulation that had no rival until the advent of the Hearst papers. Although a man of extraordinary energy, Pulitzer broke down in 1887 from overwork. And even after this, an invalid, blind, and absent on long cruises in his steam yacht, he exercised a minute supervision over all the affairs of the *World*. In 1903 he announced that he would bequeath to Columbia University $1,000,000 to build and endow a school of journalism and would provide that an additional million be turned over if after a specified period the school was in successful operation. Classes were instituted in 1912, and the building was finished in 1913, Mr. Pulitzer having died Oct. 29, 1911. To the Philharmonic Orchestra of New York he left $500,000. His estate was appraised at more than $20,000,000. Ralph Pulitzer succeeded his father as owner of the *World*. Consult J. L. Heaton, *The Story of a Page* (New York, 1913); also Alleyne Ireland, *Joseph Pulitzer* (ib., 1914).

PULKOVA, pụl'kô-vȧ. A village in the Government of Saint Petersburg, Russia, situated on a high ridge, about 10 miles southwest of the capital. It is noted as the site of the principal observatory of Russia.

PULLET. One of the many provincial names for the British edible clam (*Mya truncata*). See CLAM, and accompanying Colored Plate.

PULLEY (OF., Fr. *poulie*, probably from LGer. *pullen*, AS. *pullian*, Eng. *pull*). A circular wheel turning on a smooth axle through its centre and with a groove cut in its rim so that a cord can run around it. A fixed pulley is one whose axle is fixed to some support, while a free pulley is not stationary, but is carried in the bight of the cord passing over it. A fixed pulley simply changes the direction of the force

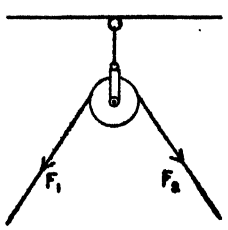


FIG. 1.

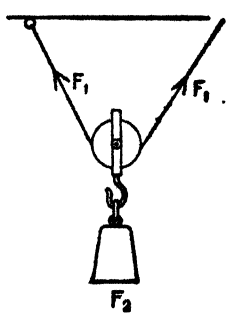

FIG. 2.

which the cord exerts. If in Fig. 1 F_1 and F_2 are two forces acting on a cord passing over a pulley, they will be equal if the system is in equilibrium.

If a free pulley carrying a weight is supported by a cord, as shown in Fig. 2, there are three forces acting on the pulley, a force F_2 vertically

down, equal to the weight of the pulley and the weight it carries, and two forces obliquely upward, each equal to F_1, due to the two branches of the cord which passes over the pulley. If the branches of the cord make an angle θ with the vertical, $2F_1\cos\theta$ is the total force acting vertically upward; therefore if there is equilibrium $2F_1\cos\theta = F_2$; and the mechanical advantage, $\frac{F_2}{F_1}$ is $2\cos\theta$. In particular, if, as is usually the case, the two branches of the cord are parallel and vertical, $\theta = 0$ and $2F_1 = F_2$.

Fixed and free pulleys may be combined in many ways, but the principle is evident. If a continuous cord passes over a free compound pulley made up of several independent wheels, in such a manner that there are n supporting branches of the cord, the mechanical advantage is n.

Pulleys are also made in which two toothed wheels of different radii are clamped together, so that as one turns the other must also; and the cord is replaced by a chain whose links fit into the teeth. Such a pulley is called a differential one. If one wheel has in its rim N teeth and the other $N - 1$, the mechanical advantage is $2N$.

The principle of the action of pulleys was first given by Stevinus. See BLOCK; TACKLE.

PULL'MAN. A city in Whitman Co., Wash., 80 miles south of Spokane, on the lines of the Oregon-Washington Railroad and Navigation Company and the Northern Pacific (Map: Washington, H 4). It is the seat of the State College and contains a United States government experiment station. The surrounding country is engaged chiefly in dairying and the growing of live stock and grain. The city has many artesian wells, one of which flows 2400 gallons a minute. Pop., 1900, 1308; 1910, 2602.

PULLMAN, GEORGE MORTIMER (1831–97). An American inventor, born in Chautauqua Co., N. Y. He worked for a time as a cabinetmaker with an elder brother in Albion, N. Y., and in 1853 took a contract for moving buildings that obstructed the widening of the Erie Canal. In 1859 he removed to Chicago, where he did business as a building contractor. In the same year he remodeled two old coaches into sleeping cars, and in 1863 he built the first new sleeping car, "Pioneer," upon the lines of the cars now in use throughout the United States. Of the Pullman Palace Car Company, which he organized in 1867, he was president until his death. He founded (1880) for his employees the model town of Pullman, Ill., and attempted to make the place an ideal home for his men. However, the company insisted on exercising sole control, and at last the residents, dissatisfied with the high rates charged for rent, water, and gas, voted (1889) in favor of annexation to Chicago. The Pullman employees were the ones who precipitated the great American railroad strike of 1894 by their stand for higher wages and shorter hours. In 1887 he invented and put into execution the idea of vestibule trains, and introduced also the dining car on the Union Pacific Railroad.

PULLMAN CARS. See RAILWAYS.

PUL'MONA'TA (Neo-Lat. nom. pl., from Lat. *pulmo,* lung). An order of air-breathing gastropod mollusks having no gills, but the mantle cavity modified into a respiratory sac or lung, with a contractile opening under the margin of the mantle. Those forms which live in the water are obliged to obtain their air supply at the surface. The heart has only one auricle and that usually lies in front of the ventricle. The nerve cords connecting pleural and visceral ganglia are not crossed. The Pulmonata are either land or fresh-water forms, except *Onchidium.* They are all hermaphroditic. The number of known species runs up into the thousands, and though they are found in all temperate regions, they abound especially in certain tropical islands, as Jamaica and the Hawaiian Islands. In America the order is represented by many species of land snails, slugs, and pond snails. Few species reach a large size, and most have rather plainly colored shells. See SNAIL.

PULMOTOR, pŭl'mō'tĕr. A mechanical device for carrying on prolonged artificial respiration and used in cases of gas asphyxiation, drowning, and for the resuscitation of newborn infants and victims of electric shock. Several types of such apparatus are made, notably the pulmotor, the Brat apparatus, the lung motor, and the salvator. In the pulmotor the inspired air is said to contain 60 per cent of oxygen, while in the apparatus of Dr. Brat pure oxygen is used. In the latter device the respiratory changes are made by hand; the pulmotor works by an automatic mechanism. A committee of scientists appointed to study the subject of resuscitation from mine gases finds that the pulmotor is not without its dangers, and is of the opinion that the device has been the subject of systematic exploitation in the United States and is rated far beyond its actual worth. Many cases of resuscitation reported in the lay press were investigated, but the accounts were so indefinite that no conclusions could be drawn from them. In testing the instrument on animals the committee found that the air or oxygen was often pumped into the stomach and that inspiration and expiration were easily interchangeable. They also found that with these machines, expiration is accompanied by a process of suction which is not physiological, and there was a tendency to suck the air out of the alveoli and small bronchi, resulting in their complete collapse. These and other observations indicate that the pulmotor in the hands of the unskilled may prove a lethal rather than a life-saving apparatus. None of these instruments should be used for more than a few minutes at a time, and the intervening periods should be given up to the employment of one of the manual methods of artificial respiration. When the patient is breathing even very slowly his removal to a pure atmosphere is usually sufficient. Consult *Report of the Committee on Resuscitation from Mine Gases,* Technical Paper 77, Bureau of Mines (Washington, 1914). See RESPIRATION, ARTIFICIAL.

PULP INDUSTRY. See LUMBER INDUSTRY.

PULPIT (from Lat. *pulpitum,* platform, rostrum). A piece of church furniture used for the delivery of sermons. In the first Christian ages, when the bishops were practically the only preachers, they delivered their addresses from the episcopal throne at the end of the apse; hence a pulpit is called *chaire* in French to this day. Then the ambo (q.v.) was sometimes used for this purpose, and later the jubé or rood loft between the choir and the nave. By the eleventh or twelfth century small movable pulpits had been introduced, which could be brought out at the time of the sermon; and by degrees the

modern pulpit was evolved. There are some excellent mediæval examples in Italy, among them one at Ravello elaborately decorated with mosaic, two very fine ones by Nicola Pisano at Pisa and Siena, and another by his son Giovanni at Pistoia. Among Renaissance pulpits one of the finest is that by Benedetto da Majano in Santa Croce at Florence. The most ancient pulpits extant in France are supposed to be not earlier than the fifteenth century. The nonliturgical churches usually use a desk set in the middle of a platform facing the audience.

PULQUE, pụl'kȧ (Sp., from Aztec *octli*). A favorite beverage of the Mexicans and of the inhabitants of Central America and some parts of South America. It is made from the juice of different species of agave (q.v.). Consult C. S. Brown, "The National Drink of Mexico," in *Overland Monthly*, N. S., vol. xxxvi (San Francisco, 1900).

PUL'SATIL'LA. See ANEMONE; PASQUE FLOWER.

PULSE (Lat. *pulsus*, a beating, from *pellere*, to drive). The rhythmical expansion of the arteries due to the blood waves caused by successive contractions of the heart. The arteries are elastic tubes and into them is injected at each contraction of the heart ventricles from two to four ounces of blood. As a consequence an already full but contracted artery becomes distended, lengthened, and uplifted, giving rise to the sensation in the examining finger which is called the pulse. The pulse wave due to any given beat of the heart is not perceptible at the same moment in all the arteries of the body. The difference in time is proportioned to the distance of the arteries from the heart and rarely amounts to more than one-eighth or one-sixth of a second. The pulse is usually felt at the radial or thumb side of the wrist, the artery being near the surface at this point and easily compressed against the bone. It may, however, be perceived in many other situations.

The pulse rate varies greatly in health according to age, sex, temperament, exercise or rest, emotional states, temperature, time of day, posture, atmospheric pressure, and personal idiosyncrasy. Before birth the average number of pulsations each minute is 150; in the newly born, from 140 to 130; during the first year of life, 130 to 115; during the second year, 115 to 100; about the seventh year, 90 to 85; about the fourteenth year 85 to 80; in adult life, 80 to 70; in old age, 70 to 60; in decrepitude, 75 to 65. In the female and in persons of a sanguine temperament the pulse rate is more rapid by several beats in the minute than in males and individuals of a phlegmatic type. The rate is also higher after a meal and during exercise. The pulse is more rapid in the evening than in the morning and in the standing than in the sitting or recumbent posture; high temperatures also accelerate it. During sleep the pulse is usually slower than in the waking state. Forty is not an uncommon rate, and instances have been known in which the pulsations were only 30 or more rarely 20 to the minute.

In disease the pulse presents wide variations in rate, regularity, volume, and tension, and is a valuable guide in diagnosis and in estimating the physical condition of the patient, and disturbances of its relation to respiration and temperature are always significant. Excessive slowness of the pulse (bradycardia) occurs in some diseases of the heart, in conditions of collapse, in meningitis, in cerebral tumors, and in jaundice. Bradycardia is also observed in convalescence from acute fevers and is probably an expression of exhaustion. As a physiological phenomenon bradycardia occurs in the puerperal state and in hunger. As a general rule in disease the pulse is more apt to be abnormally fast (tachycardia) than slow. Nearly every disturbance of health tends to quicken the pulse; rapid heart action is the constant accompaniment of acute inflammation, of fever in all forms, and of most heart diseases. When the intervals between successive beats of the heart are not of uniform length, the pulse is said to be irregular. A pulse intermits when a beat is dropped at intervals. In pulsus alterans there is a strong beat followed by a weak one; in pulsus bigeminus the beats occur in twos; in pulsus trigeminus, by threes. Pulsus paradoxus consists in the diminution or total disappearance of the pulse during inspiration, and is a very rare occurrence.

The pulse is said to be full when the volume is greater than usual, and small or contracted under the opposite condition. Fullness may depend on general plethora and on prolonged and forcible contractions of the left ventricle of the heart; a small pulse results from general deficiency of blood, from feeble action of the heart, congestion of the venous system, or exposure to cold. When very small it is termed threadlike.

The tension or hardness of the pulse is estimated by the degree to which it resists compression. A hard pulse can scarcely be stopped by any degree of pressure by the finger. Hardness is favored by a powerfully acting heart, a normal amount of blood, and contraction of the peripheral blood vessels, as e.g., by cold. Softness of the pulse is favored by a feeble heart, by valvular imperfections interfering with the supply of blood to the arterial system, and by a free flow through the capillary area. A hard pulse is usually indicative of inflammation and a soft or compressible pulse of general weakness.

The blood from the veins returns to the heart under normal conditions in a steady stream, the pulse being lost in the capillary area. Some pulsation, however, can often be seen in the larger veins near the heart, the jugular veins, e.g., in many persons with a healthy circulation. The expansion of the vein is synchronous with dilatation of the ventricles, and collapse with contraction. Another kind of pulsation, in which this relation is reversed, takes place when the tricuspid valves guarding the veins become insufficient through disease. A wave of blood is sent back into the venous trunks, producing a visible pulsation. This phenomenon may also be produced by hypertrophy of the right auricle and aneurism of the aorta.

An instrument has been devised by which the variations of the pulse can be indicated upon paper attached to a revolving cylinder. See ARTERY, *Diseases of the Arteries;* BLOOD PRESSURE; HEART, DISEASES OF THE; PULSIMETER.

PULSIM'ETER (Neo-Lat., from Lat. *pulsus*, pulse + Gk. *μῆτρον*, *mētron*, measure). An apparatus used to record the force and rapidity of the pulse beat. Such an instrument for the radial artery is called the sphygmograph, the graphic tracing made being called the sphygmogram. For recording the electrical changes caused by the contraction of the heart muscle an instrument is called the electrocardiograph,

the tracing being designated as the electrogram. See SPHYGMOGRAPH.

PULSOM'ETER. See PUMPS AND PUMPING MACHINERY.

PULSZKY, pụl'skĕ, FRANZ AUBEL (1814–97). A Hungarian politician and author, born in Eperies. He studied law and visited Germany, Italy, France, Russia, and England, where he wrote in German and Hungarian *Aus dem Tagebuche eines in Grossbritanien reisenden Ungarn* (1837). In 1839 he entered the Diet as member from Sáros. In 1848 he became Undersecretary of State in the Hungarian Ministry of Finance and subsequently Minister of Commerce. After Kossuth went to England Pulszky remained with him and accompanied him on his journey through America, described in *White, Red, and Black* (1852), in English. As he had been condemned to death *in contumaciam* by the Austrian government in 1852, he went to Italy, where he joined Garibaldi in his expedition to Calabria in 1862. In 1866 he was pardoned. After his return to Hungary he was elected to the Diet and became director of the National Museum at Pest. His publications include: *Die Jakobiner in Ungarn* (1851), a romance; *Eletem és Korom* (1882), an autobiography; *Die Kupferzeit in Ungarn* (1884).

PULTE, pụl'te, JOSEPH HIPPOLYT (1811–84). An American physician. Born at Meschede, Westphalia, Germany, he emigrated to the United States in 1834 and practiced as a homœopathist in Cherrytown, Pa. In 1844 he removed to Cincinnati, where he lived thenceforth. There, in 1872, he founded with others the Homœopathic Medical College, at which institution he was professor of clinical medicine. He was the author of *Organon der Weltgeschichte* (1844; Eng. ed., 1859); *Homœopathic Domestic Physician* (1850; 50th thousand, 1872); *Woman's Medical Guide* (1853; 4th ed., 1863).

PULTENEY, pŭlt'nĕ, WILLIAM, EARL OF BATH (1684–1764). An English political leader, born in London. He was educated at Westminster School and Christ Church, Oxford, and after traveling on the Continent entered Parliament as a Whig in 1705. On the prosecution of Walpole in 1712 he defended him with great eloquence, and from 1714 to 1717 was his Secretary of State for War. He continued to support Walpole until 1721, when the latter, becoming Premier, failed to include Pulteney in his administration. In 1725, therefore, Pulteney joined the opposition and became the bitter antagonist of his former friend, succeeding by the brilliancy of his speeches in depriving him of his place. Shortly after Walpole's fall in 1742 Pulteney was created Earl of Bath. On the resignation of the Pelham ministry in 1746 he was made Premier, but, unable to form a cabinet, he held the office for only two days and then practically retired from public life. He joined Lord Bolingbroke in establishing the *Craftsman* (1726), a political periodical, and he wrote many political pamphlets and verses, including the popular song *The Honest Jury, or Caleb Triumphant.*

PULTOVA, pụl-tō'vȧ. A government and a city of Russia. See POLTAVA.

PUL'TUSK, pụl'tụsk. A town of Poland, in the Government of Warsaw, situated on the Narev about 34 miles north of Warsaw. It is a well-built town with an ancient castle, the former residence of the bishops of Plotzk. It is noted as the scene of an engagement between the Russians and the French in 1806. Pop., 1910, 18,636.

PULVERIZERS. See GRINDING, CRUSHING, AND PULVERIZING MACHINERY.

PULVI'NUS (Lat., cushion). A term in botany, designating the swollen base of certain petioles which by its differences in turgidity causes the movement of the leaf blade. It is most conspicuous in the pea family, but nowhere so highly specialized or so responsive to stimuli as in the sensitive plant, *Mimosa pudica.* See MIMOSA.

PU'MA (Peruvian name), COUGAR, or MOUNTAIN LION. A large American cat (*Felis concolor*), originally native from the watershed of Hudson Bay to the Straits of Magellan, and still present except in the most civilized parts of the country. It is of slender build, with a rather small head and long limbs, and usually measures about 40 inches from the snout to the root of the tail, which usually is about 26 inches in length and of nearly the same thickness throughout. Unlike the other great American cat, the jaguar (q.v.), which is densely spotted, the adult puma has no spots, except that the lips and the outer rim of the ear are black, there is a patch of white on each side of the muzzle, and the tip of the tail usually is blackish. The upper parts are uniform dull fox red, appearing gray in certain lights, owing to the fact that each hair is fawn gray, red only at the tip; the throat, belly, and inside of the legs are reddish white. This unspotted, tawny coat led the earliest explorers on the Atlantic coast to regard the animal as a lion, and the name survives in the West. The early settlers in the States called it a panther (usually pronounced "painter"). "Cougar" is derived from a Brazilian language, but involves an error. (See COUGAR.) "Puma" was its native name in Peru. Considering that the species is distributed over so great a range of territory, its variations in form and color are surprisingly small.

In the eastern United States it has been greatly dreaded as a fierce and treacherous beast, particularly dangerous because of its alleged habit of springing upon travelers from branches of trees or rocky ledges. In the West, on the other hand, the mountain lion, although more numerous in the Rocky Mountains than the panther ever appears to have been in the East, has always been regarded as a shy and cowardly beast, little to be feared except when cornered. The truth seems to be that this animal has less ferocity than any other of the great cats, and under ordinary circumstances is inclined to avoid rather than to attack men, and often seems to seek their company in a friendly way. This timidity and confidence aided the easy extinction of these animals throughout the eastern part of the country, but they are abundant in the Rocky Mountains and westward, where the ranching industries supply them with abundant food in the young cattle and horses. The principal food of the puma in North America was deer, but it seized any smaller prey which came in its way. In the case of sheep, to which in the southwestern United States it is especially destructive, the puma rarely contents itself with taking a single one, which would satisfy its hunger, but, having once entered a fold or flock, it kills right and left, so that in many cases 100 sheep have been killed out of a flock in one night by a single puma. Their silence when hunting or when

attacked is a notable characteristic; yet on rare occasions on winter nights they make the woods resound with terrifying screams. The young are born in the early spring and are usually two or three in number; and it is believed that under natural conditions most pairs breed only once in two years. The kittens at first are covered with black spots and stripes, and their tails are ringed. These markings disappear at the end of about six months, after which they become of the uniform color of their parents. Full size is not attained before the end of the second year, and during all this time they associate with the mother, while the father of the family seems to lead a solitary existence. Like other cats, their hunting is entirely at night.

True, "The Puma," an illustrated monograph with full bibliography, in *Annual Report Smithsonian Institution* (Washington, 1889); C. H. Merriam, *Vertebrates of the Adirondacks* (New York, 1893); J. H. Porter, *Wild Beasts* (ib., 1894); Baillie-Grohman, *Fifteen Years . . . in the Hunting Grounds of Western America* (London, 1900); W. H. Hudson, *The Naturalist in La Plata* (4th ed., 1903). See Colored Plate of CAT FAMILY, accompanying article LION; HUNTING BIG GAME.

PUM'ICE (from Lat. *pumex;* probably connected with *spuma,* foam). An effusive igneous rock, having a spongy or frothy texture and composed largely or entirely of glass. It is frequently made up of parallel fibres or threads with intervening spaces to form a delicate structure. It is produced by the expansion of the occluded moisture of lavas when they reach the surface of the earth, and is most abundantly developed in lavas of rhyolitic composition (see RHYOLITE), since these are usually very viscous. It may, however, be exceptionally produced in connection with any effusive rock, and is hence classified in respect to its chemical composition into rhyolite pumice, trachyte pumice, and the like. Most of the commercial product is derived from the Lipari Islands. See ABRASIVES.

PUMP. See PUMPS AND PUMPING MACHINERY.

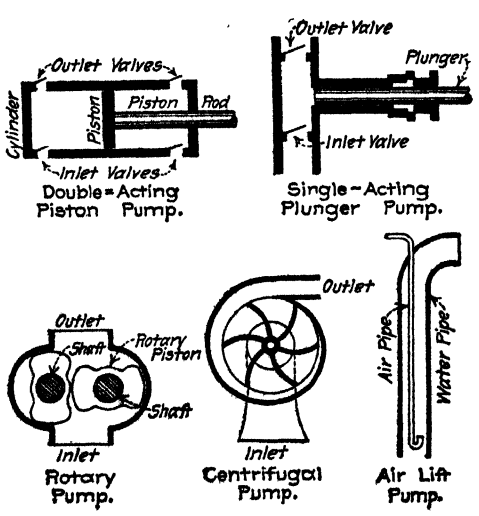
PUMPEL'LY, RAPHAEL (1837–). An American geologist, born in Owego, N. Y., and educated in Hanover, Germany, and in the mining schools of Paris and Freiburg, from 1854 to 1860. After explorations in Corsica and in Arizona he received in 1861 a commission from the Japanese government to explore the mineral wealth of the island of Yezo. In February, 1863, under pressure of the antiforeign party, the Shogun dismissed the foreign employees who were "spying out the land." Pumpelly then went to China and in behalf of the government made journeys through the central and northern provinces and into the desert of Gobi in order to report upon the coal supply. In 1864 he spent a short time in Nagasaki, Japan, and then returned to Europe by way of Siberia. The Smithsonian Institution published a volume recording his geological researches in China, Mongolia, and Japan, and this was supplemented by a popular narrative of his travels and adventures entitled *Across America and Asia* (1870). After his return to the United States Pumpelly was professor of mining in Harvard University (1866–73). He was the State geologist of Michigan (1869–71) and then of Missouri (1871–73), and in 1879–81 he served with the United States Geological Survey. In 1879–80 he conducted at Newport, R. I., an investigation for the National Board of Health on the filtering ability of various soils. In 1881–84 he organized and directed the northern transcontinental survey. In 1903 he explored the Transcaspian country under the auspices of the Carnegie Institution of Washington. In 1905 he was elected a member of the National Academy of Sciences and in the same year served as president of the Geological Society of America. His publications include: *Geological Researches in China, Mongolia, and Japan,* published by the Smithsonian Institution (1866); *Across America and Asia* (1870); *Iron Ores and Coal Fields in Missouri* (1873); *Geology of the Copper District of Michigan* (1875); "The Mining Industries of the United States," in vol. xv of the *United States Census Report* (1886); *Geology of the Green Mountains* (1894); *Explorations in Central Asia* (1905); *Prehistoric Civilization of Anan* (1908).

PUMP'KIN (variant of *pumpion,* from OF. *pompom,* variant of *pepon,* from Lat. *pepo,* from Gk. *πέπων, pepōn,* kind of melon, ripe; connected with Skt. *pakva,* ripe, from *pac,* to cook; influenced by popular etymology with the Eng. diminutive termination *-kin*). The common name of several annual, vinelike, tendril-bearing herbs of the genus *Cucurbita,* family Cucurbitaceæ, natives of warm countries, cultivated for their fruits. The common field pumpkin (*Cucurbita pepo*) is a coarse running rough-leaved vine, often exceeding 20 feet in length. The fruit is gourdlike, oblong with flattened ends, yellow when ripe, and normally weighing from 15 to 40 pounds. The edible portion consists of a fleshy layer an inch or more thick beneath the rind. In America the pumpkin is extensively planted in cornfields in occasional hills of corn. In its raw state the fruit is used as a cattle food and, after having its hard outer rind and seeds removed, for making pies. The methods of cultivation are the same as for squash (q.v.). See Plate of CUCUMBER ALLIES.

PUMPKIN INSECTS. See SQUASH INSECTS.

PUMPKIN SEED. The common sunfish (q.v.). See Plate of DARTERS AND SUNFISH.

PUMPS AND PUMPING. See MINING.



PUMPS AND PUMPING MACHINERY (OF., Fr. *pompe,* Ger. *Pumpe, Plumpe, Plumpfe;* possibly, though very doubtfully, connected with Lat. *plumbum,* lead). Devices used to move liquids and gases. The various kinds of pumps, without regard to their motive power, may be broadly classified as follows: (1) bucket lifts, or water elevators, by means of which a balanced pole, or sweep, a windlass, or a wheel lowers, raises, and empties one or more buckets or other receptacles; (2) displacement pumps acting on the principle that two bodies cannot occupy the same space at the same time; (3) impellers, which by their own continuous motion in the water to be moved impart some of their velocity to water with which they come in contact; (4) impulse pumps, which employ the force of a suddenly arrested large column of water to lift a smaller column to a greater elevation than the original source (see HYDRAULIC RAM); (5) injectors and ejectors, in which condensed steam traveling at high velocity sweeps along water brought in contact with it.

Most gas and air pumps are displacement and impeller machines, though a few aspirators,

working like ejectors, are seen. These notes refer particularly to hydraulic machinery.

Bucket Lifts, or Water Elevators. These are the simplest of the four classes of pumps named. They have been used from the remotest historical times and are still employed in varying forms the world over. The well sweep, or bucket and balanced pole, still frequently seen in certain rural sections of America, is much the same as the shadoof of Egypt and the picotah of India. The single bucket or, in Oriental countries, the earthen pot attached to a rope wound around a windlass is another very common water lift. A series of buckets mounted on an endless rope or chain, dipping into the water below and running over and driven by a wheel above, is an improvement over either of the foregoing, giving a continuous stream of water. Primitive multiple bucket or pot lifts of this general character, driven by animal power acting through a rude combination of wheels and horizontal sweeps, are sometimes known as Persian wheels. Modern refinements of this device are called chain pumps. Norias are ancient wheels (1000 B.C., in China) with buckets attached, each in a plane with the axle but inclined towards the inner end. Sometimes the wheel carrying the buckets is placed in and driven by a running stream. Another form of water lift is the scoop wheel, composed of a series of curved blades, terminating in a hollow axle, into which they discharge the water scooped up by the revolution of the wheel. Where similarly arranged spiral tubes take the place of the blades the device is called a tympanum. Of the various water lifts described the bucket and chain pumps are most extensively used, particularly where manual labor is costly.

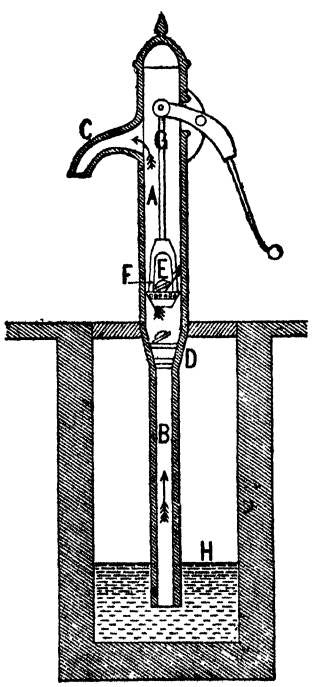
Displacement Pumps. Commonly these employ a piston, fitting in a cylinder, forcing the water ahead of it, or a plunger not fitting the cylinder and merely displacing some of the

PUMPING MACHINERY—TYPES OF PUMPS.

contents. Instead of a piston steam or air may be used to effect the displacement. Valves are essential to prevent back pressure or flow on the return stroke or when idle. In the simplest form valves are pieces of leather or rubber cut to the desired shape and hinged at one edge or side; they lift for the passage of the water upward and close on the reverse stroke. In most large pumps, for strength of design, many small valves are employed instead of one of sufficient size to accommodate the whole flow of water. The majority of such valves consist of an inlet, valve seat, disk, or valve proper, stem, cover plate, and spring, although the spring may be omitted. The disks are commonly made of vulcanized India rubber and the other parts of bronze. Ball and cone valves are also used, particularly on deep well pumps. Valve stems control the lift of the valves and prevent displacement from their seats, while the springs are designed to take up slack. The Reidler valve, used on some of the highest grades of large reciprocating pumps, is closed mechanically instead of by the force of the liquid being pumped, and therefore has a positive and comparatively gentle motion.

Displacement pumps are subdivided into many classes, of which the following are the most important: *Reciprocating pumps* have either pistons or plungers which move alternately back and forth or up and down, always in a straight line. Such pumps are single or double acting, according to whether the water is displaced on one or both parts of the stroke. Pumps are known as simple, duplex, triplex, etc., according as one, two, or more pistons or plungers are driven by a motive-power unit. They are also known as direct-acting when the motive power is applied in a direct line with the movement of the piston or plunger, and as of the crank-and-flywheel type or of the beam type when either of these devices is employed to transmit the motion. The beam is similar to the walking beam of some steamboats and is an essential feature of the old Cornish beam engine. See STEAM ENGINE.

Crank-and-flywheel pumps are quite extensively used, particularly for high duties and for power pumps. Direct-acting pumps are very common. While large numbers of simple pumps are in use, duplex and triple, but more particularly duplex, are the rule, except for small sizes and special purposes. Triplex pumps with a single shaft geared to a motor or turbine are in common use for hydraulic-press work for pressures as high as 5000 pounds per square inch or more. *Rotary pumps* have revolving instead of reciprocating pistons. In a very common form two pistons revolve on parallel axes. Their longitudinal surfaces are formed into a series of curves, so that they mesh closely on the inside as they revolve, while their outer parts fit tightly against a curved pump chamber. *Chain piston pumps* are a simple type, consisting of a series of pistons mounted on an endless chain. Both pistons and chain pass upward through a vertical cylinder, forcing water ahead of them, then descending again to repeat the process.



The pulsometer is a most useful automatic apparatus in which the pump and motive power are combined. The displacement is effected by means of steam acting in two pear-shaped chambers connected at the top to a steam inlet and at the bottom to water inlet and discharge chambers. On admitting steam into one of these the water is forced out gradually until the chamber is empty, when the steam is turned into the other chamber. The first refills with water as the trapped steam condenses, and these actions are repeated in alternate chambers. Such pumps are very largely used by contract-

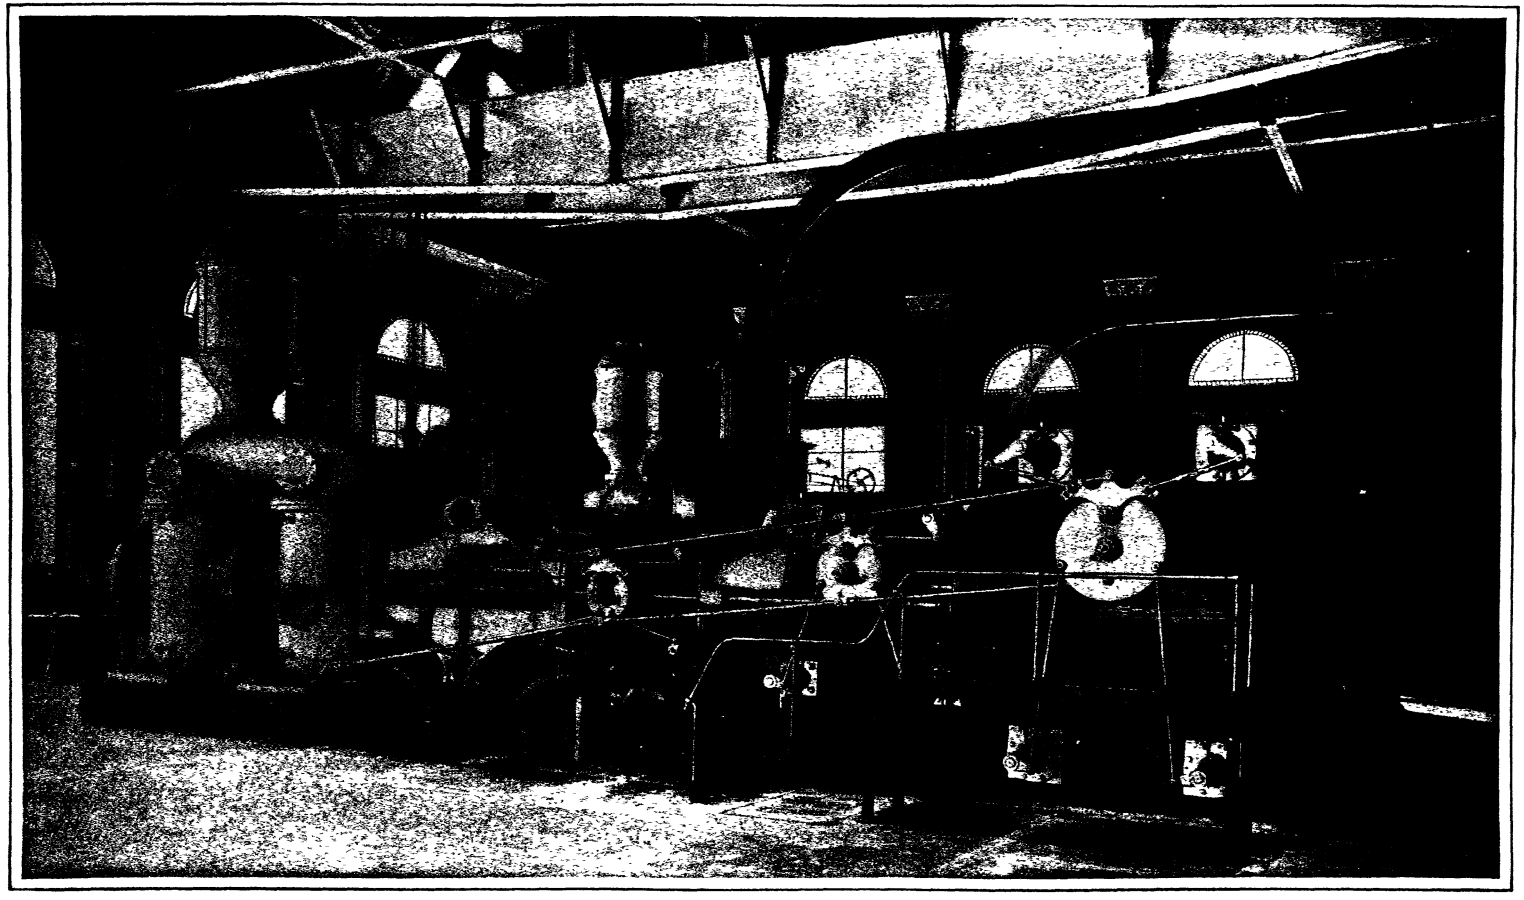
ors for pumping ditch water, on account of their rugged construction.

The work done by a pump, when the pump is placed above the level of the water to be raised and at the same time below its final elevation, is frequently classified as suction lift for the first part and force lift for raising the water above the pump level. Pumps may perform either suction or force lift alone, or the two combined, according to their location.

As steam lifts more water than any other artificial agent, the term "pumping engine," and even the word "pump" alone, is often employed to denote the combination of a pump and a steam engine in one machine. Electric motors are much used to drive both small and large pumps, and these are commonly designated as electric pumps. When a pump is driven by detached motive power, it is termed a power pump. The term "pumping engine" is usually confined to more or less elaborate machines of large capacity, and the terms "steam pump" and "electric pump" to machines of smaller capacity and simpler design, but there is no hard and fast line between the two. Other motive powers for pumps are gas, gasoline, and oil engines. With the exception of the steam pumping engine the various motors employed to drive pumps will not be described further in this article, and most of the principles involved in the steam end of pumping engine will be explained under STEAM ENGINE.

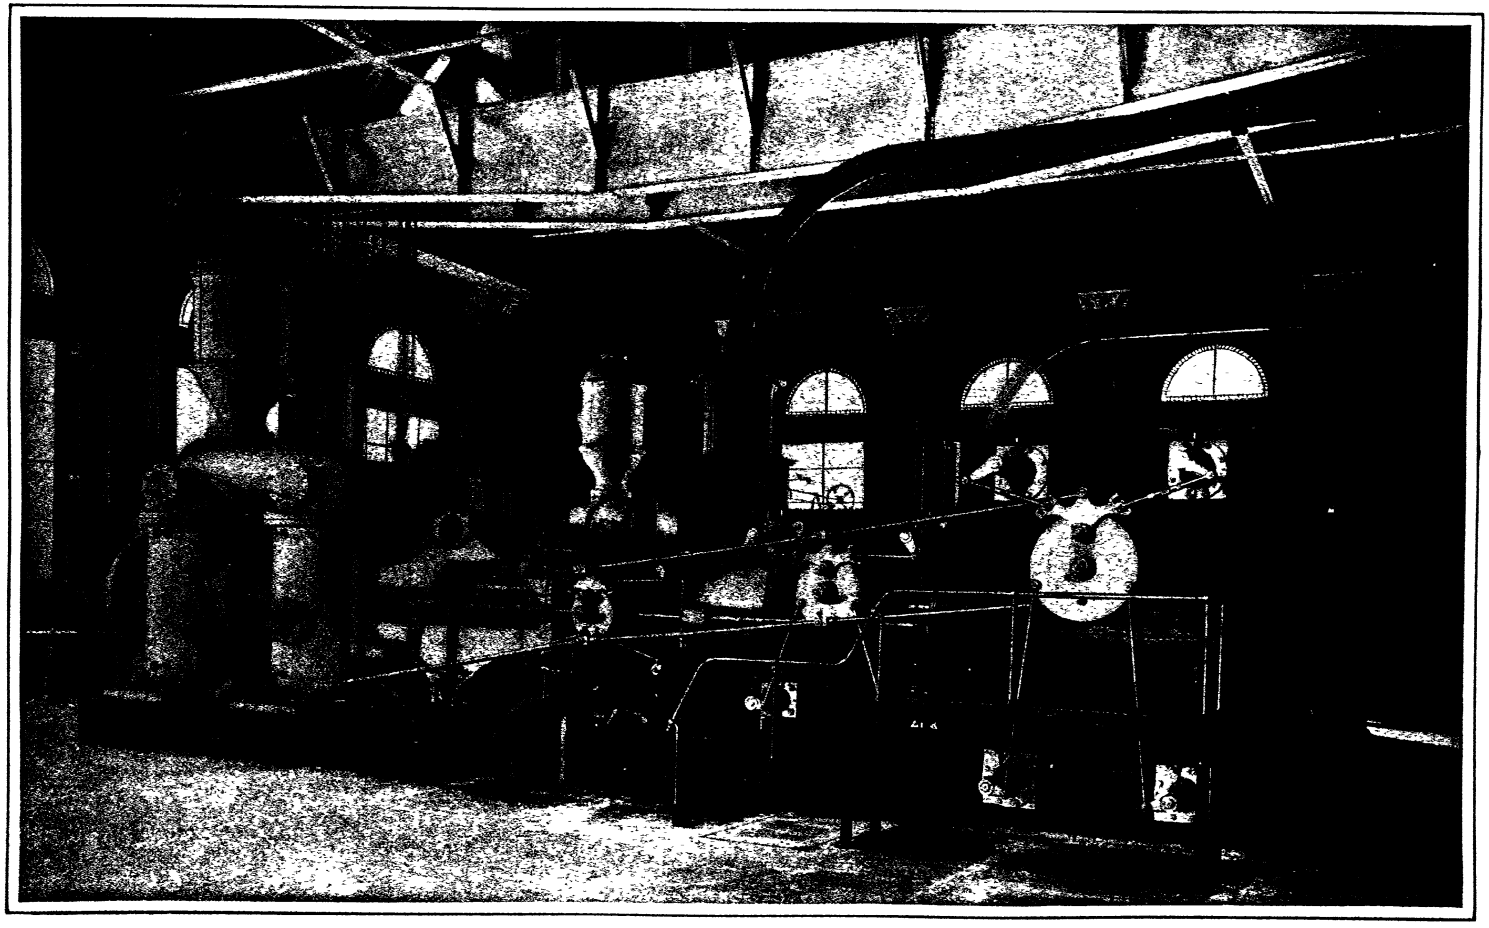
The accompanying diagram represents the ordinary suction hand pump. A pipe *B* leads up to a cylinder or barrel *A* with the outlet *C*. In the cylinder the valve *D* opens upward. On the piston *F* is a valve *E* opening upward. In working the pump the rod *G* is raised and the valve *E* shuts. The air contained in the lower part of the barrel becomes rarefied and the valve *D* opens. Atmospheric pressure on the water surface *H* causes the liquid to rise in the pipe *B* and air to flow through *D*. When the piston descends it slightly compresses the air in the barrel, which shuts the valve *D* and opens C. As this action continues the air is all forced out and water takes its place. Every successive upward stroke discharges a body of water equal to the displacement of the piston into the pipe above it, and the pump will draw water as long as the action of the piston is continued.

SINGLE SUCTION PUMP.



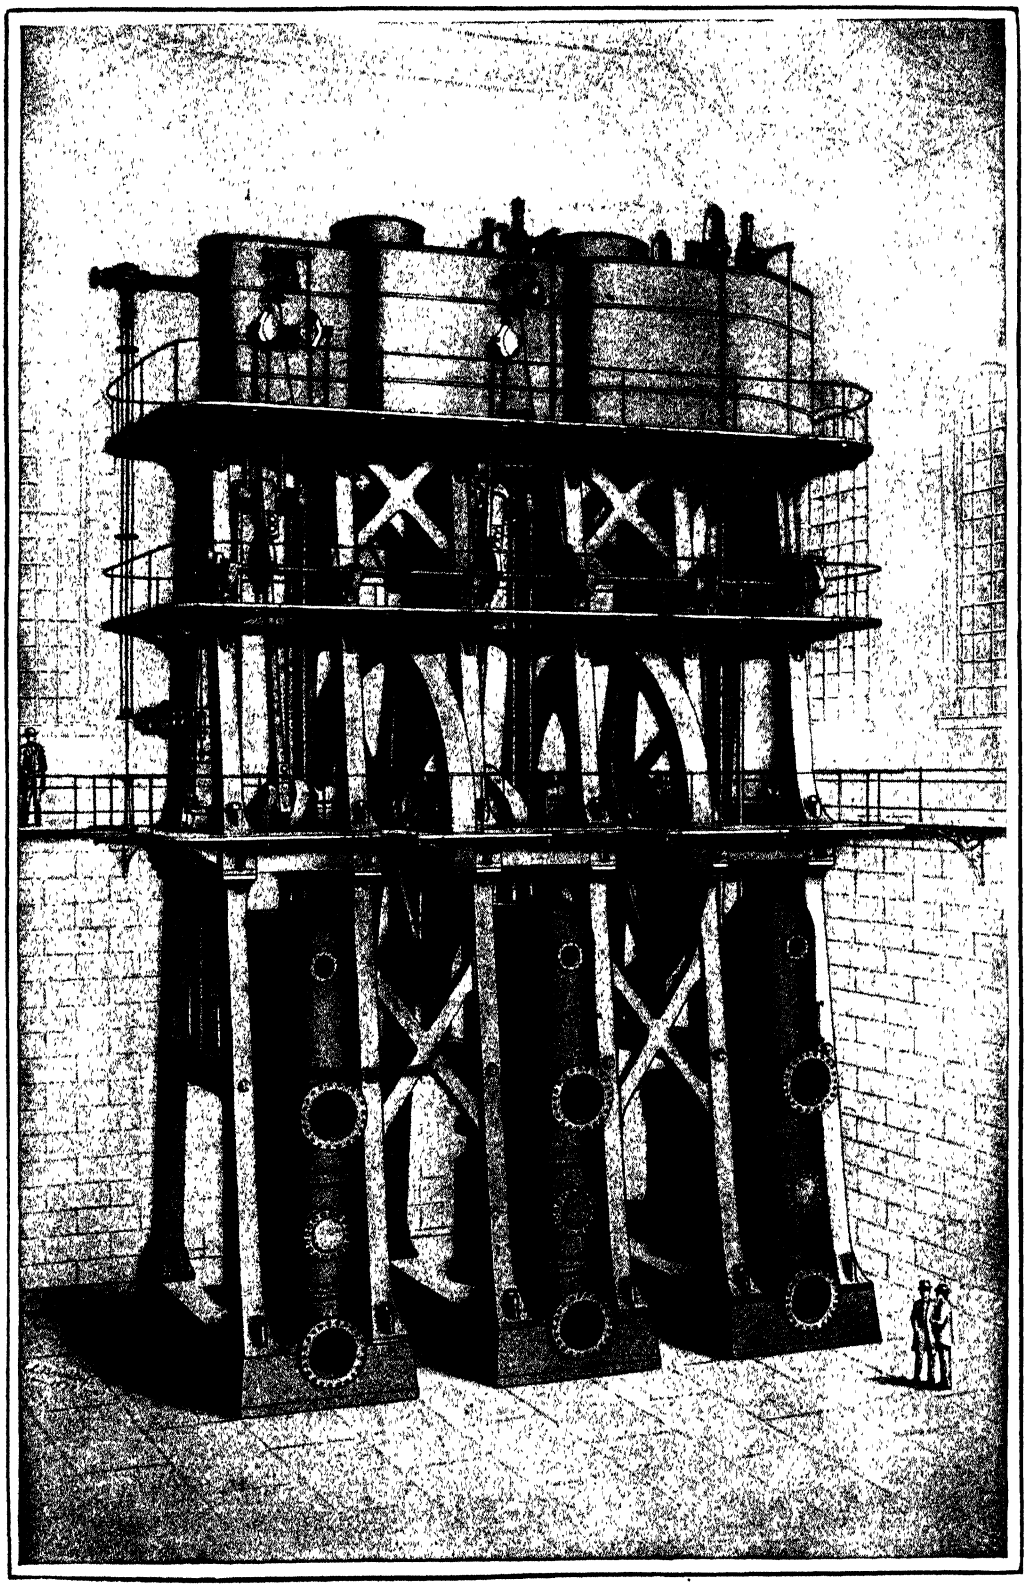
The ordinary forms of lift and force pumps are similar to the suction-lift pump before described, except that the piston is solid and the valve *E* is placed in the discharge pipe, which then leads out from the cylinder below the piston. The water is drawn up into the barrel by suction and then the pressure of the piston in its downward stroke forces it through the outlet valve to any height that may be required.

In these pumps water is discharged in a series of rushes or jerks. It is a great object to procure a continuous discharge, both for its convenience and for the saving of the power wasted by the continual acceleration and retardation of the ascending column. With force pumps this can be done by making the pump double acting, with intake and discharge pipes and valves in the cylinder on both sides of the piston and with the pump rod passing through a water-tight stuffing-box head. An air chamber on the discharge pipe makes the flow still more uniform. The water forced into the pipe during a stroke compresses this air, which, acting as a spring, returns this force to the ascending column when the piston stops to reverse its motion. The pistons or plungers may work in either a horizontal or vertical direction, giving rise to the terms "horizontal" and "vertical" pumps.



Impeller Pumps include the centrifugal, screw (propeller) and jet (injector and aspirator) types. *Centrifugal pumps*, in their simplest form, consist of a series of vanes, or blades, mounted radially on an axis and closely inclosed, except for a chamber around the impeller circumference, in a casing. The centrifugal action of the revolving blades throws the water outward into the discharge passage. When guide vanes are placed in the casing passage around the impeller to guide the water, decrease its velocity, and increase the pressure, one has the turbine pump. The pressure developed by a single rotor depends on the speed, and practical design requires a pump with several impellers on one shaft for heads above about 150 feet, the discharge of one impeller going to the intake of the next.

Aspirators and *injectors* make use of a jet of steam or water, which, being delivered at high velocity through a small throat, imparts some of its velocity to the water to be moved. The air lift has been classed by some as a displacement and by others as a jet pump. It seems more correct to say that its action depends upon the formation of a column of mixed water and air, which, because of its lesser specific gravity or weight, is overbalanced, or raised, by a column of water. Two tubes are employed, the smaller of which is centred within the larger. The small inner type conveys compressed air down into the volume of water to be lifted. The air and water together rise up through the outer and larger tube. This device is used oftentimes as a substitute for deep-well reciprocating piston pumps, which require the placing of moving parts deep in the well and connecting by long rods with motive power at the surface. Air-lift pumps are cheap in first construction, simple in operation, and have no wearing parts, but their fuel economy is low.



Steam Pumping Engines. The simplest of these machines consists of a single steam and a single water cylinder, with a common piston, but this type did not come into use until ponderous beam engines had been employed for scores of years. Most steam pumping engines

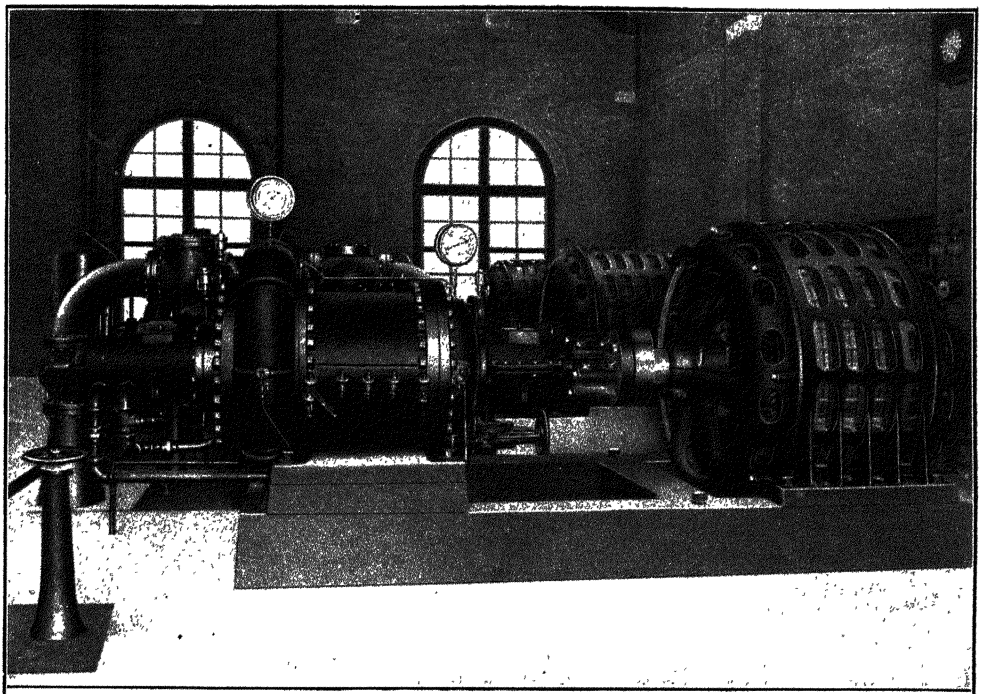
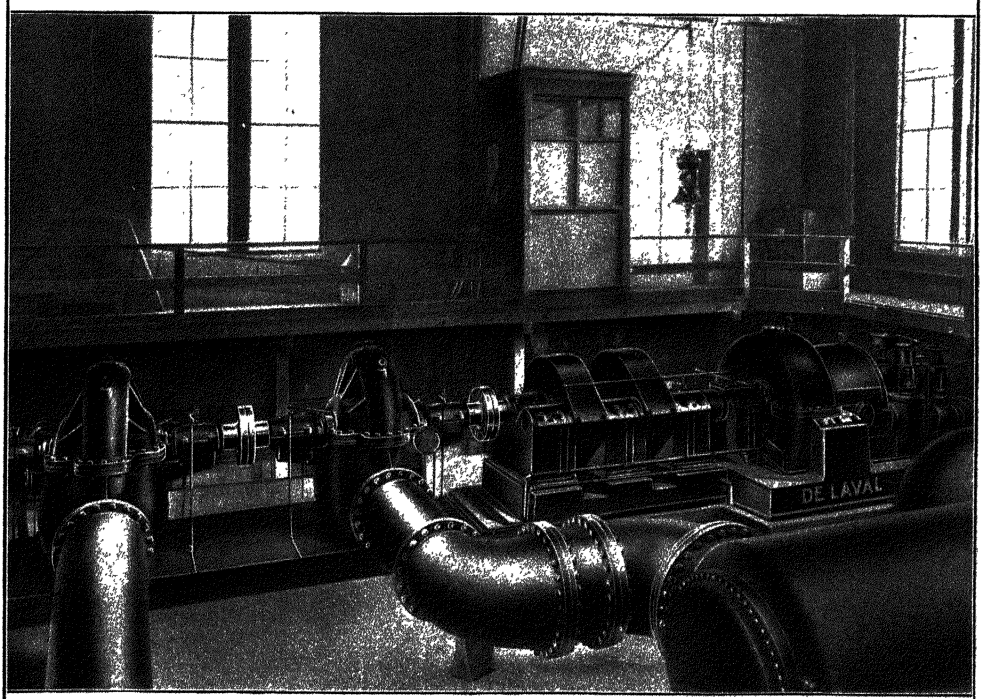
of coal. Since coal is variable in quality there was substituted for it as a basis the work done by 1000 pounds of dry steam; the use of superheated steam made the heat content of 1000 pounds of steam a variable, so that a further refinement, foot pounds of work per 1,000,000 B. T. U., has been substituted. The duty of pumping engines has increased, in round numbers, from 6,000,000 foot pounds per 100 pounds of coal (coal basis) for the Newcomen atmospheric pumping engine of 1769 to 180,000,000 foot pounds (heat-unit basis) for the best crank-and-flywheel triple-expansion pump of the present day. The wide range of efficiency of various types of pumps now used is shown by the following figures from Turneaure and Russell's *Water Supply* (New York, 1908), based on the duty per 1000 pounds of steam: high duty, 168–100 million; ordinary pumping engines, 100–75 million; steam pumps, 40–10 million; direct-acting deep-well pumps, 6–2 million; vacuum pumps, 8–2 million; jet pumps, 4–1 million foot pounds. Power pumps, with direct-connecting engines, the pumps alone having an efficiency of 75 per cent, are ranked at 114 to 37 million according to the type of engines. The air-lift pumps, with a pump efficiency of 25 per cent, are figured to give duties of 31,000,000 to 6,000,000 foot pounds per 1000 pounds of steam, with various styles of air compressors. The thermal efficiencies of the above three classes of pumping apparatus (i.e., pump and motive power combined) range from 20.6 per cent for the high-duty engines to 0.13 per cent for the jet pumps, 14.7 per cent for the triple-expansion condensing engines and power pumps, 4.8 per cent for simple high-speed condensing engines and power pumps, and 4 to 0.77 per cent for air-lift pumps. Since this list was compiled progress in design and construction has brought the records of high-duty machines up to 180 million and centrifugal power pumps to 165 million.

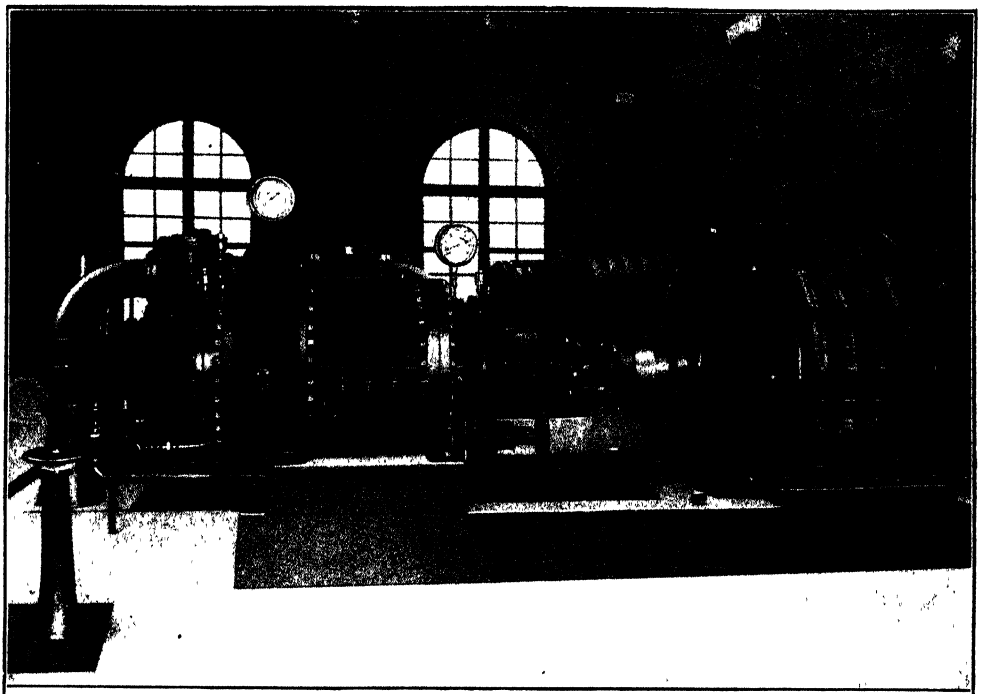


SECTION THROUGH HUMPHREY PUMPING UNIT AT CHINGFORD, ENGLAND.

Station has four 47,500,000-gallon and one 26,000,000-gallon units; head, 25 to 30 feet. Tests have shown a fuel consumption of 0.93 pound coal in the gas producers for water horse-power hour of the pumps.



SECTION THROUGH SINGLE-STAGE DOUBLE-SUCTION CENTRIFUGAL PUMP.



Historical Sketch. The earliest authentic record of a displacement pump seems to be a description of the force pump of Ctesibius of Alexandria, in Hero's *Spiritalia*. Two single-acting vertical pumps were operated alternately by a common beam, or brake, and the two discharge pipes were connected with an air chamber and the stream was then thrown from a movable nozzle. In the fifteenth century there is evidence of the frequent use of hand pumps in wells, and, in fact, it seems that they may have been well known over 1000 years earlier, for a German translation of *Vegetius* (Erfurt, 1511) contains an illustration of a suction-lift pump with a rectangular barrel. The original of this work was dedicated to Valentinian II (375–392 A.D.). The substitution of a plunger for a piston in the ordinary force pump is credited to Sir Samuel Moreland, who obtained an English patent on the device in 1675. A

districts. The sewage is received in an air-tight chamber provided with valves on both the inlet and outlet pipes. Compressed air from a central station is let in to displace the sewage in the chamber. The falling sewage, when the chamber is empty, automatically shuts off the air supply. The Liernur system of removing house wastes, developed about the same time as the Shone, makes use of a vacuum instead of compressed air. By this means the wastes are from time to time sucked into central chambers, and from there to a single central station, where the air-exhausting pumps are located. See SEWERAGE.

The air-lift pump was suggested by Freiburg in a pamphlet published in 1797, described in an English translation (1876) of lectures on mining by Callon, patented by Joseph P. Frizzell, of Boston, in 1880, and used in Berlin, Germany, about 1885. About the latter date Prof. Elmo G. Harris, of Rolla, Mo., developed an air lift. But the introduction of the device to practical use was largely due to Julius G. Pohle, who made various applications of air to raising water, beginning in 1886. Since then the Pohle and various other air-lift pumps have been adopted for raising water from deep wells at many municipal and private water-supply plants. Different designers have used various foot pieces for the introduction of the air to secure small bubbles in some cases and large air bodies in others. Recent investigations, however, show that the results are nearly alike in all cases and that the foot-piece details are relatively unimportant. Very small bubbles coalesce to form larger ones, and very large air bodies are broken up into smaller ones. The greatest improvement since Pohle's work has been the booster of F. S. Miller, of Indianapolis. This is a simple vented separation chamber into which the water-air mixture is discharged. The water can be carried from this by the residual air pressure for distances of several hundred feet and elevated without repumping.

The development of the steam pumping engine was foreshadowed by the steam fountain of Hero, the improved steam fountain of the Italian Porta, described by him in 1601, in which a separate boiler was used, and the inventions of the Marquis of Worcester, who is supposed to have been the first to put this device in practical operation for raising water intermittently. In 1663 Worcester secured patents on an improvement of this device. A separate boiler supplied steam alternately to two vessels placed over the water to be lifted and connected thereto by means of pipes. The condensation of steam in the vessel created a vacuum, whereupon atmospheric pressure filled this chamber with water from below. Meanwhile steam displaced the water in the other vessel. This was a forerunner of the pulsometer pump, described above.

Next in order of importance among those to whom we are indebted for the pumping engine comes Thomas Savery, who in 1698 patented the first pumping engine used to drain the mines of Cornwall. The water-raising features of this machine were essentially the same as those of Worcester, but Savery added a surface condenser and a second or feed-water boiler. In 1705 Thomas Newcomen, John Calley, and Savery patented a pumping machine which combined a steam piston, outside condenser, balanced beam, pump rods, and a bucket piston pump. On applying the condensing jet a vacuum was created beneath the piston, whereupon atmospheric pressure forced the piston down, and with its fall the steam end of the beam also fell, while the water end, with the pump rods and pump, was lifted. When steam was admitted beneath the piston the atmospheric pressure was balanced and the pump rods fell. Smeaton made great improvements in the Newcomen engine, but it was James Watt who, during the second half of the eighteenth century, transformed the atmospheric into the steam engine. (See STEAM ENGINE.) Watt left the pump end of the device much as he found it. Towards the close of the eighteenth century the use of the steam engine had been confined almost wholly to the raising of water, and the most notable steam pumping engines thus far developed had been erected in the mines of Cornwall. From 1800 to 1840 various improvements in these machines were made and the term "Cornish engine" came into use. The pump end changed from the bucket piston lift to the plunger force pump, but the ponderous beam still remained.

In 1840 Henry R. Worthington, of New York, while experimenting on the application of steam to canal navigation, invented the direct-acting steam pump to feed his boilers. In 1845 the manufacture of such pumps was begun in South Brooklyn, and in 1850 Mr. Worthington submitted a number of small low-lift valves for the single high-lift valve previously employed. In 1855 the first direct-acting Worthington pump for water-works service was put in use at Savannah, Ga. It was not till 1863 that the first duplex Worthington pump was erected. This was at Charlestown, Mass., and it had a capacity of 5,000,000 gallons a day. In 1884 the Worthington high-duty pump attachment, already described, was perfected by C. C. Worthington. The original device was invented by J. D. Davis in 1879 and subsequently bought by the Worthington firm. The Worthington pumps are of the horizontal type.

A high-duty pumping engine, designed by I. P. Morris of Philadelphia, was installed at Lowell, Mass., in 1873. It was a vertical compound, having the two steam cylinders under one end of the beam and the pump and flywheel under the other end. It had a daily capacity of 5,000,000 gallons and gave a duty of 93,000,000 foot pounds per 100 pounds of coal. In the same year (1873) another type of high-duty pumping engine, after designs by E. D. Leavitt, Jr., of Cambridgeport, Mass., was tested at Lynn, Mass. It showed a duty of 104,000,000 foot pounds per 100 pounds of coal. This was the first of a series of high-duty flywheel engines designed by Leavitt, which changed, later on, from the compound to the triple expansion type. One of these pumping engines, built for the Calumet and Hecla Mining Company, in Michigan, has a daily capacity of 60,000,000 gallons. For a high-lift and high-duty pump this is believed to be unsurpassed in size.

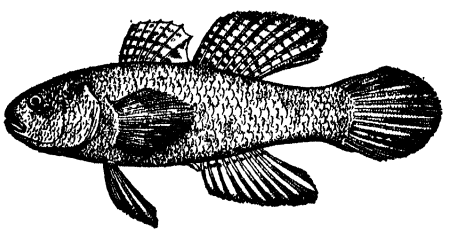
Another name connected with the development of pumping engines is that of George H. Corliss, of Providence, R. I. He erected a compound engine with double-acting pump plungers at Pawtucket, R. I., in 1878, which gave a duty of 127,000,000 foot pounds per 100 pounds of coal. The pump end had annular bronze valve disks only $\frac{1}{12}$ inch thick. The diameters of the valves were 2¼ inches and the lift 1 inch. The aggregate area of the valves was equal to

the area of the plungers. A type of flywheel pumping engine which has been very widely used in the United States is the Holly-Gaskill, invented by H. F. Gaskill, of Lockport, N. Y. The first of these was erected at Saratoga Springs, N. Y., in 1882. It had a capacity of 4,000,000 gallons a day and showed test duties ranging from 102,000,000 to 113,000,000 foot pounds per 100 pounds of coal. It was a compound, horizontal, crank-and-flywheel engine with double-acting plunger pumps.

Another class of high-duty pumping engines is commonly known as the Allis, from the makers, and is frequently named from the chief engineer of the builders, Edwin Reynolds. The first pump of this type was built in 1886 for the city of Milwaukee, Wis. The three pumps are single-acting plunger, the engines are triple-expansion, and the cranks are placed on the axle at the angle of 120° with each other, in order so to vary the time of the stroke of each pump as to give a continuous flow of water. This pumping engine gave a test of 129,000,000 foot pounds per 100 pounds of coal, greatly exceeded by later Allis machines.

A series of pumping engines notable for refinements of design and efficiency have been designed by B. Nordberg of Milwaukee. Prominent features of his type are the system of steam jackets to prevent cylinder condensation and the recovery of exhaust heat for boiler feed water.

Old Municipal Pumping Plants. In 1582 a Dutchman named Peter Maurice erected a large pumping plant at London Bridge for the water supply of London. A current wheel drove 16 force pumps, each 17 inches in diameter and 30 inches long. By this means 216 gallons of water per minute, or 311,000 gallons a day, were raised to a cistern at an elevation of 120 feet, from which buildings near by were supplied through lead pipes.



The earliest pumping plant in America, or at least the earliest one on record as supplying water for municipal purposes, was built at Bethlehem, Pa., some time between 1754 and 1761. It is described as a 5-inch lignum-vitæ pump, and lifted water to a height of 70 feet through bored hemlock logs. In 1761 three single-acting iron force pumps of 4-inch bore and 18-inch stroke, driven by an undershot water wheel, were substituted. Of other early American pumping plants, the Centre Square and the Fairmount works at Philadelphia, started in 1801 and 1815 respectively, are perhaps the most notable. It is stated that about 1760 a Newcomen atmospheric pumping engine was imported from England for use at copper mines near Belleville, N. J. What appears to have been the first steam pumping engine to be built in the United States was erected by the city of Philadelphia in 1800 and put in operation on Jan. 27, 1801, at the Centre Square Works. One of the pumps lifted water from the river level to a second pump about 50 feet higher, which in turn raised it another 50 feet. Both pumps were double-acting force pumps and the engines had wooden lever beams and flywheels. The pumps had a daily capacity of 3,000,000 gallons. The iron steam cylinder of at least one of these engines was cut in halves, united by copper, and secured externally by an iron band 18 inches wide. This cylinder was 36 inches in diameter.

PUNA. See POONA.

PUÑACA, pōō-nyä'kȧ. A small goby or guavina (*Dormitator maculatus*), dark brown, with lighter bluish spots, and from 1 to 2 feet in length. It presents a great variety of forms. This and a number of closely allied fishes (see GUAVINA) are called sleepers because of

THE PUÑACA.

their burying themselves in the mud in order to pass unfavorable seasons in dormancy.

PUNCH (abbrev. of *Punchinello*, from Fr. *Polichinelle*, from It. *pulcinello*, clown, buffoon, puppet, probably a dim. of *pulcino*, child, young chicken, from *pullus*, young chicken, young of any animal). The chief personage in the popular comic drama of *Punch and Judy*, performed by means of small, hollow, flexible puppets, animated by the thumb and two fingers of the exhibitor. The latter, who holds Punch and Judy above his head, himself remains concealed in a long, upright, portable box or by curtained poles. The miniature stage, as it were, is thus raised to a level easily seen by a seated audience. The small figures of Punch and Judy should be distinguished from marionettes. See PUPPET.

The history of the play in which Punch figures is hardly less obscure than that of its designation. The invention of the piece is ascribed to an Italian comedian, Silvio Fiorello, about 1600, but it was later modified by Andrea Calcese, and very likely it is in substance much older. The personality of Punch has even been traced back to the simpleton Maccus of the ancient Atellan farces, though with little other proof than its resemblance to a small bronze figure of the latter, discovered near Naples in 1727. The form of the play as we know it seems to be largely of French development, since our Punch is in several respects quite different

from the character as he has survived in the vicinity of Naples. Having found its way to England in the seventeenth century or perhaps earlier, the exhibition became very popular there. Its popularity seems to have reached its height in the time of Queen Anne, and Addison has given in the *Spectator* a criticism of one of the performances. The scenes, as now given by strolling *Punch and Judy* shows, are much shortened from those originally performed, in which allusions to public events of the time were sometimes interpolated. The minor variations of the acted version are infinite. A similar character is said to exist in the puppet shows of India and elsewhere in the Orient. In Paris Punch, who is a great favorite of the children on afternoons in the Champs Elysées, is called Guignol (q.v.). This name properly belongs to a puppet character of Lyons, invented about the end of the eighteenth century, quite local and figuring in several mimic comedies. When brought to Paris the title was applied to the original Polichinelle. Punch generally appears as a hook-nosed, humpbacked figure, knavish, boastful, and cowardly, and given to the reckless use of a club which is often in play upon the backs of his wife Judy and others of the *dramatis personæ*. Consult works cited under PUPPET; also Payne Collier, ed., *Punch's Real History* (1st ed., London, 1828; 3d ed., ib., 1844), illustrated by Cruikshank.

PUNCH. A humorous and satirical illustrated weekly, the best of its kind in England. It is doubtful if the whole story of its origin will ever be known, but the consensus of opinion seems to be in favor of crediting the original idea to Ebenezer Landells, a London wood engraver and draftsman, and Henry Mayhew, a well-known wit and writer. The original idea was to reproduce in London the success of Philipon's *Charivari*, which already had an established position in Paris. Mayhew secured Mark Lemon as editor and a staff of writers, and the first issue was published on July 17, 1841. According to Lemon's manifesto, published in the first number, it was destined to fight for the abolition of the Fleet and Marshalsea prisons and of capital punishment and to uphold the standard of national integrity and virtue. It succeeded with the first part of its programme, and while it has ceased its crusade against capital punishment it has consistently attacked abuses of all kinds. Throughout the world it is regarded as an exponent of English opinion scarcely inferior to the London *Times* itself. While it draws its materials as freely from the happenings of foreign politics as from the occurrences of English national life, it has nevertheless always judged external events from the English point of view and home affairs from a high moral standard.

At the time of its inception it was practically the only periodical which could be said truthfully to represent the attitude of the great mass of the British nation, absolutely free from party or governmental bias. Its humor, like its policy, has been typically English—so much so that it has been frequently misunderstood by foreign critical opinion, with the result that its insularity has lost for it the best work of non-English contributors. An exception to this rule was the engagement of Artemus Ward. The renowned French caricaturist Caran d'Ache has also drawn for it. A list of the Englishmen who have met weekly about the table on which most of them have carved their initials would include many of the best-known writers and artists. Among the former may be mentioned Douglas Jerrold, Thomas Hood, and Thackeray, who wrote for it until 1854; among the latter, Keene, Sambourne, Leech, Tenniel, Briton Rivière, Du Maurier, Harry Furniss, and Phil May. Lemon was editor from the beginning until 1870; the later editors have been Shirley Brooks (1870–74), Tom Taylor (1874–80), Sir F. C. Burnand (1880–1906), and Sir Owen Seaman (1906–). Consult M. H. Spielmann, *The History of Punch* (London, 1895), and G. S. Layard, *Shirley Brooks of Punch* (New York, 1907).

PUNCH (from ML. *punctuare, punctare*, to pierce, from Lat. *punctum, punctus*, point, from *pungere*, to pierce). A tool for cutting circular or other shaped pieces out of metal, wood, or other materials or simply for making holes. The simplest form of this instrument consists of a piece of steel formed at one end into a cylinder, the end of which is ground to a square cutting edge. The other end of the punch is made strong and thick, to receive blows from a hammer and to serve as a handle. Tubular punches are sometimes used which cut blanks for various purposes, gun wads or valves, which are retained for special work. Punches operated either by hand or power through a system of levers or toggle joints are also made where a die or punch fits accurately into a corresponding hole through which the material is forced. See DIES AND DIE SINKING; METAL-WORKING MACHINERY.

PUNC'TUA'TION (Fr. *ponctuation*, ML. *punctuatio*, marking with points, a writing, from *punctum*, point). In writing or printing, the use of certain marks, called points, to separate sentences and parts of sentences. Its most important office is that of preventing ambiguity or obscurity.

In Greek inscriptions and manuscripts generally there is no attempt to separate the words, and in early times no system of punctuation was employed. It is true that in some archaic inscriptions columns of dots are occasionally found separating words, but they have no reference to the pauses and cannot properly be called punctuation. However, even by the end of the fourth century B.C., readers found it convenient to indicate to a slight extent pauses by arbitrary signs, though books of that period seem to have known no division of words or use of diacritical signs. The development of an organized system of punctuation seems to have occurred at Alexandria. To judge from the papyri, the earliest mark is used to indicate a new paragraph. Here a slight space is left in the line (later a large initial is sometimes found), while below the line in which the pause occurs is drawn a short horizontal line (the so-called *παράγραφος, paragraphos*) which sometimes takes the form of a wedge. This sign is used in the plays to indicate a change of speaker, and in the papyrus of Bacchylides to mark in the odes the strophe, antistrophe, and epode. Another method was the employment of a dot or small circle, and we are told that Aristarchus of Byzantium systematized this use so that the point high above the line indicated a full stop, that low on the line a lesser pause, like a semicolon, and the point in the middle a comma. This system, however, though accepted by the grammarians,

does not appear in the papyri, where the point is usually placed high, whatever its value.

In general it may be said that these and other diacritical signs seem to have been used chiefly in works of the poets, whose dialectic and archaic forms presented greater difficulties to the ordinary reader. The Greek manuscripts of later date show a system more like that now employed. About the ninth century the comma appears to denote the slight pause, while the high dot (·) indicates a colon or semicolon, and the full stop is denoted by a larger dot or double dot and a space. A little later the interrogation point (;) appears, though not very frequently. The Latin grammarians adopted the punctuation by dots from the Greeks, but seemingly modified the system slightly so as to give the middle dot the middle value and the lower the smallest. The oldest manuscripts, however, show no punctuation at all, and the later uncials show great variety and no recognized system. In the seventh century we find the equivalent to a comma, the semicolon with its modern value, and a full stop expressed by a more complex sign. In the Carolingian and later manuscripts the system is somewhat altered and approaches more closely that in common use, as the comma is introduced and an inverted semicolon to indicate a pause between comma and semicolon, while a sign of interrogation also appears. Quotation marks in various forms are found early in both Greek and Latin manuscripts.

All modern languages agree practically in the use of the same points, applied according to principles laid down by Aldus Manutius (1450–1515), but since his time, of course, extensively developed. Differences in detail between languages rest mainly on different methods of thought and construction, though some peculiarities are arbitrary. In Spanish a question or an exclamation has its special mark at the beginning as well as at the end. This peculiarity arose doubtless from the fact that on account of the variable position of a subject noun in Spanish it is not always easy to distinguish at first sight a declarative from an interrogative sentence. French has a special set of quotation marks, and German uses commas in normal position at the beginning and inverted commas at the close of a quotation. But the leading principles are universal. Liberal insertion of points is called close punctuation, and omission of all but those absolutely necessary is known as open punctuation. The latter practice probably prevails at present in the best English usage, although the only statement that may be made with certainty in this respect is that usage is not uniform.

Differing methods of pointing have been called rhetorical punctuation and grammatical punctuation, with the supposition that in the former case, for guidance in reading, each place of natural pause should be indicated by a distinctive point. It was probably this rhetorical or elocutionary consideration that led to the assignment of time values to the marks. The comma was said to indicate a pause long enough to count one, the semicolon two, the colon three, and the period four. In any case the reader's individuality may ignore punctuation. Consequently punctuation governed by purely grammatical circumstance seems likely to prevail increasingly, although it has not yet entirely superseded the other method. Another classification has been made, including, besides rhetorical and grammatical, etymological and reference punctuation; but, although the marks for the last two purposes are used in positions similar to those of real punctuation, their nature more nearly approaches that of diacritics.

The comma is used to mark the slightest actual turn or jointure in grammatical construction, and thus occurs much more frequently than any other point.

The semicolon is used after a clause when the turn in sense is too distinct to use merely a comma and not sufficient for a period; most frequently between clauses all or some of which contain commas.

The colon is now generally confined to an introductory function, especially at the transition point of the sentence.

The period is a full stop and marks the end of a sentence.

The dash is used to denote a sudden change in the construction, a sudden interruption or irregularity.

Marks of parenthesis are used to inclose interpolations in a sentence. Square brackets inclose an insertion not merely disconnected, but having no effect on the meaning of the context. An apostrophe marks the possessive or elisions. The use of various other marks is commonly explained in treatises on punctuation, including marks of reference, elision, emphasis, connection, and diacritics.

Bibliography. Among the fullest of the older treatises are: Goold Brown, *Grammar of English Grammars* (London, 1851; new ed., New York, 1857); John Wilson, *Treatise on Grammatical Punctuation* (5th ed., Boston, 1856). Recent works are: A. S. Hill, *General Rules for Punctuation* (Cambridge, Mass., 1878); F. H. Teall, *Punctuation* (New York, 1899); T. F. and M. F. A. Husband, *Punctuation: Its Principles and Practice* (ib., 1905); A. M. Smith, *Proofreading and Punctuation* (Philadelphia, 1905); Frances M. Perry, *Punctuation Primer* (New York, 1908); Horace Hart, *Rules for Compositors and Readers at the University Press* (Oxford, 1912). On the history of punctuation, consult Omont, *De la ponctuation* (Paris, 1881), and Maurice Prou, *Manuel de paléographie* (3d ed., ib., 1910).

PUNCTURE, LUMBAR. See LUMBAR PUNCTURE.

PUN'DIT, also **PAN'DIT** (from Skt. *paṇḍita,* learned). The name given to a Brahman who is versed in the Sanskrit language and in the science, laws, and religion of the Hindus.

PUNICA FIDES, pū'nĭ-kȧ fī'dēz (Lat., Punic faith). A term used by the Romans to express treachery, in allusion to the popular conception of the Carthaginians.

PU'NIC WARS. The name commonly given to the three great wars waged between Rome and Carthage (q.v.). Of these the first (264–241 B.C.) ended with the cession of the Carthaginian part of Sicily to Rome; the second (218–201 B.C.) resulted in the surrender of Spain by Carthage to Rome; the third (149–146 B.C.) ended in the destruction of Carthage. The Latin word *punicus,* or *pœnicus,* was the name given by the Romans to the Carthaginians, in allusion to their Phœnician descent. See CARTHAGE; HASDRUBAL; HAMILCAR; HANNIBAL; ROME; SCIPIO.

PUN'ISHMENT (from *punish,* from OF., Fr. *punir,* from Lat. *punire, pœnire,* to punish,

from *pœna*, punishment, expiation, pain, from Gk. ποινή, *poinē*, punishment; connected with Gk. τίνειν, *tinein*, Skt. *ci*, to repay). Pain or suffering inflicted because of some misdeed. In criminal law the word "punishment" is used to designate the penalty inflicted by the state upon a person for committing a criminal offense. The earliest forms of punishment were those which carried with them the idea of vengeance and were inflicted with the desire to do harm to him who had previously done harm. More recently, however, the idea of retribution has made way for the theories of prevention and reformation. The former of these theories insists that the state shall inflict upon a criminal only such punishment as will keep him from further wrongdoing and deter others from criminal acts. The latter theory regards the reformation of the criminal as the only legitimate design of punishment and maintains that when this is accomplished further punishment should cease. None of these three theories—of retribution, prevention, or reformation—holds absolute sway in our criminal codes. Generally there are traces of all three, although the tendency of recent development has been in the direction of reforming the criminal.

In the early history of society the infliction of punishment for crime was left in the hands of the person wronged or of his kin, clan, or tribe. The punishments inflicted were usually characterized by cruelty and were out of proportion to the offense committed. Indignities were frequently inflicted upon the body of a criminal after death. When, moreover, certain standards concerning the degree of offense came generally to be accepted, the punishment for the same offense varied according to the social rank of the injured party. In the course of time a system of fines was substituted for physical punishment. By the payment of a fine to the injured person or to his family the offender was made free from liability to further punishment.

With the increasing complexity of society and the development of the idea of the state, the right to punish was taken away from the offended party and vested in the state. Crimes came to be considered as offenses against the state, the social order, and punishment is now regarded as an act of social defense calculated to establish the inviolability of the law and to deter those who may be criminally inclined from overstepping the limits of legally permissible conduct.

Punishments are of varying nature; they may involve encroachment upon the life or physical integrity, on the personal liberty, on the property, or on the rights and privileges of an offender. To the first of these classes belong capital punishment and such generally obsolete punishments as the cutting off of tongue or hands. In the second class we find deportation, imprisonment, and compulsory labor. The third class includes fines and the confiscation or destruction, by the state, of an offender's property. As punishments of the fourth class the criminal is often deprived of political or civil rights belonging to citizenship, such as the electoral franchise, capacity to testify in courts of justice, or to hold office. Forms of punishment formerly in vogue, but now discarded among civilized nations generally, are mentioned under TORTURE.

Some of the qualities which ideal punishments should possess, to correspond to modern ethical standards, are the following: (*a*) Morality. Punishments should not stunt or destroy the moral sense of the culprit or of those witnessing the punishment. (*b*) Equality. Punishments should represent a damage or pain of equal importance or intensity to different offenders committing the same crime. This condition is difficult to fulfill, for the imposition of different punishments for one and the same crime seems to be a violation of democratic principles, while a fixed fine of, say, $100 for a specific offense represents a much severer punishment for a poor man than for a man of wealth. (*c*) Personality. The evil effects of punishment should be confined to the offender alone and not extend to innocent persons. (*d*) Elasticity. The punishment should be such that it can be varied to suit the various degrees of guilt. (*e*) Commensurability. The diverse punishments of the criminal code must be of such a kind that they may be compared with one another and thus permit the judge to choose among several penalties that which corresponds in severity to the gravity of the offense. (*f*) Reparability. It should be possible in case of judicial error to repair the injury done to a person unjustly condemned.

Sometimes the laws prescribe a definite penalty for a specific offense, and the judge then has no choice. Usually, however, he is permitted to elect among several penalties which the law permits for a given misdemeanor; he may choose, e.g., between "a fine of from $1 to $100 or imprisonment for a period not less than three days or more than three months." Theoretically the nature and method of punishment might be left entirely to the discretion of the judge; but this system is unknown in practice. Consult: A. M. Earle, *Curious Punishments of Bygone Days* (New York, 1896); Sir H. J. Maine, *Ancient Law: Its Connection with the Early History of Society and its Relation to Modern Ideals* (4th Amer. ed., ib., 1906); F. H. Wines, *Punishment and Reformation* (ib., 1910); Raymond Saleilles, *Individualization of Punishment*, translated from the second French edition by R. S. Jastrow (Boston, 1911); George Ives, *History of Penal Methods* (New York, 1914). See CAPITAL PUNISHMENT; CRIMINOLOGY; PENOLOGY.

PUNJAB, pŭn-jäb′, or **PANJAB** (Hind., five rivers: the Jhelam, Chenab, Ravi, Sutlej, Beas). A northwest province of British India (q.v.) (Map: India, B 2). Of a gross area of 136,330 square miles 99,779 square miles are directly under British administration, the remainder being occupied by a number of feudatory native states, of which the largest is Bahawalpur. The extreme northern part of the province lies among the foothills and projecting spurs of the Himalaya, but the greater portion consists of an almost perfectly level plain sloping gently from an elevation of 1600 feet at the base of the mountains to less than 200 feet in the extreme southwest. This plain is traversed by the Indus (which flows on or near the west boundary) and its great tributaries, the Jhelam, Chenab, Ravi, and Ghara, or Sutlej (the chief affluent of which is the Beas), which all unite into the Panjnad before they enter the main stream near the southwestern boundary. The climate of the plains is excessively hot and for the most part dry between April and September, the temperature sometimes rising to 120°. The winters are cool, with occasional frosts at

night. The rainfall, which occurs under the monsoons in June, ranges from 36 inches in the north to only 4 inches in the south, being in the greater portion insufficient for the needs of agriculture. Healthy vegetation is accordingly confined to narrow lands along the river courses, and the great interfluvial tracts, known as *doabs*, are covered only with a scanty jungle of scrub, here and there affording pasturage.

As in all parts of India, most of the inhabitants are engaged in agriculture. The soil as a rule is highly fertile and only lacks an adequate water supply. In the south there is practically a barren desert. In the extreme north good crops are usually raised without irrigation. There is a larger irrigated area in this province —11,589,778 acres in 1912–13—than in any of the other governmental divisions. This area has been greatly extended in recent years by the large irrigating enterprises of the government of India, the government canals supplying an area in 1912–13 of 7,026,031 acres. The area watered by wells was 3,601,882 acres, but reservoirs or tanks are almost wholly wanting. In the south the canal system of irrigation prevails and the irrigated areas fringe the river courses. In the northern half of the country wells are common, and the cultivated area is not limited to the proximity of the rivers. The Punjab has become noted for its wheat crops. It produces more wheat than any other province. The wheat-growing area was 8,766,689 acres in 1912–13. Rice, on the contrary, receives much less attention than in India generally; the area in 1912–13 was 741,901 acres. Areas planted to other important crops in the latter year were: grain, 3,400,919 acres; spiked millet, great millet, and millet, 3,909,317; maize, 1,097,989; barley, 1,006,715; all food grains and pulses, 20,405,340. Under oil seeds there were 1,093,690 acres; sugar cane, 367,373; fibres, 1,497,716 (including cotton, 1,442,929). Total area cropped, 24,159,016 acres. The general desert conditions are a serious disadvantage to pastoral pursuits, yet this industry receives considerable attention. In the drier portions of the country the most serviceable animals are camels, of which the Punjab contains over 60 per cent of all in British India. For live-stock statistics, see INDIA, *Stock Raising*.

Some manufacturing is engaged in, the Oriental domestic methods being most common. In 1912 there were 208 factories; average number of hands employed daily, 32,865. Among the chief products are muslins and other cotton goods, manufactures of camel's hair, and glazed tiles and pottery. The potter's art especially has degenerated under foreign influence. The province now has railroad connection with the three principal trade centres of India, Calcutta, Bombay, and Karachi. The Indus River affords water transportation, but railway competition has reduced this to a minimum. The principal imports into the Punjab from other parts of India include cotton goods (mostly European), sugar, rice, and iron. The leading exports are wheat, raw cotton, hides, grain and pulse, and rape and mustard seed. Over 90 per cent of the wheat passes through the port of Karachi.

The chief executive officer of the province is the Lieutenant Governor, who is appointed by the Governor General with the approval of the Secretary of State for India. The Lieutenant Governor has no executive council, but under the Government of India Act (1912) he appoints a legislative council of 27 members (11 official, 14 unofficial, and 2 experts).

The population of the Punjab directly under British administration in 1891 was 19,009,368; in 1901, 20,330,337; in 1911, 19,974,956. These figures include the population (about 390,000) of Delhi, with surrounding territory, which in 1912 was detached and made a chief commissionership. The population per square mile in 1911 was 200; that of the native states was, in 1901, 4,424,398; in 1911, 4,212,794. Since the Punjab lies at the northwest gateway of India, the various migrations and military expeditions from the west have passed through it, making it the scene of numerous conflicts. The result has been that in many respects it is different from the other portions of India. The Caucasian blood is more pronounced, as is also the military spirit. The Jats constitute a large part of the population. The Pathans have scattered settlements throughout the province, and the Beluchis have settlements on the lower Indus. Over one-half of the people are Mohammedans. A large number of Jats are Hindus. The Sikhs (q.v.) are an offshoot from the Hindu Jats. The caste system, as adopted by the Indus valley Jats, differs materially from the original system. The sikhs have endeavored without success to abolish caste. As in other parts of India, most of the population live in rural villages. The largest cities (after Delhi, which had 232,837 inhabitants in 1911) are: Lahore, the capital, 228,687; Amritsar, 152,756; and Multan, 99,243. For further statistics of population, see INDIA. In 1913 there were in the Punjab (including Delhi) 8526 schools of all grades, with 421,766 pupils (of whom 59,561 are female). For the history of the Punjab, see SIKHS; for the language, see PANJABI LANGUAGE AND LITERATURE.

Bibliography. *Report on the Administration of the Punjab and its Dependencies* (Lahore, 1863 et seq.); Sir L. H. Griffin, *The Rajas of the Punjab* (2d ed., London, 1873); Cunningham, *Archæological Survey of India*, vol. xiv (ib., 1882); Medlicott, *Sketch of the Geology of the Punjab* (Calcutta, 1888); F. A. Steele, *Tales of the Punjab Told by the People* (New York, 1894); F. St. J. Gore, *Lights and Shades of Hill Life in the Afghan and Hindu Highlands of the Punjab* (London, 1895); Muhammad Latif, *History of the Punjab from the Remotest Antiquity to the Present Time* (ib., 1896); Gough and Innes, *Sikhs and the Sikh War: The Rise, Conquest, and Annexation of the Punjab State* (ib., 1897); T. L. Pennell, *Among the Wild Tribes of the Afghan Frontier* (2d ed., Philadelphia, 1909); F. B. and W. H. Workman, *Peaks and Glaciers of Nun Kun* (New York, 1910).

PUN'KIE (of uncertain etymology). One of the biting midgets of the family Chironomidæ and genus *Ceratopagon*. These flies are very minute, and one species (*Ceratopagon nocivum*) is the cause of considerable distress to hunters in the Maine woods, where it is called no-see-um. Other species are found in both North and South America. The larvæ feed on decaying animal or vegetable matter.

PUNNAH, pŭn'a. A native state of India. See PANNA.

PUN'NETT, REGINALD CRUNDALL (1875–). An English zoölogist, born at Tonbridge, Kent, and educated at Clifton and at Caius

College, Cambridge. He was lecturer in St. Andrews University from 1899 to 1902, fellow of Caius College (1901), professor of biology at Cambridge (1909–12), and thereafter professor of genetics in the same university. He became a fellow of the Royal Society in 1912. In his field, mainly the study of heredity, he published, besides papers, *Mendelism* (1905).

PUNO, pōō'nō. The southeasternmost department of Peru (Map: Peru, C 6). Area, about 41,200 square miles. The north part of the department is occupied by the Carabaya Range of the eastern cordillera of the Andes, whose forest-covered slopes belong to the region of the Montaña and give rise to the river Madre de Dios. The south half belongs to the basin of Lake Titicaca, a part of which lies in the east of the department. The greater part of the inhabitants, chiefly Aymara Indians, live in the lofty Titicaca basin, where the climate is cold and but little agriculture can be carried on. The chief occupations are the mining of gold and silver and cattle raising, especially llamas and vicuñas. Pop., 1896, 537,345; 1910 (est.), 403,000. The capital is Puno (q.v.).

PUNO. The capital of the Department of Puno, Peru, 100 miles east of Arequipa, on the west shore of Lake Titicaca and on the Southern Railway of Peru (Map: Peru, D 7). It is the centre of an extensive transit trade between Bolivia and other countries. There are gold, silver, and copper mines in the vicinity. Pop. (est.), 11,081.

PUN'SHON, WILLIAM MORLEY (1824–81). An English Wesleyan Methodist minister. He was born at Doncaster, Yorkshire, became a local preacher in the Methodist church, entered the ministry in 1844, and was sent for a few months to the theological institution at Richmond. His first regular parish was Whitehaven (1845), and he held pastorates in Newcastle-on-Tyne, Sheffield, Leeds, London, and Bristol. In 1868 he was sent to Canada, where he was president of the conference for five successive years, and was instrumental in building churches, strengthening Victoria University, and enlarging the denomination. In 1873 he returned to England. In 1875 he became secretary of the Wesleyan Methodist Missionary Society. He published volumes of addresses, lectures, and sermons and one volume of poems. Consult F. W. Macdonald, *Life of William Morley Punshon* (3d ed., London, 1888), and J. Dawson, *Morley Punshon, the Orator of Methodism* (ib., 1906).

PUNT, pōōnt (Egypt. *Puĕnt*). A country on the Red Sea, often mentioned in the hieroglyphic inscriptions, whence the Egyptians obtained incense, gold, ebony, ivory, leopard skins, ostrich feathers, and other commodities. The earliest recorded voyage to Punt was under King Assa of the fifth dynasty, and King Se'ankh-ka-rē of the eleventh dynasty sent an expedition which, crossing the desert from Koptos to the Red Sea, built a ship and sailed down the coast to Punt. Expeditions were also sent thither by Amenemhat II, Thothmes III, Ramses III, and other monarchs. Queen Hatshepsut (Hatasu), who sent a whole fleet to Punt, caused the details of the voyage to be depicted upon the walls of the temple of Deir el Bahri, with interesting representations of the inhabitants of the land and of their dwellings. The question as to whether Punt was on the Asiatic or the African side of the Red Sea has caused much discussion, but from the evidence of the monuments it seems to have corresponded with the modern Abyssinian and Somali Coast. Consult: Johannes Dümichen, *Die Flotte einer ägyptischen Königin* (Leipzig, 1868); Müller, *Asien und Europa* (ib., 1893); Adolf Erman, *Life in Ancient Egypt* (London, 1894); Naville, "Deir el-Bahri," in *Egypt Exploration Fund, Memoirs XII, XIII, XIV, and XIX* (London, 1894 et seq.); J. H. Breasted, *A History of the Ancient Egyptians* (New York, 1908).

PUNT, pŭnt (AS. *punt*, from Lat. *ponto*, punt, pontoon, from *pons*, bridge). A heavy, oblong, flat-bottomed boat, propelled by a pole thrust against the bottom of a river or lake and useful where stability and not speed is needed. It is a primitive form of boat, found in many countries, notably from ancient times on the waterways of Mexico. Punting has, however, become a popular sport, especially in England, where the conditions of climate and the nature of the rivers are particularly favorable to it. The Thames Punting Club was revived in 1890 and holds championship and other races. This club differentiates punts from other partly similar boats by defining a punt as "a flat-bottomed craft without stem, keel, or stern post, and with the width at each end at least one-half of the width of the widest part." Amateur punting championships have been held in England annually since 1886, and professional races since 1876. See BOAT.

PUNTA ARENAS, pōōn'tà à-rā'nàs. A port of Chile, situated on the northwest shore of the Strait of Magellan, capital of the Territory of Magallanes. The town has broad streets, several fine buildings, and electric lighting. There are coal, copper, and gold mines and considerable timber in the vicinity. Stock raising is the chief occupation. Punta Arenas is a port of call and coaling station for all steamers passing through the strait, and has a trade in wool, skins, beef, and other cattle products. It is the seat of a United States consul. Pop., 1907, 12,199.

PUNTARENAS, or **PUNTA ARENAS.** The principal seaport on the Pacific coast of Costa Rica, situated on the Gulf of Nicoya, 44 miles west of San José (Map: Central America, E 6). Its harbor is provided with an iron breakwater, but large vessels anchor outside. It is the western terminus of the transcontinental railroad from Port Limón. It has steamship communication with the United States. In 1913 its exports included coffee, rubber, tortoise shell, and silver. It is the seat of a United States consular agent. Pop. (est.), 4735.

PUNXSUTAWNEY, pŭnks'sụ-tą'nĭ. A borough in Jefferson Co., Pa., 106 miles by rail northeast of Pittsburgh, on the Buffalo, Rochester, and Pittsburgh and the Pennsylvania railroads (Map: Pennsylvania, D 5). Among the features of interest are the two hospitals, a sanitarium, the John A. Weber Memorial Manual Training School, and post-office and high-school buildings. The manufactories include glassworks, foundries, ironworks, machine shops, and planing, flour, feed, and silk mills. A high-grade bituminous coal is mined in the surrounding region, and there are some farming and stock-raising interests. Punxsutawney and Clayville boroughs were consolidated and incorporated in 1907 as Greater Punxsutawney. Pop., 1900, 6746; 1910, 9058; 1914 (U. S. est.), 10,043.

PU'PA (Lat., doll, puppet). That stage in the life of an insect having perfect metamorphoses which intervenes between the larva and the adult. See INSECT; METAMORPHOSIS.

PUPIE'NUS (M. CLODIUS PUPIENUS MAXIMUS). Joint Emperor of Rome with Balbinus for a few months in 238. They were elected by the Senate when the news came that the two Gordians had died in Africa, and both were before long assassinated by the soldiery.

PUPIL, OF THE EYE (from Lat. *pupilla*, a ward, minor, dim. of *pupa*, a girl, lass). The aperture in the iris through which light penetrates to the interior of the eyeball. The normal pupil is round and constantly varies in size according to the requirements of accommodation and the necessity for regulating the amount of light. Contraction and dilation of the pupils are effected through a complex nervous mechanism, acting on the sphincter and radiating fibres of the iris. Irritation of the sympathetic nerves dilates the pupil, irritation of the oculomotor fibres contracts it. It dilates in the dark and contracts in bright light and when the eyes converge upon near objects. It dilates when the skin of the neck is pinched or pricked because of irritation of the cervical sympathetic nerves. Certain drugs have the power of dilating or contracting the pupil. (See MYDRIATICS; MIOTICS.) Normally the pupils are equal in size, and their edges are smooth; but inflammation of the iris may prevent their natural movement on one side or the other, making them unequal in outline. Differences in refractive conditions of the two eyes will sometimes account for unequal pupils (*anisocoria*). *Hippus* is a term applied to the rapid contraction and dilatation of the pupils on sudden exposure to light; it may be seen in health, but it is an important diagnostic sign in the early stages of meningitis, hysteria, and disseminated sclerosis. A transient, rapid, unsymmetrical dilation of the pupil has been put forward as an important diagnostic sign in early tuberculosis. It is believed to be owing to irritation of the upper thoracic sympathetic ganglion by tuberculous glands. The behavior of the pupil in locomotor ataxia is an important diagnostic sign. This, the so-called Argyll Robertson (a Scottish physician, 1837–1900) pupil, does not respond to light, but does react to accommodation. A similar pupillary phenomenon is observed also in cerebral syphilis and progressive paresis. It is thought to depend on sclerotic changes in the fibres of that portion of the nucleus of the third nerve which governs the light reflex, the part that presides over accommodative contraction not being implicated. In optic atrophy and glaucoma the pupils are widely dilated and fixed because the retinal fibres are unresponsive to light. The pupils are dilated in shock, collapse, profound anæsthesia, anæmia, brain tumor, or abscess, the later stages of meningitis, in aortic regurgitation, asphyxia, and postdiphtheritic paralysis of the third nerve. During sleep and in old age the pupils are contracted. See EYE.

PUPIN, pū-pēn', MICHAEL IDVORSKY (1858–). An American physicist and inventor, born at Idvor, southern Hungary, of Servian ancestry. He was educated at the village school of his native town and at a military school at Prague and came to America in 1874. He graduated from Columbia College in 1883, and studied mathematics and physics at Cambridge and at Berlin (Ph.D., 1889). While abroad, he held the John Tyndall Fellowship of Columbia. Upon his return to America he was appointed instructor in mathematical physics at Columbia University, in 1892 adjunct professor of mechanics, and in 1901 professor of electromechanics. In 1911 he became director of the Phœnix Research Laboratories. He was elected a member of the National Academy of Sciences in 1906. Professor Pupin's most important researches were in electrical resonance, in theoretical and experimental consideration of the magnetization of iron, and in electrical-wave propagation, a field in which he applied his researches to long-distance telephony and multiplex telegraphy. (See TELEPHONE.) The Bell Telephone Company in the United States and the German telephone interests in Europe acquired rights in Professor Pupin's telephone patents. Upon the outbreak of the Balkan War (1912), Pupin was appointed by the Servian government Honorary Consul General in New York, and at that time and also during the Great European War he was an active exponent of the Servian cause. In the summer of 1915 he organized a group of Columbia students who went to Servia for relief work.

PUPIP'ARA (Neo-Lat., from Lat. *pupa*, doll, puppet, pupa + *parere*, to bring forth). A so-called series of flies, including those forms in which the female gives birth to full-grown larvæ which immediately transform to pupæ. The term is really erroneous, and the group is not a natural one, the points of resemblance, as Müggenberg suggests, being probably the results of convergence. The series comprises four families, the Hippoboscidæ or bird ticks (see TICK; FOREST FLY), the Braulidæ or bee lice, the Streblidæ, and the Nycteribiidæ or bat ticks. (See TICK.) The flies of this group have very abnormal habits and live by sucking the blood of mammals, birds, and bees; in some cases they are wingless parasites. The family Braulidæ consists only of a single species, *Braula cœca*, a minute insect which lives on bees. The adult is said to deposit a pupa in the cell of a bee by the side of a young bee larva. The queen bee is said to be especially affected by the adult Braulas. The series Pupipara corresponds with the group Eproboscidæ, which is ranked as a suborder of the Dipters.

PUPPER, pụp'pẽr, JOHANN. See GOCH, JOHANNES VON.

PUPPET (OF. *poupette*, doll, from Lat. *pupa*, doll, puppet). A small jointed figure, commonly of wood or cardboard, representing a character on the stage of a puppet theatre, and moved with strings, rods, or otherwise by a concealed agent. For the dialogue in this mimic drama, the invisible operator varies his voice as he takes the different rôles. The more elaborately installed puppets are now commonly called marionettes, from the French term *marionnettes*, a diminutive, perhaps through the form *mariolettes*, of Marie, and denoting originally little figures of the Virgin Mary. Of the simpler form of puppets, the familiar representatives are Punch and Judy. See PUNCH.

The origin of this form of entertainment is lost in antiquity. It was known to both Greeks and Romans. Figures with movable limbs have been found even in the tombs of ancient Egypt and of Etruria, though many of these were probably only dolls for children and afford little evidence of a puppet drama. Of this perhaps the earliest development was in India. It is

significant that the Sanskrit equivalent for stage manager, *sûtradhâra*, literally means "thread holder." In China puppet shows are likewise known, and also an adaptation of them in which the movable figures cast their shadows upon a curtain, whence the name *ombres chinoises*. See SHADOW PLAY.

Puppet shows have received perhaps their highest development among the Javanese, who may have derived the idea from India. The Javanese puppets are ordinarily about 2 feet high and of elaborate, usually grotesque formation. They are used for shadow plays as well as for direct representation, and the dramas in which they are employed are of great elaboration, often of religious and ceremonial significance. Among the Turks, too, and in Mohammedan countries generally, the puppet show is a popular entertainment, in which, it is asserted, the marionette actors exhibit a style of immorality even more atrocious than does our own Punch. Puppet shows were used in the Middle Ages by the Christian Church, among other dramatic means, such as miracle plays. In England these religious puppet plays were called *motions*. The earliest exhibitions of this kind consisted of representations of stories taken from the Old and New Testaments or from the lives and legends of saints. In Germany puppets are said to have been known as early as the twelfth century. Lessing and Goethe in their day thought the subject not unworthy of their serious artistic attention. A favorite piece in the German puppet theatres early in the nineteenth century was *Doktor Johannes Faust*, which was published at Frankfurt in 1846. In France the introduction of regular marionettes is commonly credited to Pierre Brioché, who had a puppet show on the Pont Neuf at Paris in the reign of Louis XIV, but there is reason to believe that they were really known there much earlier. They have been especially popular at Lyons, where the character of *Guignol* was invented, but naturally they are a familiar adjunct to fairs and other periodic festivities generally.

Of the marionette drama of western Europe the real home, however, seems to be among the Italians. Puppet theatres have been known for centuries at Naples, Milan, and elsewhere, and in America the best-maintained marionette shows are among Italian immigrants. The dialogue in these mimic theatres is in its detail largely extemporized. The favorite themes are legends of the court of Charlemagne. There is, moreover, a considerable literature for the marionette stage. Thus, besides what has already been mentioned, may be cited such German collections as S. A. Mahlmann, *Marionettentheater* (Leipzig, 1806), Karl Engel, *Deutsche Puppenkomödien* (Oldenburg, 1874–92), Arthur Kollmann, *Deutsche Puppenspiele* (Leipzig, 1891), and also some of the best-known pieces of Maeterlinck, to say nothing of his imitators. A distinction might, however, properly be drawn between plays actually for marionette performance and the so-called "plays for marionettes," which merely form a modern literary type subtly defined through the associations of the name. On the puppet theatre there are observations in the *Spectator* and the *Tatler*, and Addison wrote a Latin poem entitled *Machinæ Gesticulantes* (Anglice, *A Puppet Show*). Consult, on the history of the subject: Charles Magnin, *Histoire des marionnettes en Europe depuis l'antiquité jusqu'à nos jours* (2d ed., Paris, 1862); Richard Pischel, *Die Heimat des Puppenspiels* (Halle, 1900); E. Maindron, *Marionnettes et guignols: La poupée dansante et parlante depuis l'antiquité jusqu'à nos jours* (Paris, 1900); Louis Lemercier de Neuville, *Théâtre des marionnettes* (2 vols., ib., 1904); id., *Souvenirs d'un montreur de marionnettes* (ib., 1911), containing a bibliography; K. F. Floegel, *Geschichte des Groteskkomischen: Ein Beitrag zur Geschichte der Menschheit* (2 vols., Munich, 1914).

PUQUINA, pōō-kē'nȧ. A people of very low grade of culture and intelligence, formerly living upon certain islands in Lake Titicaca and the adjacent shores in southern Peru. Their language constitutes a distinct stock and is said to have been at one time one of the three general languages of Peru. Consult: D. G. Brinton, *The American Race* (New York, 1891); Raoul de la Grasserie, *Langue Puquina* (Leipzig, 1894); J. T. Polo, in Sociedad de Geografía de Lima, *Boletín*, vol. x (Lima, 1901).

PURACÉ, pōō'rȧ-sā'. A volcano rising from the Cordillera Central in Colombia, 220 miles southwest of Bogotá and immediately east of the town of Popayán. Its present height is about 15,500 feet, but previous to 1849, when its top was blown off by an explosion, it was considerably higher.

PURANA, pōō-rä'nȧ (Skt., ancient lore). The name of a class of late poetic Hindu works of mixed cosmogonic, epic, and didactic character. The word *purâṇa* occurs frequently in the prose texts of the Veda as a designation of the Veda's own cosmogonic and legendary lore; the name is also given to the great epic, the *Mahâbhârata* (q.v.). But in its most distinctive sense the word refers to a class of writings which certainly do not date before the sixth century A.D. and some of which may be as late as 1500 A.D. The existing Puranas seem to be sectarian religious manuals for the people, written in the interest of either the worshipers of Vishnu (q.v.) or Siva (q.v.). Though the fundamental Hindu Triad, Brahma, Vishnu, and Siva, is recognized, the Vishnuite Kurma-Purana does not hesitate to say: "Vishnu is the divinity of the gods, Siva of the devils"; to Brahma all alike refer only in a perfunctory fashion. According to ancient tradition the ideal Purana is divided into five parts: (1) primary creation, or cosmogony; (2) secondary creation, or the destruction and rebuilding of worlds; (3) genealogy of gods and patriarchs; (4) *Manvantaras*, the periods of reigns of Manus; (5) the history of the dynasties of kings. Though no extant Purana is so divided, yet the subject matter roughly follows that order. The entire type of composition is of secondary importance; it borrows its themes very largely from the epic literature and represents religion, practices, and legends in an exaggerated, fantastic, often distorted fashion. The actual light which the Puranas shed upon the antiquity they profess to illumine is very small. The number of Puranas is said to be 18, in the following order: Brahma, Padma, Vishnu, Siva, Bhagavata, Naradiya, Markandeya, Agni, Bhavishya, Brahmavaivarta, Linga, Varaha, Skanda, Vamana, Kurma, Matsya, Garuda, Brahmanda. Some lists omit the Agni and replace it by the Vayu-Purana. Of these the second, third, fifth, sixth, tenth, seventeenth, and probably the first are Puranas of the Vishnu sect; the fourth, eighth, thirteenth, fifteenth, and sixteenth belong to

the Siva sect. The others are not so well defined. A great many of the Puranas have been edited and published, especially in the collection of texts published in Calcutta under the name of *Bibliotheca Indica*. One of the best-known English translations is that of the Vishnu-Purana by Wilson, edited by Fitzedward Hall (5 vols., London, 1864–77). The first nine books of the Bhagavata-Purana were translated into French by Burnouf (3 vols., Paris, 1840–47). Among the recent English translations the following deserve to be noted: *Markandeja puranam* (Calcutta, 1896); M. N. Dutt, *Agni puranam* (2 vols., ib., 1903–04); Pargiter, *Mārkandeya puranam* (with notes, ib., 1904); *Ganda puranam* (ib., 1908); *The Purāṇa Text of the Dynasties of the Kaliage* (with introduction and notes, London, 1913). Consult: Roussel, *Cosmologie hindoue d'après le Bhāgavata Purāna* (Paris, 1898); H. H. Wilson, *Puranas, or an Account of their Contents and Nature* (2d ed., Calcutta, 1898); Paul and Neumann, *Krichnas Welteingang: ein indischer Mythos in zwanzig Andachten aus dem Vischnupurānam übertragen* (Munich, 1905); Jahn, *Das Sauraparāṇam, ein Kompendium spätindischer Kulturgeschichte und des Sivaïsmus* (Strassburg, 1908); A. A. Macdonell, *History of Sanskrit Literature* (London, 1913).

PURBACH, pōōr'bȧḥ, **PEURBACH,** poir'-bȧḥ, or **PEUERBACH,** poi'er-bȧḥ, GEORGE VON (1423–61). An Austrian mathematician and astronomer, born near Linz. He studied in Vienna and traveled in Germany, France, and Italy, where he delivered astronomical lectures at Ferrara, Bologna, and Padua. In 1454 he was astronomer to King Ladislas of Hungary and somewhat later was made professor of mathematics at the University of Vienna and with Regiomontanus was one of the leaders in mathematical thought in his century. Purbach compiled a table of sines, taking $60 \cdot 10^4$ for unity or the length of the radius, and thus prepared the way for decimal fractions. The table was completed after his death by his pupil Regiomontanus. Purbach also calculated new tables of the planets and gave a new list of the fixed stars. He wrote: *Tractatus super Propositiones Ptolemœi de Sinubus et Chordis* (1541); *Theoricæ Novæ Planetarum* (1488 and several later eds.); *Sex Priores Libri Systematis Almagesti* (1496, 1550); *Institutiones in Arithmeticam* (1511); *Tabulæ Eclipsium super Meridiano Viennensi* (1514). With Regiomontanus he wrote an *Epitome in Cl. Ptolemœi Magnam Compositionem* (1543). Consult: Schubert, *Peuerbach und Regiomontanus* (Erlangen, 1828); Fiedler, *Peuerbach und Regiomontanus, eine biographische Skizze* (Leobschütz, 1870).

PUR'CELL. A city and the county seat of McClain Co., Okla., 33 miles south of Oklahoma City, on the Atchison, Topeka, and Santa Fe and the Gulf, Colorado, and Santa Fe railroads (Map: Oklahoma, D 3). It is situated in a farming district, producing chiefly alfalfa, cotton, small grain and corn, and it has oil and flour mills and elevators. Purcell adopted the commission form of government in 1911. Pop., 1900, 2553; 1910, 2740.

PURCELL, HENRY (1658–95). One of the most eminent of English musicians. He was born at Westminster and was the son of Henry Purcell, one of the gentlemen of the chapel royal appointed at the Restoration. He lost his father at the age of six and was indebted for his musical training to Cook, Humphreys, and the famous English Church organist and composer, Dr. Blow. His compositions at a very early age showed evidence of talent. In 1680 he was chosen to succeed Dr. Christopher Gibbons as organist of Westminster Abbey, and in 1681 he was made organist of the chapel royal. He wrote numerous anthems and other compositions for the Church, which were eagerly sought after for the use of the various cathedrals, most of which have retained their place and popularity to the present day. Purcell's dramatic and chamber compositions are even more remarkable. Among the former may be mentioned his music to *The Tempest*, his songs in Dryden's *King Arthur*, his music to Howard's and Dryden's *Indian Queen*, to Urfey's *Don Quixote*, and his *Fairy Queen*, the manuscript of which, long lost, was found in 1901. A great many of his cantatas, odes, glees, catches, and rounds are yet in demand throughout England. In 1683 he composed 12 sonatas for two violins and a bass. Purcell studied the Italian masters deeply and often made reference to his obligations to them. In originality and vigor, as well as harmony and variety of expression, he far surpassed both his predecessors and his contemporaries. His Church music was collected and edited from the original manuscript by Vincent Novello, in a folio work which appeared in 1826–36, with a portrait and essay on his life and works. He was regarded as the father of what has since come to be recognized as English melody. He died of consumption in London and was buried in Westminster Abbey. Consult: J. F. Runciman, *Purcell* (London, 1909); W. H. Cummings, *Purcell* (ib., 1911); P. Scholes, *Life of Purcell, the Master Musician* (New York, 1915).

PURCELL, JOHN BAPTIST (1800–83). An American Roman Catholic bishop. He was born at Mallow, Ireland, but early came to the United States. He studied at Asbury College (Baltimore) and at Mount Saint Mary's College (Emmitsburg, Md.), where, after study abroad, he became professor of moral philosophy and later president. In 1833 he became Bishop of Cincinnati, in 1839 assistant at the pontifical throne, and in 1850 Archbishop of Cincinnati.

PUR'CHAS, SAMUEL (c.1575–1626). An English clergyman and author. He was born at Thaxted, Essex, graduated from St. John's College, Cambridge (1600), and held several livings, becoming chaplain of St. Martin's, Ludgate, London. Having inherited many unpublished narratives from Hakluyt, he afterward devoted himself entirely to literary work. His works are: *Purchas, His Pilgrimage, or Relations of the World and the Religions Observed in All Ages* (1613), a compilation of the reports of voyagers, some 1200 authors being consulted; *Purchas, His Pilgrim. Microcosmus, or the History of Man. Relating the Wonders of His Generation, Vanities in His Degeneration, Necessity of His Regeneration* (1619); *Hakluytus Posthumus, or Purchas His Pilgrimes, Containing a History of the World in Sea Voyages and Land-Travells by Englishmen, and Others* (4 vols., 1625, reprint 20 vols., Glasgow, 1905–07). This work contains the matter left by Hakluyt, and is valuable, despite many errors.

PURCHASE. A mechanical contrivance of pulleys and ropes for gaining power. See BLOCK; PULLEY; TACKLE.

PURCHASE. In its technical legal sense, the act by which a person acquires an estate in land in any way other than by inheritance, where the heir is substituted in place of his ancestor by operation of law. Thus, one who acquires lands by gift or by devise is a purchaser, as well as one who buys it for a valuable consideration. See SHELLEY'S CASE, and consult the authorities referred to under REAL PROPERTY.

In a popular sense the word "purchase" denotes the act of buying any kind of property, the purchaser being called the *vendee* and the seller the *vendor*. See SALE.

PURCHASE SYSTEM. A former system of obtaining commissions in the British army, abolished by royal warrant in July, 1871. The system did not exist in the Royal Artillery, Engineers, Marines, 19th to 21st regiments of cavalry, and the 101st to 109th regiments of foot. Regulations fixed the value of the different grades as follows:

Lieutenant colonel	£4,500
Major	3,500
Captain	1,800
Lieutenant	700
Cornet or ensign	450

In practice much higher prices would often be paid, particularly in the Guards regiments. No rank above lieutenant colonel could be purchased. The United States Army Regulations provide five different ways by which an enlisted man may be discharged before the expiration of his term of enlistment. One of these is "discharge by purchase," the rules and prices governing such discharge being published from time to time by the War Department.

PURCHAS JUDGMENT. A celebrated ecclesiastical judgment rendered by the judicial committee of the Privy Council in Herbert *v.* Purchas, an appeal from the Canterbury Court of Arches brought in 1871. The defendant or respondent was charged with popish practices in connection with public services conducted by him at St. James's Chapel, Brighton, England. The principal offenses charged were the use of the mixed chalice, of a cap or biretta, of "holy water," and of wafer bread in the Eucharist, the wearing of certain vestments, and the turning of his back to the people at certain stages of the service. The decision of the court was adverse to Mr. Purchas on all points except that relating to the biretta. The judgment was rendered on an ex parte hearing, as the respondent was provided with funds to procure counsel only after the decision was pronounced; his petition for a rehearing of the case was refused, and the course of the court in so doing was the subject of much unfavorable comment. Mr. Purchas was compelled to pay the costs and admonished to discontinue the prohibited practices. He refused to comply and in 1872 was suspended and his property sequestrated to pay the costs of the suit.

PURDUE (pēr-dōō′) **UNIVERSITY.** A coeducational State institution of higher learning at Lafayette, Ind., established in 1869 and named for John Purdue, an early benefactor. Its income is derived chiefly from the land grant of 1862 and from the Morrill and Hatch acts and State appropriations and amounted in 1914 to $567,070. The university is in effect an Indiana institute of technology. It embraces seven schools: Mechanical Engineering, Civil Engineering, Electrical Engineering, Chemical Engineering, Agriculture, Science, and Pharmacy. Students in each of the schools are required to spend an average of three hours a day in laboratory, shop, or field. It confers the degrees of bachelor of science and pharmaceutical chemist in course, and the following degrees for advanced work: master of science, mechanical, electrical, civil, and chemical engineer. In 1914 there were 2252 students and 188 instructors. The university has 279 acres of land in its campus and farm. Its endowment was $340,000, its grounds and buildings were valued at $1,403,000, and the total value of its property was $1,950,950. The library contained 40,000 volumes. The president in 1915 was W. E. Stone, LL.D.

PURE-FOOD LAW. A law passed by the Congress of the United States in June, 1906, and which went into effect on Jan. 1, 1907. It prohibits misrepresentation and adulteration and the misuse of preservatives in the preparation of foodstuffs and drugs. A fine not to exceed $500 or one year's imprisonment or both is the penalty for the first offense and for each subsequent offense and conviction a fine of not less than $1000 or one year's imprisonment or both. The administration of the law is in the hands of the United States Department of Agriculture with the collaboration of the Treasury Department and the departments of Commerce and Labor. For the provisions of the law, see ADULTERATION; FOOD.

PUREQUE. See GUITAR FISH.

PURGATION. See COMPURGATION.

PUR'GATIVES (Lat. *purgativus*, cathartic, from *purgare*, to cleanse, from *purus*, pure + *agere*, to drive, to do). Medicines which, within a comparatively short time after administration, produce a more or less fluid evacuation of the bowels. These drugs act partly by stimulating the peristaltic motion (q.v.) of the intestine, whereby the contents of the bowel are hurried in their passage to the rectum, and partly by determining the passage of a large amount of fluid into the intestine from the blood vessels. They may be classified as follows: 1. *Laxatives* (see LAXATIVE). 2. *Simple purgatives*, including aloes, rhubarb, cascara sagrada, senna, and ox gall. 3. *Drastic purgatives*, such as jalap, scammony, gamboge, croton oil, colocynth, elaterium, and calomel. Small doses of the drastic purgatives act as mild cathartics; when taken in large doses, they act as irritant poisons and are employed when milder purgatives have proved inefficient or when it is necessary to remove a large quantity of fluid from the system, as in dropsical affections. Certain of these drugs, as jalap, elaterium, and scammony, are called *hydragogue* cathartics because of the large amount of secretion they excite. 4. *Saline purgatives*. These also increase the secretion of intestinal fluid and hinder its reabsorption, so that a large amount of it accumulates in the bowel and excites gentle peristalsis and a free evacuation. The salines are largely used as habitual purgatives. They form the essential ingredient of most purgative mineral waters (q.v.). In this class are sulphate of magnesia, sulphate of soda, phosphate of soda, and the potassio-tartrate of soda either in simple solution or in the form of Seidlitz powder (q.v.). 5. *Cholagogue purgatives* are those which have a stimulating effect either on the secretion or flow of the bile and produce green-colored or "bilious" stools. Several of the drugs already mentioned possess this property. Among the cholagogues most frequently employed are

podophyllin, calomel, mercury, and the phosphate and sulphate of soda. Consult W. H. White, *Materia Medica* (13th ed., London, 1914).

PURGATORIO, pōōr'gȧ-tō'rē-ō (It., Purgatory). The second part of Dante's *Divina Commedia.*

PUR'GATORY (Late Lat. *purgatorium,* from *purgare,* to cleanse). In theology, the condition or place in which souls of the baptized who die guilty of venial sins or liable to temporal punishment for sins are cleansed and made meet to enter the purity of heaven. "All who die at peace with the church, but are not perfect, pass into purgatory." Such souls are still linked by sympathy with the church on earth and may be aided by the prayers of Christians and especially by the sacrifice of the Mass in their behalf. The belief in purgatory was declared by the Council of Trent to be a matter of Catholic faith. The belief was laid down as a dogma by Gregory the Great (604). The doctrine is based by Catholic theologians on biblical passages using fire as the symbol of purification (Mal. iii. 2; Matt. iii. 11; 1 Pet. i. 7), the late Jewish belief in prayers for the dead (2 Macc. xii. 40 ff.; Tobit iv. 18; see PRAYER FOR THE DEAD), and the evidences of the belief in the early Church. In the Middle Ages the belief in purgatory became universal, and Aquinas, Bonaventura, Gerson, and other theologians held that the fire was material. The Greek church holds to an intermediate state in which the soul is fitted for heaven and may be benefited by the prayers of the living, but refused to affirm material fire. The early reformers—the Cathari, the Waldenses, Wiclif, and his followers—denied the doctrine. Protestant theology rejects it on the ground that it is not taught in the Bible and that the conception of salvation by faith leaves no room for a separation of the faithful from God after death. Consult: W. Barrows, *Purgatory Doctrinally and Historically Opened* (New York, 1882); J. Bautz, *Das Fegfeuer* (Mainz, 1883); Louvet, *Das Fegfeuer* (Paderborn, 1895); William Allen, *Souls Departed* (new ed., St. Louis, 1901); A. J. Mason, *Purgatory* (London, 1901). See ESCHATOLOGY; INTERMEDIATE STATE.

PURG'STALL, JOSEPH HAMMER-. See HAMMER-PURGSTALL.

PURI, pōō'rē. See JAGANNATH.

PURIFICA'TION (Lat. *purificatio,* from *purificare,* to make pure, from *purus,* pure + *facere,* to make). In a biblical sense, the act through which an individual became fit to approach the deity or regained his place in the community after having been excluded from it by some disability. Purification consisted chiefly in ablutions, but these were sometimes accompanied by special sacrifices as expiations. Priests and Levites were consecrated for the divine service by "purification" (Lev. viii), and certain religious acts could be performed only after ablutions. Generally no one was allowed to enter the temple or synagogue without washing or "sanctifying" himself. In the postexilic period washing was considered by some (as the Pharisees and Essenes) one of the chief duties of piety. Apart from the temple service, however, many other things required purification. (See UNCLEANNESS.) It is a mistake to assume that the origin of laws of purification is hygienic; they are merely phases of the general notions of taboo (q.v.). The question of health naturally enters later, in the reflective age, but has no force in primitive times. Laws similar to the Jewish are found among Mohammedans, and with Hindus and Persians laws of purification are even more exacting.

PU'RIM. One of the later Jewish festivals. According to the Book of Esther this festival was instituted to commemorate the deliverance of the Jews of Persia from a massacre with which they were threatened in the days of Xerxes (485–465 B.C.) at the instigation of Haman, the King's prime minister. It is celebrated on the fourteenth and fifteenth of the month Adar and is preceded by a day of fasting as preparation. (Cf. Esther iv. 15–17.) Scholars who hold that the Book of Esther (q.v.) is largely or purely fictitious think that it may have been written to justify and account for a fast and festival the origin of which was lost in obscurity. What the earlier significance of fast and festival was can only be conjectured in the absence of definite data. They are thought to be of Babylonian origin. The occurrence in the spring suggests a solar festival, the fast representing the death of winter, while the festival marks the joyous return of spring. Thus interpreted, Haman and Vashti symbolize the disappearance of the old year; Mordecai and Esther, hailed as King and Queen, are the new favorites who bring in fertility and renewal of vegetation. Mordecai is regarded as a derivative of Marduk, the chief god of Babylon; Esther is thought to be a form of Ishtar, the Babylonian goddess; while Haman is supposed to represent the Elamitish divinity Humman. It is possible that this Babylonian festival, originally celebrating the deliverance from Elamitish power, survived through the Persian period and received new features. The Feast of Purim corresponds in time with a festival, mentioned in the Books of the Maccabees, in celebration of a victory gained by Judas Maccabæus, on the thirteenth of Adar, 161 B.C., over Nicanor (1 Macc. vii. 49; 2 Macc. xv. 36). This seems to have been earlier a festival in honor of the dead. See FESTIVALS.

The name Purim is explained in the Book of Esther as "lots," and the application of it to the festival as due to the fact that Haman cast lots to determine a day favorable for the extermination of the Jews (Esther iii. 7; ix. 26). This is probably merely a piece of folk etymology and illustrates the obscurity as to the meaning of the name at the time of composition of the book. In Babylonian there is a word *puru,* one meaning of which seems to have been "a round stone," and then "lot," from the use of stones in divination. Possibly the Jewish author of the Book of Esther, living in Persia or Babylonia, had this word in mind, but it does not necessarily follow that *pūrim* is identical with *puru.*

As celebrated by Orthodox Jews, the Purim festival is a time of feasting and merrymaking. It begins as soon as the stars appear on the evening of the fourteenth of Adar. Among some of the Levantine Jews the custom still prevails of whitewashing the tombs and bringing offerings of flowers at the Purim festival; and this has been interpreted by some scholars as a survival from the time when the festival was connected with the ancestral cult.

Frazer, *Golden Bough: A Study in Magic and Religion*, part iii (3d ed., London, 1911).

PURINE, pū'rĭn (from Lat. *pus, puris*, pus). A group of chemical combinations containing the purine nucleus C_5N_4, better called purine bases or bodies. The hydrogen compound of the nucleus C_5N_4 is called purine proper ($C_5N_4H_4$). We have three classes of purine bases, (1) oxypurines, which are supposed to represent end products of the breaking up of the nucleins of the muscles; (2) aminopurines, and (3) methylpurines.

PU'RITAN, THE. A yacht which defended the America's cup in 1885. See YACHTING.

PURITANI, Ī, ē pōō'rē-tä'ne (It., The Puritans). An opera by Bellini (q.v.), first produced in Paris, Jan. 25, 1835; in the United States, Feb. 3, 1844 (New York).

PU'RITANS (from Lat. *puritas*, purity, from *purus*, pure). A party title, originally a nickname which came into use about 1564, to designate that section of the Church of England which desired a more thorough reformation of the church than was effected under Elizabeth, as such reformation was understood by continental Protestantism, especially of the Calvinistic school. From the beginning of the Reformation age there had been three parties in the Church of England: a Romanizing element which desired to continue the connection with the Pope, whom it regarded as the vicar of Christ; a Protestant party, which desired the full modification of the Church of England, at least in doctrine, into conformity with continental Protestantism; and an intermediate party that, for want of a better designation, may be called Anglican, which wished to see all foreign ecclesiastical authority rejected, disliked monasticism, and welcomed the use of English in the services of the church, but did not desire such thoroughgoing modification of its doctrine or organization as the Protestant section sought. This Anglican party looked to the sovereign as the source of ecclesiastical government and was that which was represented by Henry VIII and Elizabeth. To the thinking of these energetic monarchs the desirable system of Church government for England was one in which the ruler should be supreme in ecclesiastical no less than in civil affairs. At the beginning of the reign of Queen Elizabeth a minority only of the population was heartily in sympathy with the Reformation. The great bulk of the clergy had been swept almost without question from the Roman obedience of Queen Mary's time into Elizabeth's Establishment; and the Queen's political policy, no less than her personal preferences, counseled her to make the ecclesiastical transition as easy as possible by retaining not a little of the ceremonies and vestments of the older worship and by insisting upon uniformity of ceremonial without very strenuous investigation into the belief or even the conduct of the ministry.

This compromise policy, however, was distasteful to the thoroughly Protestant party in the Church of England. Yet at first few of the Puritan leaders desired anything more than the disuse of the vestments, which seemed to them to symbolize too great a distinction between clergy and laity, and the abandonment of certain ceremonies which appeared to them to countenance what they deemed Roman sacramental misconceptions. Strongly conscious of the spiritual needs of England, they desired, furthermore, the establishment everywhere of an earnest preaching ministry and of vigorous discipline. These aims conflicted, however, with the Queen's policy of inclusion, and she set herself vigorously to enforce conformity in ceremony by the aid of the Bishops, who under the Elizabethan policy were regarded primarily as royal agents.

The result of this policy was a further evolution in Puritanism itself. While a great portion of the Puritans continued to represent the desires of the earlier period of the party which have just been described, a considerable section now went further and questioned the rightfulness of that form of Church government "by law established" which prevented the reforms they wished. The typical leader of this second stage of Puritanism was Thomas Cartwright (1535–1603). In his opinion the only biblical system of Church government was one essentially Presbyterian; and while he was willing to tolerate the existence of an extremely modified episcopacy, he would introduce into each parish the disciplinary and elective features of Presbyterian government. From thence onward until the Restoration, a large portion of the Puritan party walked in Cartwright's footsteps and sought the modification of the Church of England essentially along Presbyterian lines. In 1567 a congregation of Puritans met for private worship without the obnoxious vestments and ritual prescribed by the Queen through Parker and the other Bishops, but their leaders were soon imprisoned. A small wing of extreme Puritanism went yet further and under the leadership of Robert Browne, Henry Barrow (qq.v.), and others, insisted that the only proper organization of the church was in separate self-governing congregations, and that it was the duty of Christian men to leave the Church of England and establish such congregations; hence this extreme radical wing of Puritanism was known as the Separatists. These Separatists were vigorously opposed by the more moderate Puritans of Queen Elizabeth's time; but their spiritual sympathizers were to be the founders of Plymouth in New England, and their conception of Church government was ultimately to dominate the Puritan settlers of Massachusetts and Connecticut.

Throughout the reign of Elizabeth the repressive policy of the government continued, but the Puritan party grew and on the death of the Queen, in 1603, entertained strong hopes of favor from the new sovereign, James I. These hopes were disappointed, notably at the Hampton Court Conference (q.v.) in 1604. The Puritan party, however, continued to gain adherents throughout James's reign and that of his son Charles I. Under the latter repeated clashes occurred between the Puritans and the Anglican court party; and when the Civil War broke out in 1642 as a result of the many points of difference between Charles and the Parliament, the Puritans identified themselves strongly with the latter, while the Anglicans cast in their lot with the former. In the struggle that followed the Presbyterian wing of Puritanism was at first dominant, especially when reënforced by

the military and political aid of the Scotch. Episcopacy was done away with so far as an act of Parliament could abolish it. The acceptance of the Solemn League and Covenant bound the English Parliament to practical Presbyterianism, and Parliament responded to the desire for a modification of the Church of England, always characteristic of Puritanism, by calling an Assembly of Divines, which met at Westminster from July, 1643, onward, to recommend alterations in doctrine and Church government. (See CREEDS AND CONFESSIONS.) The result of its sessions was the preparation of an essentially Presbyterian Directory for Worship and form of discipline, of a Confession of Faith, and of two Catechisms. This Westminster Confession was accepted by the General Assembly of the Church of Scotland in 1647 as its doctrinal standard, and approved, with some modifications, though not completely given the sanction of law, by the English Parliament in 1648.

But while the Westminster Assembly had been doing this work, the influence of anti-Presbyterian types of opposition to episcopacy had been growing in the army. The Presbyterian majority in Parliament and in the Westminster Assembly were as strongly insistent on uniformity and as opposed to toleration as the Anglican party had been. But the more radical religious thinkers represented in the army, who were grouped together under the general name of Independents, demanded by their very variety of opinion a certain measure of toleration, and the course of the struggle made the army the dominant force, for the time being, in English political life. The result was that the Presbyterian system was never fully established in England and the Westminster Confession of Faith never obtained more than a limited recognition there. The forces of Puritanism were divided, and Presbyterian Puritanism found it impossible to establish the principles which it desired to make controlling. Under the protectorship of Cromwell to his death, in 1658, the army's principle of partial toleration was dominant. His death left no efficient successor, and the restoration of the monarchy and with it Anglicanism was inevitable. Attempts were made at adjustment by which the Presbyterian wing of Puritanism, at least, might be included in the Establishment, and men like Richard Baxter labored to this end, but without success. Puritanism, instead of being a party within the Church of England as it had thus far been, was driven outside that church and made to assume the attitude of Dissent, to the great spiritual loss of the English Establishment. The triumphant Anglican faction adopted a rigorously persecuting policy towards Puritanism. Under the Act of Uniformity (q.v.) all Puritans who would not wholly accept the Prayer Book were driven from their livings. Episcopal ordination was now made obligatory; and by the Conventicle Act of 1664 any assembly of five or more persons not of the same family, for worship, was forbidden, save in conformity with the Church of England. The Five-Mile Act of 1665 forbade all in holy orders who would not take oath never to attempt any alteration in the government of church or state to continue to live within 5 miles of where they had exercised their ministry or of any English borough.

James II modified this repressive policy by issuing a Declaration of Indulgence in 1687; but a permanent legal status was not acquired by Puritan Dissent until after the revolution which put William and Mary on the throne. The Toleration Act of 1689 gave to the evangelical dissenting bodies a permanent and recognized, if limited, freedom of worship and an established legal position. At the time of the Toleration Act about two-thirds of the Puritan Dissenters appear to have been Presbyterian in polity and one-third Congregational or Baptist. During the course of the eighteenth century the Presbyterian wing of Puritanism became largely affected by Arian and Unitarian opinions, while the Congregational section was not so influenced to any marked extent. By the beginning of the nineteenth century the Congregational wing was the largest, and the spiritual life of Puritanism had been greatly reënforced by the effect of the Wesleyan movement. Its later history may be traced in the story of the religious bodies known as Presbyterian, Congregational, and Baptist.

Outside of England, the chief effect of the Puritan movement is to be seen in the planting of New England and the development of its characteristic religious faith and ecclesiastical polity. See CONGREGATIONALISM.

PURKINJE, pur'kin-yĕ, JOHANNES EVANGELISTA, KNIGHT VON (1787–1869). An Austrian physiologist, born at Libochowitz, near Leitmeritz, Bohemia. At 18 he entered the Order of Piarists, with whom he served as a teacher, but he left after three years, before taking orders. He then studied medicine at the University of Prague (M.D., 1819), becoming assistant there and returning, after 26 years (1823–49) at Breslau, to fill the chair of physiology. While in Breslau he arranged a physiological laboratory in his own house (1824), thus becoming the founder of laboratory training in German universities. Purkinje was the leading physiologist of his time, his observations and discoveries in the field of ophthalmology, embryology, and histology being of the greatest importance. His dissertation *Beiträge zur Kenntniss des Sehens in subjectiver Hinsicht* (1819) was a notable work, and brought him the friendship of Goethe. Ophthalmology he followed up for the next four years, making valuable discoveries of subjective visual figures, recurrent images, etc. In 1823, 70 years before Sir Francis Galton, he pointed out the importance of finger prints in *De Examine Physiologico Organi Visus et Systematis Cutanei*. In 1825 he described the germinal vesicle in the egg, *Symbolæ ad Ovi Avium Historiam ante Incubationem;* in 1833 he discovered the sudoriferous glands of the skin with their excretory ducts (in Wendt's dissertation *De Epidermide Humana*); and in 1835 ciliary epithelial motion, *De Phænomeno Generali . . . Motus Vibratorii*, etc., with G. Valentin. He found (in 1837) the pear-shaped ganglionic cells in the cerebellum (the so-called Purkinje cells), the lumen of the axis cylinder in the nerves, and the ganglionic bodies in the brain. Two years before Schwann pointed out the identity of the structure in animal and vegetable cells Purkinje discussed the cellular theory (1837); in the same year and in 1838 he wrote of artificial digestion in *Magendrüsen und die Natur des Verdauens im Magen* and in *Ueber künstliche Verdauung*. In 1839 he described the Purkinje fibres in the muscles of the uterus (W. Kasper's dissertation *De Structura Fibrosa Utcri Nongravidi*), and in 1840 those in the muscles of the heart (B. Palicki's dissertation *De Musculari Cordis Structura*). The first to use the microtome, Canada balsam, and glacial acetic acid in microscopical examinations, he also introduced the use of 5 per cent salt solutions in lacerated wounds to prevent gangrene. It was Purkinje, too, who proposed the word "protoplasma" for the groundwork of cells. Besides the essays noted and many others, he wrote *Beobachtungen und Versuche zur Physiologie der Sinne* (1823–26).

PURPLE. A color between crimson and violet. Painters in oil and water colors produce the different shades of purple by the admixture of red and blue. From a very early period purple has been one of the most highly prized of all colors and came to be the symbol of Imperial and royal power. Probably one great reason for this was the enormous cost of the only purple color known to the ancients, the Tyrian purple, which is properly a deep crimson. It was obtained in minute quantities only from a Mediterranean species of molluscous animal or shellfish, the *Murex trunculus*, and perhaps also *Purpura lapillus*. (See MUREX; PURPLE SHELL.) During the Byzantine epoch purple became anew the symbol of the Imperial family; thus, the Imperial decrees were written in ink of this color. The costumes of the cardinals are reminiscent of this custom. Later it was manufactured from a lichen called the orchella in Italy, which supplied the rest of Europe with the prepared dye called orchil or archil (q.v.). The color was very fugitive and soon ceased to be used by itself; it, however, was found very useful in combination and has a remarkable power of brightening up other colors. Many improvements have been made in archil dyeing, especially in fixing it. Its value, however, has been greatly lessened by the discovery of the beautiful series of purples yielded by coal tar. Consult Alexander Dedekind, *Ein Beitrag zur Purpurkunde* (Berlin, 1898), and Karl Faymonville, *Die Purpurfärberei des klassischen Altertums* (Heidelberg, 1900).

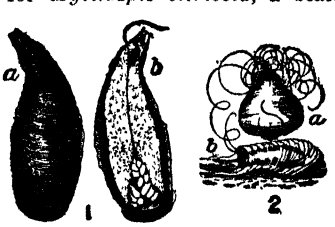
PURPLE, ROMAN. See MUREXIDE.

PURPLE COPPER ORE. See BORNITE.

PURPLE-FACED MONKEY. A Ceylonese langur. See LANGUR; WANDEROO.

PURPLE FINCH. A beautiful crimson-tinted finch of the eastern United States and Canada. See FINCH, and Plate of FAMILIAR SPARROWS, with the article SPARROW.

PURPLE GRACKLE, HERON, MARTIN, ETC. See GRACKLE; HERON; ETC.



PURPLE HEART. See PURPLE WOOD.

PURPLE ISLAND, THE. A long poem by Phineas Fletcher (1633), describing the human body allegorically as an island of which the bones are foundations; arteries, rivers; heart and organs, cities; intellect, the king, attacked by diseases and vices.

PURPLE OF CASSIUS. See CASSIUS, PURPLE OF; GOLD.

PURPLES. A nematode disease of wheat. See EARCOCKLES.

PURPLE SCALE. A name originating in Florida for *Mytilaspis citricola*, a scale insect

THE PURPLE SCALE.

1, mature scale: *a*, upper surface; *b*, under surface, showing eggs. 2, a scale in formation: *a*, top view; *b*, side view.

which occurs exclusively upon citrus plants and swarms in the orange and lemon orchards of the southern United States, frequently causing great damage. It was introduced at one or two places in California about 1896 and is even more injurious in that State than in Florida when special efforts are not made to reduce its numbers. The species is probably of Chinese origin and has now spread to most parts of the world where oranges and lemons are grown. It occurs upon the twigs and branches, but has a strong tendency to overrun the leaves and the fruit. It is apt to infest the lemon, citron, and those varieties of orange which have large oil cells in the

skin of the fruit, such as the tangerine. The remedy most in use in Florida is the kerosene emulsion spray.

PURPLE SHELL. A gastropod mollusk of the genera *Murex* and *Purpura*, whose secretions give a purple stain. Certain other mollusks, as *Janthina* and *Aplysia*, yield a violet-hued liquor, while others, as *Arca*, pour forth red blood. The discovery and use of this color are prehistoric, and myths have arisen to explain them. Long before the beginning of the Christian era the gathering of the mollusks and application of the dye were practiced in factories all about the eastern part of the Mediterranean, several species of small *Murex* serving the purpose—principally *Murex trunculus*. The most famous place of production was near Tyre, whence the product came to be called Tyrian purple. It was limited in supply and costly and from an early time was reserved wholly for the use of royalty in church and state. Accounts of the various tints are given by Pliny (*Natural History*, vol. ii, book ix) and by others. The most highly esteemed Tyrian hue was a deep blood color, but full violet, heliotrope, and intermediate shades were made by blending. Tarentum, in southern Italy, also produced a famous red, and great heaps of broken shells in that neighborhood remained in 1789 to attest the importance of this ancient industry. The process was one of crushing the shell and macerating the animal. The juices were at first nearly colorless, but on exposure to the sunlight and proper treatment the rich purple hue was developed.

Of the mollusks other than *Murex* which yield the dye, the most important is the nearly related *Purpura*, especially the dog whelk (*Purpura lapillus*), a shell the size of an almond or smaller, which abounds on both coasts of the North Atlantic and which has been used from early times both in Great Britain and in New England as a source of an indelible violet ink for marking, ornamenting, and even dyeing textile fabrics. The color appears to be confined to a "vein" or gland near the head, which yields a drop of viscid liquid, which, when first dropped upon the cloth, or used with a pen to draw letters or an ornamental design, is colorless, but, as soon as it is exposed to the sun, changes rapidly from light to deep green, to blue, and at last to a fine purplish red. "'If the cloth be now washed with scalding water and soap and laid again in the sun, the color changes to a beautiful crimson," which is permanent. This dye was extensively used in Ireland in the fifteenth century for ornamenting women's gowns in drawn designs. Consult M. S. Lovell, *Edible Mollusca of Great Britain* (2d ed., London, 1884), and general works on conchology and antiquities.

PURPLE WOOD, or PURPLEHEART. The plum-colored heartwood of *Copaifera pubiflora* and *Copaifera bracteata*, of the family Leguminosæ, natives of British Guiana, where it is generally called Mariwayana. It is said that no other wood was so satisfactory for use in gun carriages and mortar beds, since it withstands violent concussions remarkably well.

PUR'PURA (Lat., from Gk. *πορφύρα, porphyra*, purple fish, purple dye). The term applied to a diseased condition in which a number of hemorrhages occur under the skin, so as to produce blotches of a more or less purple color. These spots vary from 1 to 4 millimeters in diameter. When small they are termed petechiæ; when large they are known as ecchymoses. At first bright red in color, they become darker and gradually fade to brownish stains. They do not fade on pressure. Purpura occurs as a secondary symptom in a large number of diseases, among them being scurvy, rheumatism, scarlatina, measles, smallpox, typhus fever, epidemic cerebrospinal meningitis, the plague, leucocythæmia, Hodgkin's disease, cirrhosis of the liver, and Bright's disease. It is dependent on an altered state of the blood or blood vessels. Purpura may follow the use of certain drugs, and snake poison produces a rapid extravasation of blood. As a distinct disease purpura occurs mainly in two forms, the simple and the hemorrhagic; these, however, may be regarded as essentially the same, but of different degrees of severity. A third variety, *peliosis rheumatica*, is also described. In its mildest form purpura appears simply as an eruption of purplish spots on the legs alone or scattered over the body and attended with little constitutional disturbance. Recovery usually takes place in from 10 to 20 days. In the hemorrhagic form the spots are larger and more numerous and bleeding occurs from the mucous membranes. The nose, mouth, stomach and intestines, kidneys, female generative organs, and the bronchi may be the sources of blood. Severe anæmia ensues, and great prostration is succeeded by death. There is often a rise in temperature. This type is usually met with in young and delicate persons, particularly girls. The treatment of the mild form is simply rest in bed, tonic medicines, and simple food. In severe cases efforts are made to stop the hemorrhage by the administration of drugs which have the power of contracting the blood vessels, notably ergot and suprarenal extract.

PURPURA LAPILLUS.

PURPURA. A genus of gastropod mollusks, represented by *Purpura lapillus*, a common snail living between tide marks on rocky shores of both coasts of the North Atlantic. It is carnivorous and is supposed to destroy young barnacles. Other species of *Purpura* inhabit the southern coasts.

PUR'PURATE AMMO'NIUM AND HYDROGEN. See MUREXIDE.

PURPURATE OF AMMONIA. See MUREXIDE.

PUR'PURE. The name for purple, one of the tinctures in heraldry (q.v.), represented in engraving by diagonal lines drawn athwart from the sinister.

PUR'PURIN (from Lat. *purpura*, purple) and ANTHRAPURPURIN. Two isomeric organic coloring substances similar to alizarin and obtained along with it from madder root. They are formed also in the artificial production of alizarin (q.v.).

PURREE, pŭr'ē. See INDIAN YELLOW.

PURSCH, or **PURSH,** FREDERICK TRAUGOTT (1774–1820). A German-American botanist, born in Grossenhain, Germany, and educated at Dresden. He emigrated to the United States in 1799 and occupied himself with botanical researches until 1811, when he went to England and there published his *Flora Americæ Septentrionalis* (2 vols., 1814), the most valuable work on the subject that had yet appeared. The following year he issued *Hortus Orloviensis*, and he died in Montreal while preparing a work upon the flora of Canada.

PURSE CRAB, or ROBBER CRAB. Names for the great East Indian coconut crab (q.v.).

PÛRS'ER. See PAYMASTER.

PURSER, LOUIS CLAUDE (1854–). A British classical scholar, born at Dungarvan, County Waterford, Ireland. He was educated at Middleton College, Cork, and at Trinity College, Dublin, where he was tutor (1881–98), professor of Latin (1898–1904), and junior bursar (after 1904). His publications include, besides articles in periodicals (especially *Hermathena*): a complete annotated edition (with W. Y. Tyrrell) of Cicero's *Correspondence*, a very important work, in seven volumes (1879–1900); the text of Cicero's *Epistles* in the "Oxford Classical Text Series"; an annotated edition of *The story of Cupid and Psyche* as related by Apuleius (1910).

PURS'LANE (OF. *porcelaine, pourcelaine*, from Lat. *porcilaca, portulaca*, purslane), *Portulaca*. A genus of plants of the family Portulacaceæ, the best-known species of which is com-

COMMON PURSLANE.

mon purslane (*Portulaca oleracea*), which grows as a weed in cultivated and waste grounds in almost all warm parts of the world and is sometimes cultivated as a potherb. It is a short-lived annual, with spreading and rather procumbent stems and obovate fleshy leaves, which, like the young shoots, are used in salads. The young and tender shoots are pickled in France like gherkins.

PURSUIVANT, pûr'swê-vant (OF., Fr. *poursuivant*, follower, from *poursuivre*, to follow, from Lat. *prosequi*, to follow, from *pro*, before + *sequi*, to follow; connected with Gk. ἕπεσθαι, *hepesthai*, Skt. *sac*, to follow, and ultimately with Eng. *see*). The third and lowest order of heraldic offices. The office was instituted as a novitiate, or state of probation through which the offices of herald and king at arms were in the ordinary course to be attained. See HERALD; HERALDRY.

PURSY MINNOW. A minnow of the typical genus *Cyprinodon*, especially *Cyprinodon variegatus*, a chubby little fish, of which the male measures 3 inches and the female 2 inches, and which abounds in all the brackish waters of the Atlantic coast south of Cape Cod. It is one of the most brightly colored of the minnows, and may be distinguished by the lustrous steel blue of the head and forward part of the back (but this fades immediately after death), the dusky bar at the tip of the tail, and the coppery tint of the abdomen. See Plate of KILLIFISHES.

PURUÁNDIRO, pōō'rōō-än'dê-rō. A town of the State of Michoacán, Mexico, 43 miles northwest of the city of Morelia. It is the centre of an important local trade and has leather manufactures. Pop., 1910, 8899.

PURU-PURUS, pōō-rōō'-pōō-rōōs'. A tribe which formerly lived along the middle Purus, a southern affluent of the Amazon, in western Brazil, and apparently constituted, with one or two other tribes of the same neighborhood, a distinct linguistic stock which Brinton calls the Arauan. The name refers to a peculiar skin disease with which they were nearly all afflicted and which was manifested by white and brown blotches. They were savages of the lowest order, both sexes going perfectly naked. They were described by Spix and Martius in 1820 and by Castelnau and Wallace in 1847 and 1853, but the name is now extinct and the tribe seems to be represented by the modern *Pammari* or *Pammary*, i.e., eaters of the *pama* berry, who live in the same region. Consult K. F. P. von Martius, *Beiträge zur Ethnographie und Sprachenkunde*, vol. i (Leipzig, 1867), and D. G. Brinton, *The American Race* (New York, 1891).

PURŪRAVAS, pōō-rōō'rà-vàs. A legendary king of ancient India, renowned for his kingly virtues and personal beauty, and still more famous on account of his love for the Apsaras, or celestial hetæra Urvaśī. Their love was sealed on condition that he would never suffer two rams, which she always kept near her bedside, to be carried from her and that she should never see him naked. The Gandharvas, choristers in Indra's heaven, and lovers of the Apsarases, being jealous of Purūravas, stole the rams during the night. At this Purūravas was enraged and, trusting that Urvaśī would not see him, as it was dark, rose in pursuit of the robbers. At that moment, however, the Gandharvas caused a flash of lightning to irradiate the scene and Urvaśī beheld the King. The compact was violated and Urvaśī disappeared. Purūravas could find her nowhere. Like one insane, he wandered over the world until he saw her in the form of an aquatic bird at Kurukshetra, sporting with four other Apsarases in a lotus pool. Urvaśī, however, forbade him to approach until, at the end of the year, she should be delivered of the son with whom she was pregnant by him; but after the child's birth she visited the King once each year. Urvaśī succeeded in propitiating the Gandharvas who had caused the separation, and eventually she and the King were enabled to pass to the sphere where Gandharvas and Apsarases dwell together. This legend is as old as the Rig-Veda. It forms the subject of the celebrated drama of Kalidasa, the Vikramorvaśī, where, however, Urvaśī's disappearance is ascribed to a fit of jealousy, during which she trespassed on the proscribed bonds of a divine hermitage. This legend is very important not only as the oldest Indo-European love story, but especially because of the long history it has enjoyed in the literature of India. Consult: K. F. Geldner, *Vedische Studien*, vol. i (Stuttgart, 1889); A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); Maurice Bloomfield, "The Myth of Purūravas, Urvaçī, and Ayu," in *Journal of the American Oriental Society*, vol. xx (New Haven, 1899).

PURÚS, pōō-rōōs'. A large tributary of the Amazon. It rises on the Montaña of east Peru, flows in a general northeasterly direction through the Acre Territory and the State of Amazonas, Brazil, and empties into the Amazon through a large delta about 150 miles above the mouth of

the Río Negro (Map: Brazil, D 5). It is a sluggish and much winding stream, flowing in its course of 1850 miles through the great forest plains. It is entirely unobstructed, and navigable for boats almost to its source; steamers ascend it 800 miles, and it has several large navigable tributaries. There are hardly any settlements along its banks, except a few stations for rubber gatherers. The river was first explored to its source in 1864 by the English traveler Chandless.

PURUSHA, pụr'ụ-shȧ (Skt. *puruṣa*, man). In Hindu philosophy, the efficient cause of the universe as contrasted with its material cause, Prakriti (q.v.). The term is also applied to the supreme god Brahma (q.v.). Consult L. D. Barnett, *Antiquities of India* (London, 1913), and A. A. Macdonell, *History of Sanscrit Literature* (ib., 1913).

PURVES, pûr'vĕs, GEORGE TYBOUT (1852–1901). An American Presbyterian clergyman, born in Philadelphia, Pa. He graduated at the University of Pennsylvania in 1872 and at Princeton Theological Seminary in 1876 and held his first pastorate in Wayne, Pa., from 1877 until 1880. He was in charge of churches in Baltimore and Pittsburgh until 1892, when he was appointed professor of New Testament literature and exegesis in Princeton Theological Seminary. In 1900 he became pastor of the Fifth Avenue Presbyterian Church in New York City, of which he was in charge at the time of his death. Dr. Purves was a preacher of unusual force and effectiveness. His publications include *Testimony of Justin Martyr to Early Christianity* (1889) and *Faith and Life* (1902), sermons.

PURVEY, JOHN (c.1353–c.1428). An English Wiclifite. He was born probably at Lathbury, Buckinghamshire. For some years he was Wiclif's parochial chaplain at Lutterworth. In 1387 he was forbidden to itinerate in the diocese of Worcester, and in 1390 he was imprisoned for being a Wiclifite. Rather than suffer martyrdom he recanted in 1401. He was given the vicarage of West Hythe, Kent, but resigned in two years. Purvey, helped by other disciples of Wiclif, set about reducing to idomatic English Wiclif's (q.v.) version of the Bible. The new translation was completed about 1388. In his *Ecclesiæ Regimen* Purvey assailed the corruptions of the Church. Consult *The Holy Bible in the Earliest English Versions*, edited by Forshall and Madden (4 vols., Oxford, 1850).

PURVEY'ANCE, ROYAL. In English law, the former right or prerogative of the crown to demand supplies and services at the lowest price, to be fixed by appraisers, usually those chosen by the royal purveyors, or officers employed in procuring the royal supplies. This was one of the oldest of the royal prerogatives and gave rise to endless abuses and complaints until it was finally abolished by act of Parliament in the period of the Commonwealth (12 Car. II. c. 24). Those upon whom the purveyors made a demand had no choice but to sell their goods or services, and usually received their inadequate pay in treasury warrants, known as tallies, which entitled the recipients to deduct the amount from future taxes. Consult Henry Hallam, *Constitutional History of England* (London, 1827; new ed., New York, 1897), and Sir William Stubbs, *Constitutional History of England* (6th ed., Oxford, 1897).

PUS (Lat., white viscous matter from a sore). A characteristic product of inflammation. It occurs as a thick, yellow, creamy fluid, differing from all other morbid exudations in containing a large number of corpuscles, having a soft and fatty feeling when rubbed between the fingers, a peculiar odor, a salty taste, an alkaline reaction, and a specific gravity of about 1.032. Like the blood, it consists of certain definite microscopic elements and of an intercellular fluid or serum (the liquor puris) in which they swim. The microscopic elements are: (1) Pus corpuscles. Some of these are globular and slightly granular; others contain two or three nuclei, which are rendered more distinct by the addition of acetic acid. These are leucocytes and proliferated tissue cells which have died and degenerated. Living corpuscles, indistinguishable from leucocytes and exhibiting amœboid movements, are also present in proportions varying with the duration of the inflammation. (2) Granular débris, derived from rapid tissue necrosis and found in the pus from acute abscesses. (3) Various species of microorganisms, usually cocci. Decomposing pus abounds in putrefactive bacteria. Liquor puris is a straw-colored, clear fluid, which on being heated coagulates into a thick, white mass. It does not undergo spontaneous coagulation, differing in this respect from ordinary serum. This is described as normal, healthy, or "laudable" pus, according to the older surgeons. There are several varieties, such as (*a*) sanious pus, which is mixed with blood and is characteristic of caries and cancer; (*b*) malignant or ichorous pus, a thin, watery, acrid, and irritating fluid; (*c*) blue pus, which is seen in *Bacillus pyocyaneus* infections; (*d*) orange pus, so colored by hæmatoidin crystals, derived from the degeneration of red blood cells; (*e*) stinking pus, caused by the bacteria of putrefaction, or the colon bacillus; (*f*) fibrinous pus, which contains flakes of lymph; (*g*) serous pus, in which serum preponderates; and (*h*) mucopus, containing a large amount of mucus. The fluid derived from tuberculous degeneration (the so-called cold abscess) and that derived from syphilitic gummata are not considered true pus.

The chemical constituents of pus are water (varying from 769 to 907 in 1000 parts), albumen (from 44 to 180), fats (from 9 to 25), extractive matter (from 19 to 29), and inorganic salts (from 6 to 13); in addition to which, mucin, glycin, urea, etc., are occasionally present. Of the inorganic or mineral constituents, the soluble salts are to the insoluble in the ratio of 8 to 1 and the chloride of sodium (the chief of the soluble salts) is three times as abundant as in the serum of the blood. See INFLAMMATION; SUPPURATION.

PUSAN, pōō-sän'. See FUSAN.

PUSCHMANN, pụsh'mȧn, THEODOR (1844–99). A German physician and historian of medicine. Born at Löwenberg in Silesia, he studied medicine at Berlin, Marburg, Munich, and Vienna (M.D. 1867). Afterward he traveled widely, practiced in Cairo, fought in the Franco-Prussian War, and finally settled in Munich. In 1878 he served as lecturer on the history of medicine at Leipzig, and thereafter was at Vienna as assistant professor and after 1888 as professor. His best-known work is *Geschichte des medizinischen Unterrichts von den ältesten Zeiten bis zur Gegenwart* (1889; Eng. trans. by Hare, *History of Medical Education*, 1891). Puschmann published the works of Alexander Trallianus in Greek text with German translation, also those of Phila-

grios and Philumenos, and wrote on the history of vaccination and of circumcision and on the general history of medicine. The *Handbuch der Geschichte der Medizin*, begun by him, was finished by Julius Pagel and Max Neuburger (qq.v.) and published in 1903–05. Puschmann's widow left $125,000 to found, in connection with the University of Leipzig, the Institut für die Geschichte der Medizin, which publishes *Studien zur Geschichte der Medizin*. See also SUDHOFF, KARL.

PUSEY, pū'zĭ, EDWARD BOUVERIE (1800–82). An English theologian, a leader in the Oxford movement. He was born at Pusey House, in Berkshire, Aug. 22, 1800, son of the Hon. Philip Bouverie, who changed his name to Pusey as a condition of his succession to the Pusey estate in 1789. He was educated at Eton and at Christ Church, Oxford, where he won high honors. In 1824 he was elected fellow of Oriel, where he became associated with Newman and Keble (qq.v.). About this time he spent two years in Germany, and his first published work was an admirable summary of the history of German theology since the Reformation. In the same year that it appeared, 1828, he was appointed to the regius professorship of Hebrew at Oxford, with the attached canonry of Christ Church, a post which he held until his death. His life, though profoundly influential, was singularly uneventful. Indeed, he lived in his books, mingling little in general society. His domestic life was saddened by successive losses of parents, brothers, wife, daughter, and son. Pusey will always be remembered for his connection with the Oxford movement. His sermon on the Rule of Faith in 1851 stemmed the tide of secessions to the Roman Catholic church after the Gorham judgment. (See GORHAM CONTROVERSY.) The revival of the practice of private confession in the English church dates from his two sermons on "The Entire Absolution of the Penitent" (1846). His teaching on the Real Presence in the Holy Communion became the accepted teaching of the Catholic school of the Church of England. He was the theologian of the new movement. His great learning, enforced as it was by the strictness and purity of his life, gave it its vitality. His suspension for preaching his celebrated sermon on the Eucharist in 1843, in which he stated views on the Real Presence opposed to the Protestant position, only enhanced his influence in the High Church party.

His power of sustained labor was remarkable and his painstaking diligence proverbial. Especially notable evidence of these traits is to be found in his work as editor in chief of the *Library of the Fathers*. His correspondence as a spiritual adviser alone was enormous, and he had a part in every important controversy in the Church of England from the time of the publication of his tract *On Baptism* in 1835 to 1879, when he and Farrar disputed the question of everlasting punishment.

At Oxford is the Memorial Pusey House, which holds his library and perpetuates his teaching. It is a small religious community. Besides several volumes of sermons Pusey's more important works were commentaries on Daniel (1864) and on the Minor Prophets (1860 et seq.); his discussions of the possibility of the reunion of Christendom, generally known by their subtitle of *Eirenicon*, in three parts (1865, 1869, 1870); and the eschatological treatise already alluded to, *What is of Faith as to Everlasting Punishment?* (1880). Consult an admirable biography begun by Canon Liddon and completed after his death by Johnston and Wilson (4 vols., London, 1893–96); C. C. Grafton, *Pusey and the Church Revival* (Milwaukee, 1902); Maria Trench, *Story of Dr. Pusey's Life* (New York, 1906); G. W. E. Russell, *Dr. Pusey* (London, 1907); Paul Thureau-Dangin, *English Catholic Revival in the Nineteenth Century* (2 vols., ib., 1914), and many of the works referred to under OXFORD MOVEMENT.

PUSHAN, pōō'shân (Skt. *Pūṣan*, prosperer, from *puṣ*, to cause to thrive). A deity of Vedic India. He is frequently mentioned in the Vedas (q.v.). He beholds all creatures, and has his home in heaven, where he rides in a golden car drawn by goats. He furthermore conducts the souls of the dead to the Pitris (see PITRI), and is consequently a guardian of roads and, by implication, a discoverer of what is hidden. In his character he is beneficent, protecting not only men, but beasts, and is therefore a deity of wealth, while as a god of fertility he is invoked in the wedding ritual, being himself the lover of his mother or, according to other hymns, of his sister. He has a unique and somewhat grotesque quality in his toothlessness, in consequence of which his food is gruel. The data concerning him make reasonable the view that he is a pastoral deity representing the sun in its beneficent aspect. Consult: J. Muir, *Original Sanskrit Texts* (London, 1868–74); Perry, "Notes on the Vedic Deity Pūsan," in *Classical Studies in Honour of Henry Drisler* (New York, 1894); A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); L. D. Barnett, *Antiquities of India* (London, 1913).

PUSHKIN, pŭsh'kĭn, ALEXANDER SERGEYEVITCH (1799–1837). The greatest poet of Russia. He was born at Moscow of a noble family, inheriting African blood from a maternal ancestor. His formal home-education, according to the fashion of the time, was exclusively French, his first knowledge of Russian being acquired from nursery tales, legends, and songs. The boy manifested no unusual precocity until he was nine years of age—indeed, he was rather backward—but then his extraordinary passion for reading began to develop. This, coupled with a photographic memory, made him as voracious and retentive a reader as Macaulay. In 1811 he entered the Imperial Lyceum at Tsarskoe Selo, where he soon attracted general attention by his outspoken criticism of men and things, his neglect of study, his bold epigrams, and his poetic endowments. His first published poem bears the date 1814, and at the public examination in 1815 he aroused the admiration of the veteran poet Derzhavin by his *Recollections of Tsarskoe Selo*. On graduating in 1817 Pushkin became a clerk in the Ministry of Foreign Affairs. He was already a well-known figure in Russian literature and was immediately admitted to membership in the literary society Arzamas, whose members included the shining lights of the day. His first important long poem, *Ruslan and Lyudmila* (1817–20), a bold combination of fancy and realism, attracted much attention. About this time, incurring the government's displeasure by his advanced political views and his avowed sympathies with the young Liberals, Pushkin was banished to southern Russia with General Inzov's colonizing bureau. The life in Bessarabia, the Crimea, the Caucasus, and Odessa meant much for Pushkin; the variety and gor-

geousness of the natural scenery, life among new people, the influence of Byron, with whose works he then became acquainted—all these made an indelible impression on the young poet and determined, in large measure, the character of his subsequent work. Thus, under the stimulus of this new environment and the inspiration of the bold Byronic verse, he produced *The Caucasian Prisoner* (1822), *The Fountain of Bakhtchisarai* (1824), the first three cantos of *Yevgény Onêgin* (Eugene Onegin), a novel in verse, and *The Gypsies* (1827). In 1824 he was transferred to his mother's estate at Mikhailovskoé (Government of Pskov). The two years spent in this remote region of Russia were the most fruitful in the poet's life. Cantos four to six of *Yevgény Onêgin*, *The Brother Murderers*, and the drama *Boris Godunov* were written during this exile. Pushkin freely admitted his indebtedness to Shakespeare (who had already displaced Byron in Pushkin's admiration), Karamzin, and the Chronicles, but his *Boris Godunov* is entirely original in character. All the characters in it, as well as the masses and historical background, are thoroughly Russian and are drawn with a marvellous fidelity to the epoch. (See GODUNOV.) The story was used as the basis for an opera by Mussorgski (q.v.). In 1828 appeared Pushkin's *Poltava* (finished in less than a month and originally named *Mazepa*), depicting the struggle between Peter the Great and Charles XII and the treachery of Mazepa. In 1830 he produced the last two cantos of *Yevgény Onêgin*. Written during some nine years, this picture of society reflects various incidents of the poet's life during its composition.

In 1831 Pushkin was attached to the Foreign Ministry with a salary of 5000 rubles and commissioned to write a history of Peter the Great. In 1833 he received 20,000 rubles to print his *History of the Pugatchev Insurrection*. During this period his works were chiefly in prose. The novels *The Captain's Daughter* (1836) and *Dubrovsky* (1841) and the history are representative of Russian prose at its best. A year after the appearance of *The Captain's Daughter* the poet was killed in a duel (sought by himself) with D'Anthès, adopted son of the Dutch Ambassador, whose association with Madame Pushkin, innocent though it was proved to be, had caused much gossip.

Pushkin is the flowering of the best in Russian literature. He possessed an original intellect reënforced by a quick intuition. His humor was gentle and his wit keen; his epigrams are among the best ever produced in any language. He had an extraordinary mastery of the technique of his art. A monument to him was erected at Moscow in 1880, and the celebration of his centenary was one of the greatest events in Russian literary history.

Bibliography. The best among the numerous editions of his works is that published by the Russian Imperial Academy of Science (begun in 1899 and still (1915) uncompleted). English translations: *Poems*, by Ivan Panin (2d ed., Boston, 1888); *Prose Tales*, by T. Keane (New York, 1896); *Translations from Pushkin*, in memory of the one hundredth anniversary of the poet's birthday, by C. E. Turner (St. Petersburg, 1899); *Russian Romance*, by Mrs. J. B. Telfer (London, 1875). In German: *Gedichte*, two volumes, by Bodenstedt, in *Gesammelte Schriften*, vols. iv and v (1865–69); *Russische Lyrik in den Versmassen des Originals*, by Hans Gerschman (Königsberg, 1895); G. Eduard, *Aus russischen Dichtern* (*Puschkin und Lermontoff*) (Reval, 1898). There are also, of course, numerous translations of separate works. Consult: Jacques Flach, *Un grand poète russe* (Paris, 1894); Michael Pokrowskij, "Pushkin und Shakespeare," in *Deutsche Shakespeare Gesellschaft Jahrbuch*, vol. xliii (Berlin, 1907); Rosa Newmarch, *Poetry and Progress in Russia* (London, 1907); Alexander Brückner, *A Literary History of Russia*, translated by H. Havelock (ib., 1908).

PUSHTU, pŭsh'tŭ. See AFGHAN.

PUS'LEY. See PURSLANE.

PUSS IN BOOTS. The popular nursery tale of the clever cat which secures a fortune and a princess for his master, a young miller, who passes under the name of the Marquis of Carabas. The story was told by Perrault as "Le chat botté," in his *Contes des fées* (1697). He found it in Straparola's *Piacevole notte*, translated in 1585, in which the hero is called Constantine's Cat. A celebrated German version is Tieck's *Der gestiefelte Kater*.

PUSS MOTH. A name in England of *Cerura vinula*, a notodontid moth common throughout Europe and northern and western Asia. It expands from 2 to 2.5 inches; the fore wings are white suffused with gray and with dull dark-gray transverse lines; the thorax is spotted with black. The larva feeds on poplar and willow and discharges an acrid fluid from an opening in the throat. At the end of the body the caterpillar has a pair of tubes in which are concealed two long flexible whips which may be rapidly thrust out and withdrawn (see Plate of BUTTERFLIES AND MOTHS, Fig. 14) and which are supposed to protect the larva from its natural enemies, as are also the terrifying attitudes which it assumes and the secretion which it ejects. When full grown it spins a solid and impervious cocoon.

PUS'TULE, MALIGNANT. See ANTHRAX; MALIGNANT PUSTULE.

PUTEAUX, pụ'tō'. A town in the Department of Seine, France, 6¼ miles west of the centre of Paris by rail (Map: Paris and Vicinity). It is situated northeast of and at the base of Mont Valérien, on the left bank of the Seine, opposite the Bois de Boulogne, with which it is connected by a bridge which crosses the Ile de Puteaux. It is a favorite residential suburb of Paris. It has dye and calico-printing works, manufactures of chemical products, and artillery works. Pop., 1901, 24,341; 1911, 32,223.

PUTE'OLI. See POZZUOLI.

PUTIGNANO, pōō'tē-nyä'nō. A town in the Province of Bari, Italy, 23 miles southeast of Bari (Map: Italy, F 4). The chief industry is weaving, and there is trade in wine, oil, and fruit. Pop. (commune), 1901, 13,969; 1911, 13,997.

PUTLITZ, pōōt'lĭts, GUSTAV HEINRICH GANS, KNIGHT ZU (1821–90). A German dramatist and novelist, born at Retzin, Brandenburg. He studied law in Berlin and Heidelberg. From 1846 to 1848 he was a functionary in the Government of Magdeburg, and thereafter he lived partly on his estate at Retzin, partly in Berlin.

In 1863 he became director of the Court Theatre in Schwerin; from 1867 to 1868 he was court marshal of the Prussian Crown Prince, after which he devoted himself to literature, dwelling in Berlin. Between 1873 and 1889 he managed the Court Theatre in Karlsruhe.

Among his works are the poetic fairy stories *Was sich der Wald erzählt* (1850; 50th ed., 1900), *Walpurgis* (1869), and *Vergissmeinnicht* (1853); two plays, read in American schools, *Badekuren* and *Das Herz vergessen;* and the dramas *Das Testament des Grossen Kurfursten* (1858), *Rolf Berndt* (1881), *Das Schwert des Damokles* (1878), and *Spielt nicht mit dem Feuer!* (1869). Consult *Gustav zu Putlitz: ein Lebensbild,* by his widow (Berlin, 1894–95); also the autobiographical *Mein Heim: Erinnerungen aus Kindheit und Jugend* (ib., 1885; 2d ed., 1886) and A. Stern in the *Grenzboten für Politik, Litteratur, und Kunst,* vol. i (Leipzig, 1896).

PUT'NAM. A city and one of the county seats of Windham Co., Conn., 34 miles north of Norwich, on the Quinebaug River and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, H 2). It has a public library and the Day Kimball Hospital. The Cargill Falls in the vicinity are of scenic interest. Putnam is situated in an agricultural region, but is interested chiefly in ironworking and in the manufacture of cotton and woolen goods, silks, cutlery, trunks, steam heaters, boxes, boots and shoes. The government is vested in a mayor, elected biennially, and a unicameral council. Putnam, incorporated in 1855, obtained its present charter in 1895. Pop., 1900, 6667; 1910, 7280.

PUTNAM, EMILY JAMES (SMITH) (1865–). An American author and educator, the daughter of Judge James C. Smith, of Canandaigua, N. Y., and wife of George Haven Putnam (q.v.). She was born in Canandaigua and was educated at Bryn Mawr College, where she took her A.B. degree in 1889, afterward spending a year at Girton College, Cambridge, England. From 1891 to 1893 a teacher of Greek at the Packer Collegiate Institute, Brooklyn, she left there to become a fellow in Greek at the University of Chicago (1893–94), and thereafter until 1900 she served as dean of Barnard College, Columbia University. In this college she later became associate in history. She married Mr. Putnam in 1899. From 1907 to 1911 Mrs. Putnam was vice president and manager of the Women's University Club (New York), and in 1901–04 she had held the presidency of the League for Political Education. Whatever came from her pen was finely done. Mrs. Putnam's *The Lady: Significant Phases of her History* (1910; 2d ed., 1913) the *North American Review* justly declared to be "the most brilliant book of essays ever written by an American woman." In addition to this volume and frequent contributions to reviews she published: *Selections from Lucian* (1891), a translation; *Greek Religion* (1913); and a second translation, that of Emile Faguet's *The Dread of Responsibility,* with an introduction (1914).

PUTNAM, FREDERIC WARD (1839–1915). An American anthropologist, born in Salem, Mass. In 1856 he was curator of ornithology in Essex Institute (Salem) and published a *List of the Birds of Essex County;* and in the same year he entered Lawrence Scientific School and took a special course under Louis Agassiz, to whom he was assistant until 1864. He was in charge of the Museum of Essex Institute from 1866 to 1873, and also superintendent of the East India Marine Society (1867–69) and director of the Peabody Academy of Sciences (1869–73). Putnam was an assistant in the Kentucky Geological Survey in 1874. From the latter year until 1909 he was curator of the Peabody Museum of Archæology and Ethnology of Harvard University, and from 1886 until his retirement in 1909 was Peabody professor of American archæology and ethnology. At the Chicago World's Fair he served as chief of the Department of Ethnology and in 1894–1903 was curator of anthropology in the American Museum of Natural History, New York. His extensive researches included explorations in Ohio, where he was instrumental in having the Great Serpent Mound preserved, and in New Jersey. He originated the *Naturalist's Directory* in 1865, was one of the founders of the *American Naturalist* in 1867, and in 1898 he was president of the American Association for the Advancement of Science. He was president of the American Folk-Lore Society in 1901, and of the American Anthropological Association in 1905, and became a member of the National Academy of Sciences and of many foreign learned societies.

PUTNAM, GEORGE HAVEN (1844–). An American publisher and author, son of George Palmer Putnam and brother of Herbert Putnam and of Mary Putnam Jacobi (qq.v.). Born in London, England, he was educated at the Columbia Grammar School, New York City, at the Sorbonne, Paris, and at the University of Göttingen. He returned from Germany to enlist in the 176th New York Volunteers as a private, and he rose to the rank of major in his regiment, having served through the Civil War and having been a prisoner both at Libby and at Danville, Va. The war over, he gave himself primarily to the business of the publishing house of which eventually he became the head, but he also gave much time to authorship and to civic affairs. In 1887 he led in organizing the American Copyright League and was the secretary of that body during its victorious fight for international copyright, which resulted in the Copyright Bill of 1891. Mr. Putnam's connection with this copyright agitation brought him the cross of the French Legion of Honor. In 1899 he married, as his second wife, the dean of Barnard College. (See PUTNAM, EMILY JAMES SMITH.) His writings include: *Authors and Publishers* (1883); *The Question of Copyright* (1891); *Authors and their Public in Ancient Times* (1893); *Books and their Makers in the Middle Ages* (1896); *The Censorship of the Church of Rome and its Influence upon the Production and Distribution of Literature* (2 vols., 1907); *Abraham Lincoln* (1909); *A Prisoner of War in Virginia* (1912); *George Palmer Putnam: A Memoir* (1912); *Memories of my Youth* (1914); *Memories of a Publisher* (1915).

PUTNAM, GEORGE PALMER (1814–72). An American publisher, grandnephew of Gen. Israel Putnam. He was born in Brunswick, Me., Feb. 7, 1814. At 14 he entered the bookstore of D. and J. Leavitt, New York. In 1840 he became partner in the house of Wiley and Putnam, of which he established a London branch in 1841. In 1848 he returned to New York and founded the publishing house which later became the firm of G. P. Putnam's Sons. Bookmaking as an art interested him from the beginning. In 1853, with the aid of George William Curtis, he established *Putnam's Magazine* (discontinued in 1857; revived 1868–71 and again 1906–10). In 1861 he organized the Loyal Publication Society. In order to serve as United States collector of internal revenue, he suspended his business for three years (1863–66) and then refounded it

in conjunction with his sons, George Haven (q.v.) and John Bishop. Another son was Herbert Putnam (q.v.). One daughter became noted as a physician (see JACOBI, MARY PUTNAM); another, Ruth Putnam, as an author. Notable among the latter's books are *William the Silent* (1894), *Charles the Bold* (1898), and *Alsace and Lorraine: From Cæsar to Kaiser* (1915). George Palmer Putnam was a founder of the Metropolitan Museum of Art, of which he was made honorary superintendent in 1872. He was also chairman of the committee on art at the Vienna Universal Exposition. He died in New York, Dec. 20, 1872. Putnam was the author, among other works, of: *Chronology, or an Introduction and Index to Universal History, Biography, and Useful Knowledge* (1833); *American Book Circular, with Notes and Statistics* (1843); *American Facts, Notes, and Statistics Relative to the Government of the United States* (1845); *The World's Progress: A Dictionary of Dates* (1850) and a supplement to this work (1861). Consult G. H. Putnam, *George Palmer Putnam: A Memoir* (New York, 1912), and id., *Memories of my Youth* (ib., 1914).

PUTNAM, HERBERT (1861–). An American librarian, brother of George Haven Putnam. He was born in New York City, graduated at Harvard in 1883, studied at the Columbia Law School in 1883–84, and in 1886 was admitted to the Minnesota bar. He was librarian of the Minneapolis Athenæum from 1884 to 1887 and of the Minneapolis Public Library from 1887 to 1891, practiced law in Boston from 1892 to 1895, and was librarian of the Boston Public Library from 1895 to 1899, when he became librarian of Congress. He was elected president of the American Library Association in 1898 and again in 1903. Besides writing frequently for the periodicals on subjects pertaining to his profession, he was a contributor to the NEW INTERNATIONAL ENCYCLOPÆDIA. Honorary degrees came to him from Bowdoin, Williams, Yale, Brown, and other institutions.

PUTNAM, ISRAEL (1718–90). An American soldier, prominent in the French and Indian and the Revolutionary wars. He was born in Old Salem Village (now Danvers), Mass., removed to Pomfret, Conn., in 1740, and became a farmer and wool grower there. In the winter of 1742–43, according to tradition, he gave evidence of unusual coolness and intrepidity by entering a cave alone and, by the light of a torch, shooting a wolf which had taken refuge there. In August, 1755, during the French and Indian War, he was commissioned lieutenant by the Connecticut Legislature, later in the year became one of Rogers's Rangers, in March, 1756, became captain, saved Fort Edward from being destroyed by fire in the winter of 1757, and in March, 1758, became major. In August, 1758, he was captured near the present Whitehall, N. Y., in an engagement with a force of French and Indians under the partisan leader Marin, but, after undergoing many hardships and narrowly escaping death, was exchanged, in November, through the influence of Col. Peter Schuyler, himself a prisoner. He served under Amherst in the Montreal expedition, went as acting colonel of the Connecticut regiment on the expedition to the West Indies, and participated in the attack on Morro Castle, Havana, July 30, 1762. In Pontiac's War he was a major of Connecticut troops under Bradstreet, sent to relieve Detroit. In 1765 he was an ardent opponent of the Stamp Act and closely identified himself with the radical Whigs, becoming one of the leaders of the Sons of Liberty in Connecticut and chairman of one of the committees of correspondence. In 1766 he was elected to the Connecticut Assembly. He opened a tavern at Brooklyn, Conn., in June, 1767. He was made a member of the so-called exploring committee of the Company of Military Adventurers organized by Gen. Phineas Lyman (q.v.) in 1772 and as such visited the Lower Mississippi valley and west Florida, where land grants had been promised to the company.

In 1774 he was among those who sent material assistance to the Bostonians, who, through the operations of the Port Bill and their attitude thereto, were put in immediate need of the necessaries of life. In April, 1775, tidings of the battle of Lexington reached him while he was plowing; he left his plow in the field, as had Cincinnatus, and, mounting his horse, rode to Cambridge in one day, a distance of 68 miles. Returning, he was made brigadier general by the Legislature, organized and drilled a regiment, and in a week was on his way back with his men to Cambridge. In May of that year he led a battalion to Noddle's Island, burned a British schooner, captured a sloop, and killed and wounded many of the enemy. By his advice it was decided to fortify Bunker Hill, in the engagement at which place he is considered by many to have been the commanding officer, though others claim this honor for Prescott. In this engagement Putnam displayed great energy and bravery, though he does not seem to have been present in the main redoubt on Breed's Hill, where Prescott commanded. On the arrival of Washington at the camp to take command in July, 1775, he brought commissions from Congress for four major generals, one of whom was Putnam. On the evacuation of Boston in the spring of 1776, Putnam was placed in command of New York. He held the chief command within the fortified lines during the battle of Long Island, was sent to Philadelphia to fortify that city in December, 1776, was afterward stationed at Crosswick and Princeton, and in May, 1777, was ordered to take command in the Highlands of the Hudson. In the summer of that year he was removed from his command in the Highlands on account of the surprise and loss of Forts Montgomery and Clinton, though he was acquitted of blame by a court of inquiry and restored to his command. In 1779, when stationed in Connecticut, Horseneck, one of his outposts, guarded by 150 men and two cannon, was attacked by the British officer Tryon, with 1500 men. Putnam, being closely pursued while on his way with his men to a swamp, is said to have dashed down a steep hill and escaped. Riding to Stamford and collecting the militia, he formed a junction with his troops, pursued Tryon in his retreat, and took 50 prisoners. In the summer of 1779 he had command of the troops in the Highlands and completed the fortifications at West Point. The army going into winter quarters, he returned home, and on starting out again for camp was stricken with paralysis, from which he never completely recovered. He died May 29, 1790, on his farm near Brooklyn, Conn. In this village is a monument to him by Karl Gerhardt, and especially notable is that by J. Q. A. Ward at Hartford. It was the grandnephew of Israel Putnam who founded the New York publishing house of G. P. Putnam's

Sons. (See the articles on G. P. Putnam and other notable descendants.) Consult: I. N. Tarbox, *Life of Israel Putnam* (Boston, 1876); W. F. Livingston, *Israel Putnam, Pioneer, Ranger, and Major-General* (New York, 1901), in "American Men of Energy Series"; F. A. Ober, *"Old Put," the Patriot* (ib., 1904).

PUTNAM, MARY TRAILL SPENCE (LOWELL) (1810–98). An American poet, translator, and essayist, daughter of Rev. Charles Lowell and sister of James Russell Lowell and Robert T. S. Lowell. She was born in Boston and in 1832 married a merchant of that city, Samuel R. Putnam. Besides numerous contributions to magazines, especially on Polish and Hungarian literature and history, she wrote two metrical dramas on slavery, *A Tragedy of Errors* (1861) and *A Tragedy of Success* (1862); a novel, *The Record of an Obscure Man* (1861); *A History of the Constitution of Hungary*, made timely by the visit of Kossuth (1850); *Memoir of William Lowell Putnam*, her son, killed at Ball's Bluff (1862); *Fifteen Days: An Extract from Edward Colvil's Journal* (1866); *Memoir of Charles Lowell*, her father (1885); and a translation from the Swedish of Fredrika Bremer's *The Neighbors*.

PUTNAM, RUFUS (1738–1824). An American soldier. He was born in Sutton, Mass., was a millwright's apprentice there from 1754 to 1757, enlisted as a private soldier for service in the French and Indian War in 1757, and became an orderly sergeant in 1759 and an ensign in 1760. While an apprentice he studied diligently during his leisure hours, gaining a fair knowledge of mathematics and history, and after 1760 devoted himself to the study of surveying, in which he soon became markedly proficient. He entered the continental army as lieutenant colonel in May, 1775, planned the defenses at Roxbury, and in August, 1776, was appointed chief engineer of the army with the rank of colonel. Preferring field service, however, he was placed in command of a Massachusetts regiment in November and in 1777 served with great gallantry in the campaign against Burgoyne. In 1779 he aided his cousin, Israel Putnam, in completing the West Point fortifications and in 1783 was made brigadier general. He was a member for several terms of the Massachusetts Legislature and during Shays's Rebellion was General Lincoln's aid. In 1786 he, with Gen. Benjamin Tupper, organized a company, composed of officers and soldiers of the Revolutionary War, to form a settlement in what is now Ohio. He was one of three directors appointed by this company (the Ohio Company) in 1787 to secure a tract of land from Congress, and, chiefly through his efforts, 1,500,000 acres were obtained at 66⅔ cents per acre. This tract was located at the junction of the Ohio and Muskingum rivers, whither in 1788 Putnam led the first party of settlers, laying out Marietta (q.v.), the first organized settlement in the Northwest Territory. He was one of the judges of the United States Court in the Northwest Territory from 1790 to 1796, concluded an important treaty with the Indians at Vincennes, Ind., in 1792, was Surveyor General of the United States from 1796 to 1803, and was a member of the Ohio Constitutional Convention in 1802. In 1812 he organized the first Bible society west of the Alleghanies. His manuscript diary, an interesting document, has been preserved. There is an autobiography, written in 1812 and also in manuscript, deposited in the college library, Marietta, Ohio. Consult: *Journal of General Rufus Putnam, 1757–60* (Albany, 1886); Sidney Crawford, "Rufus Putnam and his Pioneer Life in the North West," in *American Antiquarian Society, Proceedings*, vol. xii (Worcester, Mass., 1899); A. B. Hulbert, in *Pilots of the Republic* (Chicago, 1906). His autobiography, journal, and other papers have been reprinted in *The Memoirs of Rufus Putnam*, edited by Rowena Buell (Boston, 1903).

PUTRID FEVER. See TYPHUS FEVER.

PUTRID SEA. A lagoon on the coast of the Crimea. See SIVASH.

PUTS AND CALLS. See STOCK EXCHANGE.

PUT'TENHAM, GEORGE (?–c.1590). The reputed author of a treatise entitled *The Arte of English Poesie, contrived into three bookes; the first of Poets and Poesie, the second of Proportion, the third of Ornament* (1589). The work has also been, with more likelihood, claimed for his elder brother, RICHARD PUTTENHEIM (c.1520–c.1601). It was issued anonymously. The book is an early landmark in the history of English literary criticism. Consult the reprint by Edward Arber (London, 1869).

PÜTTER, pŭt'tĕr, JOHANN STEPHAN (1725–1807). A German jurist, born at Iserlohn. He studied at Halle and Jena and after 1757 was professor of law at the University of Göttingen. He exerted great influence on the law institutions of his time, and some of his works, which are written with care and originality, are still valuable. His principal work is *Historische Entwicklung der heutigen Staatsverfassung des deutschen Reichs* (1786–99); and his other writings include *Elementa Juris Publici Germanici* (1754); *Primæ Lineæ Juris Privati Principum* (1768); *Literatur des deutschen Staatsrechts* (1776–91).

PUTTKAMER, pŭt'kä-mĕr, ROBERT VIKTOR VON (1828–1900). A Prussian statesman, born at Frankfort-on-the-Oder. He studied in 1846–50 at Heidelberg, Geneva, and Berlin, entered the government service in 1854, and became *Regierungsprasident* (president of an administrative district) at Gumbinnen in 1871 and at Metz in 1874. In 1873 he was elected to the Reichstag, where he was prominent as a strong Conservative, in 1877 became Chief President of the Province of Silesia, and in 1879 Minister of Education and Public Worship. He took measures against the undenominational schools, made concessions to the orthodox Evangelicals, and introduced a simplified form of German spelling. In 1881 he was appointed Minister of the Interior and vice president of the ministry. His conservative administration, and particularly the methods employed by him in favoring the election of government candidates, was attacked by the Radicals, notably in a speech by Eugen Richter, and disapproved by Frederick III upon the latter's accession. He therefore resigned (1888) and held no other office until his appointment as Chief President of Pomerania by William II in 1891. From this post he resigned in 1899.

PUTUMAYO, pōō'tōō-mä'yō. This name was applied to certain alleged atrocities in the Putumayo rubber district of Peru which were reported to the British government in 1911–12.

Sir Roger Casement was ordered to make a thorough investigation. His report confirmed the rumors of the selling of Indians into bondage and of brutal floggings when insufficient amounts of rubber were brought in by the native workers. The United States government declared itself ready to coöperate with Great Britain in securing reform. The Peruvian government promised reforms, but little was accomplished. After an investigation (July, 1912) by a United States agent, the Peruvian government protested against the attitude of Great Britain and the United States, but ordered a thorough investigation and punishment of the guilty. Thirty-two persons implicated were arrested and an efficient judicial and administrative system was installed in the district by President Billinghurst. See ICA.

PUT YOURSELF IN HIS PLACE. A novel by Charles Reade (1870).

PUVIS DE CHAVANNES, pụ'vē' de shá'vàn', PIERRE (1824–98). The leading mural painter of the nineteenth century. Born at Lyons, Dec. 14, 1824, the son of an engineer, of a distinguished family of Burgundy, he took the classical course in a lycée and then studied in a technical school preparatory to his father's profession. After deciding to become a painter he worked without profit under Henri Scheffer, Delacroix, and Couture, but studied to more effect the works of the early Florentines, especially those of Giotto in Italy, being, therefore, in the main self-taught. He first exhibited in the Salon of 1850, not 1859 as is commonly stated. His first decorative works, "War" and "Peace," exhibited in 1861, were acquired by the government for the Museum of Amiens, in which his early decorations can best be studied, such as "Work and Rest" (1863); "Ave, Picardia Matrix" (1865); "Ludus Pro Patria" (1880). After the Universal Exposition of 1867, when he received the cross of the Legion of Honor (Officer, 1887; Commander, 1889), his position was secure. He was constantly employed upon Salon juries and artistic commissions, and the greater part of his time was taken by great series of mural paintings for French public buildings. Among the principal of these are two fine representations of Marseilles in ancient and modern times for the museum there; two historic scenes for the hôtel de ville, Poitiers (1874–75); the "Infancy of St. Genevieve" (1876–77), in the Panthéon at Paris—a beautiful idyllic scene; a series of splendid decorations for the museum of his native town, Lyons, among which are "Sacred Grove, Dear to the Arts and Muses" (1884), "An Antique Vision" and "Christian Inspiration" (1886). In 1889 he decorated the great hemicycle of the Sorbonne with an allegory of the noble purposes of its foundation, entitled "Alma Mater."

Puvis de Chavannes was the moving spirit in the secession of the Société Nationale des Beaux-Arts from the Salon in 1890, and he was president of the société from 1891 till his death. His decorations in the hôtel de ville, Paris, include "Hommage à Victor Hugo" (1894), in which the poet is represented as dedicating his lyre to the city, and two fine landscapes, "Summer" and "Winter." In 1896 he completed his decorations for the Boston Public Library, "The Muses Saluting the Spirit of Enlightenment" and eight fine panels of the "Arts" and "Sciences." His last monumental work was three other large paintings of the life of St. Genevieve, in the Panthéon. The last years of his life were saddened by the illness of his wife, the Princess Cantacuzene, after whose death he himself soon died.

Puvis de Chavannes was an epoch-making figure in modern mural painting. Before his day it had counterfeited reality, but he, reverting to Giotto and Ghirlandaio, restored it to its proper function, decoration. He painted in flat surfaces with unerring decorative effect and in a subdued color scheme. Eliminating the ineffective and accidental in nature, he achieved by simplification grand typical effects, both in landscape and in figure, which were with him of equal importance. His works are full of lyric sentiment and breathe the serene charm of a far-away primeval age. His large collection of drawings and careful studies was left by his nephews to the Luxembourg Museum, the city of Paris, and the Provincial museums possessing his works. Besides his mural decorations he painted a number of canvases of fine decorative quality, such as "Girls on the Seashore" (1879); the "Poor Fisherman" (Luxembourg, 1881); "Le Doux Pays," which received the medal of honor in 1882; "The Beheading of St. John Baptist" (John Quinn, New York). The Metropolitan Museum, New York, possesses "The Shepherd's Lay" and "Child Gathering Apples." Of his portraits the most interesting are those of himself at 25 and of his wife (1891), called "The Lady in Mourning," in the Lyons Gallery. Consult: Marius Vachon, *Puvis de Chavannes, un maître de son temps* (Paris, 1900); *Masters in Art*, vol. iv (Boston, 1903); *Puvis de Chavannes*, in Newnes Art Library (London, 1905); André Michel, *Puvis de Chavannes, with a Biographical and Critical Study* (ib., 1912); J. G. Huneker, *Ivory Apes and Peacocks* (New York, 1915).

PUY, pụ-ē', LE. The capital of the Department of Haute-Loire, France, 37 miles southwest of Saint-Etienne, at the junction of the Loire, Borne, and Dolezon valleys (Map: France, S., H 3). It is picturesquely situated on the steep south slopes of Mont Anis, from the summit of which rises precipitously the huge basaltic mass called Rocher de Corneille, crowned by the colossal statue of Notre Dame de France, 52 feet high, on a pedestal 20 feet in height, made in 1860 from 213 Russian cannon captured at Sebastopol. The most notable building of Le Puy is the cathedral, situated in the highest part of the town and reached by a grand stairway of 136 steps. Other notable features are the prefecture, the palais de justice, the Crozatier Museum with a fine art collection, and the monumental Crozatier Fountain. Guipure and other lace, bells, and clocks are manufactured. Le Puy is the ancient Podium. It was the capital of the mediæval District of Velay. Pop., 1901, 20,507; 1911, 20,944.

PUYALLUP, pū-ăl'ŭp. A city in Pierce Co., Wash., 10 miles southeast of Tacoma, on the Great Northern and the Northern Pacific railroads (Map: Washington, C 3). It contains a State Masonic home, a G. A. R. widows' home, and a Carnegie library. The chief industrial plants are saw mills, box factories, and a fruit cannery. Raspberries are grown here in large quantities. Pop., 1900, 1884; 1910, 4544.

PUYALLUP, pū-ăl'ŭp. A tribe of Indians of Salishan stock (q.v.). They speak the same lan-

guage as the Nisqualli and joined with them in the Treaty of Medicine Creek in 1854. They formerly claimed the entire territory of Puyallup River and exercised a dominating influence among the neighboring tribes. They are now chiefly confined to a reservation in the vicinity of Tacoma, and number 309.

PUY-DE-DÔME, pụ-ē′-de-dôm′. A south-central department of France, formerly a part of Auvergne (q.v.) (Map: France, S., H 3). Area, 3090 square miles. Plateau and mountain occupy three-fourths of the surface; plain and valley the rest. The volcanic peaks of the Auvergne Mountains, grand in their desolation and presenting numerous extinct craters, render this region orographically one of the most interesting in France. The highest peak in the Mont Dore group has an elevation of 6187 feet. Puy-de-Dôme, 4086 feet, gives its name to the department. The principal river is the Allier (a tributary of the Loire), which from south to north traverses the fertile valley of Limagne. Rye, wheat, oats, apples, chestnuts, and grapes are cultivated. Coal is mined. There are numerous mineral springs. The mountain forests yield timber. Capital, Clermont-Ferrand. Pop., 1901, 544,194; 1911, 525,916. Consult Georges Bonnefoy, *Histoire de l'administration civile dans la province d'Auvergne et le département du Puy-de-Dôme* (4 vols., Paris, 1895–1902), and Boule and others, *Puy-de-Dôme et Vichy* (ib., 1901).

PUZZUOLANA, pōōt′swō-lä′nà. See POZZUOLANA.

PYÆMIA, pī-ē′mĭ-à (Neo-Lat., from Gk. *πύον, pyon*, pus + *αἷμα*, haima, blood). A type of blood poisoning, or septicæmia (q.v.), distinguished by the formation of secondary metastatic abscesses in different parts of the body. Pyæmia represents a form of septicæmia in which, in addition to the general distribution of septic material throughout the body, this material containing bacteria becomes lodged at different points, thus setting up local foci of infection. These new abscesses usually occur where the blood current is slow, as in the bones, and in viscera which have a terminal circulation —the brain, spleen, lungs, and kidneys. In suppuration of the intestines the most common seat of metastasis is the liver. Pyæmia is usually preceded by thrombosis of a vein near a septic wound. The vein wall becomes inflamed; the blood current is retarded; a clot forms, which is invaded by bacteria; the clot becomes softened, pieces of it are broken off and carried along by the blood stream until the capillaries are reached, and the *embolus*, as it is now called, is arrested. When an embolus lodges in an organ having a terminal circulation, that part of the organ supplied by the blocked vessel becomes anæmic and breaks down into an abscess, which in turn may become a focus for the manufacture of more emboli. Metastases in the lungs occur chiefly near the pleural surface and in the lower lobes. Serous effusion, often with much fibrin, may occur into the pleural and pericardial cavities. Local inflammation of joints, especially of the knee and shoulder, may occur. With the exception of those occurring in serous membranes, these inflammations are usually purulent in character. An increase in the number of white blood cells (leucocytosis) is of constant occurrence. While other species of bacteria act as occasional excitants of pyæmia and septicæmia, two species of pyogenic bacteria—the staphylococcus and streptococcus and especially the latter—are usually concerned. (See BACTERIA.) Other microörganisms may act as causative factors.

Pyæmia is very often a fatal complication. It is marked by recurrent chills and sweats and by a high and irregular fever of the intermittent type. The breath has a sweetish odor, the tongue is brown and parched, and emaciation is rapid. The disease may run its course in a few days or last for months. Treatment consists in eliminating the original focus if possible, incising secondary abscesses when accessible, and drawing off the fluid from serous cavities. Stimulants, of which alcohol is the best, must be freely given, and these, with iron and quinine, constitute the most reliable therapeutic aids. Specific serums and vaccines have been found rather disappointing. See SEPTICÆMIA.

PYAT, pyà, FÉLIX (1810–89). A French Communist and journalist. He was born at Vierzon and trained for the law. After the failure of the Socialist call to arms in 1849, he escaped to Switzerland. Thence he went to Belgium and England as a member of the European Revolutionary Committee. The events of 1870 brought him back to France to take active part in the Commune. He was a prime mover in the overturning of the Vendôme Column and on the collapse of the Commune escaped to London. In his absence he was condemned to death (1873), but he was pardoned (1880) and elected deputy from Marseilles (1888). He contributed to many newspapers and edited several revolutionary journals. He wrote several very popular Socialistic plays, of which *Mathilde*, *Diogène*, and *Le chiffonnier de Paris* are characteristic.

PYATIGORSK, pyà′tyĕ-gôrsk′, or **PIATIGORSK.** A noted watering place on the left bank of the Podkumsk in the Territory of Terek, north Caucasia, situated on the south slope of the Mashuka and south of the Beshtau, 124 miles by rail northwest of Vladikavkaz. There are about 20 sulphur springs ranging in temperature from about 84° F. to 117.5° F. and used both for bathing and drinking. It has some importance as a trade centre. Pop., 32,000.

PYC′NOGON′IDA. See PANTOPODA.

PYC′NOSTYLE. See INTERCOLUMNIATION.

PYD′NA (Lat., from Gk. Πύδνα). A Greek settlement in ancient Macedonia, on the west coast of the Thermaic Gulf. It seems to have passed early into the power of the Macedonians, but appears from time to time as independent. In the fourth century B.C. it was a dependency of Athens, but was captured by Philip II (father of Alexander the Great), who converted it into a strong fortress. Near it took place in 168 B.C. the great battle between the Romans under Æmilius Paulus (q.v.) and the Macedonian King Perseus, in which the latter was defeated and the Macedonian Empire destroyed. Consult Johannes Kromayer, *Antike Schlachtfelder in Griechenland*, vol. ii (Berlin, 1907).

PYE, HENRY JAMES (1745–1813). An English poet laureate, eldest son of Henry Pye of Faringdon in Berkshire. He was educated at Magdalen College, Oxford (M.A., 1766; D.C.L., 1772), and entered Parliament, but retired in 1790. He collected his poems in 1787 under

the title *Poems on Various Subjects*. Though he was a tame versifier, he became laureate in 1790 through the favor of Pitt. The appointment met with ridicule, and his annual birthday ode was long a merry incident among literary men. Pye's most ambitious poem was an epic in six books on Alfred (1801). He also translated Bürger's *Lenore* (1785) and the *Poetics* of Aristotle and wrote novels and plays.

PYELITIS, pī'ē-lī'tĭs (Neo-Lat., from Gk. πύελος, *pyelos*, trough, pan, pelvis). Inflammation of the pelvis of the kidney. It may be caused by kidney stones, or by infection extending from the bladder. It arises sometimes during typhoid fever, scarlet fever, diphtheria, or smallpox, and may be caused by tuberculosis or cancer. Severe pains in the loins accompany the disease. The urine contains a variable amount of pus and blood. The severe forms caused by the presence of kidney stones require surgical treatment (removal of the calculi). In lighter cases regulation of the diet and avoidance of all stimulating drinks will prove beneficial.

P'YENG-YANG, pyĕng'-yäng', or **P'YUNG-YANG**. A town of Korea. See PINGYANG.

PYGMA'LION (Lat., from Gk. Πυγμαλίων). A legendary king of the island of Cyprus. Enamored of a beautiful ivory statue which he had made, he requested Venus to give it life. His prayer was granted, and the vivified statue bore him a daughter, Paphos, who, according to some, became by Apollo mother of Cinyras, the founder of Paphos. Others told how Cinyras married Metharme, daughter of Pygmalion. The love of Pygmalion for his statue is told by Ovid (*Metam.*, x, 243). According to another version Pygmalion conceived a passion for the temple statue of Aphrodite herself. In modern times the name Galatea is often associated with that of Pygmalion, but for this there is no ancient authority. Consult C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed., Boston, 1911).

PYGMIES, pĭg'mĭz (Lat. *Pygmæus*, from Gk. Πυγμαῖος, *Pygmaios*, pygmy, dwarf, of the length from the elbow to the knuckles, from πυγμή, *pygmē*, measure from the elbow to the knuckles, fist; connected with Lat. *pugnus*, fist). All peoples whose short stature is a racial trait rather than the result of adverse conditions of life; usually races with a male average height of not more than 1.50 meters (4 feet, 11 inches) are recognized as pygmies. According to Kollmann, the ancestors of the human race were pygmies, but this conclusion has failed of general acceptance. Under the term "pygmy" we may discuss (1) the wavy-haired Asiatic pygmies; (2) the woolly-haired Negritos; (3) the woolly-haired Central African pygmies, sometimes referred to as Negrillos.

(1) The Wavy-haired Asiatic pygmies include the Sakai or Senoi of the southern part of the Malay Peninsula, the Toala of Celebes, the Vedda, and some jungle tribes of the Deccan. All these are generally considered survivals of a formerly widespread pre-Dravidian race, which some scholars connect with the Australians. Some of these tribes are slightly taller than the pygmies as defined above and show indications of mixture with another race. They differ from (2) and (3) in the shape of the head, which is dolichocephalic.

(2) The Negritos include the Andaman Islanders (Mincopie), the Semang of the central regions of the Malay Peninsula, the Aeta of Luzon and other islands in the Philippines, and the Tapiros, as well as possibly additional peoples, of New Guinea, where the other tribes reported as pygmy are, however, mixed breeds.

(3) The occurrence of African pygmies, called Obongo, averaging 4 feet, 7 inches, was reported by Du Chaillu from the territory of the Ashango on the west coast, but little credence was given to his accounts until among the Mangbettu Schweinfurth determined the existence of the Akka, whose stature hardly ever exceeded 4 feet, 10 inches. Since then pygmy tribes have been found widely scattered in the equatorial forest regions of Africa, the name commonly applied by the taller Bantu being Batua (Batwa); this name, is, however, confusing, as it occasionally refers not to pygmies but merely to tribes shorter than the speakers. Von Luschan believes that these pygmies and the Bushmen of South Africa are genetically related. In a broad classification the Negritos and Negrillos seem to belong together. Culturally the pygmies of all types represent a very simple grade. In general they are nomadic hunters and lack a definite social organization. See DWARF.

Flower, "The Pygmy Races of Men," in *Journal of the Anthropological Institute*, vol. xviii (London, 1888–89); Armand Quatrefages de Bréau, *The Pygmies*, translated by Frederick Starr (New York, 1895); A. H. Keane, *Man: Past and Present* (Cambridge, 1899); Sir H. H. Johnston, *Uganda Protectorate* (London, 1902); Armand Hutereau, *Notes sur la vie familiale et juridique de quelques populations du Congo belge* (Brussels, 1910), with map of Congo Pygmies; A. C. Haddon, "The Pygmy Question," in A. F. R. Wollaston, *Pygmies and Papuans* (New York, 1912); Von Luschan, in *Zeitschrift für Ethnologie* (Berlin, 1914).

PYGMY FINCH. See GRASSQUIT.

PYGMY OWL, or **GNOME OWL.** One of a group of about 30 species of the genus *Glaucidium*. With the exception of Australia, Canada, and the eastern United States, they are found over much of the tropical and temperate regions. They have a small head without ear tufts, short and rounded wings, and densely feathered legs. Four forms of the American Pygmy Owl (*Glaucidium gnoma*) are known from the West and Southwest. They frequent wooded districts and are diurnal, flying about and feeding in bright sunshine. Small birds pay but little attention to them, although, besides their regular diet of insects, mice, and lizards, they occasionally catch birds. The nest is placed in the deserted hole of a woodpecker.

PYGMY PARROT. One of the diminutive parrots of New Guinea, of the subfamily Nasiterninæ, which are smaller than a song sparrow. They have beaks like those of miniature cockatoos and short square tails; the males have gorgeous plumage, but the females are more soberly dressed.

PYGOP'ODES (Neo-Lat. nom. pl., from Gk. πυγή, *pygē*, rump + πούς, *pous*, foot). An order of birds, originally including the grebes, loons, auks, murres, and puffins. This is now known to be an unnatural assemblage, and the use of the term has been abandoned in this sense. It is properly retained by some writers as the name of an order equivalent to Colymbiformes of others, including only the loons and grebes.

PYLE, HOWARD (1853–1911). An American

illustrator, painter, and author. He was born in Wilmington, Del., March 5, 1853, and studied art at a private school in Philadelphia and at the Art Students' League, New York. He started his career as an illustrator for *Harper's Monthly*, to which he contributed for many years. In 1879 he returned to Wilmington, where he afterward resided and taught. Pyle was one of the foremost American illustrators, especially successful in work for children. A master of linear composition and a keenly observant realist, he was bold and original in his sense of design and equally efficient in pen-and-ink, wash drawings, and oils, in which medium many of his later illustrations were executed. His best subjects were taken from the colonial periods of New England and New Amsterdam, from the days of chivalry, and from the life of adventurers and seafaring men. Pyle possessed genuine humor, historical knowledge, and decided literary ability, often writing the text for his illustrations. He was author and illustrator of the *Merry Adventures of Robin Hood* (1883); *Pepper and Salt* (1885); *The Rose of Paradise* (1887); *Men of Iron* (1891); *Twilight Land* (1895); *The Garden behind the Moon* (1895); *Rejected of Men* (1903); *The Champions of the Round Table* (1905); *The Story of Sir Launcelot* (1907); *Stolen Treasure* (1907). Pyle's influence as a teacher at the Drexel Institute, Philadelphia, was important. Probably his most notable pupil was Maxfield Parrish (q.v.). He was elected a National Academician (1907) and received a gold medal at Buffalo (1901). His death occurred Nov. 9, 1911.

PYLO'RUS. See ALIMENTARY SYSTEM.

PY'LUS, or **PYLOS** (Lat., from Gk. Πύλος). An ancient town of Messenia in the Peloponnesus, on the promontory of Coryphasium at the northern entrance to the Bay of Pylus (Navarino), connected in early Greek legend with Neleus and his son Nestor (Map: Greece, Ancient, B 3). After the conquest of Messenia by the Spartans the place seems to have been abandoned, until in 425 B.C. it was occupied by the Athenian general Demosthenes, who fortified the promontory and successfully repelled assaults of the Spartans by sea and land. The Athenians held Pylus for 15 years, when it was recaptured by the Spartans and again fell into obscurity, though after the restoration of the Messenians it became the port of Messenia. At the end of the thirteenth century it was fortified with a strong Venetian castle, and another was built at the southern entrance to the bay, near the town of Navarino, generally regarded as Pylos. The mediæval name is due to the settlement here in 1381 of Navarrese mercenaries, though others derive it from Avarino and trace it to an Avar settlement 800 years earlier. In the bay was fought, on Oct. 20, 1827, the great naval battle of Navarino (q.v.), in which the Turkish-Egyptian fleet was destroyed by the united English, French, and Russian fleets under Admiral Codrington. Consult Baedeker, *Greece*, 413–415 (4th Eng. ed., Leipzig, 1909); J. G. Frazer, *Pausanias's Description of Greece* (2d ed., New York, 1913). See GREECE, *History*, The War for Independence; NAVARINO.

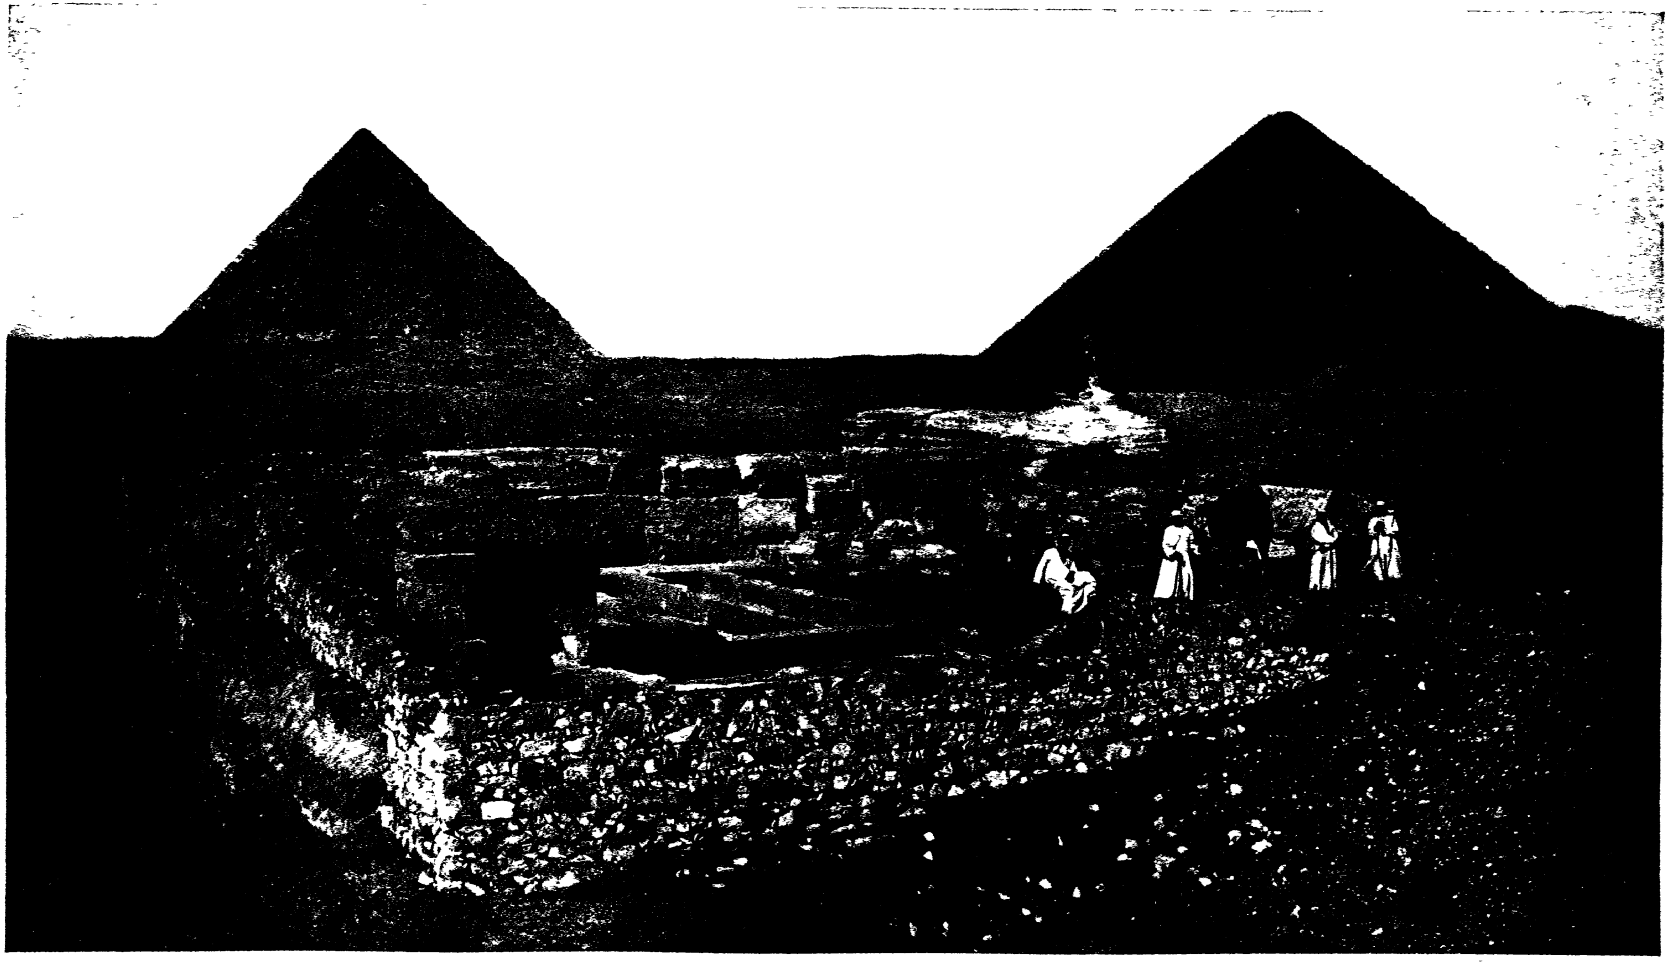
PYM, JOHN (1584–1643). An English parliamentary leader, born at Brymore in Somersetshire. In 1599 he entered what is now Pembroke College, Oxford, but did not graduate, and in 1602 entered the Middle Temple, though he was never admitted to the bar. There is some doubt whether Pym sat in the Parliament of 1614, but in any case he was not prominent until the Parliament of 1621. He was a Puritan, and his first speeches in Parliament were directed against the Catholics, not so much, however, on account of their religion as on account of their politics. He became so obnoxious to the court that he was imprisoned for three months in his home in London. In the first three parliaments of Charles I he was the leader in the impeachment of Montagu and Manwaring, two clergymen who had attacked Calvinistic doctrines and treated the Parliament with scant respect, and he was prominent in the impeachment of Buckingham. He was also prominent in the agitation which preceded the Petition of Right (q.v.). Nothing is heard of him in the intervals between parliaments. During the 11 years of Charles's personal government he was intimately connected with various schemes for the settlement of the Connecticut valley. In 1640, on the meeting of the Short Parliament, Pym became its real leader, though no formal leadership was recognized in those days, and his influence over the Puritan party continued undiminished until his death. He opened the Short Parliament with a speech two hours in length, setting forth the grievances of the nation, and persuaded the Parliament to postpone the supplies until these grievances were redressed. On the opening of the Long Parliament, which met likewise in 1640, Pym was resolved to proceed to extremities. He introduced and conducted the impeachment of Strafford for high treason in attempting to subvert the constitution, but he resisted in vain the dropping of the impeachment and the introduction of the bill of attainder, though it was due to his efforts that, notwithstanding the bill of attainder, Strafford was heard in his own defense. The Triennial Act (q.v.) was largely his measure. The adherence of the Bishops to the cause of Charles I led to the demand for their abolition, and Pym supported the "Root and Branch" bill which was introduced for this purpose, though it was not his intention to introduce Presbyterianism.

He naturally took a prominent part in drawing up and passing the Grand Remonstrance (q.v.) in 1641, and he even proposed at this time to hold the King in check by making his ministers responsible to Parliament. On the unsatisfactory outcome of the campaigns in 1642, Pym favored and carried out, though reluctantly, the union with the Scots, with the unwelcome condition of the acceptance of the Covenant and the introduction of a Presbyterian form of Church government. Even before the meeting of the Long Parliament Pym may have had communication with the Scots, and he was the leader of the five members whom Charles on Jan. 4, 1642, attempted in vain to arrest in person on the floor of the House of Commons on the charge of treasonable conspiracy. Consult: John Forster, *Statesmen of the Commonwealth of England* (5 vols., London, 1841–44); Goldwin Smith, *Three English Statesmen* (new ed., London, 1868); S. R. Gardiner, *The Great Civil War* (4 vols., ib., 1893); I. A. Taylor, *Revolutionary Types* (ib., 1904).

PYNCHEON, pĭn'chon, CLIFFORD. A broken-down elderly man in Hawthorne's *House of the Seven Gables*.

PYN'CHON, JOHN (1621–1703). An American colonist, born in Springfield, Essex County, England. He was brought to Massachusetts when a child by his father, William Pynchon (q.v.). By inheritance and by purchase from the Indians he obtained large tracts of land in the Connecticut valley, on which he established Northampton, Hadley, Deerfield, and other towns. His diplomacy in treating with the Indians was of great service to the Colony. He held many important public offices, including that of councilor under Sir Edmund Andros in 1688–89 and again under the new charter from 1693 until his death.

PYNCHON, THOMAS RUGGLES (1823–1904). An American clergyman and educator, born in New Haven, Conn. He graduated at Trinity College, Hartford, and in 1849 was ordained. His first charge was in Boston, and afterward he had churches in Lenox and Stockbridge, Mass. (1849–54). He was Scoville professor of chemistry and natural sciences at Trinity from 1854 until 1877 and from 1874 until 1883 was president of that institution. In 1887–1902 he was professor of moral philosophy there.



PYNCHON, WILLIAM (1590–1662). An American colonist and theologian. He was born at Springfield, Essex, England. He emigrated to the Colony of Massachusetts in 1630 and was treasurer of the Colony in 1632–34. He was one of the first settlers of Springfield (1636). On a visit to England in 1650 he published *The Meritorious Price of our Redemption, Justification, etc., Clearing it from Some Common Errors.* The strongly anti-Calvinistic position of this work made it very unacceptable to the Puritan clergy, and on his return to Massachusetts he was condemned by the Legislature, which, in 1650, ordered his book to be burned in Boston market. As the result of further study he retracted some of his opinions, but his position in America continued unsatisfactory, and in 1652 he returned to England and settled at Wraysbury, near Windsor. He replied to his principal critic, Rev. John Norton, in the second edition of his book (1655). Consult: H. M. Dexter, *Congregationalism of the last Three Hundred Years as Seen in its Literature* (New York, 1880); W. F. Adams, *Pynchon Family* (Springfield, Mass., 1898); F. H. Foster, *Genetic History of New England Theology* (Chicago, 1907).

PYN'SON, RICHARD (?–1530). One of the early London printers, by birth a Norman. He undoubtedly learned his trade in Normandy, and not under Caxton, as has been often asserted. Some time before 1493 he began printing near Temple Bar, and about 10 years later he moved to Fleet Street. Pynson issued some of the most beautiful books published at that time in England. From his press proceeded more than 300 books. Among the earliest were Chaucer's *Canterbury Tales* (1493); Parker's *Dialogue of Dives and Pauper* (1493); *Terence* (1496), the first classic printed in England; the *Morton Missal* (1500), representing his finest work. He became printer to Henry VIII, from whom he received a pension. It was he who introduced (1509) Roman type into England.

PYORRHŒA (pī'ŏr-rē'à) **ALVEOLARIS** (Neo-Lat., from Gk. πύον, *pyon,* pus + ῥοία, *rhoia,* flow); RIGG'S DISEASE; INTERSTITIAL GINGIVITIS. A chronic destructive disease of the sockets of the teeth. In the beginning of the disease patients are unaware of any discomfort or abnormal symptoms. In the later stages there is a dull, gnawing pain about the roots of the teeth and still later tenderness on chewing food. The gums are deep red in color and tend to fall away from the teeth. They bleed at the slightest touch, even during the process of brushing or examination. Sometimes pus exudes between the gums and the teeth when the former are pressed upon. The teeth eventually become loose and drop out or have to be extracted. Treatment consists in the removal of tartar or other deposits found upon the exposed cementum. Pus pockets have to be washed out and disinfected, preferably with a weak solution of iodine, hydrogen dioxide, or physiological salt solution. Tooth powders and mouth washes have very slight curative effects, although they may be used to prevent the development of pyorrhœa. In addition to the merely destructive effect upon the teeth, many cases of obscure digestive disturbances, and particularly chronic joint affections and endocarditis, have been traced to suppuration about the teeth. Arthritis deformans is the most frequently complicating disorder. The microörganisms regarded as chiefly responsible are the staphylococcus, streptococcus, and pneumococcus, all pus-producing cocci, but the most virulent germ and the one most provocative of complications is the streptococcus. Bass and Johns made an important contribution to the pathology of Rigg's disease when they discovered that the *Endamœba buccalis* was present in 85 out of 87 cases examined, and also showed that rapid improvement or cure followed the injection of emetine hydrochloride. Consult Bass and Johns, *Alvcolodental Pyorrhœa* (Philadelphia, 1915).

PYRA, pē'rà, IMMANUEL JAKOB (1715–44). A German poet. He was born in Kottbus, studied theology at Halle, where he joined S. G. Lange's (q.v.) Dichterbund, and with Lange lived at Laublingen. The two poets published *Freundschaftliche Lieder* (1746), which, with their delight in the poetry of religion and friendship and in unrhymed verse, foretell Klopstock. Pyra boldly and rather pedantically attacked Gottsched (q.v.) in 1736 with *Erweis dass die Gottschedianische Sekte den Geschmack verderbe* (1743), and his premature death was partly due to the bitter personalities with which the attack was returned.

PYR'AMID (Lat. *pyramis,* from Gk. πυραμίς, pyramid, from Egyptian *per-em-us,* coming out in breadth, denoting probably the ratio of the base to the height). A polyhedron (q.v.) one of whose faces (the base) is a polygon and whose lateral faces are triangles. A pyramid is said to be regular when the base is a regular polygon and the vertex lies in the perpendicular to the base erected at its centre. The altitude is the perpendicular distance between the base and the vertex. The slant height of a regular pyramid is the altitude of any one of the triangles which make up its lateral faces. When a pyramid is cut by a plane the portion containing the base is called a truncated pyramid; if the intersecting plane is parallel to the base the truncated pyramid becomes a frustum of the original pyramid. The formula for the volume of a pyramid is $V = \frac{1}{3}bh$ and for the frustum $V = \frac{h}{3}(b + b' + \sqrt{bb'})$, where b and b' are the bases and h is the altitude. Consult Holzmüller, *Elemente der Stereometrie* (Leipzig, 1900–02).

PYRAMIDS

PYRAMIDS OF CHEOPS AND CHEPHREN SPHINX AND TEMPLE OF CHEPHREN

PYRAMID. A solid structure, usually of stone, having a square base and triangular sides meeting in an apex. True pyramids are found only in middle Egypt and date from the period between the fourth and twelfth dynasties, though a few may be somewhat older. Pyramidal buildings occur elsewhere, but they differ in important particulars. The pyramids of Mexico, e.g., have flat tops and the sides form successive stages or steps. Those of Abydos and Meroë are merely imitations of pyramids on a small scale; they are really sepulchral chambers having the pyramidal form externally, and are usually provided with porticoes representing the funerary chapels of older tombs. The pyramids found at Cenchreæ and at Rome are sporadic attempts to reproduce the Egyptian type.

With regard to the mode of construction of the pyramids of Egypt, two principal theories have been advanced. Lepsius, followed by Ebers, and more recently by Borchardt, believed that each king, on ascending the throne, began to build a pyramid as a tomb and monument for himself. This was usually laid out upon a comparatively small scale, so that if the builder had but a short reign his tomb might be complete. As time passed, successive layers were added, and the size of the monument was thus proportioned to the length of the builder's reign. This theory is combated by Petrie (q.v.), who believes that each pyramid was begun and carried out upon a definite design of size and arrangement. The plan was occasionally altered, but in such cases the alteration was not gradual, but sudden. The outer casing of the pyramids was invariably of massive blocks of fine stone, well joined and carefully polished. The interior of the mass varied at different periods. In the oldest pyramids it was formed, so far as is known, of courses of rough-hewn blocks laid with a little mortar. In later times the core was formed of brick and rubble inclosed between inner and outer walls of solid masonry, and under the twelfth dynasty the core is almost entirely of sun-dried bricks. Each pyramid contained a sepulchral chamber, which was always low down and was usually excavated in the rock underlying the structure. It was reached by a passage opening from the northern face of the pyramid and passing, in its course, through one or more lesser chambers. The external entrance was usually situated above the level of the sepulchral chamber, and the passage sloped downward at a moderate angle. Pyramids seem to have stood originally within walled inclosures, and traces of the walls are still to be found in many cases. To each pyramid was attached a temple in which the funerary worship of the deceased Pharaoh was conducted by priests who were supported by a regular endowment. Such temples are still to be seen at Ghizeh, and the priests of the various pyramids are frequently mentioned in the Egyptian inscriptions. Around the pyramid of each king are grouped the tombs (mastabas) of the nobles and high functionaries who had lived under his reign.

The pyramids that now exist in Egypt, some 75 in number, extend in groups from Abu Roâsh on the north to Medum on the south. The group of Abu Roâsh consists of three pyramids all ruined; the largest of them has lost its outer casing and is now a shapeless mass of Nile mud inclosing a nucleus of massive stone. One of the others still contains a sepulchral chamber and the passage leading to it. Farther to the south lies the group of Ghizeh, by far the most important among the Egyptian pyramids. The largest of the group is the *Great Pyramid*, the tomb of Cheops (q.v.), the second King of the fourth dynasty. It was called by the Egyptians *Yechwet Chufu* (the glory of Chufu) (Cheops). Its present perpendicular height is 451 feet, but originally, including the nucleus of rock at the bottom and the apex which has disappeared, it measured 482 feet, or more than 50 feet higher than St. Peter's at Rome. The sloping sides, which rise at an angle of 51° 50′, are now 568 feet in slant height and have a length of 750 feet at the base. The cubic contents amount to about 3,057,000 cubic yards, representing a weight of no less than 6,848,000 tons. According to Petrie's estimate the pyramid contains about 2,300,000 blocks of stone averaging some 40 cubic feet in size. In its present condition this immense edifice covers a space of nearly 13 acres. The material of which it is constructed consists of stone from the Mokattam and Tura hills on the opposite side of the Nile. Traces of the road by which the stone was conveyed are still visible. The outer casing of this pyramid has long since disappeared, and the underlying courses of rough-hewn stone now form a series of steps. The entrance is in the north face of the pyramid at the height of about 48 feet from the ground. From it there was a narrow passage, 3 feet, 4 inches high by 3 feet, 11 inches wide, which, after descending into the interior at an angle of 26° 41′ for a distance of 293 feet, terminates in a horizontal corridor, 27 feet long, 3 feet high, and 2 feet wide, leading to a subterranean chamber hewn in the solid rock. This chamber is 46 feet long, 27 feet wide, and 10½ feet high. Its floor lies 101½ feet below the level upon which the pyramid is built, and a blind passage opens from its farther end. Some 60 feet from the external entrance a second passage branches off from the long descending passage and ascends at about an equal angle for a distance of 121 feet, when it enters the Great Hall. At this point a horizontal corridor leads from the ascending passage to the so-called Chamber of the Queens, which is 17 feet long, 18 feet, 10 inches wide, and 20 feet high. The Great Hall, which continues the ascending passage, is 28 feet high and 155 feet long, but is very narrow, the width of the lower part being 3 feet, 4 inches and that of the upper part only 2 feet, 7 inches. It terminates in a horizontal passage 122 feet long and 3 feet, 8 inches high, expanding about the middle into an antechamber. At the end of the horizontal passage is the King's Chamber, the most remarkable of all the chambers in the pyramid. The northern and southern sides are each 17 feet in length, the eastern and western sides 34½ feet, and the height is 19 feet. The floor is 139½ feet above the plateau upon which the pyramid stands. The chamber is lined with finely polished granite slabs, and the ceiling is formed of nine great blocks of granite, each 18½ feet long. Within the chamber is a mutilated stone sarcophagus, the lid of which has disappeared. In order to relieve the roof of the pressure of the superincumbent mass of masonry, five hollow chambers were constructed above it. The first four have flat ceilings, while the

last is roofed with blocks bearing obliquely against each other. Two air shafts (8 × 6 inches) run from the King's Chamber to the northern and southern faces of the pyramid. Near the Great Pyramid, on the east side, are three small pyramids built for members of Cheops's family; a few hundred yards to the southeast is the Sphinx (q.v.).

The *Second Pyramid*, situated about 200 yards southwest of the Great Pyramid, was erected by Chephren (q.v.), the successor of Cheops, and was called by the Egyptians *Wer-Chafrê* (great is Chephren). Its present perpendicular height is 450 feet (formerly 458 feet), while the sloping sides, measuring each 694½ feet at the base, rise at an angle of 52° 20′ to the height of 566¾ feet. Part of the original casing still remains at the top. The fact that it stands upon a higher level than the pyramid of Cheops gives it the appearance of greater height. The rocky ridge upon which it is built rises somewhat towards the west and north, and a considerable part of it had to be cut away in order to secure a level surface. The leveled space around the base of the pyramid was paved with blocks of limestone. Two passages, both on the north side, give access to the interior. One of these is in the pavement in front of the pyramid, the other is 38 feet above the surface of the ground. The upper passage descends at an angle of 25° 55′ to a depth of 105 feet and leads through a horizontal corridor to the sepulchral chamber called, from its discoverer, Belzoni's Chamber. It is hewn in the rock and is 46½ feet long, 16⅓ feet wide, and 22½ feet high. Belzoni, who opened the pyramid in 1818, found in this chamber a granite sarcophagus filled with rubbish. The lower passage, beginning in the pavement in front of the north face of the pyramid, first descends at an angle of 21° 40′, then runs horizontally for 59 feet, and then ascends, terminating in the horizontal corridor leading to Belzoni's Chamber; the total length of the passage is 97 feet. Near the middle of its horizontal portion a small chamber is introduced, and a descending passage, 22 feet long, leads to another chamber, 34 feet, 3 inches long, 10 feet, 4 inches wide, and 8 feet, 5 inches high.

The *Third Pyramid*, called by the Egyptians *Neter-Menkaurê* (Menkaurê is divine), was built by Menkaurê, the successor of Chephren and the Mycerinus of Herodotus. Its perpendicular height is 204 feet, and the sides, which slope at an angle of 51°, rise to the height of 262¾ feet. Each side measures 356½ feet at the base. The lower part of the pyramid is cased with slabs of polished red granite. The entrance is about 13 feet above the ground on the north side. From it a passage slopes down at an angle of 26° 2′ for a distance of 104½ feet, then, becoming nearly horizontal, passes through an antechamber 12 feet long, 10 feet wide, and 7 feet high, and finally enters a large chamber 44½ feet long, 12½ feet wide, and 13 feet high, in which were found the remains of a stone sarcophagus. From the floor of this chamber a shaft leads to the tomb chamber, which lies below. It is paved with fine granite blocks and has an arched roof formed of blocks placed against each other at an angle and hollowed out on the inside. In this chamber Colonel Vyse found the basalt sarcophagus of Mycerinus, but it was lost at sea in 1838 while being conveyed to England. In the chamber above were found a part of the wooden coffin of the King and some fragments of his mummy. To the south of this pyramid are three small pyramids, probably constructed for members of the family of Mycerinus.

South of Ghizeh are the pyramids of *Abusir*, the ancient Busiris, erected by kings of the fifth dynasty. The entrances of these pyramids are, as usual, on the north side, and in all of them the tomb chamber is reached by a passage at first slanting and afterward horizontal. The northernmost of the three largest pyramids (originally 14 in number) is that of Sahurê, the second King of the fifth dynasty. Its perpendicular height, originally 163½ feet, is now only 118 feet. The central pyramid is that of Rê-en-woser, the sixth King of the same dynasty. The largest of the three, which has a perpendicular height of 165 feet (formerly 229 feet), has not yet been identified. The other pyramids of this group are mere heaps of ruins.

The burial field of Saqqâra contains a considerable number of pyramids. Of special interest is the so-called step pyramid, the tomb of Zoser, the second King of the third dynasty. It rises in six steps which are respectively 38, 36, 34½, 32, 31, and 29½ feet in height; the width of each step is from 6 to 7 feet. The perpendicular height is 197 feet. The interior of the pyramid contains a very numerous and complicated series of passages and chambers. According to Petrie it is not a true pyramid at all, but a mastaba enlarged by successive additions into the pyramidal shape. The slope of the sides (about 75°) differs considerably from that of the true pyramids. Near it is the pyramid of Unas, the last King of the fifth dynasty, and in the vicinity are the pyramids of the Pharaohs Teta, Pepi I, Mer-en-rê, and Pepi II of the sixth dynasty. These pyramids were opened in 1881, and the walls of their chambers were found to be covered with long religious texts.

South of Saqqâra are the pyramids of Dahshûr, which are in a simple and massive style much like those of Ghizeh. The group consists of two large and two smaller pyramids of stone and two of mud bricks, the latter being usually known as the black pyramids. The more northerly of the two brick pyramids, which formerly had a casing of stone, is the tomb of Usertesen III of the twelfth dynasty. Its present height is 90 feet. To the southwest of it is a large stone pyramid 326 feet high and 702 feet in width. To the south and east are the remains of other pyramids, and still farther to the south is a pyramid of peculiar form, usually termed the blunted pyramid. The lower portion slopes at an angle of 54° 41′, while the sides of the apex form an angle of 42° 59′. It is 321 feet in height and 620 feet square. The name of the builder is unknown, but it probably belongs to the oldest period of Egyptian history.

The next group of pyramids, south of Dahshûr, is the group of Lisht, of which the more southerly is the tomb of Usertesen I of the twelfth dynasty. Still farther south is the pyramid of Medum (q.v.). To the west of Medum, on the edge of the Fayum, are the pyramids of Illahun and Hawâra, the former the tomb of Usertesen II, the latter that of Amenemhat III. The pyramid of Illahun is built with a frame-

work of stone filled up with mud bricks, while that of Hawâra is built entirely of mud bricks, though it was doubtless originally cased over with fine stone.

Outside of Egypt the pyramid never assumed national or characteristic importance, except perhaps in Central and South America, especially Peru. Even there what are called pyramids are more properly vast platforms with sloping sides richly carved. Some of these have been explored by the Yale expeditions under Professor Bingham. Pausanias (ii, 25) describes certain Greek pyramids between Argos and Epidaurus, and Varro, quoted by Pliny, the tomb of Lars Porsena at Clusium, consisting of five steep-sided pyramids on a vast podium 300 feet square. The zikkurats of ancient Assyria were a species of stepped pyramid. At Rome the tomb of Caius Cestius near the San Paolo gate is a true pyramid of stone, about 90 feet high. See FOUNDATION.

PYR'AMUS (Lat., from Gk. Πύραμος) **AND THISBE,** thĭs'bē (Lat., from Gk. Θίσβη). Two lovers whose tragical history is told by Ovid, *Metamorphoses*, iv, 55–465. They were natives of Babylon and immediate neighbors. But though tenderly attached to each other, their parents would not consent to their marriage, and they were obliged to content themselves with stolen interviews through an opening in the wall between their gardens. On one occasion they arranged to meet at the tomb of Ninus, where Thisbe, who was first at the trysting spot, was startled by a lioness. She fled, leaving her veil behind, which the fierce animal tore and covered with blood. Soon after Pyramus appeared, and, seeing the bloody veil, believed that his mistress had been murdered, and killed himself. Thisbe now returned and, beholding her lover lying dead on the ground, put an end to her own life.

PYRAR'GYRITE (from Gk. πῦρ, *pyr*, fire + ἄργυρος, *argyros*, silver). A sulphantimonite of silver that crystallizes in the hexagonal system, has a metallic lustre, and is dark red or black in color, the latter color being best seen by transmitted light. When found in quantity it is a valuable silver ore.

PYRENEES, pĭr'ē-nēz. A high mountain chain of Europe, extending from the southeast corner of the Bay of Biscay to the Mediterranean. The Cantabrian Mountains of the north coast of Spain are a continuation of the Pyrenees, so that the entire mountain system extends from Cape Creus in the Mediterranean to Cape Torifiana on the northwest coast of Spain, a distance of 630 miles; but the name Pyrenees is applied only to that part of the system which forms the boundary between France and Spain and which has an east and west extension of about 280 miles. The mountains, with an area of over 20,000 square miles, form the water parting between the rivers of France and Spain and form an effective barrier between the two countries. Unlike the Alps, which have a number of passes practicable for wagon roads, the Pyrenees are a true sierra whose sawlike ridges are notched only a little below the level of the peaks, so that but two passes practicable for wagons exist between the two extremities—the Col de la Perche between the valleys of the Tet and the Segre and the Col de Somport (traversed by Hannibal) on the old Roman road from Saragossa to Oloron. The highways that start as roads generally merge into mule paths and are valueless for commerce. The two railroads between France and Spain cross the low coastal strips at the extremities of the mountains, and are thus greatly deflected from direct routes, so that most of the commerce between the two countries is carried by sea.

The Pyrenees were upheaved above the sea during the latter part of the Eocene epoch, when a large part of Europe was buried under the ocean, but most of the foldings are of Oligocene age and contemporaneous with the Alps. Granite forms the kernel of the mountain system and is overlaid by masses of chalk and sandstone. The culmination of the mountains is only 11,168 feet above sea level; and, owing to the far extending south slope, which falls gently to the plain of Spain, the mean height of the mountain mass is only about 3500 feet.

The mountains do not form a continuous chain or two chains between the Atlantic and the Mediterranean. The surveys, especially on the Spanish side, seem to show that no continuous line forms the culminating portion of the Pyrenees, but that this backbone of the mountains is a series of broken chains which do not coincide with the water parting between France and Spain, but cross this divide obliquely. Some of these broken chains extend from northwest to southeast, and others intersect them from southwest to northeast, so that by alternately digressing from one of these directions to the other the irregular crest of the Pyrenees acquires its general direction, which from the Atlantic to the Mediterranean is 9° south of due east.

The north slopes of the Pyrenees are shorter and much steeper than those on the south or Spanish side. The Central, or High Pyrenees, extending about 150 miles, from Port de Canfranc to the valley of Aran, have the highest summits, including the Pic d'Enfer (10,109 feet), Balaitous (10,318), Vignemale (10,820), Mont Perdu (10,994), Pic des Posets (11,047), and Maladetta, or the Pic d'Anethou (11,168). The Eastern Pyrenees with three high summits (Pic Carlitte, Puigmal, and Canigou) maintain the heights with great uniformity and finally descend with great suddenness to the sea at the eastern extremity. The Western Pyrenees, on the other hand, have a gradually diminishing slope westward from Pic du Midi d'Ossau (9465 feet), so that near the Bay of Biscay the elevations are less than 3000 feet. The snow line, ranging from 8800 to 9200 feet, is nearly 1000 feet higher than in the Alps, while the general level of the mountains is considerably lower. Most of the highest summits are on the boundary crest, but the culminating point of

the Maladetta is in Spain. The extent of the snow fields and glaciers is therefore insignificant as compared with that of the Alps. The entire area of glaciers is estimated at 13 square miles, confined almost altogether to the north slopes of the Central Pyrenees, the largest glaciers being on the Maladetta (1760 acres) and on the Mont Perdu group (1472 acres). Along the north slope of the Pyrenees are a number of famous watering places, including Bagnères-de-Bigorre and Bagnères-de-Luchon. The little Republic of Andorra (q.v.) lies among the Eastern Pyrenees on the south slope.

PYRÉNÉES, pē'rā'nā', BASSES. A southwestern department of France. See BASSES-PYRÉNÉES.

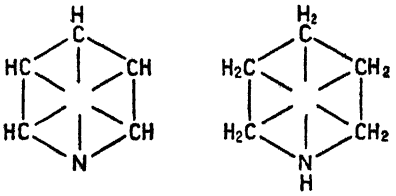
PYRÉNÉES, HAUTES. A southwestern frontier department of France. See HAUTES-PYRÉNÉES.

PYR'ENEES, PEACE OF THE. A treaty of peace concluded between France and Spain, Nov. 7, 1659, on an island in the Bidassoa River. It brought to an end the struggle between the two powers, which with intervals of peace had continued since the beginning of the sixteenth century, when Louis XII of France and Ferdinand the Catholic entered into the contest for supremacy in Italy. Spain ceded to France most of Artois and parts of Flanders, Hainault, and Luxemburg; in the south it surrendered Roussillon and a part of Cerdagne, thus making the Pyrenees the boundaries between the two countries. The Infanta Maria Theresa was promised in marriage to the young Louis XIV (q.v.).

PYRÉNÉES-ORIENTALES, pē'rā'nā'-zō'rē-äN'tàl'. A maritime department of South France (Map: France, S., G 6). Area, 1598 square miles. The department presents a series of three parallel valleys formed by spurs from the Pyrenees, which run east and west and are watered by the Agly, the Tet (the principal river), and the Tech. The southwest corner is drained by the Sègre (Segura), a tributary of the Ebro. An extensive plain occupies all the north and east of the department. The climate is equable. The vegetable products include fine grain and some of the choicest fruits. Wines constitute the wealth of the district and include the red wines of Roussillon and the white muscatel of Rivesaltes. The chief exports are wine, cocoons, live stock, animal products, anchovies, etc. Capital, Perpignan (q.v.). Pop., 1901, 212,121; 1911, 212,986.

PYRE'NOID (from Gk. *πυρήν, pyrēn*, stone of a fruit + *εἶδος, eidos*, form). A differentiated portion of a chromoplast (q.v.) of proteid nature, which, since starch grains are usually formed around it, is sometimes called an amylum body. It is regarded as a food reserve.

PYRETHRUM, pĭr'ĕth-rŭm. See INSECT POWDER, and Colored Plate of CHRYSANTHEMUMS.



PYR'GOS. A town of Greece, capital of the Nomarchy of Eleia. It is situated near the west coast of the Morea, 40 miles southwest of Patras, in a fertile region producing great quantities of currants, grapes, and oranges (Map: Greece, C 4). These products are exported through the port of Katakolon, with which the town is connected by a short railroad. Exports of currants attain 2,000,000 tons annually. Railroads also run to Patras and to the ruins of Olympia. The town is built on the site of ancient Letrinoi, a station on the road connecting Elis to Olympia. Pop., 13,690.

PYRGOTELES, pēr-gŏt'ĕ-lēz. See CAMEO.

PYRHE'LIOM'ETER (from Gk. *πῦρ, pyr*, fire + *ἥλιος, hēlios*, sun + *μέτρον, metron*, measure). The name given by Pouillet to an instrument devised by him for the purpose of measuring the amount of heat received from the sun in a unit of time by a unit surface. This quantity increased by the amount of heat lost while the solar radiation is passing through any part of the earth's atmosphere is sometimes called the "solar thermal constant," and all apparatus expressly designed to measure the intensity of radiant heat may properly be called pyrheliometers; but as the solar radiation may produce either thermal, optical, or chemical effects, according to the nature of the substance upon which it falls, the pyrheliometer is really a special form of actinometer (q.v.) or radiometer. Pouillet's instrument, devised in 1837, "consists of a thermometer whose bulb is inclosed in a thin flat metallic box filled with water. The upper surface of the box carefully blackened is placed perpendicularly to the rays of the sun. The heating of the thermometer during five minutes' exposure to the solar action is noted, and also its cooling during five minutes when the sunlight is cut off by a screen. The elevation of temperature produced by the heat of the sun in five minutes, corrected for the effect of cooling or warming when the sun's rays are cut off, is to be divided by the mass of the water in the apparatus and the area of the surface; this gives the quantity of heat expressed in calories as received by a unit surface in a unit time." In 1885 Prof. Knut Ångström devised his differential pyrheliometer, composed of two identical disks of copper, each carrying a thermoelectric junction and exposed alternately to the action of the sun, a galvanometer placed in the circuit of the two junctions measuring their difference of temperature; and in 1893 he brought out his compensating pyrheliometer. "Two thin strips of blackened metal identical in every way are placed side by side. One of these is exposed to the rays of the sun, while the other is kept in the shade; the latter is warmed up by an electric current until its temperature is identical with that of the strip that is warmed by the sunshine. Therefore at this moment the thermal effect of the solar radiation per unit of time is equal to that of the electric current." In 1893 Chwolson constructed a pyrheliometer consisting essentially of two thin plates gilded on the back and blackened in front, alternately exposed to and shielded from sun-

shine, and whose differences of temperature can be measured many times in rapid succession by thermoelectric methods. Chwolson's apparatus has been adopted by the Russian meteorological service, while Ångström's apparatus has commended itself to the Weather Bureau of the United States. Crova's mercury pyrheliometer consists of a mercurial thermometer bulb carefully blackened and receiving the solar rays through a narrow aperture of known area. The bulb is alternately shaded and exposed several times in succession, and the differences between the readings give the correct effect of the sunshine. When the bulb has been properly calibrated and its water equivalent is known, its changes of temperature can be converted into calories and the instrument becomes an absolute actinometer. The Weather Bureau uses also a form of pyrheliometer developed by Prof. C. F. Marvin, in which the pyrheliometer is mounted equatorially and caused to follow automatically the sun. A mechanically operated shutter exposes the blackened silver block to the sun for exactly one minute and shades the block the next minute and so on. The heating and cooling of the silver block thus exposed is accurately and very conveniently measured by an electrical resistance thermometer embedded in the silver block. The results of prolonged investigations by C. G. Abbot lead him to place the value of the solar thermal constant at the mean distance of the earth from the sun at 1.933 calories per minute per square centimeter, but in general such figures are affected by an uncertainty as to the exact absorption by the earth's atmosphere. A very complete review of pyrheliometers is given in the report on radiation by Jules Violle, published in the report of the meeting at St. Petersburg, 1899, of the International Meteorological Committee. The latest results, including those secured by a pyrheliometer sent into the atmosphere to an altitude of over 18,000 meters on July 11, 1914, are presented by C. G. Abbot in *Smithsonian Institution, Miscellaneous Collections*, vol. lxv, no. 4 (Washington, 1915).

PYR'IDINE, C_5H_5N. A basic compound of carbon, hydrogen, and nitrogen. It is usually prepared on a commercial scale from coal tar; it combines with the sulphuric acid used in purifying the coal-tar hydrocarbons, and when the acid is neutralized with soda, a mixture of pyridine and several other bases (notably quinoline) separates out in the free state; from this mixture pyridine is isolated by fractional distillation, and it may then be obtained pure by transforming it into one of its salts and purifying the latter by repeated crystallizations. Pure pyridine is a colorless liquid that boils at 115° C. (239° F.) and may be identified by its peculiar odor. The derivatives of pyridine include many of the alkaloids (q.v.); nicotine, e.g., is closely allied to it, and when subjected to a process of oxidation yields nicotinic acid, $C_5H_4N.COOH$, a compound evidently derived from pyridine by substituting a carboxyl group (COOH) for one of its hydrogen atoms. Another important derivative of pyridine is *piperidine*, $C_5H_{10}NH$, a colorless, powerfully basic liquid that boils at 106° C. (222.8° F.) and may be identified by its pepper-like odor. Piperidine may be obtained, on the one hand, from pyridine, by the action of nascent hydrogen; on the other hand, it may be prepared from the alkaloid piperine (q.v.), a characteristic constituent of pepper, by the action of caustic potash. The chemical constitution of pyridine and of piperidine is represented, respectively, by the following graphic formulæ:

PYRIDINE. PIPERIDINE.

See ALKALOIDS.

PY'RITE (Lat. *pyrites*, from Gk. *πυρίτης*, flint, millstone, relating to fire, from *πῦρ*, *pyr*, fire). An iron disulphide (FeS_2) that crystallizes in the isometric system, has a metallic lustre, and is of a brass-yellow color. It is widely disseminated, occurring in rocks of all kinds and of all ages, sometimes in the form of grains disseminated throughout the mass of a rock or along the line of contact between basic eruptives and sedimentaries; as irregular and sporadic and concretionary masses in sedimentary rocks and modern sands and gravels; in the form of true fissure veins; and as interbedded, often lenticular masses, sometimes of immense size, lying conformably with the stratification of the inclosed rock. The origin of the mineral in the older crystalline rocks is frequently somewhat obscure, but in sedimentary rocks it is regarded as due to the precipitation of the included ferruginous matter by sulphureted and deoxidizing solutions produced by decomposing animal and vegetable matter. When found on the surface the mineral is often considerably altered by oxidation and hydration, forming limonite. The amount produced in the United States in 1913 was 341,338 long tons, valued at $1,286,284. The mineral finds its principal use in the manufacture of sulphuric acid and ferrous sulphate (green vitriol). Small quantities are used in the manufacture of vermilion paints, and some varieties of pyrite have been cut into squares, ovals, and other shapes for use as settings for rings, scarf pins, charms, trinkets, etc. Owing to its yellow color, pyrite has been frequently called *fool's gold*. See COPPER.

PYRKER VON FELSÖ EÖR, pêr'kĕr fŏn fĕl'shē ā'ĕr, JOHANN LADISLAUS (1772–1847). An Austro-Hungarian cleric and poet. He was born at Lángh, Hungary, studied at Stuhlweissenburg, and entered a Cistercian cloister at Lilienfeld. He was made Archbishop of Erlau in 1827. His poetry, mostly ambitious epic, full of patriotism and piety, comprises: *Tunisias* (1819; 3d ed., 1826), in 12 cantos; *Rudolf von Habsburg* (1824; complete, 1827); *Perlen der heiligen Vorzeit* (1821); *Legenden der Heiligen* (1842); *Bilder aus dem Leben Jesu und der Apostel* (1843). Of more significance are his lyrics, *Lieder der Sehnsucht nach den Alpen* (1845). Pyrker's collected works (3 vols.) appeared in 1853–56.

PYRMONT, pêr'mŏnt. A small town in the Principality of Waldeck, west Germany, 15 miles northeast of Detmold. It is celebrated for its mineral springs, which were formerly among the most famous in Europe and are still visited by an average of 18,000 patients annu-

ally. Permanent population, 1900, 1483; 1910, 1705.

PYRMONT. A former principality of Germany, united with Waldeck (q.v.).

PYROG'RAPHY (from Gk. *πῦρ, pyr*, fire + *-γραφία, -graphia*, from *γράφειν, graphein*, to write). The process of burning a design on wood, leather, or other substances, by means of a hollow needle, which is heated over a spirit lamp and kept hot by blowing through it with a rubber ball gas generated by benzine. The needle is guided by the hand like a pencil, and according to its temperature, which is easily regulated, burns more or less deep and dark lines. Pyrography is often combined with painting and relief.

PYR'OLIG'NEOUS ACID. See ACETIC ACID.

PY'ROLITE. See EXPLOSIVES.

PY'ROLU'SITE (from Gk. *πῦρ, pyr*, fire + *λοῦσις, lousis*, bath, from *λούειν, louein*, to wash). A mineral manganese dioxide that crystallizes in the orthorhombic system, has a metallic lustre, and is of a dark iron-black or steel-gray color. Manganese oxides are believed to have been formed from the decomposition of pre-existing manganiferous silicate constituents of the older crystalline rocks and the subsequent decomposition of the oxides in secondary strata. Pyrolusite is the common ore of manganese and is extensively worked for that product, being used in the manufacture of alloys, such as ferromanganese and manganese bronze; as an oxidizing agent, in the manufacture of chlorine and oxygen; and as a coloring material in the manufacture of glass, pottery, and paints.

PY'ROMA'NIA (Neo-Lat., from Gk. *πῦρ, pyr*, fire + *μανία, mania*, madness). A variety of impulsive obsession occurring without clouding of consciousness or disorder of judgment in a psychasthenic and thus a borderland state. In the old nomenclature it was classed with the degenerative insanities, i.e., the insanities depending upon an hereditary or acquired constitutional condition. It is therefore a psychoneurosis, caused by what Janet calls a lowering of the psychological tension. During certain periods the patient manifests an uncontrollable desire to commit arson and feels relief and pleasurable sensation when watching flames. Between these attacks he is sublucid. The patient is capable of attending to his affairs, perhaps, but is nervous or hysterical and evinces morbid irritability. Attacks of pyromania are usually sudden, though sometimes preceded by brief depression. The patient has full insight into the morbid character of his mental condition. But the impulse or imperative conception is strong, and the patient obeys. The morbid impulse to incendiarism occurs not infrequently in epileptics and menstruating girls, rarely in pregnant and hysterical women. See DIPSOMANIA; INSANITY; KLEPTOMANIA.

PYROM'ETER (from Gk. *πῦρ, pyr*, fire + *μέτρον, metron*, measure). An instrument used for measuring temperatures above the range of the ordinary mercury thermometer. One of the first pyrometers was that invented by Musschenbroek about 1725 and consisted of a metallic bar which expanded upon heating. Wedgwood (1782) made for his personal use in the pottery industry a pyrometer which depended upon the amount of permanent contraction of clay cylinders when heated to very high temperatures. Daniell (1821) devised a pyrometer which made use of the relative expansion of a metal bar and a tube of earthenware. The crude pyrometer of Wedgwood, however, served for nearly a century, and it is only in comparatively recent years that pyrometry has been placed upon a scientific basis. The normal or ideal standard temperature scale is the thermodynamic scale based upon the second law of thermodynamics. This is experimentally realized, with certain extremely small corrections, by the gas thermometer, which in the temperature range 100° C. to 1600° C. makes use of the expansion of nitrogen contained in a bulb of an alloy, 80 per cent platinum and 20 per cent rhodium. Higher temperatures are based on the extrapolation of the Wien-Planck or Stefan-Boltzmann radiation laws.

Experiment has established a number of fixed temperature points, such as the melting points of zinc (419.3° C.), antimony (630° C.), copper (1083° C.), platinum (1755° C.). The calibration of all pyrometers is ultimately based upon these and other experimentally determined fixed points. The following types of pyrometer are in extensive use: 1. *Mercury in glass thermometers.* Although mercury boils at 357° C. under atmospheric pressure, by filling the space above the mercury with carbon dioxide or nitrogen under pressure and employing a high-grade combustion glass tubing for the bulb and stem, mercury in glass thermometers may be used to 560° C. 2. *Calorimetric pyrometers* utilize the total heat of metals such as nickel. A nickel block is placed in the furnace of which the temperature is desired and when thoroughly heated is removed and dropped into a vessel of water. The rise in temperature of the water is a measure of the temperature of the furnace. 3. *Fusible cones* (Seger), used in potteries, are small cones of clay with compositions so arranged that their melting points differ in steps of about 20°. If it is desired to heat the furnace to a given temperature, the cone corresponding to this temperature is placed in the furnace and the heat applied until the cone softens and bends over. 4. *Veritas firing rings*, used in potteries, depend upon the permanent shrinkage of certain clay rings when exposed to heat. The diameters of the rings are measured before and after heating. 5. *Thermocouples.* Temperatures are measured by the magnitude of the electromotive forces set up between wires of different materials when one junction is exposed to the temperature to be measured and the other junctions are kept at some known temperature. In the LeChatelier couple one wire is of platinum and the other of an alloy 90 per cent platinum and 10 per cent rhodium. This couple may be operated up to 1600° C. For temperatures below 1000° C. base-metal couples are frequently used on account of inexpensiveness, the usual metals being iron, copper, copper alloys, and nickel alloys. 6. *Resistance thermometers.* This method of high-temperature measurement ordinarily makes use of the variation in the electrical resistance of platinum. In one of its simplest forms the pyrometer consists of a coil of platinum wire wound on a mica frame and incased in a protecting tube of porcelain. 7. *Optical pyrometers* may be used for any temperature above 600° C. This type of instrument is based upon the photometric principle of matching the intensity of the radiation, usually of one color such as red, emitted by a glowing material with

that of the same color from a standard lamp. The brightness of a source increases very rapidly with the temperature, and hence this method is capable of high accuracy. Moreover, this form of pyrometer is not placed in the furnace, but is operated at a distance of several feet and hence does not deteriorate rapidly with use. This and the radiation pyrometer are the only instruments which permit the measurement of extremely high temperatures, such as that of the electric arc (3500° C.), or of the sun (6000° C.). 8. *Radiation pyrometers* make use of the heat radiated by a glowing material. This heat falls upon the receiver of the pyrometer, and the resulting small rise in temperature of the receiver is measured by a thermocouple or by the expansion of a bimetallic spring mounted within the receiver.

Recording pyrometers.—The thermoelectric, resistance, and radiation pyrometer may be made self-recording, so that a printed record of the temperature of the furnace may be obtained. Recorders or indicating instruments for these pyrometers may be located several hundred feet from the furnace of which they are registering the temperature. Consult: Waidner and Burgess, "Optical Pyrometry," and Burgess and Foote, "Radiation Pyrometry," in United States Bureau of Standards, *Scientific Papers*, Nos. 11, 250 (Washington, 1904, 1915); C. R. Darling, *Pyrometry* (New York, 1911); and Burgess and LeChatelier, *The Measurement of High Temperatures* (3d ed., ib., 1912). See RADIATION; THERMOMETER; THERMOMETRY.

PYR'OMOR'PHITE (from Gk. *πῦρ, pyr*, fire + *μορφή, morphē*, form). A mineral lead phosphate and chloride that crystallizes in the hexagonal system, has a resinous lustre, and in color is of various shades of green, yellow, and brown. It occurs with lead ores, usually in veins.

PY'RONOME. See EXPLOSIVES.

PY'ROPE. See GARNET.

PYROPH'ORUS (Neo-Lat., from Gk. *πυροφόρος*, fire bearing, from *πῦρ, pyr*, fire + *-φόρος, -phoros*, bearing, from *φέρειν, pherein*, to bear). Any solid substance which is capable of taking fire on exposure to the air at ordinary or but slightly elevated temperatures. This property is possessed chiefly by finely divided solid bodies, such as metallic iron or nickel, reduced from the oxide by heating in hydrogen. The spontaneous inflammability in such cases is explained by the capacity of the powders for rapidly condensing air within their pores, thereby causing a considerable rise of temperature, while at the same time they present a large surface to the action of oxygen. The substances possessing this property include numerous salts, such as lead citrate or tartrate, which after ignition in a glass tube until gaseous matter is no longer evolved and then being left to cool take fire instantly on being thrown out into the air. "Homberg's pyrophorus" is obtained by heating alum with lampblack or similar carbonaceous matter.

PY'ROPHOSPHOR'IC ACID. See PHOSPHORIC ACID.

PY'ROPHYL'LITE (from Gk. *πῦρ, pyr*, fire + *φύλλον, phyllon*, leaf). A hydrous aluminium silicate that is believed to crystallize in the monoclinic system, although it is not usually found in distinct crystals. It has a pearly lustre and in color ranges from white, through various shades of yellow, to green. It has a soapy or greasy feeling that suggests its similarity to various forms of talc, which it closely resembles. It occurs in some of the older rocks. It is used for the manufacture of slate pencils, the variety employed for this purpose being known as "pencil stone." It is further used for making tailors' chalk (French chalk). The compact varieties, which are known as *agalmatolite*, or *pinite*, have been extensively used by the Chinese and Japanese in the manufacture of small images and objects of art.

PYRO'SIS (Neo-Lat., from Gk. *πύρωσις*, a burning, from *πυροῦν, pyroun*, to burn, from *πῦρ, pyr*, fire), or WATER BRASH. A symptom of certain forms of indigestion in which at intervals a regurgitation of a considerable quantity of a watery acrid or acid fluid occurs, usually accompanied by a burning sensation in the epigastrium, frequently extending up behind the sternum to the throat. In common parlance the regurgitation is called water brash, and the sensation is heartburn. See DYSPEPSIA; INDIGESTION.

PY'ROSO'MA (Neo-Lat., from Gk. *πῦρ, pyr*, fire + *σῶμα, sōma*, body). A compound, pelagic, luminous tunicate. See ASCIDIAN; LUMINOSITY OF ANIMALS.

PYROTECHNY, pī'rō-tĕk'nĭ (from Gk. *πῦρ, pyr*, fire + *τέχνη, technē*, art). The art of making fireworks. The origin of pyrotechny is unknown, but the art was early practiced in the East and has attained the highest degree of perfection among the Chinese and Japanese. Although inflammable compositions, known as Greek fire, were used in European warfare before gunpowder had become known among the Western nations, fireworks, as now denominated, became known to them about the middle of the fourteenth century, and we find record of their having been used as an accessory of public pageantry in 1588. The early development of fireworks in Europe was due to the Florentines, and the Italians long retained their supremacy in this field.

The chief materials employed in the manufacture of fireworks are gunpowder or its constituents, charcoal, sulphur, and saltpetre, or other oxidizing salts; metals and metallic salts which on burning give rise to various-shaped sparks or a brilliant light, or which impart color to the flame; touch paper and fuse or quick match, by which the charges are ignited and inflamed; paper and wood from which to construct the cases and sticks; and resin, camphor, lycopodium, soaps, gum, lampblack, and similar bodies with which to modify the character of the reaction.

Roman Candles. In the Roman candle we have the stars or balls, made up of gunpowder ingredients mixed with color or light-giving materials compacted into hard masses by the aid of gum or shellac, resting on loosely confined layers of granulated gunpowder, interspersed between well-compacted masses of slow-burning composition, all inclosed in a stout paper or cardboard case. The stars are hollow and are provided with a piece of quick match by which they are ignited. The end of the case is primed with powder and capped with touch paper. When the latter is ignited the priming powder is inflamed and this sets fire to the composition, or dark fire as it is technically called, which slowly burns with the production of flame and sparks until the star is reached, when the grained gunpowder upon which it rests is ignited, burns rapidly, and expels the star with a loud report.

Rockets consist of a cylindrical paper or cardboard body, or fusee, filled with propelling composition, to the upper end of which is attached a shorter and wider paper tube called the pot, which contains the garniture, or material that produces the brilliant clusters of stars or showers of golden or colored rain, etc., which appear when the rocket has risen to a great height. The garniture is ignited by the flame which flashes through a hole in the clay plug at the top of the fusee as the rocket reaches its greatest altitude.

Pinwheels and other revolving pieces are constructed by coiling the paper case, when not too tightly filled with composition, about a flat wooden block or frame which in use is attached to a tree or board by a nail upon which it may freely revolve, the revolution being determined by the pressure of the gas evolved as the composition burns.

Touch Paper consists of a thin, rather tough paper which has been sponged with a weak solution of saltpetre until saturated and then dried.

Quick Match consists of cotton wick which has been saturated with a weak solution of saltpetre, then coated with a thick paste of gunpowder and gum, spread evenly over it, and then dried.

Colored Fire. In producing light and color, there are added to the gunpowder composition steel filings for brilliant fire or cast-iron filings for Chinese fire. Copper filings give a greenish tint to flame; zinc filings a fine blue color; powdered magnesium a dazzling white light; amber, colophony, or common salt affords yellow fire. Lampblack produces a very red color with gunpowder and a pink with nitre in excess, and it serves for making golden showers. Yellow sand or glistening mica communicates to fireworks golden radiations. Verdigris imparts a pale green; sulphate of copper and sal ammoniac a palm-tree green; barium salts a grass green; strontium salts crimson; calcium salts orange. Potassium picrate on burning produces a whistling sound and has recently been introduced for use in whistling bombs and rockets. Camphor yields a very white flame and aromatic fumes. Lycopodium burns with a rose color and a magnificent flame. The published recipes and formulas for the manufacture of the materials used in fireworks are very numerous, while each manufacturer has his special mixtures and methods of treatment.

Greek Fire (q.v.) is supposed by some to have been composed of asphaltum, nitre, and sulphur, by others to have had approximately the composition of gunpowder. A modern composition known by this name consists of a solution of phosphorus in carbon disulphide with or without sulphur, potassium chlorate, and mineral oil. Rockets, known as Congreve rockets, carrying explosive shells and incendiary compositions in the pot, were used in the siege of Boulogne in 1806 and in the British war with the Burmese. Bengal lights are used as distress signals at sea, while Roman candles, or similar devices throwing colored stars, are used, with a telegraphic code, for over-water communication.

PY'ROXENE (from Gk. *πῦρ, pyr*, fire + *ξένος, xenos*, guest), or AUGITE. A name applied to a group of mineral metasilicates, of which the mineral pyroxene is the type. The latter is a metasilicate of calcium and magnesium, often with iron, and sometimes with manganese, and zinc, that crystallizes in the monoclinic system, and is usually founded in prismatic crystals, although sometimes granular, coarse or fine. According to its composition the species is divided by Dana into the following subspecies: diopside, called also malacolite, or alalite, a calcium-magnesium pyroxene, whose color varies from pure white and yellowish or grayish white to green; hedenbergite, a calcium-iron pyroxene of a black color; schefferite, a manganese pyroxene sometimes containing iron, of a brownish color; and augite, an aluminium pyroxene sometimes containing small quantities of the alkalies, of a black color. These varieties are common minerals and are found in crystallized limestone and dolomite and frequently in the older rocks. Pyroxene is an essential constituent of many igneous or eruptive rocks, and with labradorite or anorthite and magnetite it forms basalt. The transparent green diopside variety is sometimes cut for a semiprecious stone.

PYROX'ENITE (from Gk. *πῦρ, pyr*, fire + *ξένος, xenos*, guest). An igneous rock of ultrabasic composition, free from feldspar and chiefly composed of one or more varieties of pyroxene or amphibole and sometimes magnetite or ilmenite. Pyroxenites easily suffer alteration from weathering, the principal products being talc (soapstone) and serpentine. They are closely allied to the peridotites. See PERIDOTITE.

PY'ROXYL'IC SPIRIT. See METHYL ALCOHOL.

PYROX'YLIN (from Gk. *πῦρ, pyr*, fire + *ξύλον, xylon*, wood). A term originally broadly applied to the products obtained by the action of nitric acid, or a mixture of nitric and sulphuric acids, on wood, paper, cotton, and similar substances. It is now more specifically restricted to soluble cellulose nitrates and especially to collodion cotton. The United States Pharmacopœia designates it as a product obtained by the action of nitric and sulphuric acids on cotton and consisting chiefly of cellulose tetranitrate $[C_{12}H_{16}(ONO_2)_4O_6]$ which is slowly but completely soluble in 25 parts of a mixture of 3 volumes of ether and 1 volume of alcohol. It is soluble in acetone and glacial acetic acid and is precipitated from these solutions on addition of water. It is exceedingly inflammable and on burning should leave no weighable residue of mineral impurity. It is used for the manufacture of pharmaceutical and photographic collodions and of pyroxylin plastics. It should be stored in cartons protected from the light, for when kept in well-closed bottles and exposed to the light it is decomposed with the evolution of nitrous vapors. See GUNCOTTON.

PYRRHIC (pĭr'ĭk) **DANCE** (Gk. *ἡ Πυρρίχη*,

hē Pyrrhichē). The oldest and most famous of the ancient Greek war dances. Regarding its origin and name accounts varied. Some attributed it to a Cretan or Spartan named Pyrrhichos, others to Pyrrhos, son of Achilles, others to the Dioscuri or the Curetes. The Cretan name is said to have been *πρύλις, prylis*. There can be little doubt that the dance originated among the Dorians of Crete or Laconia, and it was especially cultivated by the Spartans as valuable training for the soldier. It seems to have been presented by a chorus of armed youths, who divided into two bands and represented, in pantomime, attack and defense, including the feints and the parries needed in individual contest. It was also danced as a solo, and sometimes by women, as is clear from Xenophon's account in the *Anabasis*, vi, 1, 12, and the testimony of the vases. At Athens it was cultivated by the Ephebi (see EPHEBUS), and was danced in the competitions of the Panathenæa (q.v.). In later times a Bacchic element was introduced and the adventures of Dionysus were depicted. In Rome it was very popular as a pantomimic spectacle. The time of the music is said to have been rapid (in Greek metre two short syllables (⏑ ⏑) are known as a Pyrrhic foot. This, however, occurs rarely, and is always to be measured as containing three metrical units, the smallest number which can form a foot). Consult White and Morgan, *An Illustrated Dictionary to Xenophon's Anabasis*, p. 193 (Boston, 1892), and the article "Pyrrhica," in W. Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1891).

PYRRHIC VICTORY. A phrase denoting a success won at a ruinous cost, referring to the battle of Asculum, in which Pyrrhus gained the victory over the Romans with such heavy losses that he is said to have exclaimed, "Another such victory and Pyrrhus is destroyed." See CADMEAN VICTORY.

PYRRHO, pĭr'rō (Lat., from Gk. Πύρρων, *Pyrrhōn* (c.365–c.275 B.C.). A Greek philosopher, born in Elis, the founder of the Skeptical school of philosophy. (See SKEPTICISM.) He was a painter in his youth, but later was attracted to philosophy by the works of Democritus and became the pupil of Bryson, a disciple of Stilpo. Afterward he attached himself to Anaxarchus and with him accompanied Alexander the Great on his expedition to the East, where, according to Diogenes Laertius, he became acquainted with the teachings of the Persian Magi and the Indian Gymnosophists. During much of his long life he lived in retirement. He was so highly esteemed by his fellow citizens that they made him their chief priest and honored him with a statue after his death; the Athenians gave him the rights of citizenship. As Pyrrho left no writings, little is certainly known of his doctrine; the chief source of information is the work of his follower, Timon the Sillographer. The main principle of his teaching seems to have been that to attain the highest good, happiness, we must know the nature of things and the relation we should bear to them. But since we know things only as they seem to us, their real nature cannot be definitely apprehended, and hence objective knowledge is impossible of attainment. Therefore the correct attitude for the philosopher is complete suspense of judgment, and in this lie freedom from trouble and peace, which is man's chief good. Consult: Waddington, *Pyrrhon et le Pyrrhonisme* (Paris, 1877); Eduard Zeller, *Philosophie der Griechen*, vol. iii (5th ed., Leipzig, 1892); J. E. Erdmann, *History of Philosophy*, English translation by W. S. Hough, vol. i (New York, 1892); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. ii, part i (5th ed., Munich, 1911); Friedrich Ueberweg-Prächter, *Grundriss der Geschichte der Philosophie*, vol. i (10th ed., Berlin, 1914).

PYR'RHOTITE (from Gk. *πυρρός, pyrrhos*, reddish, from *πῦρ, pyr*, fire). A mineral iron sulphide, frequently containing nickel, that crystallizes in the hexagonal system, has a metallic lustre, and in color is bronze yellow to copper red. It occurs with magnetite and apatite, also with other sulphides in the older rocks, as well as sometimes in meteorites.

PYRRHUS, pĭr'rŭs. See NEOPTOLEMUS.

PYRRHUS (Lat., from Gk. Πυρρός) (c.318–272 B.C.). King of Epirus, son of Æacides and Phthia and a distant kinsman of Alexander the Great. According to one account he was a descendant of Neoptolemus (otherwise called Pyrrhus), son of Achilles. When Æacides was deposed by a faction of his people and driven from his Kingdom, Pyrrhus, who was then but an infant two years of age, was rescued by some faithful attendants of the King and carried to Glaucias, King of a tribe of the Illyrians. By him he was restored to his Kingdom when 12 years old, but in 302 was again driven out and took refuge with Demetrius Poliorcetes. After serving in the battle of Ipsus he went as a hostage for Demetrius to Egypt, where he married the stepdaughter of Ptolemy Soter. Thence returning to Epirus, he regained possession of his throne, and immediately directed his attention to the conquest of Macedonia. He obtained possession of the western part of that country and, when his former friend Demetrius became King, joined a coalition with several others to drive him out. He was successful, and in 287 B.C. the Kingdom was divided between Pyrrhus and Lysimachus. Pyrrhus reigned but a few months, however, and was then himself expelled in favor of Lysimachus.

In 281 B.C. the people of Tarentum, a Greek colony in lower Italy, then at war with the Romans, sent an embassy to Pyrrhus, in the name of all the Greek colonies in Italy, offering him the command of all their troops against their enemies. Taking up their cause, Pyrrhus in 280 B.C. arrived at Tarentum with 25,000 troops and 20 elephants. The first battle between Pyrrhus and the Romans, who were commanded by the consul, M. Valerius Lævinus, took place at the river Siris in Lucania. Only through the help of the elephants, whose strange appearance and gigantic size excited a sudden panic among the Romans, did Pyrrhus win the victory. See PYRRHIC VICTORY.

He now advanced into central Italy, on his way towards Rome, but, finding the city well defended, he withdrew to Tarentum and wintered there. In the following year (279 B.C.) he was victorious over the Romans at Asculum in Apulia, but lost so heavily that, unable to follow up his victory, he withdrew to Tarentum. Having been invited by the Greeks of Sicily to assist them in their struggles with the Carthaginians and the Mamertines (q.v.), Pyrrhus effected a truce with Rome (278) and crossed into Sicily. His first exploits in that island were both brilliant and successful, so that the

Carthaginians were confined to Lilybæum and the Mamertines to Messana. Then the Sicilians began to murmur at the burdens put upon them by Pyrrhus and to treat with the enemy, and in 276 B.C. Pyrrhus left the island and returned to Tarentum. On his way he fought the Carthaginian fleet off Syracuse and the Mamertine army near Rhegium. In the following year (275) he was completely defeated by Manius Curius Dentatus, near Beneventum, and in 274 he returned to Epirus, leaving Milo with a garrison at Tarentum. In 273 he once more invaded Macedonia, over which Antigonus Gonatas was King, and established himself a second time as ruler of that country. In 272, at the request of Cleonymus, the rightful but excluded King of Sparta, he led a force into the Peloponnesus. He attacked Sparta, but was repulsed, and then withdrew to Argos, to assist Aristeas, one of the leading citizens of the place, in his rivalries with Aristippus. Here he met Antigonus of Macedon, the champion of the opposite faction, and a fight took place in the streets of the city. Pyrrhus was thrown from his horse and stunned by a tile thrown from a housetop by the mother of the man whom he was about to kill, and was then killed by one of the soldiers of Antigonus. Consult the standard histories of Rome; also: J. G. Droysen, *Geschichte des Hellenismus* (2d ed., Gotha, 1877–78); Rudolf Schubert, *Geschichte des Pyrrhus* (Königsberg, 1894); J. P. Mahaffy, *Alexander's Empire* (New York, 1898); Carl Klotzsch, *Epirotische Geschichte bis zum Jahre 280 vor Christus* (Berlin, 1911).

PY'RUS (variant spelling of Lat. *pirus*, pear). A genus of trees and shrubs of the family Rosaceæ, to which belong some of the most valuable fruits and ornamental trees and shrubs of temperate climates, having a five-celled fruit called a pome with a cartilaginous endocarp and two seeds in each cell. It includes species differing very much in appearance, in foliage, and in almost everything except the character of the flower and fruit. Some botanists separate the apples (*Pyrus malus*) as a distinct genus. See APPLE; BEAM TREE; PEAR; ROWAN TREE.

PYTHAG'ORAS (Lat., from Gk. Πυθαγόρας). A famous Greek philosopher and geometer, born at Samos, probably in the forty-ninth Olympiad (584–581 B.C.). He was the son of Mnesarchus and is said to have been the pupil of Pherecydes. He had become known in Ionia as a man of great learning when, perhaps driven from home by disgust at the tyranny of Polycrates about 530 B.C., he migrated to Magna Græcia and settled at Crotona. Here he founded an exclusive brotherhood among the aristocracy of the place. The fame of it spread abroad and attracted into its circle men and women not only from other neighboring colonies, but from all parts of south Italy. The original purpose of this brotherhood was probably religious and not political, and yet the society became involved in the fierce struggles between the aristocracy and the democracy that were at this time raging in lower Italy; and when the popular party gained the upper hand, in its wild fury it turned upon the Pythagorean brothers and burned them in their meeting places. Only a few escaped. It is not certain whether Pythagoras himself perished in this outbreak or whether he had previously died peacefully in Metapontum, whither he is said to have retired when the storm was gathering. He is said to have traveled from Persia to Gaul in search of wisdom, to have become initiated in Egypt into the venerable mysteries of that country, and there to have acquired mathematical lore and a belief in the transmigration of souls. He is even reported to have been the son of Hermes in a previous metempsychosis and to have been permitted to bring with him into his earthly life the memory of all his past experiences, and he is credited with all sorts of miraculous performances.

The exact character of his own personal teachings is a matter of dispute. His name is mentioned only three times in the whole Aristotelian corpus; both Plato and Aristotle speak frequently of Pythagoreans; they evidently knew nothing definite of the views actually promulgated by Pythagoras himself. The main reason for this ignorance is to be found in the fact that Pythagoras committed nothing to writing, and every disciple strove to gain credit for his own phase of Pythagoreanism by attributing it to the venerated master, whose *ipse dixit* carried so much weight.

It seems reasonable, in the light of all we know, to suppose that the early Pythagorean brotherhood was one of the mystic circles, numerous at that time, founded with a view of purifying its members from some imaginary guilt and accomplishing this end by the observance of taboo. Among the *akousmata*, or exoteric teachings of the later Pythagoreans, we find such prohibitions as these: not to sit on a quart measure; not to step across the beam of a balance; not to eat beans or the heart of animals; not to stir fire with iron; not to look in a mirror beside a light. All these punctilios point almost unmistakably to primitive magic. As Burnet remarks, we find in such practices, so senseless to the outsider, an explanation of the popular outburst against the society. The domination of such a religious order ruling the state must have been galling enough. "Greek democracies could never pardon the introduction of new gods. . . . This introduced, as it were, an unknown and incalculable element into the arrangements of the state, which might very likely be hostile to the democracy, and was in any case a standing menace to the mass of citizens, who had no means of propitiating the intruding divinity."

But although the main motive of the brotherhood was thus superstitious, there is no doubt that a certain philosophic doctrine was taught to the brethren by its learned founder. Like all the early Greek philosophies, it was probably cosmological, and it was likewise dualistic. "The two primary opposites, the Limited and the Unlimited, were brought together in a 'harmony' which could be numerically determined." (Burnet.) The Unlimited was space, the Limited was the definite forms in which space manifested itself. Space was not regarded as an abstract entity; it was rather a material sensible thing, probably identified with air. Hence the universe was said to breathe. The unlimited air is in its essence dark; the principle of limitation is fire, the bright element which reveals definite spatial outlines.

How much mathematics Pythagoras knew is likewise uncertain. To him with little question is to be ascribed the first proof of the theorem known to the Egyptian "rope stretchers" con-

cerning the right-angled triangle (see HYPOTENUSE), which they knew in the case of the triangle with sides 3, 4, 5, without giving a rigorous proof. Of other matters, what is to be ascribed to Pythagoras himself and what to his pupils it is difficult to decide. Therefore we generally speak of a mathematical truth as being discovered by the Pythagoreans rather than by Pythagoras. See PYTHAGOREANISM.

PYTHAGORAS OF RHE'GIUM. A famous Greek sculptor of the first half of the fifth century B.C. He is commonly called a Rhegian, but on a pedestal at Olympia bearing his signature he calls himself a Samian, and it is probable that he was one of the emigrants from Asia Minor to Magna Græcia about 496 B.C. He belongs to the period of transition from the archaic art to the great masters of the time of Phidias. (See GREEK ART.) He was especially celebrated for his statues of athletes and, we are told, introduced symmetry and rhythm into sculpture. This seems to refer to the careful adjustment of the harmony between the parts by a study of proportions and to the endeavor to secure graceful and flowing lines removed from the stiffness and schematic treatment of the archaic school. He also was said to have been the first to render the hair, veins, and muscles in a natural manner. His importance was evidently great in the development of Greek art, but none of his works can be identified with certainty. Consult: Sir Charles Waldstein, *Essays on the Art of Phidias* (New York, 1885); Maxime Collignon, *Histoire de la Sculpture grecque* (2 vols., Paris, 1892–96); Henri Lechat, *Pythagoras de Rhégion* (Lyons, 1905); E. A. Gardner, *A Handbook of Greek Sculpture* (London, 1911).

PYTHAG'ORE'ANISM. The philosophical system advocated by the followers of Pythagoras. No point in Greek philosophy is more disputed than the proper interpretation of Pythagoreanism. The probability is that there was no one single consistent theory accepted by all Pythagoreans, but that each of these theories was held by some one or more of their number. The real question is not what Pythagoreans taught, but what was the earliest statement of philosophical problems given by accredited Pythagoreans. Even this question cannot be answered with assurance, as far as the fundamental principle of the system is concerned. Pythagoras himself probably gave no clear expression of philosophical opinion, because he was not so much interested in philosophical theory as in religious and moral reform. See PYTHAGORAS.

Philolaus, a contemporary of Socrates and Democritus, was probably the first distinctively philosophical Pythagorean, but unfortunately we have only fragments of his works, and even they are of doubtful authenticity. Nor is the witness of Plato and Aristotle to his teachings wholly unambiguous. It is probable that Philolaus started from geometrical facts and the phenomena of sounds presented by the strings of the heptachord and that he held an atomistic view of the constitution of the world. The ultimate units of reality were considered to be perceptible spatial points of material character. Two such points made a line, three made a surface, and four made a solid. By number he did not mean an abstraction, but the concrete quantum of such points. The smallest constituent parts of the earth were considered cubical, those of fire tetrahedral, those of water icosahedral, while those of "the fifth element which embraces all the others" were dodecahedral. But the Pythagoreans went further and gave quantitative values to things immaterial, which were thus construed in a material way. The soul was correlated in some way with the number six; reason, health, and light with seven; love, friendship, and prudence with eight. Such phantasy is the result of an attempt to reduce all reality to terms found satisfactory in explaining sensible reality. Along with this curious fiction went a mystical significance of numbers. The Pythagoreans were fond also of arranging things by opposites and finding 10 such pairs.

The Pythagorean cosmology is interesting, as it was a guess that came so near the truth concerning the solar system. Much of it was fanciful, but in spite of these vagaries it is interesting to note the fact that Pythagoreanism taught that the earth is a sphere revolving around a central fire. The central fire, however, was not the sun, but an invisible object, because towards it the farther side of the earth is always turned. The sun and stars shine by light reflected from this self-luminous centre. The heaven of the fixed stars, the sun, the moon, the five then known planets, and the earth made only nine objects; hence to fill out the perfect number of ten a counterearth was invented. Solar eclipses were due to the intervention of the earth between the central fire and the sun; lunar eclipses to the invervention of some heavenly body, sometimes the countersun, between the central fire and the moon. "They assumed that from the revolution of the spheres there resulted a melodious musical sound, the so-called harmony of the spheres." (Windelband.) Following Pythagoras, the Pythagoreans accepted the doctrine of metempsychosis, or transmigration of souls; but the doctrine of the world soul, sometimes ascribed to the Pythagoreans, was probably not a part of their system.

The Pythagoreans laid much emphasis on music, as can be seen from their doctrine of the music of the spheres and from their insistence on the all-importance of harmony. But besides the discovery of the relation between the length of the strings of the lyre and the tones emitted, they did not contribute much to the theory of music.

While geometry was founded by the Ionic school, the main progress made in it was due to the Pythagorean school in Italy. The Pythagoreans were the first to give the rigorous proofs now demanded and to use mathematics in a specialized meaning. To Pythagoras himself is probably due the first rigorous proof of the proposition known by his name (Euclid, i, 47; see HYPOTENUSE). The school was concerned chiefly with the questions "how many" and "how great," i.e., with number and magnitude, and the Pythagorean geometry is mostly concerned with those relations of areas, volumes, and lines which admit of arithmetical expression. Geometry was to them a means for investigation in the theory of numbers. Expressions like plane and solid numbers used for the contents of spatial magnitudes of two and three dimensions also serve to indicate the constant tendency to objectify arithmetical thought by means of geometry. The knowledge of the Pythagoreans in the field of elementary series was quite comprehensive (see SERIES), and the three proportions, arithmetical, geometrical, and harmonical, were known to them. The so-called most perfect or musical proportion, e.g., $6 : 8 = 9 : 12$, was invented by the Babylonians and is said to have been first brought to Greece by Pythagoras. By improvement in definition, by systematization, and by the use of deduction the study of geometry at the hands of the Pythagoreans was made a factor of liberal education. For bibliography, see PYTHAGORAS.

PYTHAGOREAN PROPOSITION. See HYPOTENUSE; PYTHAGORAS.

PYTH'EAS (Lat., from Gk. Πυθέας). A Greek navigator, born at Massilia (Marseilles) in the fourth century B.C. He is said to have sailed around the west coast of Europe and through the English Channel to Thule, the most northern land known to the ancients, perhaps Mainland, the largest of the Shetland Islands. Nothing is accurately known about his life. He gave an account of his first voyage in his *Description of the Ocean*, in which he stated that he traveled through Britain and that its circumference was over 40,000 stadia. The island of Thule, he said, had neither air nor land nor sea, but a composition of all of them, in which the whole universe was suspended. This substance, which could not be penetrated by land or sea, he had himself seen and was told that it was "a connecting link of the universe." He puts Thule six days' sail from Britain. He says that the sun never sets during the summer solstice in Thule. On a second voyage he skirted the shore of Europe, from Cadiz to a river which he called Tanais. This may have been the Elbe, which he may have confused with the Don, the classical name of which was Tanais. He was also a mathematician and astronomer and was the first to determine the meridian altitude of the sun at the summer solstice by the use of a gnomon. The fragments of his writings were collected and published by Arvedson at Upsala in 1824, and by Fuhr, *De Pythea Massiliensi* (Darmstadt, 1835). Polybius and Strabo speak of him contemptuously, but modern geographers are more favorable in their judgment. It is supposed that he was sent out by the Massilians for the purpose of increasing their commercial connections. Consult: E. H. Bunbury, *History of Ancient Geography* (London, 1883); H. F. Tozer, *History of Ancient Geography* (Cambridge, 1897); H. Berger, *Geschichte der wissenschaftlichen Erdkunde der griechen*, part iii (2d ed., Leipzig, 1903); Christ-Schmid, *Geschichte der griechischen Literatur*, vol. i, part i (6th ed., Munich, 1912).

PYTH'IA (Lat., from Gk. Πυθία). The priestess of Apollo at Delphi. See DELPHI.

PYTHIAN (pĭth'ĭ-an) **GAMES** (Lat. *Pythia*, from Gk. Πυθία). The second of the four great national festivals of the Greeks, held in the Crissæan Plain, near Delphi. (See GAMES, ANCIENT.) Their origin was attributed to Apollo, in celebration of his destruction of the dragon Python. At first they were held under the superintendence of the priests of Delphi every ninth year and consisted solely of a musical contest between singers, accompanied by the cithara. After the first Sacred War the character of the festival was changed, and the Amphictyons assumed charge. (See AMPHICTYONIC COUNCIL.) The first of the new series was held in 586 B.C., but it was not till the second celebration in 582 B.C. that the laurel wreath was given as a prize, and from this date the Pythian series was reckoned. They were from this time held in the summer of the third year of each Olympiad, probably in August, and seem usually to have occupied four days. The first day was devoted to the musical contests, which always held the chief place. Among them the most important was the Pythian Nomos, a solo on the double flute, which represented the victory of Apollo over the dragon. On the second day came athletic games, much like those at Olympia (q.v.), and on the third the horse racing. The latter contests were held in the Crissæan plain. On the fourth day seem to have come the festival procession and sacrifices. The musical contests were increased in later times; even poets and historians competed. Consult: J. H. Krause, *Die Pythien, Nemeen und Isthmien* (Leipzig, 1841); August Mommsen, *Delphika* (ib., 1878); Stengel, "Griechische Kultus-Altertümer," in Müller, *Handbuch der klassischen Altertumswissenschaft*, vol. v (Munich, 1898); G. V. Schömann, *Griechische Alterthümer*, vol. ii (4th ed., by J. H. Lipsius, Berlin, 1902); E. N. Gardiner, *Greek Festivals and Sports* (London, 1910).

PYTHIAN ODES. See PINDAR.

PYTH'IAS. See DAMON AND PHINTIAS.

PYTHIAS, KNIGHTS OF. A secret, benevolent, charitable society, based upon and emphasizing fraternity and universal brotherhood. It was founded at Washington, D. C., Feb. 15, 1864, by Justus H. Rathbone and six companions who, besides a constitution, adopted a ritual previously prepared by Mr. Rathbone. The first lodge was named Washington, and the second, created April 12, 1864, was Franklin No. 2. A new constitution was adopted four years later, when the governing body of the organization, the Supreme Lodge, Knights of Pythias of the World, was created, to which grand lodges, governing bodies in the several States, were to be and have been subordinate. The fraternity confers three degrees: the initiatory rank of page, the armorial rank of esquire, and the chivalric rank of knight. Its motto is, "Be generous, brave, and true." The earlier growth of the order was slow, it numbering fewer than 7000 members in the first five years of its existence. From 1868 to 1880 lodges of the fraternity were established in rapidly growing numbers. In 1915 it had definite organization in every State in the Union and in point of

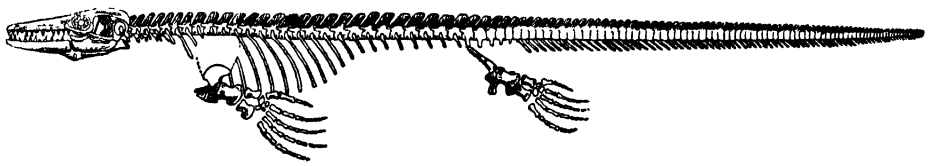
numbers is the fourth largest secret society. Its castle halls are also found in the provinces of the Dominion of Canada, in the Panama Canal Zone, Hawaii, the Philippine Islands, Alaska, and Australia.

Its total membership in the United States and Canada is 729,044, the number of members elsewhere being small, the latest record placing that aggregate at 1420. In the United States more than one-third of the membership is found in Ohio, Indiana, Illinois, and Pennsylvania. The society has nine homes in as many States where its dependents, members and relatives, are cared for. More than 40 periodicals are published in its interest.

Perceiving the advantage to be obtained by utilizing the organization, so far as its members desired, to secure the benefits furnished by the mutual-assessment, secret-insurance orders, the endowment or insurance branch of the Knights of Pythias was established in 1877, under separate management but subject to the control of the Supreme Lodge. Members of the endowment branch have privileges similar to those enjoyed by all other members, in addition to which they conduct a mutual-insurance association based on assessments. Membership in this branch is 71,816, and total insurance in force is $98,686,234. The total amount paid to beneficiaries to the beginning of 1915 was $38,075,593.

The uniform rank of the order is the military division. Its chief officer is entitled major general, but control rests with the Supreme Lodge. Members are elected from those who have attained the rank of knight. In all about 20,000 Knights of Pythias are members of the military branch.

The Dramatic Order, Knights of Khorassan, is an organization that brings together the social side of the fraternity and constitutes the playground of the order. One hundred and ten temples of the Dramatic Order have been established in as many cities, and at annual conventions of the Knights of Pythias the parts which the Knights of Khorassan play are elaborate with pageantry.



The Order of Pythian Sisters, formed in 1888, is made up of women relatives of Knights of Pythias and such of the Knights as may desire to become members. It has no further connection with the Knights of Pythias except that it is recognized as an associate body. Woman membership in this sisterhood is said to exceed 75,000.

Knights of Pythias of North and South America, Europe, Asia, and Africa is an organization similar to that already described, except that it consists exclusively of negroes and that there is no affiliation or relationship between them other than similarity of names, emblems, and the like. While there are no official figures at hand, it is stated there are over 50,000 members of these colored Knights of Pythias in the United States and in some West Indian Islands.

PY'THON (Lat., from Gk. Πύθων, from Πυθώ, *Pythō*, Πυθῶν, *Pythōn*, older name of Delphi and the surrounding region). In Greek mythology, a horrible serpent produced from the slime of Deucalion's flood. He lived on Parnassus (q.v.) and was slain by Apollo.

PYTHON. Any large snake of the subfamily Pythonidæ of the family Boidæ. The pythons differ from the boas (see BOA) in such anatomical particulars as the presence of certain supraorbital bones and two rows of subcaudal scales The best-known species is the common adjiga or rock snake (*Python molurus*) of Ceylon, India, and eastward to China, specimens of which have been seen 30 feet long. It is yellowish, with a series of large, reddish-brown, dark-edged patches along the back, and another of smaller blotches on the sides. A snake 30 feet long could undoubtedly overcome a tiger, bear, or buffalo under favorable conditions, as has been related of these monsters. Another very large species of the Indo-China and Malayan region is *Python reticulatus*, more common eastward than the rock snake and marked in a lozenge pattern. Africa possesses several beautiful pythons, especially numerous on the equatorial west coast, where they are venerated by certain tribes and kept and tended in temples. All the pythons lend themselves easily to captivity and taming. These snakes lay a hundred or so eggs, which are regularly incubated by the female. Consult: *The Field* (London, 1894); Zoölogical Society of London, *Proceedings* (ib., 1899); R. L. Ditmars, *Reptiles of the World* (New York, 1910).

PY'THONOMOR'PHA (Neo-Lat. nom. pl., from *python*, python + Gk. μορφή, *morphē*, form). A suborder of extinct marine reptiles of serpent-like appearance, found fossil in the Upper Cretaceous rocks of Europe, North and South America, South Africa, and New Zealand. The vertebral column is made up of from 115 to 130 vertebræ; both pairs of limbs are modified into paddles for swimming; the long depressed skull is lizard-like, and the mandibles could be moved in a horizontal plane, thereby enabling them to swallow large prey. The jaws are provided with large conical teeth of formidable aspect. These animals were essentially sea serpents. The best specimens have been obtained from the chalk beds of Kansas. *Tylosaurus*, of which a finely preserved complete skeleton showing even the cartilages may be seen in the American Museum of Natural History in New York City, had a length of 30 feet. *Platecarpus* is a similar, smaller animal, with body from 10 to 15 feet long, abundant in the Cretaceous of the western United States and France. *Clidastes* was one of the smallest members of the group, with a body 6 to 12 feet long, and is from the Cretaceous of the United States. *Mosasaurus*, with its jaws armed with powerful teeth, was the largest of the group and attained a length of 40 feet. It was found in the Upper Cretaceous of western Europe and of the United

PLATECARPUS CORYPHÆUS (RESTORED).

States. Consult: Williston and Case, "Kansas Mosasaurs," *Kansas University Quarterly*, vol. i (Lawrence, 1892); Williston, "On Mosasaurs, etc.," in *Kansas University Quarterly*, vol. ii (ib., 1893); id., in *University Geological Survey of Kansas*, vol. iv (Topeka, 1898); H. F. Osborn, "A Complete Mosasaur Skeleton," in *Memoirs of the American Museum of Natural History*, vol. i, part iv (New York, 1899); Von Zittel and Eastman, *Textbook of Palæontology*, vol. ii (ib., 1902).

PYX, pĭks (Lat. *pyxis*, from Gk. *πυξίς*, box, from *πύξος*, *pyxos*, box tree, boxwood). The sacred vessel used in the Roman Catholic church to contain the consecrated Host. Anciently it was sometimes of the form of a dove, which was hung suspended over the altar. More commonly, however, it was, as its name implies, a simple box, generally of the precious metals, or at least of metal plated with gold or silver, sometimes of ivory, whose use, however, was forbidden in 1588. At present the pyx is commonly cup-shaped, with a close-fitting cover of the same material. The interior is ordered to be of gold or at least plated with gold. The tabernacle from which the pyx hung over the altar received from it the name "ciborium," which is now often applied to the pyx itself. A special class of pyx is that which contains relics; these may be made of silver or ivory. The name may also be applied to the receptacle in which the Eucharist is carried to those who are sick.

PYX'IE, Pine Barren Beauty, Flowering Moss (*Pyxidanthera barbulata*). A small creeping shrub of the family Diapensiaceæ. It is a common plant in New Jersey and North Carolina upon moist sandy soil and is esteemed for its pink buds and white five-petaled blossoms, which appear in early spring.

Q

Q The seventeenth letter and thirteenth consonant of the English alphabet. In Greek this letter was called *koppa* and in Semitic *qoph*. It was early displaced in Greek by *kappa* (*k*), surviving only as a numeral sign for 90. For the development of the character, see ALPHABET.

Soon after the Norman Conquest the letter was introduced into English from Norman French words in *q*. It replaced Anglo-Saxon *cw* in several Germanic words, as *queen* from *cwēn*, *quick* from *cwīc*, *quoth* from *cwæþ*.

In sound the letter is the velar explosive. Since *q* in English is always followed by *u* plus a vowel, the usual phonetic value (*kw*) is that of the velar explosive labialized. This sound is formed simultaneously in two places, the soft palate (velum) and the lips.

Qu (pronounced *kw*) represents Indo-Germanic velar *g* in its labialized form g^{u}, Indo-Germ. *guna*, woman; Skt. *gnā*, Bœotian Gk. *βανά*, AS. *cwēn*, Eng. *queen;* Skt. *jīv*, live, Gk. *βίος*; AS. *cwīc*, Eng. *quick*. On account of the difficulty of pronouncing a guttural followed by a labial semivowel there is in some languages a tendency to develop a new labial consonant *p;* thus, Gk. *πω̃*, Lat. *quō;* Lat. *quattuor;* Oscan *petora;* Welsh *pedwar;* Bret. *pevar* (but Ir. *cethir*). Contrast also Fr. *quatre* (pronounced *k*) and Rum. *patru*. Almost all the English words containing *qu* are of Latin or French origin, as *quadrangle*, *quart*, *quaint*. In some words borrowed from the French the sound is that of a simple *k*, as *pique*, *coquette*. *Qu* does not occur medially except in such compounds as *inquire*, *requite*, *inquisition*.

As a mediæval Roman numeral Q = 500. In Latin Q. was the abbreviation for Quintus.

Q. C. stands for Queen's Counsel; Q. E. D. (Lat. *quod erat demonstrandum*) = which was to be proved; *qr.* = quarter or quire; *qt.* = *quart;* q.v. (Lat. *quod vide*) = which see; q.d. (Lat. *quasi dictum*) = as if said, or (Lat. *quasi dixisset*) = as if he had said. Consult Maurice Prou, *Manuel de Paléographie* (3d ed., Paris, 1910).

QAF. See CAF.

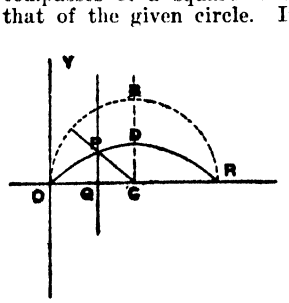
QA'RAITES, or **KARAITES** (Heb. *kara'im*, readers, from *ḳara'*, to read). A Jewish sect. Anan, who died c.780 A.D., was the founder, and for some time his followers were known as Ananites. The name Kara'ites, indicating their adherence to the Scriptures (Heb. *miḳra'*) and not to the Talmud, appears for the first time in the works of Benjamin al Nahawendi (c.830 A.D.). When Anan's hereditary claims to the position of exilarch were rejected by the rabbis of Sura and Pumbeditha, he was proclaimed by those who upheld his rights. Sentenced to death by the Moslem authorities, his life was saved by Abu Hanifa (q.v.). Only fragments of his writings have been preserved by Moses ben Elijah Bashyazi (1544–72). Qaraites differ from the Rabbinites in refusing to base the calendar on astronomical calculation, in many rules concerning the Sabbath and the other festivals, in their views concerning consanguinity, and in many interpretations of the law. Their disregard for the Talmud led them to a more intense study of the Bible and also to the acceptance of many opinions of earlier dissenting bodies, like the Samaritans, the Essenes, the Sadducees, and the Zadokites. A tendency to allegorical interpretation like that of the Hellenistic Jews is seen in some of their writers, a radical criticism even of the Bible in others, as in Ishmael of Akbara and Daniel al Kumisi (ninth century), and strict literalism combined with asceticism in many others. The movement spread to many lands. In the sixteenth century Roman Catholic writers often compared them with the Protestants because of their opposition to tradition. Eminent among them were Nahawendi, Akbari, Ḳumisi, Kirḳisani, Judah Hadassi, Aaron ben Elijah of Nicomedia (fourteenth century), and Caleb Afendopolo (fifteenth century). There are about 10,000 Qaraites in Russia to-day and about 2000 elsewhere. Consult Fürst, *Geschichte des Karaerthums* (Leipzig, 1865), but especially Abraham Harkavy, article "Karaites" in the *Jewish Encyclopædia* (New York, 1904).

QUA BIRD. See NIGHT HERON.

QUACK'ENBOS, GEORGE PAYN (1826–81). An American educator, born in New York City. He graduated at Columbia in 1843 and studied law, but became a teacher in New York private schools. He edited the *Literary American* (1848–50), wrote a novel, translated Hauff's *Marchen* (1849), edited Spiers and Surenne's French dictionary (1852), and published many schoolbooks, including one on United States history (1854), one on rhetoric (1854), one on natural philosophy (1859), one on English grammar (1862), and one on practical arithmetic (1868).

QUA'COLTH. A North American Indian tribe. See KWAKIUTL.

QUA'DI. An ancient Germanic people of the Suevic race, inhabiting that part of southeastern Germania (q.v.) which lay between the Gabreta Sylva, the Hercynian Forest, the Sarmatian



Mountains, and the Ister or Danube. The Emperor Tiberius placed them under his protection and made Vannius, one of his generals, King over them. During the reign of Marcus Aurelius the Quadi rose in alliance with the Marcomanni and other Germanic tribes. It was only after stubborn resistance that they were conquered, in 174 A.D. Six years later Commodus, the successor of Marcus Aurelius, recognized their independence. Nothing is known about them after the end of the fourth century.

QUAD'RANT (from Lat. *quadrans*, fourth part, from *quattuor*, four). In mathematics, one of the four equal parts into which a circle is divided by two perpendicular lines passing through the centre. (See TRIGONOMETRY.) In astronomy, the quadrant signifies an instrument somewhat similar to the sextant (q.v.) and formerly much used for the determination of angular measurements. The quadrant employed by Ptolemy was of stone, with one polished side, on which the graduations were made. Tycho Brahe (1546–1601) used a similar quadrant, called by him the *quadrans muralis sive tichonia*, at the observatory of Uranienborg. For an illustration of this quadrant, consult Brahe, *Astronomiæ Instauratæ Mechanica* (Wandsbek, 1598). Picard was the first who applied telescopic sights to this instrument. About this time the large mural quadrant (of 6 to 8 feet radius) began to be introduced into observatories. But these quadrants possessed various inherent defects, which led to the use of the repeating circle, otherwise called the mural circle. See SEXTANT.

QUADRATIC EQUATION. See EQUATION.

QUADRATIC RESIDUES. See NUMBER.

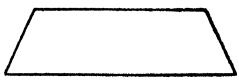
QUAD'RATURE (Lat. *quadratura*, from *quadrare*, to square, from *quadra*, *quadrus*, square, from *quattuor*, four). In mathematics, the process of determining the area of a surface. The term comes from the conception that we find a square whose area is equal to that of a given surface. The quadrature of the circle is one of the three famous problems of antiquity, the others being the trisection of an angle (q.v.) and the duplication of the cube. (See CUBE.) These problems, like that of perpetual motion, have had their devotees in all ages since the advent of geometry and physics. The quadrature of the circle means the determination of the area of a circle of given radius, or the construction by the use of only the straight edge and the compasses of a square whose area is equal to that of the given circle. It was known to the Greek geometers that the area of a circle is half the rectangle whose sides are its radius and circumference respectively, so that the determination of the length of the circumference of a circle in terms of the radius, or the evaluation of π is precisely the same problem as that of the quadrature of the circle. A brief outline of the history of attempts to evaluate the ratio π is given in the article CIRCLE.

QUADRATRIX.

The quadrature of curves can often be effected by means of another curve, a so-called quadratrix. An important type of this curve is that probably invented by Hippias of Elis (c.400 B.C.), used both for quadrature and trisection and called the quadratrix of Dinostratus. The curve, probably the most ancient of the transcendental ones, may be defined as the plane locus of the intersection of a straight line revolving uniformly about a point and another straight line moving uniformly parallel to a given direction.

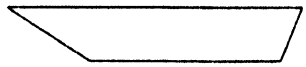
If in the figure $CO = r$ is the uniformly revolving radius, and PQ is the line moving parallel to OY, then the locus of P, their intersection, or the curve OPR, is the quadratrix. Its rectangular equation is $y = (r - x) \tan \frac{\pi x}{2r}$; r is a mean proportional between the quadrant OB and the segment CD; and thus the circumference of a circle may be expressed in terms of the radius. Whence, if it were possible to construct D geometrically, the quadrature of the circle would be effected by elementary geometry, a condition which is always understood when it is said that the quadrature of the circle cannot be effected. Another important form of the quadratrix is that of Tschirnhausen (1687). This curve may be defined as the locus of the point P, lying at the same time upon LQ parallel to BO, and upon MP, parallel to OA (OAB being a quadrant of radius $OA = r$), where L moves over the quadrant and M moves over the radius r uniformly. The equation of the curve is $y = r \sin \frac{\pi x}{2r}$. It has been used for the multisection of angles and the quadrature of curves.

Consult: Newton, *Tractatus de Quadratura Curvarum* (London, 1706); Montucla, *Histoire des recherches sur la quadrature du cercle* (Paris, 1754); Schellbach, *Ueber mechanische Quadratur* (Berlin, 2d ed., 1884); Felix Klein, *Famous Problems of Elementary Geometry* (Eng. trans., Boston, 1897); Dickson, "Construction with Ruler and Compasses," and Smith, "The History and Transcendence of π," in J. W. A. Young, *Monographs on Modern Mathematics* (New York, 1911).



QUADRATURE. In astronomy, a planet is said to be in quadrature when there is a right angle at the earth between the direction of the planet and the direction of the sun.

QUADREGNA, kwä-drā'nyȧ, CONTE DI. See AVOGADRO, AMADEO.



QUADRIGA, kwŏd-rī'gȧ. See ARCH, TRIUMPHAL; CHARIOT.

QUAD'RILAT'ERAL (from Lat. *quadrilaterus*, four-sided, from *quattuor*, four + *latus*, side). A polygon (q.v.) of four sides. Among the remarkable properties of the quadrilateral are the following: the lines joining the midpoints of the successive sides form a parallelogram; the lines joining the mid-points of the opposite sides bisect each other. The bisectors of the four angles of a quadrilateral form another quadrilateral whose opposite angles are supplemental; a quadrilateral of the latter kind is inscriptible in a circle. The sum of the squares on the four sides of a quadrilateral is equal to the sum of the squares on the diagonals plus four times the square on the line joining their mid-points. A square can be constructed equal to any polygon and hence equal to any quadrilateral, but the area of a quadrilateral cannot in general be expressed as an algebraic function of the sides.

As the words are commonly used in the United States, a trapezium is a quadrilateral no two of whose sides are parallel, and a trapezoid is a plane quadrilateral having two of its sides parallel. If the angles at the extremities of either parallel side are equal, the trapezoid is said to be isosceles. If the other two sides of the trapezoid are parallel, the figure becomes a parallelogram. This is not, however, the general usage, for the trapezium has historically been more often taken to mean what is above described as a trapezoid, and vice versa. Consult T. L. Heath, *The Thirteen Books of Euclid's Elements*, vol i (Cambridge, 1908). See MENSURATION; PARALLELOGRAM.

ISOSCELES TRAPEZOID

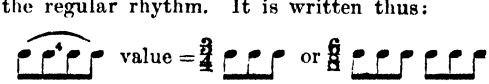
TRAPEZOID.

QUADRILATERAL. A common designation for the strong military line formed by the four fortresses of Mantua, Peschiera, Verona, and Legnago, which constituted a great bulwark for Austria in maintaining her dominion in northern Italy in the nineteenth century. Of great importance during the European War which began in 1914 was the Polish quadrilateral comprising the fortresses of Warsaw, Ivangorod, Novogeorgievsk, and Brest-Litovsk. See FORTIFICATION; ITALY.

QUADRILLE, kwȧ-drĭl′ (Fr., square). A dance of French origin, consisting of consecutive dance movements, generally five in number, danced by couples, or sets of couples, opposite to and at right angles to one another. The name is derived from the fact that the dancers are arranged into squares consisting each of four couples. The dance originated in the French ballets of the eighteenth century and was almost immediately adopted by society. Its modern form dates from the beginning of the nineteenth century. The music alternates between triple and duple time, 3–8, or 6–8, and 2–4. Musard was the most distinguished composer of quadrille music, and under his treatment it became for a time one of the art forms.

QUADRILLE. A game of cards played by four persons. The tens, nines, and eights are discarded from the pack. The rank and order of the cards in each suit vary according as they are or are not trumps and are different in the black and red suits. The ace of spades is always the highest trump and is called Spadille; the ace of clubs, or Basto, is always the third highest trump; while the deuce of spades or clubs, or the seven of hearts or diamonds, known as Manille, is the second highest trump, according to the suit which is the trump, being always of the trump suit. When the black suits are not trumps, the black cards rank as in whist; and when they are trumps the order is the same with the exception as above mentioned of the deuce, which (in the trump suit only) becomes Manille, the deuce of the black suit which is not trumps retaining its position as the lowest card. The game is now practically obsolete. A good description of the game of Ombre or L'Hombre, practically the same game as quadrille, will be found in Pope's *Rape of the Lock.*

QUADRIV'IUM (Lat., four branches of mathematics, place where four roads meet). The name given, in the language of the schools of the West, to the higher course of the mediæval studies, from its consisting of four branches, as the lower course, for an analogous reason, was called trivium (q.v.), or three roads. The quadrivium consisted of arithmetic, music, geometry, and astronomy. These four studies compose the secondary part of the curriculum outlined by Plato in the *Republic* and are described in the seventh book of that work. See LIBERAL.



QUADROON, kwȧ-drōōn′ (from Sp. *cuarterón*, quadroon, fourth part, from *cuarto*, from Lat. *quartus*, fourth, from *quattuor*, four). The name given to a mixture of European and negro in which the relative proportion of blood is three-fourths white and one-fourth black. The first mixture is called mulatto, the second tierceroon, the third quadroon, the fourth quintroon, etc. See MISCEGENATION; MIXED RACES.

QUADRU'MANA (Neo-Lat. nom. pl., from Lat. *quattuor*, four + *manus*, hand). In the system of Cuvier, an order of Mammalia which contained the animals most nearly resembling man in their form and anatomical characters, viz., the monkey and lemur families. The name indicates that the extremities of all limbs are *hands*, formed for grasping. The term is no longer used, as these animals are now classed with man in the order Primates (q.v.).

QUAD'RUPLE ALLIANCE (Lat. *quadruplus*, fourfold, from *quattuor*, four + *-plus*, -fold). 1. A league formed by Great Britain, France, Austria, and the Netherlands against Spain in 1718, when the policy of that country under the guidance of the ambitious Alberoni (q.v.) threatened to destroy the laboriously established balance of power in southern Europe. Consult Ottokar Weber, *Die Quadrupelalliance vom Jahre 1718* (Vienna, 1887).

2. A league formed by Great Britain, Austria, Prussia, and Russia in 1840, for the purpose of checking the power of Mehemet Ali (q.v.), whose victory over the Turks at Nisib (1839) threatened the overthrow of the reigning Ottoman dynasty. Mehemet Ali was compelled to surrender Syria, which he had overrun, and to content himself with the hereditary rule over Egypt.

QUAD'RUPLET (from Lat. *quadruplare*, to make fourfold, from *quadruplus*, fourfold). In music, a rhythmical group of four notes, the time value of which is equal to three or six of the regular rhythm. It is written thus:

QUÆSTOR, kwĕs′tôr (Lat., investigator). The title of a class of Roman magistrates reaching as far back, according to all accounts, as the period of the kings The oldest quæstors were the *quæstores parricidii*, two in number, whose office was to conduct the prosecution of persons accused of murder and to execute the sentence that might be pronounced. They ceased to exist as early as 366 B.C. A far more important though later magistracy was the *quæstores classici*, to whom was intrusted the charge of the public treasury. They appear to have derived the epithet of *classici* from their having been originally elected by the centuries, whose members were divided into *classes*. At first they were only two in number. but in 421 B.C. two more were added. As province after province was added to the Roman Republic, the number was increased, and in the time of Cæsar

it was 40. On its first institution the quæstorship was open only to patricians, but after 421 B.C. plebeians also became eligible. Consult A. H. J. Greenidge, *Roman Public Life* (London, 1901), and F. F. Abbott, *A History and Description of Roman Political Institutions* (3d ed., Boston, 1911).

QUAGGA, kwăg'à (Hottentot name). One of the wild horses of South Africa (*Equus quagga*), intermediate between the horse and the zebra and now extinct. In length of ears and character of the tail it resembled the horse, although it agreed with the asses in wanting the callosity in the inner side of the hind leg. It was rather smaller than the zebras, which it resembled in its reddish-brown color and in having a dorsal stripe and its head and fore quarters irregularly banded and marked with dark-brown stripes, which became fainter until lost on the body. In some cases these transverse stripes reached back to the haunches, but they were always absent from all four legs, which were nearly white. The quagga originally wandered in great herds over the plains of South Africa, and its name was derived from its shrill, barking neigh, the last syllable of which was prolonged into a sort of scream. The flesh and hide were both of great value to the early settlers, and the animal was killed with ruthless waste by the Boers as food for their slaves and also because, by their curiosity and alertness, the quaggas interfered with hunting, alarming all other game in the neighborhood as soon as they discovered the hunter's presence. Thus by 1850 it was nearly exterminated. The quagga seemed easily susceptible to domestication and training, but few attempts seem ever to have been made in South Africa to utilize the animal. Consult: H. A. Bryden, *Nature and Sport in South Africa* (London, 1897); G. Renshaw, *Natural History Essays* (London, 1904); and early writers on zoölogy and sport in South Africa. See EXTINCT ANIMALS; ZEBRA; and Plate of EQUIDÆ.

QUAHOG, kwą'hąg. See CLAM.

QUAI D'ORSAY, kā dôr'sā'. The name of a portion of the left bank of the Seine at Paris, opposite the Place de la Concorde. From the fact that the Chamber of Deputies and other government buildings front on it, its name is used to denote the French government as Downing Street denotes the English.

QUAIL (OF. *quaille*, Fr. *caille*, from ML. *quaquila*, from MDutch *quakele*, *quackel*, quail, from *quacken*, Dutch *kwaken*, to quack; onomatopoetic in origin). Originally and strictly, a small game bird of the Old World of the genus *Coturnix*, nearly allied to partridges, but having a more slender bill, a shorter tail, longer wings, no spur, and no red space above the eye. Quails never perch on trees, but always alight on the ground, and far excel partridges in their power of flight. They are among the smallest of gallinaceous birds. The common quail (*Coturnix coturnix*, or *communis*) is found in most parts of the Old World, and in the Mediterranean region, where it is most familiar, is migratory. Species of quail are found in different parts of Asia, although no other is so abundant as the common quail and none migrates as it does. The rain quail (*Coturnix coromandelica*) is numerous in India. The Chinese quail (*Excalfactoria chinensis*), only about 4 inches long, is abundant in China, and is there kept for fighting, the males being very pugnacious. It is also said to be used for another singular purpose—the warming of the hands of its owner.

In America the word "quail" is used for all those small birds that have no feathers on the tarsus. In the United States only one species occurs east of the Mississippi, the well-known bobwhite (partridge of the Southern States, quail of the North), *Colinus virginianus*, which occurs as far north as southern Maine and Minnesota. It is about 10 inches long. The upper parts are reddish brown variegated with black, buff, and gray; the forehead and band on breast black; the cheeks, throat, breast, and belly white, the latter barred with black; the sides chestnut, marked with black and white. The female has the forehead, cheeks, and throat buff. Bobwhite is in great demand for the table. It feeds on seeds, berries, and other vegetable matter. The nest is on the ground and the eggs, 10 to 18 in number, are pure white. Its loud clear notes, imitated in its name, are the three-syllabled "ah bob-white," accented sharply on the last; but the first is not always plainly heard. In the Western and Southwestern States are found several relatives (Odontophorinæ), five of which differ markedly from *Colinus*, not only in their coloration, but also in the presence of a noticeable crest. In the California quail (*Lophortyx californica*) and Gambel's quail (*Lophortyx gambeli*) the crest consists of six feathers, erect and recurved; in the mountain or painted quail (*Oreortyx pictus*) the crest is made of two long, drooping feathers; in the blue quail (*Callipepla squamata*) the crest is composed of numerous rather short, soft feathers, and the same is true of the remarkable Massena fool quail of Arizona (*Cyrtonyx montezumæ*). All these birds are exceptionally handsome, the prevailing tints being slaty blue, olive brown, chestnut or tawny, black and white. The head, especially in the male, is noticeably marked with black or brown and white. The mountain quail is the largest (1 foot long), while the Massena quail is the smallest (only 9 inches long). The eggs of *Lophortyx* and *Callipepla* are remarkable for being speckled. Consult authorities cited under PARTRIDGE; and see Plate of PARTRIDGES, ETC. See Colored Plate of GAME BIRDS, accompanying article GROUSE; and of EGGS OF GAME AND WATER BIRDS.

QUAIN, JONES (1796–1865). An English anatomist, a brother of Richard Quain, born in Mallow, Ireland. He received his medical education in Dublin and Paris. Settling in London, he was lecturer on anatomy and physiology in the Aldersgate School of Medicine (1829–31) and professor of the same branches (1831–36). He lived in retirement during the last 20 years of his life, chiefly in Paris. He was the author of *Quain's Elements of Anatomy* (1828; 11th ed., 1915) and of a translation of Martinet's *Pathology* (1835), and also published in 1858 a series of *Anatomical Plates*.

QUAIN, RICHARD (1800–87). An English anatomist and surgeon, born at Fermoy, Ireland, a brother of Jones Quain. He studied medicine in London and Paris. He was appointed demonstrator in 1828 and professor of anatomy in 1832 in the University of London, resigning in 1850, and assistant surgeon in 1834 and surgeon in 1848 to the North London Hospital, from which he resigned in 1866. He was president of the Royal College of Surgeons in 1868. Among his works are: *Anatomy of the Arteries* (1844); *Diseases of the Rectum* (1854); *Clini-*

cal Lectures (1884). Dying, he bequeathed nearly £75,000 to University College, London, for education in modern languages (especially English) and in natural science.

QUAIN, Sir Richard (1816–98). An English anatomist and physician, born in Mallow, Ireland, a cousin of Richard and Jones Quain. He studied at University College, London, and became fellow in 1857 and vice president in 1889 of the Royal College of Physicians, and was elected Lumleian lecturer for 1872 and Harveian orator in 1885. In 1890 he was appointed physician extraordinary to Queen Victoria and a year later was created Baronet. In 1891 and 1896 he was elected president of the General Medical Council. Quain was especially active in the publication of the second and following editions of the *British Pharmacopœia*, acting as secretary, later as chairman of the publication committee. He published *Diseases of the Muscular Walls of the Heart* (1872), *The Healing Art in Its Historic and Prophetic Aspects* (1885), and edited the *Dictionary of Medicine* (1882; 3d ed., 1902).

QUAKER CITY. A popular name of Philadelphia, Pa., in allusion to its early settlers.

QUAKER POET. A title given to John Greenleaf Whittier It has also been used of Bernard Barton and John Scott.

QUAKERS. See Friends.

QUAKERTOWN. A borough in Bucks Co., Pa., 16 miles south of Bethlehem, on the Quakertown and Delaware River and the Philadelphia and Reading railroads (Map: Pennsylvania, L 6). It has a public library and, among the industrial establishments, cigar and cigar-box factories, silk mills, harness factories, stove foundry, etc. Pop., 1900, 3014; 1910, 3801.

QUAKING GRASS (*Briza*). A small genus of mostly European grasses, with loose panicles and drooping, generally broad, compressed spikelets suspended by delicate stalks and tremulous in the slightest wind. The panicles are often used in winter bouquets. *Briza media* is considered a valuable pasture grass for dry situations in central Europe. It has become naturalized in the United States and Canada. *Briza maxima*, a larger species, and *Briza minor*, a smaller one, are similar in habit.

QUALITY. See Primary Qualities; Secondary Qualities.

QUAMASH, kwŏm'ăsh (from the North American Indian name), or Biscuit Root (*Camassia esculenta*). A North American bulbous plant of the family Liliaceæ, nearly allied to hyacinth, abounding on the prairies. The roasted bulbs are agreeable and nutritious and were much used by the Indians for food. The scapes, which are sheathed at their bases, are a foot or more tall and bear 10–40 blue or purple flowers. A larger-flowered plant, common in the Northwest, has often been confused with this species. It is properly designated *Camassia quamash*. Other species, indigenous to the Pacific coast region, are sometimes cultivated in the East.

QUANAH, kwä'nä. A city and the county seat of Hardeman Co., Tex., 192 miles by rail northwest of Fort Worth, on the Fort Worth and Denver City, the St. Louis and San Francisco, and the Quanah, Acme, and Pacific railroads (Map: Texas, C 2). Among the noteworthy features are the county courthouse, high school, and an irrigated farm containing a lake of 2000 acres. Cattle, cotton, corn, wheat, and cement plaster are produced in the vicinity, and there are flour mills, manufactories of cottonseed oil and cake, cotton compresses, etc. Pop., 1900, 1651; 1910, 3127.

QUANA (kwä'nâ) **PARKER** (c.1845–1911). A Comanche chief and the most influential leader among the three confederated tribes of Kiowa, Comanche, and Apache, in southwestern Oklahoma. He was a half-breed, the son of a captive white woman who was married to a chief of the Kwahadi band. Upon the death of his father Quana Parker became chief. He was prominent in 1874, when he led 700 warriors of the confederated tribes in a desperate attack upon the fort known as the Adobe Walls on the South Canadian River in the Texas Panhandle. In the subsequent encounters he took an active part until the final surrender a year later, being the last man to come in with his band. Recognizing the advent of a new order of things, he went down into Texas to learn something of the white man's ways and returned to his tribe an apostle of civilization. In 1882 he began to advocate the leasing of the surplus pasture lands of the reservation, in which he finally succeeded, thus increasing the revenues of the tribes by more than $100,000 yearly. In 1888 he was appointed a judge of the Indian court to try minor Indian offenses. In 1892 he was the first signer of the treaty by which the lands of the reservation were opened to settlement in 1901. He made many visits to Washington as a delegate for his people and traveled extensively in other parts of the country. After the Indians were made citizens by the opening of the reservation he filled one or two local offices under the county government

QUANTICS, kwŏn'tĭks. See Forms; Function.

QUANTITY OF MOTION. See Momentum

QUANTUM (kwōn'tŭm) **HYPOTHESIS.** See Radiation.

QUANTZ, kvänts, Johann Joachim (1697–1773). A German flautist, born at Oberscheden, Hanover. In 1716 he went to Dresden, where he joined the town orchestra under Heine. He was at first an oboist, but, after a thorough course of instruction under Buffadin, he exchanged the oboe for the flute. In 1728 he played before Frederick the Great (then Crown Prince) at Berlin and so delighted him that he arranged for personal instruction on the flute. When Frederick ascended the throne, in 1740, the flautist was called to Berlin as chamber musician and court composer, which position he held till his death. His published compositions include 6 flute sonatas with bass (1734), 6 duets for flutes (1759), choral melodies to 22 odes by Gellert (1760), and *Application pour la flûte traversière à deux clefs*. About 300 flute concertos and 200 different compositions for flute (duos, trios, quartets, and soli) are preserved in manuscript in Potsdam. Quantz improved the flute by the addition of a second key and the sliding top for tuning the instrument.

QUAPAW, kwä'pą (from *Ugaqpa*, down stream). A tribe of Siouan stock (q.v.), prominent formerly, under the name of Arkansas, as the allies of the French in the early days of the Louisiana Colony. The Quapaw, Omaha, Ponca, Osage, and Kaw speak dialects of the same language and according to their traditions, borne out by historical evidence, formerly lived as one people in the eastern part of the United States, but migrated westward and separated near the

mouth of the Ohio, where the Quapaw turned southward, while the others continued west or north. Under the name of Capaha they are mentioned in the De Soto narrative of 1540; they were then located on the Mississippi apparently not far above Memphis. In 1818 they sold all of their claims in Arkansas, upper Louisiana, and on the east bank of the Mississippi, excepting a reservation extending from the Arkansas southward to the Saline River. They were then rapidly declining from whisky and wars with other tribes, but were still estimated at 1000. They drifted westward until the remnant, a few hundred including mixed bloods, was finally gathered upon their small reservation in the northeastern corner of Oklahoma. In their former aboriginal characteristics and customs they resembled the Osage, but seem to have been of more warlike spirit and fixity of purpose. The few that remain (231 in 1915) appear to be prosperous and able to hold their own with their white neighbors.

QUARANTINE, kwŏr'an-tēn (It. *quarantina*, from ML. *quarantena*, period of forty days' quarantine, number forty, Lent, from Lat. *quadraginta*, forty). Originally the period of 40 days during which a ship arriving in port and suspected of being infected with a contagious, malignant disease was forbidden to land freight or passengers. From the second half of the fourteenth century the Italian republics established quarantine regulations, directed towards the East, against the invasion of pestilence. In 1403 Venice instituted the first maritime quarantine, followed by Genoa in 1467. During the latter part of the eighteenth century Austria stretched a permanent cordon of troops across her eastern frontier, but even this failed to shut out the plague, which ravaged her provinces. The example of the Italian cities was early adopted by Marseilles, and an efficient system of sanitary supervision was developed, finally passing under the control of the sanitary magistrates. Other European seaport cities enforced rules and regulations of varying effectiveness. In 1850 delegates from the principal states bordering the Mediterranean convened in Paris and adopted a convention and code of international sanitary regulations, which was subsequently generally adopted by all powers and is enforced in their commercial relations with one another. Under its provisions a ship clearing is given a clean bill or a foul bill according as the port from which she sails is free or infected with a contagious disease, the plague, cholera, and yellow fever being especially guarded against. Ships entering port are at once put under quarantine, varying in length with the character of the contagion feared. Further regulations are laid down regarding the disinfecting and handling of merchandise in cargo. Special restrictions have also been adopted against the Oriental countries, Egypt and Turkey, and for this purpose sanitary boards are maintained in Alexandria, Constantinople, and other frequented ports, with physicians located in different parts of the countries liable to epidemic diseases, whose duty it is to investigate and report to the local authorities and consular offices the condition of the general health.

In modern usage the term "quarantine" is also applied to the sanitary rules and regulations adopted within a state to restrict the spread of contagious diseases within its own boundaries. They are enacted by the state in the exercise of its sovereign power (see POLICE POWER), and so absolute is this that even summary proceedings invading the rights of the individual or destroying valuable property are upheld as constitutional. Besides the Federal quarantine regulations providing for the protection of the United States in its intercourse with foreign nations, the various State jurisdictions have general statutes authorizing the organization of State boards of health and similar local boards in cities, villages, and towns, prescribing how they shall be constituted and defining their powers and duties. This power is usually conferred upon municipal corporations by the charter granted by the legislature or by general statute, but, in the absence of such express authority, it cannot be implied as incident to the ordinary powers of the corporation. Conflict between the United States and State authorities is provided for by the terms of the Federal statutes (U. S. Rev. Stats., § 4792; Rev. Stats., U. S. Supp., 1874–91, p. 157, c. 66, § 5) requiring customs, revenue, and other Federal officers to observe State health and quarantine laws. Reasonable charges for quarantine services may be imposed upon a vessel under State authority, and there can be no recovery from the State or municipality for losses resulting from the quarantining or disinfecting of premises infected with contagious disease, where the method employed was proper and the use made of the premises was a necessary one. Further, a municipality cannot be held liable for an act of its health officer in wrongfully confining in quarantine a citizen reasonably believed to be afflicted with a contagious disease, since the act done is governmental in its character; but the officer may become personally liable where he acted wrongfully or in excess of his duty. A carrier is protected from liability for nondelivery of goods or passengers where such act would be a violation of quarantine regulations.

The *widow's quarantine* was the term applied under the common law to her right to remain in the mansion house 40 days after her husband's death, during which time her dower should be admeasured and assigned. This right was guaranteed by section 7 of the Magna Charta and has been perpetuated with various modifications in the statutes of the several States.

Doty, *Prevention of Infectious Diseases* (New York, 1911); *Quarantine in the Maritime Cities of the United States*, published by the New York Academy of Medicine (ib., 1913); also publications of the United States Bureau of Public Health and Marine Hospital Service (Washington).

QUAREGNON, kà're-nyôN'. A mining town of Belgium, in the Province of Hainault, situated 4 miles west of Mons. There are large and important coal mines and blast furnaces. Pop., 1900, 16,249; 1910, 18,675.

QUARITCH, kwŏr'ich, BERNARD (1819–99). An English bookseller, born at Worbis in Prussian Saxony. He was a bookseller's clerk in Germany till 1842, then went to London, where he was first employed by the publisher Bohn and where eventually he set up for himself, becoming a British subject in 1847. Throughout his life he had made a specialty of Oriental literature, and he printed grammars in the Turkish, Persian, and Arabic languages, besides making a collection of Oriental manuscripts. Prob-

ably the best-known books from his press were the first four editions of FitzGerald's (q.v.) *Omar Khayyám*. He was represented at all the great book sales in Europe and America and acquired many rare works. His invaluable catalogues include: the first (1860); a great catalogue of 2395 pages (1880); the *Bibliotecа Xylographica, Typographica, et Palæographica* (1873), a catalogue of early productions of the printing press in all countries; and his last, *General Catalogue of Old Books and Manuscripts* (7 vols., 1887–88; with supplements, 12 vols.). He was succeeded by his son.

QUARLES, kwärlz, FRANCIS (1592–1644). An English poet, born at Rumford, Essex, educated at Cambridge, and subsequently entered at Lincoln's Inn. He held several minor posts of honor or emolument under Royalist favor. Of his 18 children one, John Quarles (1624–65), is remembered as the author of *Fons Lachrymarum* (1648) and of other poems. As an author Quarles the elder was variously active—as a pious poet, as a writer of books of devotion, and as a prose romancer. Originally Quarles's productions were received with solemn popular satisfaction, but the critics of the seventeenth and eighteenth centuries, Suckling, Pope, and others, sneered at him. His collected works, edited by A. B. Grosart, appeared (1874) in the Chertsey Worthies Library. Consult F. E. Hutchinson, "The Sacred Poets," in *Cambridge History of English Literature*, vol. vii (New York, 1911).

QUARLES, JOHN. See QUARLES, FRANCIS.

QUARRY, kwŏr'ĭ (OF. *quarré*, square). In ornament and decoration this word is used to designate (1) a decorative pattern formed by two sets of intersecting lines forming equal four-sided meshes and (2) a unit or mesh of such a pattern. When the meshes are filled each with a floral or other ornament, the design or pattern is called a diaper (q.v.); but many writers use "quarry" to designate both the open-mesh and the decorated patterns. In England diamond-shaped tiles and panes of glass, or squares of either set diagonally, are sometimes called quarries or quarrels

QUARRY, QUARRYING (OF. *quarriere*, Fr. *carrière*, from ML. *quadraria*, quarry, place where stones are squared, from Lat. *quadratus*, p.p. of *quadrare*, to square). The open excavation from which any useful stone is taken for building and engineering purposes is called a quarry; the operations required to obtain rock in useful form from a quarry are called quarrying. Quarrying processes are three in number, viz., by hand tools, by explosives, and by channeling and wedging. To understand the operations of the quarryman it is necessary to bear in mind that all rocks belong to one or other of two great classes, viz., the stratified and the unstratified. The former are sedimentary rocks occurring in parallel beds or strata, and consist chiefly, in so far as we are at present concerned, of sandstone and limestone. Unstratified or igneous rocks, which include greenstone or whinstone, granite, and porphyry, have no distinct bedding, i.e., they do not lie in separate layers. Roofing slate is a metamorphic rock, and splits into thinner laminæ in the direction of its *cleavage* than in the direction of its bedding, the former being often at right angles to the latter. Granite and other igneous rocks have also a natural jointing, although they are not stratified. Advantage is taken of these peculiarities in quarrying the different rocks, but in the main the systems adopted do not greatly differ.

Hand tools alone may be successfully used for quarrying stone which exists in beds. The principal hand tools are the pick, the crowbar, the drill, hammer, wedge and plug, and feathers. With the drill and hand hammer a row of holes a few inches apart is drilled partly through the layer or stratum, perpendicular to its plane of stratification and along the line at which it is desired to break the stone. These holes are usually drilled from ⅜ inches to ¾ inches in diameter. In each hole are placed a plug and two feathers. The plug is a narrow wedge with plane faces; the feathers are wedges flat on one side and rounded on the other. When a plug is placed between two feathers the three together will slip into a cylindrical hole, and by driving the plug down between the feathers it exerts a splitting or cleaving force of great intensity. In quarrying, as first stated, each hole in a long row is filled with a plug and feathers; by striking each plug a sharp blow with a hammer, hitting them in succession, and by repeating the operation again and again, the combined splitting force of the plugs and feathers finally becomes great enough to rupture the rock. Generally the plugs and feathers are used only for effecting the larger subdivisions of the rock, the smaller pieces being split and broken by hammers and wedges Sometimes this method of quarrying is called the plug-and-feather method.

Explosives are the means most commonly employed for detaching large blocks of stone in quarries, these blocks being afterward split and broken into smaller stones by wedges or by the plug-and-feather method. In this method of quarrying the drill holes are put down to the depth to which it is required to break the rock and are then partly filled with some explosive, which is discharged by the usual methods of blasting (q.v.). The kind of explosive used depends upon the character of the result which is sought. In quarrying rock to be crushed into small fragments for road work, concrete making, etc., the object sought is a rather finely broken mass of stone, and here, because of its great shattering effect, some form of high explosive, as dynamite, is employed. When building stone of large size is to be quarried, weaker and slower-acting explosives, as gunpowder, are employed. The drill holes are usually made by rock drills operated by power, though hand drills and churn drills are also used. The drill holes are driven vertically in a row some distance back of and parallel to the edge of the working face of the quarry and are blasted simultaneously so as to force outward a rectangular mass of rock.

Channeling is the process of cutting long narrow channels in rock to free the sides of large blocks of stone. Channeling machines, or channelers, are made in a variety of forms, the most common of which is a vertical steam boiler mounted on wheels and provided with mechanism for self-propulsion, having on the same carriage with the boiler a steam cylinder which operates, like a percussion drill, a flat bar with a cutting edge. In operation the machine is run forward and back so as to carry the cutter back and forth along the line on which the channel cut is to be made. If the rock is in layers the channel cut is often not made the full depth of the layer, but is sunk deep enough to permit the insertion of wedges by which the rock is split, the cut or

groove guiding the fracture. When the rock is not in layers it is often necessary to undercut the block as well as to cut a channel around it. This is done by drilling a series of holes along the bottom, the process being called gadding by quarrymen. Wedges inserted in the drill holes serve to separate or split the rock at the bottom. A special form of machine called a gadder is used for undercutting. It consists essentially of a rock drill arranged to be operated horizontally and receiving motion from an engine taking steam from a vertical boiler, the whole being mounted on a carriage. The channeling and wedging process of quarrying is extensively used in quarrying marble, sandstone, limestone, and the other softer rocks, but is not a successful process for granite and other similarly hard stones. For a description of the methods and tools used in cutting quarry stone into suitable shapes for structural purpose, see STONE CUTTING AND DRESSING.

QUAR'TAN FEVER. See MALARIA AND MALARIAL FEVER.

QUARTER. See WEIGHTS AND MEASURES.

QUARTER CRACK. A form of sand crack, an affection of the horse; specifically a vertical crack in the horn of the lateral part of the wall of the foot. When the crack is directly in front it is called a toe crack. Toe cracks are most common in the hind feet, while quartercracks nearly always affect the fore feet, and similarly the inside quarter is more liable to the injury than the outside one, in that when in motion it is subject to a greater part of the weight of the horse. In the normal foot the coronet or (for authorities differ) the sensitive laminæ which cover the external surface of the pedal bone secretes an adhesive material which binds firmly together the fibres of the wall of the hoof. When the secreting membrane is prevented from carrying out its functions the material secreted under such conditions loses its power and the horn which it supplies becomes deficient in strength. Where this disease is of hereditary tendency the horn is so weak that it would seem to split if subjected to a violent strain. Relative dryness of the horn is the principal predisposing cause of sand cracks, while a predisposition to quarter cracks exists in contracted feet and in those where the toe turns out or the inside quarter turns under. The various forms of sand crack may be caused by the much to be condemned system of using seated shoes and of paring the frog, an unnatural custom by which the entire weight of the animal is thrown on the crust of the foot instead of being properly distributed between the wall, the frog, the outer portion of the sole, and the bars. Among other causes of perverted secretion may be mentioned hard ground and the strain of fast work. Cart and cab horses are especially liable to sand crack. The usual treatment is: (1) To prevent movement between the edges of the crack; (2) to heal the exposed tissues should they be wounded or inflamed; and (3) to encourage the downward growth of sound horn from above a crack, for it is evident that as the edges of the crack cannot reunite, the growing down of the crack is the only effective remedy. Consult M. H. Hayes, *Veterinary Notes for Horse Owners* (London, 1897), and Leonard Pearson and others, *Special Report on Diseases of the Horse*, published by United States Bureau of Animal Industry (rev. ed., Washington, 1911).

QUARTER DAYS. Conventional dates on which, by custom or agreement, leases begin and terminate and rent becomes payable in England. Rents are generally made payable by the express terms of the lease on the usual quarter days. These are, in England and Ireland, Lady Day, March 25; Midsummer Day, June 24; Michaelmas Day, September 29; and Christmas Day, December 25. In Scotland there are two legal terms in each year and two conventional terms, the latter being adopted only when expressly so agreed. The legal terms are Whitsunday, May 15, and Martinmas, November 11; and the conventional terms are Candlemas, February 2, and Lammas, August 1. The law of Scotland differs from that of England in this, that if nothing is said between the parties on letting houses and lands, these legal terms are impliedly included as part of the agreement, both as regards time of entry and payment of rent.

QUAR'TERING. In heraldry, the bearing of two or more coats on a shield divided by horizontal and perpendicular lines. See HERALDRY *Marshaling of Arms.*

QUARTERING. See BILLETING.

QUARTERING. See HANGING.

QUAR'TERMAS'TER. In the United States Army, a commissioned officer serving either on the staff supply department or bureau known as the quartermaster corps or in a line regiment or battalion as regimental or battalion quartermaster. These regimental officers are assisted by quartermaster sergeants in the performance of duties connected with the service of supply. To each troop, battery, and company is allowed one quartermaster sergeant to assist the captain in similar duties. The quartermaster corps, whose chief, the quartermaster-general, has the rank of major general, with headquarters at the War Department, Washington, D. C., is the supply department of the army. Formerly there were a subsistence department, supplying rations, and a pay department charged with the distribution and accounting for funds for payment of the army. Both of these have been absorbed by the quartermaster corps (Act of Aug. 24, 1912), which performs all the duties formerly divided between three independent departments. The quartermaster corps is charged with the duty of providing means of transportation of every character, either under contract or in kind, which may be needed in the movement of troops and the material of war. It furnishes all public animals employed in the service of the army, the forage consumed by them, wagons and all articles for their use, and the horse equipment for the quartermaster corps. It furnishes clothing, camp and garrison equipage, barracks, storehouses, and other buildings; constructs and repairs roads, railways, bridges; builds and charters ships, boats, docks, and wharves needed for military purposes; supplies subsistence for enlisted men and others entitled thereto; supplies

articles for authorized sales and issues; furnishes lists of articles authorized to be kept for sale; gives instructions for procuring, distributing, issuing, selling, and accounting for all quartermaster and subsistence supplies; has charge of the supply and distribution of and accounting for funds for the payment of the army and such other financial duties as are specially assigned to it; and attends to all matters connected with military operations which are not expressly assigned to some other bureau of the War Department.

Besides commissioned officers there are enlisted members of the quartermaster corps, consisting of such number and grades as the Secretary of War may from time to time authorize under the provision of law. In 1915 the authorized personnel of the corps was as follows: 1 major general (the quartermaster-general); 2 brigadier generals; 14 colonels; 20 lieutenant colonels; 48 majors; 102 captains; 15 master electricians; 403 quartermaster sergeants, quartermaster corps; 600 sergeants, first class; 1000 sergeants; 650 corporals; 45 cooks; 2500 privates, first class; 1190 privates; total commissioned, 187; total enlisted, 6403; aggregate, 6590. Under the Act of Aug. 24, 1912, the 6000 authorized enlisted men of the quartermaster corps are not to be counted as part of the strength of the army. The officers of the quartermaster corps are detailed from the line of the army for periods of four years, after which they return to duty with their line regiments. A number of the higher grades are still filled by officers holding permanent appointments as quartermasters under the old law. As vacancies therein occur they will be finally filled by detailed officers, so that the entire corps will ultimately be a detailed corps in which the position is held for four years only, under the provisions of the Act of Feb. 2, 1901.

In the British army regimental quartermasters are usually noncommissioned or warrant officers of long service, who receive the commission of honorary lieutenant with their appointment of quartermaster. They combine subsistence with their regular quartermaster's duties, being responsible for the quantity of all food supplies required by the regiment or corps with which they serve. There are no company or troop quartermaster sergeants, color sergeants (q.v.) of companies being responsible for that branch of work. There is also a quartermaster-general with a staff. See ARMY ORGANIZATION.

In the navy and merchant service a quartermaster is a petty officer who assists in the navigation of the ship. At sea he superintends the steering of the seaman at the wheel, looks out for the log, writes up the columns in the log book, and has charge of the navigator's stores. He also keeps a lookout with his spyglass both in port and at sea, reporting such occurrences as are of interest to the commanding officer or officer of the deck.

QUARTERMASTER CORPS. See QUARTERMASTER.

QUARTERS, MILITARY. See PAY AND ALLOWANCES.

QUARTER SESSIONS. In England, a court or meeting of justices of the peace, who assemble every quarter of the year for judicial as well as miscellaneous business. It is an inferior court of record, having power to punish for contempt of court, to adjourn cases, and to summon juries for adjourned sittings. The meetings are fixed by statute to be held in the first full week after December 28, March 31, June 24, and October 11 respectively. The chief officer of the Court of Quarter Sessions is the clerk of the peace. The original jurisdiction of the Court of Quarter Sessions is largely confined to criminal business, but it has certain minor civil jurisdiction by virtue of statutes and also appeals from certain courts of summary jurisdiction. Most of the administrative business formerly attended to by the Court of Quarter Sessions was transferred to the county councils in 1888. In Scotland there is also a Court of Quarter Sessions of the Peace, held four times a year at the county town. Consult: J. F. Archbold, *Practice of the Quarter Sessions* (5th ed., London, 1898); T. S. Pritchard, *Jurisdiction, Practice, and Procedure of the Quarter Sessions* (2d ed., ib., 1904).

QUARTET' (It. *quaretto*, from *quarto*, Lat. *quartus*, fourth, from *quattuor*, four). A concerted composition for four voices or instruments, in which all the parts are real, i.e., no one can be omitted without injuring the proper effect of the whole. As early as the fifteenth century four-part writing had been recognized as the kind most suitable for combining harmonic fullness and clearness with ease of execution. Since then it has been regarded as the groundwork of all composition. During the seventeenth century, however, the tendency was towards the employment of large masses in double and triple choruses (schools of Rome and Venice; see MUSIC, HISTORY OF). But during the eighteenth century the development of the string quartet led to a return to four-part writing. In the nineteenth century Mendelssohn and Schumann did much to popularize the male quartet. One of the highest forms of modern music is that written for the string quartet, which consists of two violins, viola, and cello. Although this combination of instruments was established by Monteverde (q.v.) as the foundation of his orchestra, no music was written for it until a century and a half later, when Haydn recognized the possibilities of this group of instruments. Haydn is the father of the modern quartet. He took the sonata form and in 1755 wrote a miniature symphony for the string quartet. Although this first quartet is very crude, Haydn soon acquired mastery of the form. He wrote in all 83 quartets. Mozart, who greatly developed the quartet, did not, like Haydn, regard it as a miniature symphony to express only miniature ideas. Some of the boldest effects in Mozart's works are found in his quartets. During the lifetime of Haydn and Mozart the quartet was assiduously cultivated by lesser composers, such as Gossec, Grétry, Sammartini, Romberg, Ries, Onslow, and others. They were succeeded by the unrivaled master of the string quartet, Beethoven. The first violin no longer had the principal melody; he placed all four instruments on a footing of absolute independence. He wrote only 16 quartets, but in these monumental works all the possibilities of the form are exhausted. Schubert wrote 20 quartets which are scarcely inferior to those of his predecessor either in profound ideas or mastery of technical workmanship. While Beethoven occasionally allows one or two instruments to rest (producing a certain thinness of tone), Schubert keeps every instrument at work from beginning to end. Schumann wrote only three quartets (op. 41), but they can be ranked with those of Beethoven and Schubert. Spohr wrote 33 quartets and four double quartets. His quartets are more like those of Haydn

and Mozart; the independence of the several instruments is sacrificed to the predominance of melody in the first violin. The same is true of Mendelssohn's quartets. The second violin and viola too frequently have only filling-up work, like tremolo, etc. Another master is Brahms, whose quartets are written entirely on the lines of his great predecessors. Some of the most important instrumental quartet organizations, with their original members, are the *Müller*, the brothers Karl, Theodor, August, Franz Müller; the *Florentine*, Becker, Masi, Chiostri, Hilpert; the *Hellmesberger*, Georg, Joseph, Joseph, Jr., and Ferdinand Hellmesberger; the *Schuppanzigh*, Schuppanzigh, Sina, Weiss, Kraft; the *Joachim*, Joachim, De Ahna, Wirth, Hausmann; the *Kneisel*, Kneisel, Roth, Svecenski, Schroeder; the *Bohemian*, Hoffman, Suk, Nedbal, Wihom; the *Brodsky*, Brodsky, Becker, Sitt, Klengel; the *Flonzaley*, Betti, Pochon, Ara, Archambault; *Quatuor de Paris*, Hayot, André, Dénayer, Salmon; *Quatuor Capet*, Capet, Bailly, Tourret, Hasselmans.

QUARTIER LATIN, kär'tyā' lă'tăn' (Fr., Latin quarter). The famous student section of Paris, a district south of the Seine, containing the Sorbonne, the Collège de France, the Institute, the Luxembourg, Panthéon, and various schools. The name *quartier* or *pays latin* was given to it because Latin was the language of mediæval scholasticism. The Latin quarter has always been the centre of youthful revolutionary ideas and a synonym for Bohemian life.

QUARTILE, kwôr'tĭl. See ASPECTS.

QUAR'TODECI'MAN. A name applied to the party in the early Christian Church which believed in celebrating Easter on the fourteenth day after the full moon, by analogy with the Jewish usage regarding the Passover. See EASTER; NICÆA, COUNCILS OF.

QUARTZ, kwôrts (MHG. *quarz*, Ger. *Quarz*, rock crystal, quartz). A mineral composed of silica or silicon dioxide, crystallizing in the hexagonal system. It is very hard, scratching glass readily, and has a specific gravity of from 2.5 to 2.8, according to the amount of impurity. When pure it is colorless and perfectly transparent, but it often has some shade of yellow, red, brown, green, blue, or black. By friction it becomes positively electrified. It is a very abundant and widely distributed mineral, largely composing the sands found on beaches and being also a constituent of most rocks. (See ROCK.) The mineral species includes two important groups—those that are crystallized and have a vitreous lustre, called phenocrystalline, and those that are massive and flintlike, called cryptocrystalline.

The phenocrystalline varieties of quartz include amethyst, asteriated or star quartz, aventurine, cairngorm, morion or smoky quartz, cat's-eye, citrine or false, Saxon, Scottish or Spanish topaz, ferruginous quartz, or rubasse (sometimes called ancona or Mont Blanc ruby), hyaline, milky or greasy quartz, rock crystal (including the Brazilian pebble, Lake George diamonds, etc.), rose quartz, sagenitic quartz, and sapphirine, or siderite. The cryptocrystalline varieties include agate (banded or eye agates, fortification or ruin agates, dendritic agate, moss agate, agatized wood, etc.), basanite (lydian stone or touchstone), beekite, bloodstone or heliotrope, carnelian, chalcedony, chrysoprase, flint, hornstone, jasper, onyx, plasma, prase, sard, and sardonyx. In addition to the foregoing should be mentioned quartz rock or quartzite (q.v.). Of similar nature are the different varieties of pseudomorphous quartz, such as the agatized wood and beekite previously mentioned.

The common variety of crystallized quartz is employed in the arts as an abrasive, principally in the manufacture of sandpaper. It is also crushed and used for polishing marble and as a filler for wood. Quartz sands are of importance in the manufacture of glass, refractory brick, mortar, cements, etc. The occurrence of quartz in the form of veins is noteworthy from the fact that such veins are the sources of many of the valuable metals, including gold, silver, copper, and lead. See ORE DEPOSITS.

QUARTZ'ITE (named from the mineral quartz, which is its principal constituent). A metamorphic rock, composed essentially of quartz and produced from the alteration of sandstone (q.v.). The process of alteration consists of the enlargement of the sand grains which compose the sandstone through accretion of silica in aqueous solution. This accretion of silica cements neighboring grains together by crystallizing around them and forms as a result a dense vitreous rock which usually discloses little if any evidence of its original nature. Quartzites frequently contain small amounts of other minerals, especially feldspar and mica, and thus grade into some of the other varieties of metamorphic rocks (q.v.).

QUARTZ MINING. See GOLD.

QUARTZ VEIN. A term applied to a fissure filled with quartz. Such veins are usually formed by precipitation from solution, but may be of igneous origin. At times the quartz carries gold or other metals and is valuable as an ore. See ORE DEPOSITS.

QUA'SI (Lat., as if, as it were) **CONTRACT.** This is a generic term in law, of modern origin, invented to denote all those obligations to pay money which do not arise from either true contract or tort. (See CONTRACT.) The distinction between true contracts and quasi contracts lies in the source of the two classes of obligations. All true contracts are founded upon intention, there being no true contract which does not result from the meeting of the minds of the parties to it. Quasi contracts, on the other hand, are obligations which are imposed by law without any reference to the intent or consent of the party whose legal duty it is to perform the obligation.

The term "implied contract" as used in earlier classifications of contracts was applicable either to a real contract, i.e., one flowing from intent, inferred from the acts of the parties, or to a so-called contract implied in law, which was not a true contract, but a quasi contract.

Quasi-contract obligations resemble torts in that both are obligations imposed by law; but while in general the duty imposed by the law of tort is to forbear, a quasi-contract obligation imposes the duty of action, viz., the payment of a definite sum of money. A tort also is in general the violation of a right in rem, for which the wrongdoer must respond in damages; but the defendant who is liable in quasi contract has either not acted at all, as in case of one who is required to pay a tax or penalty, or if he has acted has done so with the consent and coöperation of the plaintiff, as one who has received money paid by mistake. There is a still further distinction between tort and quasi contract, which has some value, although not of universal

application. While the liability of the tort-feasor is to pay damages for the injury which the plaintiff has suffered from his tortious act, the liability in quasi contracts is generally the restoration to the plaintiff of money or the money value of property which the defendant has secured at the plaintiff's expense and which upon legal or equitable grounds should be returned to him. Thus, the remedy for negligent injury of the plaintiff's property is a tort action. The remedy for appropriation of the plaintiff's property by the defendant may be an action in quasi contract to recover the value of the property, or, as will appear, the plaintiff may seek his remedy in tort to recover damages for its conversion, the same act giving rise to an action either in quasi contract or tort at the election of the plaintiff.

The following is a classification of quasi-contractual obligations which has been followed to some extent and which, although not free from criticism, is perhaps as satisfactory as any which has been suggested:

Quasi contracts may be said to be founded (1) upon a record, (2) upon statutory or official or common-law duty, (3) upon the doctrine that no one shall be enriched at the expense of another.

(1) It is clear that record obligations or judgments are not true contracts, since they are imposed without the consent of the judgment debtor and properly form one distinct class of quasi contracts.

(2) The second class includes all obligations to pay money imposed by some positive rule of law, whether by statute or common law. It includes the obligation to pay penalties imposed by statute, the obligation of a sheriff to pay the proceeds of a levy to the judgment creditor, the obligation of an infant or lunatic to pay for necessaries, the obligation of a husband to pay for necessaries supplied to his wife—being examples of true quasi contract.

(3) The third class embraces all other recognized quasi contracts, and in all there is present the element of unjust enrichment of the defendant at the plaintiff's expense. It cannot be said, however, that unjust enrichment is a definite rule or principle of decision such that a plaintiff is entitled to recover in every case of unjust enrichment at his expense. The scope of this subdivision of quasi contracts will be best understood by referring briefly to the more important groups of cases included within it.

Money Paid by Mistake. It is a general rule that money paid or the value of property delivered to another under mistake of fact may be recovered in a quasi-contract action. If, however, the mistake is one of law, no recovery is allowed.

Waiver of Tort. As has already been said, there are certain circumstances under which one who has suffered injury by the tortious act of another may at his election sue either in tort or quasi contract. As the remedies are not concurrent, the election of the plaintiff to sue in *indebitatus assumpsit* or quasi contract is said to be a waiver of the tort. The basis of recovery is restitution, the return to the plaintiff of the money value of property taken from the plaintiff by the defendant's tortious act. Torts therefore give rise to quasi contracts only when the tort-feasor has by his wrongdoing enriched himself at the expense of the plaintiff. Thus, if the defendant's tort consists merely in injuring or destroying the plaintiff's property without direct benefit to the defendant, the sole remedy is in tort.

Plaintiff in Default under a Contract. In general a plaintiff who is in default under a contract has no right either upon the contract or in quasi contract. If, however, performance by the plaintiff has become impossible and the contract is one which may be said to contemplate impossibility of performance so that the impossibility is an excuse for the plaintiff's non-performance, he may recover in quasi contract the value of the performance which he has already given under the contract. Thus, in contracts for personal service, if one is unable to perform because of sickness or death, he or his estate is entitled to recover the reasonable value of services rendered up to the time of the impossibility of performance. When the plaintiff is in default under a contract which the courts will not enforce because it is illegal, he may recover the actual value of his performance already rendered if the contract is *malum prohibitum* (see MALUM IN SE AND MALUM PROHIBITUM) only, but in case of contract *malum in se* the law leaves the parties to it without relief.

Defendant in Default under a Contract. When a defendant is in default under a contract because performance by him has become impossible, the plaintiff is entitled to recover in quasi contract for benefits conferred by him upon the defendant, and this is permitted irrespective of the liability of the defendant to respond in damages for his breach of the contract. Thus, freight money paid in advance may be recovered from the carrier if performance by him becomes impossible; or if one has paid in advance for the personal services of another who is unable to complete his performance because of sickness or death, he may recover in quasi contract the proportion of the compensation remaining unearned. The same rule of recovery is applied whenever the defendant is willfully or inexcusably in default under his contract under such circumstances that he may be said to have abandoned the contract. In case the defendant is in default under a contract which is illegal, the plaintiff's right of recovery in quasi contract depends upon the character of the contract. If the contract is *malum in se*, there can be no recovery. If it is *malum prohibitum*, there can still be no recovery if the plaintiff is in equal wrong (*in pari delicto*) with the defendant. If, however, the plaintiff is not *in pari delicto*, he may recover the value of the performance which he has given to the defendant under his contract.

In general, whenever a defendant is in default under a contract which cannot be enforced because it does not comply with the statute of frauds, the plaintiff may recover the money value of the performance which he has given to the defendant under his contract. The measure of recovery, as in all other cases of quasi contract, is the value of the benefit conferred on the defendant by the plaintiff and not necessarily the contract price.

In all cases the basis of recovery is the duty of the defendant to restore to the plaintiff money or money value of property which he has received at the plaintiff's expense and which upon legal or equitable grounds he should return to the plaintiff. Cases on Quasi Contracts (Minneapolis, 1911); F. C. Woodward, *Law of Quasi Contracts* (Boston, 1913).

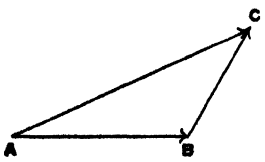
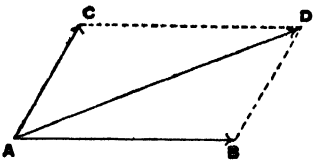
QUA'SIMO'DO, *Fr. pron.* kà'zē'mô'dô'. In Hugo's *Notre Dame de Paris,* the hunchback bell ringer of Notre Dame.

QUASKY. See OQUASSA TROUT.

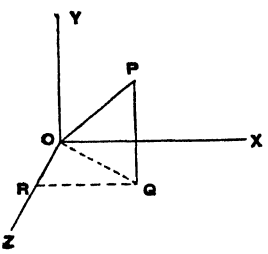
QUASSIA, kwŏsh'ĭ-à (Neo-Lat., from *Quassi,* or *Coissi,* name of a Surinam slave who used its bark as a remedy for fever). A genus of trees and shrubs of the family Simarubaceæ. *Quassia amara,* a native of tropical America, is a shrub 10 to 15 feet high, with racemes of bright-red flowers and large pinnate leaves with remarkably winged and pointed leafstalks. The wood, and particularly that of the root, is intensely



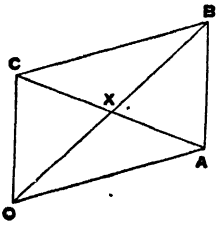


QUASSIA.

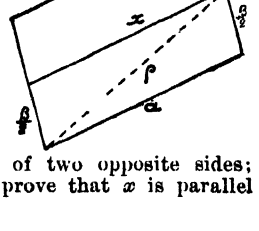
bitter, and was formerly used in medicine under the names of quassia wood, bitterwood, bitter ash, etc. Cabinetwork made of it is free from insect attacks. The wood of *Quassia africana* (see BITTERWOOD) has been used to increase the bitterness of beer, being cheaper than hops. Beer so made is said to become muddy and flat.



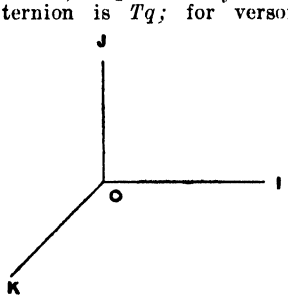
QUATERNARY PERIOD (Lat. *quaternarius,* consisting of four, from *quaterni,* four each, from *quattuor,* four). A term employed to characterize the Post-Tertiary strata. See PALEOLITHIC PERIOD; PLEISTOCENE PERIOD.



QUATER'NIONS (Lat. *quaternio,* group of four, from *quaterni,* four each). A branch of mathematics invented by Sir William Rowan Hamilton (q.v.) about the middle of the nineteenth century. It extends the idea of complex numbers (see COMPLEX NUMBER) to three-dimensional space, and besides being interesting as a branch of pure mathematics, it finds numerous applications in physics. The first concept peculiar to the quaternion theory is that of vector (Lat. *vector,* carrier). A line segment AB has not only length, but also direction, and two line segments AB, $A'B'$ are considered equal when they have the same absolute length and the same direction; e.g., in the parallelogram $ABB'A'$, AB, $A'B'$ are called vectors because they are considered as carrying the points A, A' to the points B, B' respectively. It is therefore evident that a vector may be transported parallel to its original position without alteration in character, and hence that it may be considered as a symbol of translation. The sum of two vectors, AB and BC, is considered to be that vector which carries A to C, viz., AC. This does not mean that the



absolute value of AB plus that of BC equals that of AC, but that (direction being also considered) a force AB plus another BC, or $AB + AC$ in the figure, equals the force AD. It is therefore evident that, with this definition of addition, the sum of the sides of a triangle or of any other closed polygon, considered as vectors, is zero. Therefore, if we have three given rectangular vectors, OX, OY, OZ, and OP, any other vector, OP, can be resolved into three vectors respectively parallel to (hence equal to parts of) OX, OY, OZ. These are RQ, QP, OR; for $OR + RQ = OQ$, and $OQ + QP = OP$, as above explained. If, now, we lay off units on OX, OY, OZ, and designate them respectively by i_1, i_2, i_3 or, as is more common in English works, by i, j, k, and designate OP by ρ, we shall have $\rho = xi + yj + zk$, the absolute length of ρ being $\sqrt{x^2 + y^2 + z^2}$. These geometric ideas are elementary and had already been used by Möbius (q.v.) in his barycentric calculus before Hamilton invented quaternions. A few illustrations of their use will be of value. Let $OABC$ be a parallelogram, the diagonals intersecting at X; then



$$OX + XA = OA = CB = CX + XB;$$
$$\therefore OX - XB = CX - XA.$$

But vectors cannot be equal unless parallel, and OXB intersects CXA; hence in the last equation it is necessary that $OX - XB = 0 = CX - XA$, and hence that $OX = XB$ and $CX = XA$. It is thus proved that the diagonals of a parallelogram bisect each other. Suppose α, β are two adjacent sides of a parallelogram, and X a line joining the mid-points of two opposite sides; then it is required to prove that x is parallel

and equal to α. Drawing ρ it is seen that $\rho = \frac{\beta}{2} + x = \alpha + \frac{\beta}{2}$, whence $x = \alpha$, which (considering x and α as vectors) shows them to be equal and parallel.

Consider, now, what is meant by the ratio of two vectors OA and OB, or rather on how many distinct numbers this ratio depends. To change OA into OB requires in general, (1) a variation in length, or the application of a stretching factor; (2) a variation in direction, which requires three angles. Hence the required ratio depends upon four distinct numbers, whence the name "quaternion." The term may be defined as a number that alters a directed line segment in length and direction. The stretching factor is called the tensor and is indicated by prefixing T to a quaternion. The turning factor is called the versor and is indicated by prefixing U. A scalar is a quaternion whose product lies on the same line as the multiplicand, and hence is merely a positive or negative number. A vector is a quaternion that turns through an angle of 90°, or $\frac{1}{2}\pi$. The symbol for tensor of a quaternion is Tq; for versor of a quaternion, Uq; for scalar, Sq; for vector, Vq. The conjugate of a quaternion q, written Kq, has the same tensor, plane, and angle, but the angle is reversed. Suppose I, J, K to be unit lengths on rectangular coördinates as in the figure. These are so situated that a positive (counterclockwise) rotation, through 90°, of J about I brings J to K; a similar rotation about K brings I to J; a similar rotation about J brings K to I. Call the operator that turns K into J i; i.e., $i = \frac{K}{J}$, or $iJ = K$. Similarly let $j = \frac{I}{K}$, or $jK = I$; and $k = \frac{J}{I}$, or $kI = J$. It therefore follows that $-\frac{J}{K} = i, -\frac{K}{I} = j, -\frac{I}{J} = k$. Hence $-J = iK = i(iJ) = i^2J$, or $-1 = i^2$. Similarly $-1 = j^2$ and $-1 = k^2$. Also, since $iK = i(jI) = -ijI$, and $iK = -J = -kI$, it follows that $-ijI = -kI$, or that $ij = k$. Similarly $jk = i$, $ki = j$. A similar line of reasoning shows that $ji = -k$, $kj = -i$, $ik = -j$, whence

$$ij = -ji = k,$$
$$jk = -kj = i,$$
$$ki = -ik = j.$$

These relations, together with the consequent equation $ijk = -1$ and the relation already mentioned, that $i^2 = j^2 = k^2 = -1$, form the basis of the quaternion theory. They show at once that in this theory multiplication is not commutative.

To illustrate the application of quaternions, let $\alpha = xi + yj + zk$ and $\beta = x'i + y'j + z'k$. Then $\alpha\beta = -(xx' + yy' + zz') + (yz' - zy')i + (zx' - xz')j + (xy' - yx')k$, and $\beta\alpha = -(xx' + yy' + zz') - (yz' - zy')i\ (zx' - xz')j - (xy' - yx')k$. Hence $S\alpha\beta = S\beta\alpha$ (i.e., the scalars are equal), $V\alpha\beta = -V\beta\alpha$ (i.e., the versors are opposites), and $\alpha\beta + \beta\alpha = 2S\alpha\beta$. Now $(\alpha+\beta)^2 = \alpha^2 + \alpha\beta + \beta\alpha + \beta^2 = \alpha^2 + 2\delta\alpha\beta + \beta^2$, which is the ordinary trigonometric formula for $c^2 = a^2 - 2ab \cdot \cos C + b^2$. Also $V(\alpha+\beta)(\alpha-\beta) = V\alpha^2 - V\alpha\beta + V\beta\alpha - V\beta^2 = -V\alpha\beta + V\beta\alpha$, because $V\alpha^2 = -V\alpha^2$ and hence is zero; and this equals $= 2V\alpha\beta$. Taking the tensors of both sides of the equation $V(\alpha + \beta) = -2V\alpha\beta$, we have the theorem: The parallelogram whose sides are parallel and equal to the diagonals of a given parallelogram has twice the area of the latter. Furthermore $\delta(\alpha+\beta)(\alpha-\beta) = \alpha^2 - \beta^2$, and vanishes only when $\alpha^2 = \beta^2$, or $T\alpha = T\beta$; whence the diagonals of a parallelogram are perpendicular to each other when and only when the sides are all equal. The chief application of quaternions, however, is in physical problems, and for these reference must be made to works upon the subject. It is evident that the complex number admits of still further generalization, to the form

$$\alpha = a_1i_1 + a_2i_2 + a_3i_3 + \ldots . a_{n-1}i_{n-1} + a_ni_n.$$

This theory has been developed by Weierstrass (*Gottinger Nachrichten*, 1884–86), Schwarz, Dedekind, Hölder, and others.

Joly, *Manual of Quaternions* (ib., 1905); Alexander Macfarlane, *Vector Analysis and Quaternions* (4th ed., ib., 1906); A. L. Baker, *Quaternions as the Result of Algebraic Operations* (ib., 1911).

QUATRAIN, kwŏt'rān (Fr. *quatrain*, from *quatre*, from Lat. *quattuor*, four). A name given (originally by the French) to a little rhymed poem of four verses (lines), or even sometimes to four verses of a longer poem, such as a sonnet, if they contain a complete idea within themselves. Epigrams, epitaphs, proverbs, etc., are often expressed in quatrains. Fitzgerald's famous version of *Omar Khayyam* is written in this verse form.

QUATRE-BRAS, kà'tr'-brà'. A village in the Province of Brabant, Belgium, about 19 miles south by east of Brussels. It is situated at the intersection of the great roads from Brussels to Charleroi and from Nivelles to Namur, whence its name. On June 16, 1815, two days before the battle of Waterloo, Quatre-Bras was the scene of a desperate and sanguinary battle between the British and their German allies under Wellington and the French under Ney, in which the former were victorious. The severe defeat of Blücher the same day at Ligny rendered Wellington's hard-won victory almost valueless; and the British commander retired next morning through Jemappes to Waterloo in order to keep up his communication with the Prussian army. The Duke of Brunswick, commanding the German troops, was killed in this battle. See WATERLOO.

QUATREFAGES DE BRÉAU, kà'tr'-fàzh' de brà'ō', JEAN LOUIS ARMAND DE (1810–92). A French naturalist, born at Berthezène (Gard).

He was educated at Tournon and Strassburg (M.D., 1833), began practice at Toulouse, and established there the *Journal de médecine et de chirurgie de Toulouse*. From 1833 to 1838 he was professor of chemistry, and from 1838 to 1840 professor of zoölogy in the faculty of sciences of the University of Toulouse. He then went to Paris, where he designed plates for the *Règne Animal Illustré*, wrote for the *Revue des Deux Mondes*, in 1850 was appointed professor of natural history at the Lycée Napoléon, and in 1855 professor of anthropology at the Musée d'Histoire Naturelle. He was elected to the Academy of Sciences in 1852. He was a noteworthy teacher and became particularly known for his anthropological investigations and his studies of the invertebrates, especially the annelids. He published many works, of which the most important was *Histoire générale des races humaines* (2 vols., 1886–89). His *La race prussienne* (1871) involved him in a scientific controversy with Virchow.

QUATREFOIL, kät'ẽr-foil' (OF. *quatrefeuille*, from *quatre*, from Lat. *quattuor*, four + *feuille*, from Lat. *folium*, leaf). An heraldic bearing meant to represent a four-leaf flower resembling a primrose. See HERALDRY.

QUATREMÈRE, kä'tr'mâr', ETIENNE MARC (1782–1857). A French Orientalist, born in Paris. He studied at the Collège de France and in 1807 was employed in the Bibliothèque Impériale. In 1809 he became professor of Greek in the College of Rouen, in 1815 was elected a member of the French Institute, in 1819 was called to the chair of Hebrew in the Collège de France, and in 1838 was made professor of Persian in the school for modern Oriental languages. In his *Recherches critiques et historiques sur la langue et la littérature de l'Egypte* (1808) he demonstrated that Coptic is the true representative of ancient Egyptian. His geographical and historical works are of great value, especially his *Mémoires géographiques et historiques sur l'Egypte* (1811); his *Histoire des sultans mamlouks* (1837–45), translated from the Arabic of Makrizi; and his *Histoire des Mongols de la Perse* (1836), from the Persian of Rashid-Eddin. He contributed valuable articles in the *Journal Asiatique* and the *Journal des Savants*, and edited the Arabic text of the Prolegomena of Ibn-Khaldun (1858). His *Mélanges d'histoire et de philologie* was published after his death by Barthélemy de Saint-Hilaire. Quatremère's library (45,000 volumes), his Arabic manuscripts, and his manuscript notes are now in the royal library at Munich.

QUATREMÈRE DE QUINCY, kăn'sē', ANTOINE CHRYSOSTOME (1755–1849). A French archæologist and politician, born in Paris. He was actively concerned in the events of the French Revolution and occupied various political positions during the Republic, Consulate, and Empire. He became intendant of arts and public monuments in 1815, perpetual secretary of the Académie des Beaux-Arts in 1816, editor of the art department in the *Journal des Savants*, and was deputy from 1820 to 1822. In 1824 he became professor of archæology at the National Library. His chief works are: *Dictionnaire de l'architecture* (3 vols., 1795–1825); *Jupiter olympien, ou l'art de la sculpture antique* (1814); *Histoire de la vie et des ouvrages de Rafaël* (1824; 2d ed., 1833); *Monuments et ouvrages d'art antique restitués* (2 vols., 1829); *Histoire de la vie et des ouvrages des plus célèbres architectes du Xe siècle jusqu'à la fin du XVIIIe* (1830); *Canova et ses ouvrages* (1834); *Histoire de la vie et des ouvrages de Michel-Ange Buonarotti* (1835).

QUATRE-VINGT-TREIZE, kä'tr'-văn-trāz (Fr., ninety-three). The last novel of Victor Hugo (1874) and one of his best works. The action takes place principally in La Vendée in 1793.

QUATTROCENTO, kwät'trō-chĕn'tō (It., four hundred). A term applied in Italian art to the period and to the art of the fifteenth century, i.e., whose dates are in the four-hundreds, disregarding the first figure. The artists of this period are designated *quattrocentisti*. The greater part of the fifteenth century is covered by the early Renaissance (see RENAISSANCE ART), though in its earlier years mediæval influences and traditions were still strong, while its later years show the rapid maturing of the arts which pass gradually into the splendid efflorescence of the *cinquecento*—the sixteenth century. See CINQUECENTO.

QUAVER. In music, an eighth note. Its measure is equal to half a crotchet, one-fourth of a minim, or one-eighth of a semibreve. It is represented thus:  ; or when two or more are conjoined, thus:  .

QUAY, kē. A landing place or wharf for unloading vessels, often supplied with mechanical devices for the loading and discharging of cargoes. Quays usually are of masonry, though they may be constructed of wood or iron on piles, but in such cases the term "wharf" is generally applied. In Europe such structures have been more permanently constructed than in the United States, and often elaborate systems of railways connect the various docks with each other and with the principal railway systems. There are also steam, hydraulic, or electrical cranes to facilitate the handling of the cargoes, and in the best docks a vessel comes alongside of the quay and the cargo is removed directly to or from railway cars or warehouses. See DOCK; HARBOR; WHARF.

QUAY, kwā, MATTHEW STANLEY (1833–1904). An American politician, born at Dillsburg, York County, Pa., Sept. 30, 1833. He graduated at Jefferson College in 1850, studied law under Judge Sterret and was admitted to the bar in 1854. During the Civil War he was successively assistant commissary-general of the State, colonel of the 134th Pennsylvania Regiment, State military agent at Washington, and military secretary to Governor Curtin. Congress awarded him a medal for gallantry at Fredericksburg. Quay was a member of the State Legislature (1865–67), Secretary of State for Pennsylvania (1872–78), Recorder of Philadelphia (1878–79), again Secretary of State (1879–82), was elected State Treasurer in 1885, and was chosen United States Senator in 1887. From 1869, when he had served as secretary of the Republican State Committee, until his death, he was the most influential Republican politician in Pennsylvania. As chairman of the executive committee of the Republican National Committee in 1888 he conducted a Presidential campaign which resulted in triumph to his party. Reëlected to the

Senate in 1893, Quay failed to succeed himself in 1899 because of a deadlock which lasted throughout the session of the Legislature. His failure was partly due to an accusation that he had been instrumental in the misapplication of public funds deposited in the People's Bank, in which he was interested. He was tried but was acquitted. Afterward he was appointed Senator ad interim by the Governor, but the Senate refused to admit him. However, he was nominated to succeed himself by the Republican State Convention, and in 1901 was reëlected for the term to expire in 1905. In 1902–03 he attracted attention by his championship of the admission of New Mexico, Oklahoma, and Arizona to statehood, and by his opposition to the Panama Canal Treaty. Quay died May 28, 1904. His remarkable skill and finesse in politics were generally recognized, but he was charged with being the boss of a reactionary and oftentimes corrupt machine. So strong was his influence, however, that his methods were followed by the succeeding political generation, and his record was frequently mentioned in the anti-Boss-Rule campaign of 1912. "Boss" Quay's political principles and actions stood in contrast to an unusually attractive personality.

QUAYLE, kwāl, WILLIAM ALFRED (1860–). An American Methodist Episcopal bishop, educator, and writer. He was born at Parkville, Me., soon after his people came to the United States from the Isle of Man. Graduating in 1885 at Baker University, Baldwin, Kans., he remained as adjunct professor of ancient languages, was assigned the chair of Greek language and literature in 1887 and from 1890 to 1892 served as president of the university. He entered the pastorate in the St. Louis Conference on his resignation, and afterward was pastor of large churches in Kansas City, Indianapolis, and Chicago. In 1908 he was elected Bishop. As a lecturer he became widely known. His writings include: *The Poet's Poet and Other Essays* (1897); *A Hero and Some Other Folks* (1900); *The Blessed Life* (1901); *The Gentleman in Literature* (1902); *Hero: Jean Valjean* (1902); *King Cromwell* (1902); *In God's Out of Doors* (1902); *Eternity in the Heart* (1904); *The Prairie and the Sea* (1905); "Lowell," in *Modern Poets and Christian Teaching* (1906); *God's Calendar* (1907); *The Pastor Preacher* (1910); *Laymen in Action* (1912); *The Climb to God* (1913); *Poems* (1914).

QUEBEC, kwē-bĕk′, formerly LOWER CANADA. One of the eastern provinces of the Dominion of Canada. Its greatest east and west measurement is nearly 1000 miles, that from north to south about 1200 miles. It reaches to Hudson Strait on the north and on the east to Labrador (Map: Canada, P 7). There are 690,865 square miles of land area and 15,969 of water area, exclusive of the Gulf of St. Lawrence and the territorial seas. The Federal Act of 1912 gave Quebec 354,961 square miles of territory at the expense of the Northwest Territories (q.v.).

Physical Characteristics. Physically and geologically Quebec is divided into three parts Almost all the vast region to the north of the St. Lawrence is a portion of the so-called Laurentian plateau, which belongs to the most ancient geological era (Archean). This is a barren, rocky, undulating region, the hills oftimes standing out in great boldness, but nowhere reaching a high elevation. The highest portion, the Height of Land, constituting the watershed between the river systems, scarcely exceeds 1000 feet in the west, but becomes gradually higher to the eastward, averaging 1700 feet in the centre of what was formerly the Labrador Peninsula, now the northern part of the province. The shores of Hudson Bay are rocky, indented by many deep bays and skirted by a large number of rocky islands. The second division consists of the narrow strip of lowlands on either side of the St. Lawrence west of Quebec. Here the general level rises but a few hundred feet above that of the sea, except where the later strata are pierced by rocks of igneous formation, which in a few instances rise quite high, Mount Royal at Montreal being the best known of these. To the eastward of these lowlands the strata have been violently upheaved, the line of dislocation running from Lake Champlain to Quebec, and thence following the estuary of the St. Lawrence, the disturbed area occupying the greater portion of Quebec south of the St. Lawrence and constituting the third division. It is a part of the so-called Acadian region. This is simply the northern extremity of the great Appalachian mountain chain. This portion of Quebec is broken and hilly throughout, rising nearly 4000 feet in Sutton Mountain in the Notre Dame Range. Rivers draining into Hudson Bay are the Harricanaw, Nottaway, Rupert, Eastmain, Big Whale, Little Whale, and Nastapoka. The Payne, Leaf, Kaniapiskaw, Whale, and George empty into Ungava Bay. The North, Fraser, Naskaupi, Hamilton or Grand, with Grand Falls (q.v.), flow into the Atlantic Ocean.

The southern portion of the province is drained by the St. Lawrence River system. This river has been the all-important factor in the history and development of the province. The numerous southern tributaries are short, the northern tributaries longer, but, owing to the frequent falls and rapids along their courses, they are of little value to navigation. These features, together with the precipitous channels through which the streams flow, and the ruggedness of the adjacent highlands, combine to produce scenery which annually attracts thousands of tourists, the Saguenay River being the most frequented. The most important southern tributary is the Richelieu. It drains Lake Champlain. The region north of the St. Lawrence drains in all directions from the Height of Land and contains numerous water-covered areas which vary from swampy lands to lakes of considerable size, the St. John, the Mistassini, Minto, Payne, Clearwater, Seal, Apiskigamish, Melville, and Michikamaru being the most important. In the southern part of the province are Lakes Metapedia, Memphremagog, Timiskaming, an extension of the Ottawa River, and Megantic. The island of Anticosti, at the mouth of the St. Lawrence, Bonaventure, a fishing station east of the Gaspé Peninsula, and the Magdalen group, north of Prince Edward Island, are the most important of the large number of islands which belong to the province.

Climate. The winters in southern Quebec are long and cold; the summers warm, though not to excess. The mean annual temperature ranges from 45° at Montreal to 29° in southern Labrador. The air is in general remarkably dry and free from fog and therefore extremely healthful and bracing, not even the extremes of the winter's cold being intolerable. The deep winter snows last from November to April (except in

the farthest district south). In the extreme north the country extends into the Arctic climatic province, characterized by a brief warm summer and a long cold winter.

Mineralogy and Mining. The province is favored with large mineral resources, but has not yet reaped any great benefit therefrom. Like Ontario, Quebec is unfortunate in not possessing coal. The tariff levied by the United States practically prohibits the exportation of ore into that country. The southeast portion of the province is highly productive of mineral wealth and has become noted for its asbestos mines, which yield 80 per cent of all the asbestos marketed in the world. In 1913 the product equaled $3,849,925 in value. Iron is mined in the region east of the Richelieu River and is found at various points along the north bank of the St. Lawrence and farther west in the region of Ottawa. For a long time small quantities of gold have been taken from the gravels of the Chaudière River. The southeast townships abound in cupriferous pyrites, and considerable copper is mined, the product being used for the manufacture of sulphuric acid. In 1913 the copper ore was valued at $866,774. Plumbago is found near Ottawa, and phosphate and mica exist to the northward. Lead is found farther west and north along the course of the Ottawa River. Some graphite and small quantities of gems of inferior quality have been placed upon the market. In 1913 the output of cement was valued at $3,361,292. The limestone of the eastern counties has been liberally drawn upon for building purposes, but its greatest use and service have been in the production of lime, the annual output of which has reached over $450,000. Granite is quarried in the counties adjacent to Vermont and New Hampshire, while just to the north of this section slate is quarried in considerable quantities. Peat is found in inexhaustible quantities, but has not yet come into use. The total mineral output for the calendar year 1914 was valued at $12,259,637.

Fisheries. Fishing is an important occupation, carried on largely in the estuary and Gulf of the St. Lawrence. In common with the other provinces Quebec enjoys the benefits of the bounty given by the Dominion government for engaging in sea fishing. Latterly the returns show that the number of men engaged in boat fishing has annually exceeded 9500. The catch in 1913 was $1,988,241 in value, the income from the cod fisheries constituting more than one-third of this amount. Lobster, herring, salmon, and mackerel are next in importance. Whales are numerous in Hudson Bay and on the Atlantic seacoast.

Fauna and Flora. Quebec still furnishes the world's market with a valuable quota of furs. The fauna of the province deserve consideration chiefly from this point of view. The moose, the caribou or reindeer, the red deer, weasel, wolf, bear, lynx, seal, muskrat, and raccoon are important, as are also the fox, beaver, marten, otter, and mink. Fox farming has become a profitable industry. The beaver, otter, and marten have become rarer. There are about 300 species of birds, among which the ducks and teal, Canada goose, wild goose, plover, and partridge are objects of sport.

In the Ottawa and St. Lawrence valleys and the highlands south of the St. Lawrence there is a mixed forest such as is typical of the New England States to the south. Here are found maples, oak, ash, beech, butternut, elm, and other hardwoods, together with the red and the white pine, the cedar, spruce, birch, and other varieties of evergreens. The region south of the St. Lawrence still contains extensive valuable forest areas, as is the case with the Upper Ottawa region. In the highland region to the north the sub-Arctic species of flora prevail, and there are but few varieties, in marked distinction from the southern section. The best forest land lies south of the watershed, and, though not equal in value to the forests of northern and central Ontario, is yet very valuable and is to-day the great lumbering region of Quebec. The tamarack and the spruce occupy the wet boggy lands in the southern portion of this region, becoming common also on the drier lands farther north. The Banksian pine flourishes in the sandy and rocky soil, but is inclined to be scrubby as compared with the noble proportions it attains farther west. It is estimated that over one-fourth the area of the province is still forest or woodland, being about 130,000,000 acres of forest, with a total of 174,956 square miles of forest reserves.

The fruit trees of temperate regions thrive in the orchards of the settled parts of the province, but especially in the central part of the St. Lawrence valley.

Agriculture. Farming is the most important occupation, though cultivation is confined largely to the fertile river valleys. In the cultivated portions the soil is loamy and of great fertility. In the vast stretch of highland north of the St. Lawrence it varies greatly in richness, much of the region being either swampy or rocky and barren, the barrenness increasing to the northward. The townships adjacent to Vermont resemble that State in physical characteristics, being better adapted to stock raising than to farming. In 1911 the province had an occupied acreage of 15,613,267 acres and an estimated arable acreage of 43,745,000. In 1914 the value of field crops was $99,279,000. According to official Dominion statistics in 1914 the yield of hay and clover in that year was valued at $53,196,000; 1,327,000 acres of oats produced 42,119,000 bushels, valued at $24,429,000; 102,000 acres of buckwheat, 2,477,000 bushels, valued at $2,056,000; 99,000 acres of mixed grains, 2,970,000 bushels, valued at $2,287,000; 85,000 acres of barley, 2,261,000 bushels, valued at $1,944,000; 115,000 acres of potatoes, 21,811,000 bushels, valued at $9,161,000; 10,500 acres of turnips, 3,446,000 bushels, valued at $1,275,000. Parts of the province are noted for their superior apples and plums, while the hardy varieties of smaller fruits grow everywhere. The average annual value of the maple-sirup product is $1,600,000. Stock raising received great attention. On June 30, 1914, the province possessed 372,009 horses, 733,476 milch cows, and 625,598 other cattle, 571,287 sheep, and 634,569 swine. According to the report of the Dominion Dairy Commissioner for 1913 there were in that year in the province 894 cheese factories, 576 creameries, and 698 combined factories making both butter and cheese. Much attention is given to dairying, especially to improving the herds of cows. In the eastern townships much of the cream produced is marketed in the United States. South of the watershed the summers are sufficiently

ENTIRE PROVINCE OF QUEBEC

L. L. POATES CO., N.Y.

warm and the soil in many places is sufficiently fertile to guarantee an extensive agricultural development. This is especially true of the Lake St. John and the Upper Ottawa regions.

Commerce, Transportation, and Manufactures. The navigable St. Lawrence River has been the determining factor in the development of Quebec. The largest ocean steamers ascend the river as far as Montreal, 500 miles from its mouth. The shipping industry of this port has made it the metropolis of Canada. Here is collected almost the whole of the interior Canadian product which is destined for foreign shipment, to which are added also large quantities of food products from the northern United States. The navigation of this river has been greatly improved (as has been also that of its north and south tributaries, the Ottawa and the Richelieu) by the construction of canals at points where their courses are interrupted by rapids. (For canals and foreign shipments, see CANADA.) The principal export products of Quebec are lumber, timber, beef, apples, and dairy products—butter and cheese. The exports for the fiscal year 1913 amounted in value to $147,723,907, and the imports to $187,301,493. Trade with the outside world is almost solely through Montreal, Quebec, St. John's, and Coaticooke. The principal imports are sugar and manufactures of cotton, iron, steel, copper, and wood.

The construction and maintenance of railroads have been aided by the Dominion, provincial, and municipal governments in accordance with settled Canadian policy. The mileage in 1914 was 4043, less than half that of Ontario. Most of the lines are south of the St. Lawrence The only line running into the northern interior is the one from Quebec to Lake St. John. The National Transcontinental Railway, the eastern portion of the Grand Trunk Pacific, runs from the city of Quebec westerly through the province, passing the northern shore of Lake Abitibi, which lies across the boundary between Ontario and Quebec. Shipbuilding, which was formerly an important industry, has almost entirely ceased. Logs used to be shipped in the rough to British ports, but now numerous saw mills have been established, and the timber is sawed into lumber before shipment. The presence of tanning barks, notably the hemlock, has given rise to an extensive tanning industry. The spruce is being largely manufactured into wood pulp and its products. In 1913 the pulp wood produced was valued at $4,107,689. Boots and shoes are made at Montreal and Quebec. Cottons are also manufactured. The manufacture of matches, potash, and other chemical products is of importance. A number of the river rapids have been utilized in the generation of electric light and power. In 1913 there was an estimated capital invested in manufactures of $378,441,000, employing 183,125 persons, with a product valued at $406,167,950. Eleven industries in 1910 had an annual output of over $11,000,000 each. These were log products, $26,669,747; boots and shoes, $22,662,178; cottons, $16,741,409; butter and cheese, $16,156,986; railway cars (repairs), railway cars (building), clothing, tobacco and its manufactures, gristmill products, paper and lumber products.

Government. A Lieutenant Governor, appointed by the Governor-General of Canada in Council, is at the head of the Provincial government. The Lieutenant Governor is assisted by an executive council of nine members, which is responsible to the elective assembly. The Legislature consists of a nominative, legislative council of 24 members and an elective assembly of 82 members. The province sends 65 members to the Dominion House of Commons and 24 to the Dominion Senate. A public-utilities commission of three members was created in 1910 and given jurisdiction over all public-utility corporations not under federal charter.

Finances. The principal sources of revenue are the subsidy from the Dominion government, which amounted in 1913–14 to $2,027,927; lands and forests, $1,777,220; duties on successions, $1,604,479; hotel and shop licenses, $1,027,596; taxes on commercial corporations, $925,093; law stamps and fees, $479,092. The principal items of expenditure are the payment of interest on the provincial debt, which amounted to $1,204,743 on June 30, 1914; administration of justice, $1,025,330; public instruction, $1,435,515; public health works, $793,850; civil government, $582,431; asylums and charities, $748,806. The total receipts for the year ended June 30, 1914, were $13,343,306 and total expenditures, $14,221,496. The ordinary revenue of the year was $9,000,374. The provincial net funded debt on June 30, 1914, was $24,579,166, or $12.26 per capita.

Population. The population increased from 1,488,535 in 1891 to 1,648,898 in 1901 and 2,003,232 in 1911. The per cent of increase in population from 1891 to 1901 was much greater than in any of the other eastern provinces and was made in spite of a very heavy emigration into the New England States. The gain is accounted for by the unusually large birth rate, the average size of the families being 5.5. The Indians numbered 9993 in 1911, most of whom were well advanced in civilization. This does not include the Indians in the territory added from the Northwest Territories (q.v.) in 1912. Quebec was originally settled by the French, whose descendants still form a large majority of the population. Their race has remained practically intact: it is still French in language, manners, and temperament. This fact is of first importance when the government of the province is considered and is the predominant factor in almost every phase of its social life. The eastern townships received a large number of United Empire Loyalists from the American Colonies during the Revolution. In 1911 the population of Montreal was 470,480 and of Quebec, the capital, 78,710. Other cities were Maisonneuve (18,684), Hull (18,222), Sherbrooke (16,405), Westmount (14,579), and Three Rivers (13,691). Montreal is the largest city in the Dominion, and the large number of racial elements represented give it a cosmopolitan air. Of the total population of the city, in 1911, 298,878 were French.

Religion. Quebec was first settled by French Catholics and was the centre of the great missionary activity of the Jesuits. The Catholic faith still continues strongly predominant, its adherents outnumbering the Protestants more than 6 to 1. They constitute two-thirds of the total Catholic population of the Dominion. In 1911 the Roman Catholics numbered 1,724,683; Anglicans (Episcopalians), 102,684; Presbyterians, 64,125; Methodists, 42,444; Lutherans, 30,268.

Education. The educational system is unlike that of any other Canadian province. There is a Council of Public Instruction, with a superintendent at the head. But the administration is represented by two committees, Catholic and Protestant, having the care of the schools of the respective faiths, prescribing such religious instruction as they see fit, and receiving proportionate support from the public funds. . The educational establishments of the province are divided into three kinds: (1) primary schools, including elementary, model or intermediate, and higher or academic; (2) classical colleges and universities; (3) special schools, such as technical schools, schools of art, etc. In 1912–13 there were 6738 primary schools, of which 5860 were Catholic and 878 Protestant; and 20 Catholic classical colleges. There were 411,774 primary pupils, of which 362,934 were Catholic and 48,850 Protestant. The classical colleges had 8189 pupils. Of special schools there are the Polytechnic School and School of Higher Commercial Studies at Montreal, 12 schools of arts and manufactures, 4 schools for deaf mutes and the blind, 3 agricultural schools, and, besides that at Oka, 39 domestic science schools, and 75 night schools. There are 11 normal schools. (For higher educational institutions, see CANADA.) The expense of the public schools averages about $11 per enrolled pupil. About 14 per cent of this is met by government grants, the rest being raised by assessment of the people.

Charities. In 1914 the provincial asylums for the insane at Montreal, Quebec, and other places contained 4464 inmates; reformatory schools had 457 inmates, and the industrial schools 450 inmates.

History. (For the period preceding permanent settlement, see CANADA.) In 1608 Champlain laid the foundations of the colony of Quebec; and as a result of his 27 years of activity in exploring the St. Lawrence and the Great Lakes as far west as Huron, in cultivating the friendship of the Canadian Indians, and in curbing the power of the Iroquois, there were in Quebec at the time of his death, on Christmas Day, 1635, some 150 colonists, who derived a precarious existence largely from the fur trade. (See CHAMPLAIN, SAMUEL DE.) Champlain's efforts were supplemented in a degree by the work of the Recollet missionaries, who arrived in 1615, and the Jesuits, who came in 1625; but the pitiable condition of the colony for the next 30 years, during which period occurred the failure of the Hundred Associates under Richelieu, clearly proved that no true elements of colonial prosperity could be expected from the initiative of individual Frenchmen. During this period, in 1642, came the founding of Montreal and the laying of the foundation of those religious establishments that under Monseigneur de Laval, the first Roman Catholic Bishop of Canada, assumed the commanding position which they continued to hold while French domination lasted. When, in 1663, Canada was made a royal government, its French population amounted to only 2500, largely centred at Quebec, Montreal, and Three Rivers.

The coming of the Marquis de Tracy in 1665, followed by his successful campaigns against the Mohawks, two years later, was the signal for a more rapid immigration. Under the intendant Talon (q.v.) the colony enjoyed a moderate degree of prosperity. Under the administration of the Count de Frontenac (1672–82, 1689–98) the Iroquois were led to respect the French power, while the area for the fur trade was greatly extended; and to accomplish this double purpose Fort Frontenac (Kingston) was established as an outpost on Lake Ontario In 1690 an English expedition under Sir William Phips was defeated before Quebec. The total immigration for the year 1663 to 1713, largely from the French provinces of Perche and Normandy, did not exceed 6000, and the population of the territory included within the present Province of Quebec at the latter date was less than 20,000; but Frontenac had made Canada a power to be feared by its English neighbors. The system of seigneurial tenure had built up the nucleus of an agricultural community on the banks of the St. Lawrence, but the vast forests of the West still attracted the more vigorous spirits of the population and rendered a settled society almost impossible.

The religious orders were often in sharp conflict with the government officials, yet their influence on the life of the colony was generally helpful. The Jesuit College at Quebec, founded in 1635, antedated Harvard, and doubtless was largely responsible for the evidence of culture in the cities noted a century later by the traveler Charlevoix and the Swedish botanist Kalm.

The memorable battle on the Plains of Abraham, Sept. 13, 1759, resulting in the fall of Quebec, which was followed by that of Montreal in the next year, brought Canada under the dominion of England. At that time, of the 60,000 French in the valley of the St. Lawrence, 8000 were gathered at Quebec, 4000 at Montreal, and 1000 at Three Rivers, the total population of the three hardly equaling that of Boston. These three cities formed the centres of the judicial districts into which the English divided the colony, with a Superior Council at Quebec. During the 11 years preceding the Quebec Act (q.v.) of 1774 the small English minority petitioned for themselves a representative system, wholly unsuited to the French population, which would have placed all power in their hands. Though their action gave rise to a race antagonism, the evident policy of both the home government and the local officials was to deal justly with their new subjects and thus secure their good will. For this reason, largely, all attempts of emissaries from the Continental Congress to stir up the Canadians against England and the expedition of Montgomery and Arnold in 1775 alike failed of their object. Much of the credit of this result is due to the wise rule of Sir Guy Carleton (afterward Lord Dorchester), the military governor.

By the end of the American Revolutionary War at least 10,000 exiled Loyalists had sought the valley of the St. Lawrence and the region bordering upon the Lakes beyond, and they now petitioned for a separate western district. By the terms of the Constitutional Act of 1791 their prayer was granted, but the period down to 1812 was marked by a growing race hostility in Lower Canada, as Quebec was then called. During the War of 1812–14 between the United States and Great Britain the province suffered little; on the contrary, the general effect was a greater unity of sentiment among the two leading elements of its population, although up to 1836 the relations between the elective assembly and the royal governors were far from

cordial. This fact, however, led but few French-Canadians of prominence to take part in the Rebellion of 1837–38, which resulted in the collapse of Papineau's scheme of "La Nation Canadienne." (See PAPINEAU, LOUIS JOSEPH.) In the latter year the population of Lower Canada approached 300,000, of whom one-fourth were of British origin, and this element largely controlled the industry of the province. Quebec and Montreal each boasted a population of 35,000.

Following the Rebellion, the two provinces were again united for general purposes by the Act of 1841, and a Parliament of Two Houses, a nominative legislative council and an elective legislative assembly, was constituted. As there was some opposition to the provision that all debates in this Parliament must be conducted in English, this was shortly repealed in favor of the French representatives from Quebec. By the Act of 1867 Quebec became a part of the Dominion of Canada, of which the course of her leaders has made her a conservative though consistently loyal member, despite scattered attempts to stir up race feeling during the Riel Rebellion of 1885 (see RIEL, LOUIS) and the Boer War. In 1888 an Act was passed compensating the Jesuits for confiscation of their estates, with a resulting agitation whose outcome was the Equal Rights Party. (See PARTY NAMES.) An alternation of Conservative and Liberal administrations until 1905 brought no great features of provincial policy on which both parties were not substantially agreed, however opposed in carrying them into effect. Extension of the provincial boundaries, increase of the Dominion subsidy, improvement of educational methods, and a firm maintenance of French-Canadian rights as guaranteed by the Quebec Act were characteristic of both parties. In 1905 Sir Lomer Gouin became Liberal Premier and put into force a progressive policy. His administration has done much to develop the resources of the province. See CANADA.

QUEBEC. The capital of the Province of Quebec and the oldest city in Canada, situated at the confluence of the St. Lawrence and St. Charles rivers, on a promontory named Cape Diamond, and on the Canadian Northern, the Intercolonial, the Grand Trunk, the Canadian Pacific, the Quebec Central, and the Quebec and Lake St. John railroads, in lat. 46° 48′ N., long. 71° 12′ W., 180 miles northeast of Montreal and 430 miles north-northeast of New York (Map: Quebec, G 4). It is a port of entry for Atlantic steamships in summer. A steam-ferry service connects the city with Lévis on the opposite bank of the St. Lawrence. An immense steel bridge across that river was in course of construction in 1915. Quebec's picturesque position, and the fact that its historical sites have never been defaced and altered, make it one of the most romantic and interesting cities in North America. It resembles, especially in the lower town, a mediæval European rather than a New World city and, owing to its impregnable aspect, has been termed the Gibraltar of America. Grouped on and below the rocky precipitous bluff, with its low irregular buildings and river craft at the base, it presents a quaint appearance. The city is divided into an upper and a lower town. Access to the former, perched high on the precipitous eminence, is obtained by several flights of narrow steps, an elevator, and a steep and winding street. The portion of the upper town near which lie the suburbs of St. John and St. Louis is surrounded by a massive wall, but several of the fortifications have been destroyed. Three gates have been removed, the two remaining being St. Louis and Kent gates. The summit of Cape Diamond is crowned by a citadel, covering 40 acres, at a height of 333 feet above the level of the river, dating in its present form from 1823 and garrisoned by Canadian militia. The upper town contains the principal residences, churches, buildings, public walks and gardens, and shops. One of its most interesting points is the Dufferin Terrace, a promenade, 1400 feet long and 200 feet above the river, opened in 1879 and affording a fine view. At the eastern extremity is a statue of Champlain, erected in 1898. This was constructed on the site of the residence of the early French governors, the Château St. Louis, destroyed by fire in 1834. In the Governor's garden, overlooking the St. Lawrence River, stands a monument to the memory of Wolfe and Montcalm, and on the St. Foye Road an iron pillar surmounted by a bronze statue commemorates the battle of St. Foye, fought on that site.

Quebec's chief attractions are the Parliament and departmental buildings; the courthouse, post office, customhouse, and city hall; the Masonic hall, the Roman Catholic cathedral, with specimens of several eminent painters; the Roman Catholic archbishop's palace, the Anglican cathedral, the Jewish synagogue, the church of Notre Dame des Victoires (1689, named in 1690 to commemorate the defeat of Sir William Phips); Hotel Frontenac, a hotel built in the style of a French château; the Grand Seminary of Quebec; Laval University, deriving its name from the first Bishop of Quebec and well equipped with a library of 125,000 volumes, a museum, a picture gallery, and scientific apparatus—the largest educational Roman Catholic institution in Canada; and the Ursuline Church and Convent, where Montcalm is buried. Quebec has also the Hôtel Dieu Convent and Hospital; the Marine Hospital, the Jeffrey Hale Hospital, the general hospital, and the asylum for the insane at Beauport. Besides the educational institutions already mentioned, there are the Laval Normal and Model School; the Convent of the Good Shepherd; a high school for Protestants; a public library located in the city hall; a Literary and Historical Society

founded in 1824, which possesses valuable records and historical manuscripts; the Canadian Institute; Geographical Society; Advocates' Library; and Parliamentary Library.

The lower town is the seat of commerce, and much rock has been cut to construct its narrow irregular streets. Near it are the districts of St. Roch and St. Sauveur, containing many manufactories. The principal manufactures are leather, iron castings, boots, shoes, lumber, tobacco, biscuits, clothing, furs, musical instruments, cutlery, machinery, nails, India-rubber goods, rope, and steel. In 1910 the value of the manufactured output was $17,149,385. The chief exports are timber, wheat, and furniture. Quebec early achieved a reputation for shipbuilding, and the *Royal William*, credited the first vessel to cross the Atlantic by means of steam alone, was built here in 1831. The docks and wharves extend 3 miles from the mouth of the St. Charles, where the spacious Louise Basin is inclosed by the Louise Embankment, which forms a fine river-front promenade. In 1913, 539 vessels, with a tonnage of 2,477,842 tons, entered and cleared at Quebec. Of this 2,342,950 tons were British.

Quebec is supplied with water from Lake St. Charles and is lighted by electricity, the power for which is obtained from Montmorency Falls, 6 miles distant. Quebec sends three members to the Dominion House of Commons and three to the Provincial Legislature.

Interesting localities in the neighborhood include the Plains of Abraham, since 1908 a public park, named after a pilot of the St. Lawrence who owned this tract of land, and containing a monument to Wolfe in honor of the victory of 1759; Wolfe's cove, where the British troops landed for their assault on the city; Près de Ville, where General Montgomery fell Dec. 31, 1775; Montmorency Falls, where Montcalm resisted Wolfe, noted for its beautiful scenery and cataract; Beauport and its asylum; Lévis, with its three forts; Lorette (q.v), with its falls, Indian church, and Indian settlement; the Chaudière Falls; Ste. Anne de Beaupré, a place of pilgrimage, whose church contains relics of Ste. Anne, supposed to effect marvelous cures; Château Bigot, an historical ruin near Charlesburg; Cap Rouge; and Isle d'Orléans, where General Wolfe established his camp prior to the siege of Quebec.

An Indian town named Stadacona occupied part of the present site of Quebec in 1535, when Jacques Cartier explored the St. Lawrence. An unsuccessful attempt at settlement was made by Sieur de Roberval in 1542–43. Its real founder was Champlain, who established a small trading post here in 1608 and gave it the name of Quebec. In 1629 Sir David Kirke captured the settlement, but it was restored to the French three years later. When the colony was made a royal government in 1663, Quebec became the capital. The English made two unsuccessful attempts to capture it, one in 1690 by Sir William Phips and the other in 1711 by an expedition under the command of Sir Hovenden Walker, and through the daring of General Wolfe in 1759 it finally fell into British possession, which has never been interrupted. A fruitless effort was made by the Americans to capture the city by assault on Dec. 31, 1775, when General Montgomery was killed. For several years (1851–55 and again 1859–65) Quebec was the capital of the Province of Canada under the Act of Union (1841–67), and the famous Confederation Debate took place in the old Parliament House in 1864. In 1908 a splendid tercentenary celebration of the founding of the city by Champlain was held. It was an event of international interest, the United States, Great Britain, and France sending representatives. Pop., 1881, 62,446; 1891, 63,090; 1911, 78,067, five-sixths being French and Roman Catholic.

QUEBEC ACT. An Act of the English Parliament passed in 1774 providing a government for the Province of Canada, which had been acquired by the Treaty of Paris of 1763. The three features of the Act which have called forth the most extended discussion were (1) the extension of the boundaries of the province so as to include all the territory northwest of the Ohio River and east of the Mississippi, thus confining the Atlantic Colonies within the Alleghanies in spite of their claims to land to the west; (2) the substitution of the French civil law therein for English law; and (3) the withholding of representative English institutions, such as existed in the other English provinces. The Act excited great indignation among English-speaking peoples both at home and especially in the thirteen English Colonies. The reason assigned by the English for the extension of the boundaries was the necessity of annexing the Northwest Territory to some civil government in view of the almost anarchical conditions there prevailing; and having reached that conclusion, the government decided that there were good reasons why it should be annexed to Canada. With regard to the substitution of the French legal system for the English, the government claimed that on account of the predominance of the French element it was found impossible to put English law into practice except in commercial matters, and as the French customary law had for the most part continued undisturbed, the Act of Parliament in question merely legalized the existing status. Finally, the English justified the withholding of representative institutions on the ground of the religious difficulties involved. In view of the Roman Catholic majority it was deemed inexpedient to exclude Catholics from the assembly; on the other hand, it was thought unsafe to admit them, and as a consequence an appointed council took the place of a representative assembly. The Act was regarded by the English colonists as a blow aimed directly at them and was a factor in bringing on the Revolution.

For the American view of the spirit and pur-

pose of the Act, consult George Bancroft, in *History of the United States* (New York, 1883–85); for the English view, G. E. Hart, *The Quebec Act, 1774* (Montreal, 1891); and an article in the *Annual Report of the American Historical Association, 1894* (Washington, 1895).

QUEBEC EXPEDITION. See WOLFE, JAMES.

QUEBRACHO, kā-brä'chō (Sp., break axe) (*Quebrachia lorentzii* or *Schinopsis lorentzii*). A South American tree of the family Anacardiaceæ, most abundant in Argentina, Uruguay, and Paraguay, extending into Brazil. The trees attain a height of 50 to 70 feet and a diameter of 2 to 4 feet. The wood is one of the hardest and heaviest known, having a specific gravity of 1.4. It is very durable and is used for railroad ties, ship and bridge timbers, wharves, etc. The heartwood yields 20 to 24 per cent tannin extract, which is used in the preparation of fine grades of leather. In addition to tannin extract quebracho contains a red, gambier-like coloring matter. Other kinds of quebracho occur in South America, white quebracho (*Aspidosperma quebracho blanco*) and red (*Aspidosperma quebracho colorado*). These species belong to the family Apocynaceæ These trees also yield tannin extract, and the bark of the white quebracho contains aspidospermine, used medicinally in asthma, croup, etc.

QUECHUA, kā'chwä. A tribe of South American Indians. See QUICHUA.

QUEDAH, kā'dä, or **KEDA.** A tributary state of the Malay Peninsula, under British protection, on the west coast, north of Perak (Map: Siam, D 5). It formerly included the island of Penang and the territory of the Province of Wellesley. Area 3800 square miles. The principal sources of revenue are derived from exports of opium, rubber, tapioca, and cocoanuts. Pop., 1911, 245,986.

QUEDLINBURG, kvād'lin-burk. A city in the Province of Saxony, Prussia, on the Bode, 34 miles southwest of Magdeburg (Map: Germany, D 3). It preserves in part its ancient walls, timbered houses, and towers, and on a rocky height is an old castle, the seat of the famous abbey of Quedlinburg, founded early in the tenth century by Henry the Fowler, King of Germany, the first four abbesses of which were daughters of German emperors. The abbey of Quedlinburg, with its district, constituted a state of the German Empire down to 1803. It became Protestant in 1539. The abbey church, restored in 1862, with its mediæval relics, is of great interest, and there are other noteworthy ecclesiastical remains, an ancient town hall, and fine sculptural monuments, including statues of Klopstock and Karl Ritter, who were born here. Quedlinburg is the centre of the second largest seed-producing district in Germany, and manufactures machinery, aniline dyes, starch, cloth, and wire goods. There is a large annual cattle market. Quedlinburg was a member of the Hanseatic League until 1477. Pop., 1900, 23,378; 1910, 27,200.

QUEEN ANNE'S BOUNTY. The fund formed by the liberality of Queen Anne to augment the poorer livings of the Church of England. The basis of the fund was the annates, or the first year's whole profits of a spiritual preferment and the tithes of later years. This tax, which at one time went to the Pope, was annexed to the crown in 1535 during the reign of Henry VIII and received by his successors down to Queen Anne, who in 1704 formed it into a trust fund for the benefit of the poorer clergy of the Kingdom. During the year 1913 the administrators of the bounty augmented 170 livings and made benefactions to the extent of £23,732 and grants to the extent of £25,069. The capital fund amounted in 1913 to upward of £7,600,000.

QUEEN ANNE'S WAR. The name commonly given to that part of the struggle known as the War of the Spanish Succession which was fought in America. In America the war began in the fall of 1702 by an unsuccessful expedition from South Carolina against the Spaniards in St. Augustine. In the north the brunt of the war fell upon New England, for, in consideration of the fact that the Iroquois promised to remain neutral, the French decided it would be wisest not to attack New York. At first the New England Indians also promised Governor Dudley that they would remain neutral, but in a few weeks they broke their promise and, in conjunction with the French, ravaged the whole New England frontier. On Feb. 29, 1704, a party of French and Indians under Hertel de Rouville captured the town of Deerfield, Mass., burned it, killed 49 of the inhabitants, and took 100 or more prisoners. In August, 1708, the town of Haverhill, on the Merrimac, suffered a like fate. The British colonists in 1704 and again in 1707 attempted, but without success, to capture Port Royal in Acadia. In 1709 an expedition against Canada was planned, but the nonarrival of an expected English fleet caused the plan to miscarry. In September of the following year 6 English vessels, with 30 from New England and 4 New England regiments, sailed from Boston, and after a short siege Port Royal was compelled to capitulate. In honor of the Queen the place was renamed Annapolis. Encouraged by this victory, the English again planned the conquest of Canada. One expedition was to march from Albany and attack Montreal; another and the more important, the nucleus of which consisted of 15 English ships of war, 40 transports, and 7 battalions of Marlborough's veterans, was to operate against Quebec. The fleet, reinforced by many Colonial vessels, sailed from Boston on July 30, 1711, but on the night of August 22d 8 vessels and about 1000 men were lost upon the rocks of the Egg Islands in the St. Lawrence. Discouraged by this event, the incompetent commander, Sir Hovenden Walker, gave up the attempt, and the whole campaign ended in a miserable failure. The remainder of the struggle was marked merely by border raids, and no important operations were undertaken by either side. In 1713 the War of the Spanish Succession was brought to a close by the Peace of Utrecht, but hostilities with the Indians continued for some time. So far as the terms of the treaty concerned North America, the French gave up the territory around Hudson Bay, and surrendered all claim to sovereignty over Newfoundland, but retained the privilege of drying fish on the west coast. Acadia was also ceded to England, but the French were allowed to keep Cape Breton.

Bibliography. *The Redeemed Captive* (Boston, 1707), by Rev. John Williams, one of the prisoners taken at Deerfield; Samuel Penhallow, *Wars of New England with the Eastern Indians* (ib., 1726); George Sheldon, *A History of Deer-*

field (Deerfield, 1895); S. A. Drake, *The Border Wars of New England* (New York, 1897); Francis Parkman, "A Half-Century of Conflict," in *France and England in North America*, part vi (2 vols., Boston, 1903); E. B. Greene, *Provincial America* (New York, 1905).

QUEEN CHARLOTTE (shär'lŏt) **ISLANDS.** A group of islands off the coast of British Columbia, 130 miles northwest of Vancouver Island (Map: Canada, D 6). Area, 5100 square miles. They are mountainous, rising to a height of 5000 feet, except Graham Island, the largest and northernmost, which is chiefly a rolling plain. All of them are densely forested and the climate is very humid. Gold-bearing quartz and copper and iron ores exist and a fine grade of anthracite is mined. They are inhabited by the remnants of the Haida (q.v.) tribe (less than 700) and a few white settlers, chiefly engaged in halibut fishing in Hecate Strait.

QUEEN CHARLOTTE SOUND. The northern part of the channel separating Vancouver Island (q.v.) from the mainland.

QUEEN CITY, or QUEEN OF THE WEST. A popular name of Cincinnati, Ohio. Buffalo, N. Y., is called the Queen City of the Lakes; and Sydney, Australia, Queen City of the South.

QUEEN CONCH. A local name in the West Indies for one of the large helmet shells (*Cassis cameo*) extensively used for cameo cutting (see CAMEO), the under layer giving a deep claret-colored background to the white design carved in the superficial layers.

QUEEN ESTHER. See MONTOUR.

QUEENFISH, or WHITE CROAKER. A small sciænoid fish (*Seriphus politus*) of the southern part of California, which is common on sandy shores, is about a foot in length and is an excellent pan fish. It is bluish above and bright silvery below, with the fins bright yellow.

QUEEN OF SHEBA, THE. See KÖNIGIN VON SABA.

QUEEN OF THE ADRIATIC. A name given to Venice on account of its situation and its early importance in the commerce of the East.

QUEEN OF THE ANTILLES. Cuba, so called because of its natural beauties and advantages.

QUEEN'S BENCH. See KING'S BENCH.

QUEENSBERRY, JOHN SHOLTO DOUGLAS, eighth MARQUIS OF (1844–1900). An English patron of sport. He succeeded his father in 1858, served in the army from 1859 to 1864, and was a representative peer for Scotland from 1872 to 1880. He became best known as a patron of sparring. He was one of the founders of the Amateur Athletic Club in 1860, and in 1867 took part in drawing up the rules bearing the name of Queensberry rules. See BOXING.

QUEENSBERRY, WILLIAM DOUGLAS, fourth DUKE OF (1724–1810). A British rake and sportsman, known as Old Q. He was notorious for his shameless excesses. As Earl of March he was Vice Admiral of Scotland from 1767 to 1776, and inherited the title of Duke, with a large fortune, in 1778. He is remembered chiefly through the poems written in his dishonor by Burns and Wordsworth. In Thackeray's *Virginians* he appears as the Earl of March.

QUEENSBERRY PLOT. A supposed Jacobite plot in Scotland in 1703, revealed, it was claimed, through the relations of the Duke of Queensberry with the notorious Lord Lovat (q.v.).

QUEENS' COLLEGE. A college at Cambridge, England. It was founded in 1448 by Queen Margaret of Anjou, consort of Henry VI, replacing a foundation called the College of St. Bernard, established two years earlier by her husband. The new foundation was known as Queens' College of St. Margaret and St. Bernard, but was refounded by Elizabeth Woodville, consort of Edward IV, under its present name. The site was given by Richard Andrew of Cambridge and the endowment gathered chiefly by the first master, Andrew Doket. Recently the college has had an enrollment of about 200 undergraduates. The buildings, which preserve their early character, are among the most interesting in the university. The library contains about 30,000 volumes. Queens' was the residence of Erasmus during his stay in Cambridge. Consult J. H. Gray, *Queens' College* (London, 1899).

QUEEN'S COLLEGE. A college at Oxford, England. It was founded in 1340–41 by Robert de Eglesfield, chaplain to Philippa, Queen of Edward III, for a provost and 12 scholars, in imitation of Christ and the Apostles. Poverty was enjoined; the college was very ecclesiastical in its tone, the fellows being required to be in holy orders, and, as a charity, 12 poor boys were supported out of its revenues. The positions in the college were virtually confined to the North Country, of which the founder was a native. Under the statutes of 1882 the college has a provost, from 14 to 16 fellows, about 25 scholars, and 2 Bible clerks. There are actually, however, 35 scholars and 20 exhibitioners, besides a number of honorary fellows and lecturers and college officials. The buildings date from the late seventeenth century, the hall by Sir Christopher Wren and the library, with about 60,000 volumes, being especially noteworthy. Among the distinguished members of the college have been John Wiclif (probably), Edward the Black Prince, Henry V, Addison, Wycherley, Jeremy Bentham, Mitford, and Jeffrey.

QUEEN'S COLLEGE, now **BELFAST UNIVERSITY.** An institution of higher education, situated at Belfast, Ireland. It was founded in 1845 and constituted part of Queen's University, Ireland, until the passage of the University Education Act in 1879; later it became a part of the Royal University of Ireland. In 1909 the college obtained an independent charter as Belfast University. See NATIONAL UNIVERSITY OF IRELAND: UNIVERSITIES.

QUEEN'S COLLEGE, CORK, founded 1845. See NATIONAL UNIVERSITY OF IRELAND.

QUEEN'S COLLEGE, GALWAY, founded 1845. See NATIONAL UNIVERSITY OF IRELAND.

QUEEN'S COUNSEL. See KING'S COUNSEL.

QUEEN'S COUNTY. A southeast inland county of Leinster, Ireland (Map: Ireland, D 6). Area, 664 square miles. The Barrow is the chief river. On the northwest border lie the Slieve Bloom Mountains, and the Dysart Hills occupy the southeast, the rest of the surface being flat or gently undulating. Dairy farming is the principal industry. Coarse linen and cotton cloths are manufactured in small quantities, and coal is mined. The capital is Maryborough. Pop., 1901, 57,225; 1911, 54,629.

QUEEN'S EVIDENCE. See KING'S EVIDENCE; STATE'S EVIDENCE.

QUEEN'S HOUSEHOLD, LADIES OF THE. See LADIES OF THE QUEEN'S HOUSEHOLD.

QUEENSLAND. An original state of Australia, occupying the northeastern part of the continent. Its extreme length from north to south is 1200 miles, its extreme breadth 940 miles, and its area is estimated at 670,500 square miles, or nearly one-fifth of the area of the United States.

Queensland has a coast line of 3000 miles. The eastern coast is lined, at a distance away of 20 to 150 miles, by an immense coral reef called the Great Barrier Reef, which is about 1000 miles long and incloses a broad sheet of quiet water filled with numerous islands. It is indented and rich in harbor sites, including Port Curtis, one of the best harbors on the Pacific, and Moreton Bay, the outer harbor of Brisbane. The Great Dividing Range, which runs along the entire east coast of the continent, here recedes farther from the sea than in the two southern states. But it sends out a number of spurs and divides into parallel coast ranges, so that the whole eastern part of the state for 300 miles from the coast is rugged and mountainous, the ranges having an average elevation of 2000 to 3000 feet, with a maximum height of 5438 feet. The western half is an undulating plain traversed in its north-central part by a western spur of the Great Divide. There are four principal drainage systems: first, the rivers flowing eastward to the Pacific Ocean, which, though short, are navigable tidal streams for considerable distances; second, those flowing through the plain southward to the Darling; third, those flowing north to the Gulf of Carpentaria; and fourth, those flowing westward or southwestward and losing themselves in the great central plains of the continent. Queensland is better watered than any of the other states.

Queensland enjoys a comparatively equable climate. The mean annual temperature in the southeast part is 69° F., and even in the arid western plains the temperature seldom rises above 95° F. The rainfall is very unevenly distributed. On the east coast it ranges from 50 inches at Brisbane to 100 and even 150 inches farther north. It decreases very rapidly towards the interior, being generally less than 20 inches west of the mountains and falling to 6 inches in the extreme west. The rainfall throughout the state is very uncertain.

The great western plains have a rich black soil, but are generally treeless, though covered with grass and shrubs. The valleys along the coast are filled with thick deposits of alluvial soil of great fertility, and here we find a luxuriant tropical forest growth. Though the predominating species are Australian types, such as *Eucalyptus* and *Acacia*, the flora of Queensland differs from that of the other states in having a large admixture of Indian, Malayan, and Polynesian types, notably among the cycads and palms. Here grow the screw pines (*Pandanus*) and the Araucarias, while the coasts and tidal streams are lined with mangrove thickets. The fauna, on the other hand, is typically Australian.

The great western plains are Cretaceous, partly consisting of the series known as Desert sandstone. It incloses a large area of metamorphic rocks in the northwest, and disappears under the Tertiary strata fringing the shores of the Gulf of Carpentaria. The eastern mountain belt consists very largely of granites and igneous rocks, with extensive volcanic areas of more or less recent origin. The granite ranges are flanked by large areas of Paleozoic rocks, chiefly Devonian and Carboniferous. There are extensive coal beds in the state, both in the Carboniferous and in the Cretaceous strata of the west. Auriferous quartz veins are also scattered through the mountain region, and lodes of silver, copper, mercury, bismuth, antimony, tin, and cobalt are also found.

The principal metals obtained are gold, tin, silver, copper, and wolfram and bismuth. The total mineral output of the state in 1912 was valued at £4,175,355, and to the end of that year at £103,901,473. Of the latter figure gold amounted to £75,217,830 (from 1860 to 1912 inclusive); copper, £10,948,399; tin, £8,110,704; coal, £5,377,235. The gold output reached its maximum in 1900, being valued at £2,871,578; from a value of £2,839,801 in 1903 the yield of gold steadily declined to £1,128,868 in 1913. Value of other mineral products in 1913: copper, £1,660,178; tin, £343,669; coal, £403,767; silver-lead (including pure silver), £432,876; wolfram, £35,359; lead, £65,683. By quantity the principal mineral outputs were as follows in 1907 and 1912 respectively: gold, 465,882 and 347,946 fine ounces; copper, 12,756 and 23,120 tons; dressed tin ore (about 70 per cent tin), 5140 and 3230 tons; coal, 683,272 and 902,166 tons. Queensland shows promise of becoming a very important producer of coal. The coal-bearing strata are extensive and widely distributed; the Ipswich beds are estimated to occupy about 12,000 square miles and the Burrum fields a considerably larger area.

General agricultural interests are becoming increasingly important, though the vast region west of the mountains is too arid to admit of successful farming. Along the coast, however, the rainfall and the soil favor the growth of a very great variety of products both temperate and tropical. The area under crop (exclusive of permanent artificially sown grasses) increased from 3353 acres in 1860–61 to 224,993 acres in 1890–91, 457,397 acres in 1900–01, 667,113 acres in 1910–11, and 668,483 acres in 1912–13. The area under sown grasses, not included above, was 205,363 acres in 1912–13, as compared with 76,943 in 1907–08. Exclusive of green forage the crop having the largest acreage in 1912–13 was wheat, with 124,963 acres; the yield was 1,975,505 bushels. Maize was planted to 117,993 acres, yielding 2,524,371 bushels; hay, 87,643 acres, 119,867 tons; potatoes, 11,675 acres, 16,386 tons. The most important crop commercially is sugar cane. The area under sugar cane in 1912–13 was 141,652 acres. Of this amount the area of productive cane was 78,142 acres and unproductive cane 63,510 acres. The yield of cane in 1912–13 was 1,135,126 tons. The production of raw sugar amounted to 112,541 tons in 1912–13 and about 243,000 tons in 1913–14. The rich lands near the mouths of the numerous streams are well adapted to sugar culture. Formerly the plantation system prevailed, the labor being done chiefly by Kanaka immigrants. Kanaka labor was discouraged by the government and it was finally prohibited in connection with the sugar industry by law which became operative in July, 1913. From 1902–03 to 1912–13 the amount of sugar produced by colored labor declined from 68 per cent to 5 per

cent of the total. A great variety of fruits are successfully grown. Bananas, pineapples, and oranges are extensively produced along the coast.

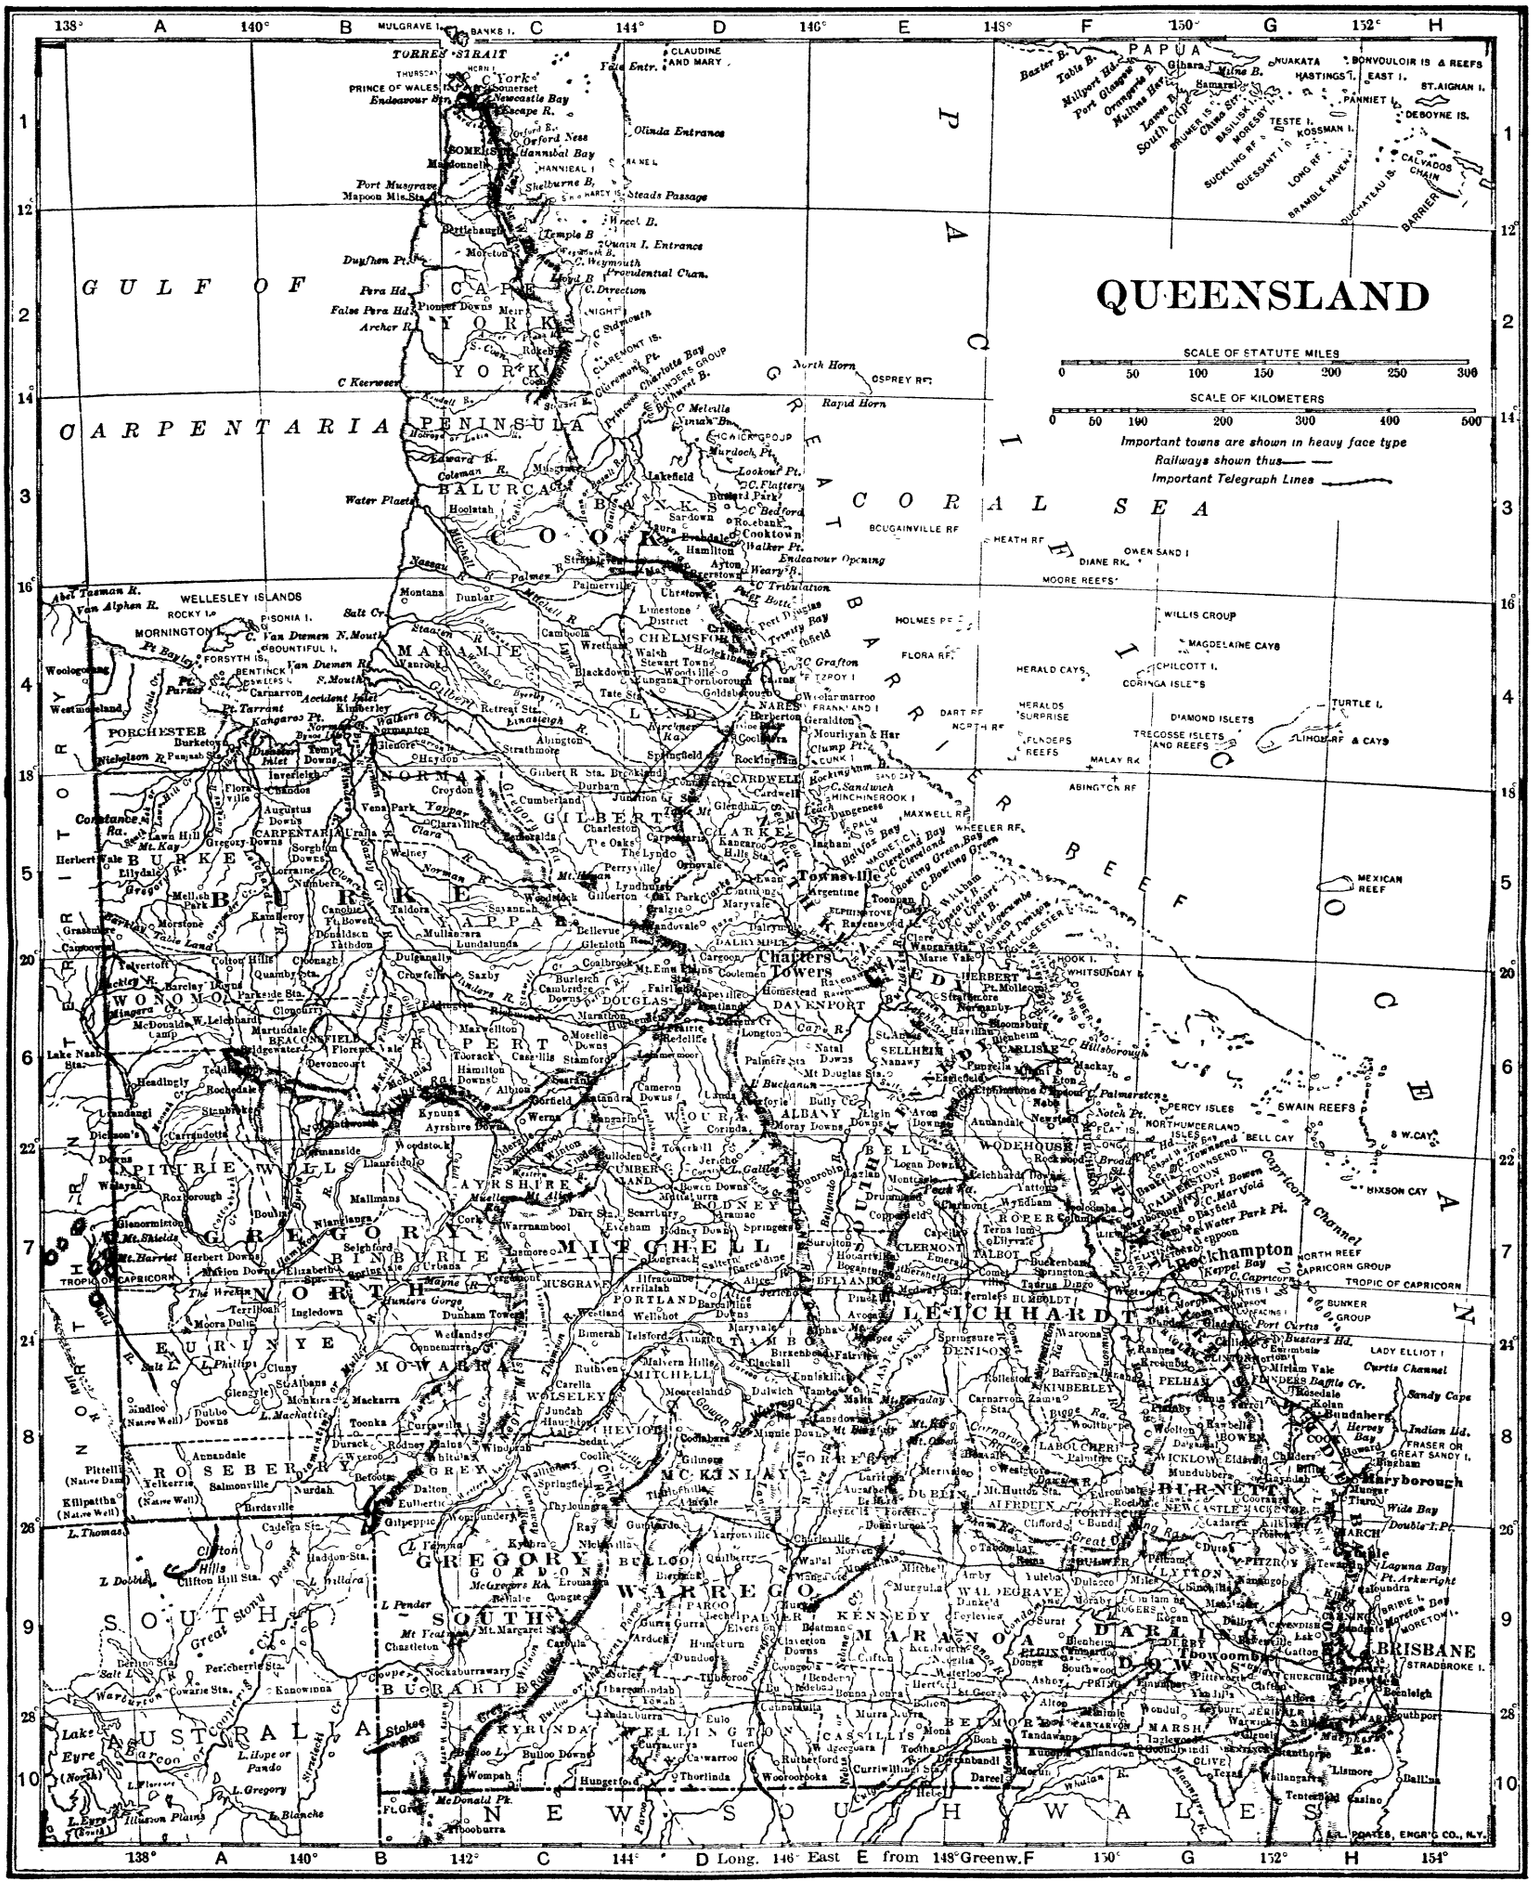
Queensland is still largely a pastoral country. Much of the region west of the mountains is adaptable to pastoral industries, though too dry for farming, and the sheep are mainly found in that part. The number of sheep increased from 6,935,967 in 1880 to 21,708,310 in 1892, but decreased to 10,339,185 in 1900. This decrease was attributed to drought. In many places the drought has been effectually guarded against by the boring of artesian wells, and occasionally by damming streams and other means. In 1911 sheep numbered 20,740,981 and in 1913 21,786,600. The latter number is 24.39 per cent of the total for the commonwealth. The estimated quantity of wool as in the grease shipped in 1911–12 was 142,382,269 pounds, and in 1912–13 136,878,270 pounds. The number of cattle increased from 3,162,752 in 1880 to 7,012,997 in 1894, after which time it decreased to 4,078,191 in 1900 and to 2,963,695 in 1905. From 1905 the number of cattle steadily increased to 5,073,201 in 1911 and 5,322,033 in 1913 (nearly half of the total for the commonwealth). The introduction of improved methods of caring for meat—freezing, preserving, etc.—makes possible larger shipments of meat products and increases the profit accruing in stock raising. Dairy farming is beginning to receive much attention and many cooperative creameries have been established in the southern part of the country. In 1900 there were 456,788 horses and 122,187 hogs in the state and, in 1913, 707,265 horses and 140,045 swine.

Queensland has a variety of industries, such as the manufacture of flour, sugar, butter and cheese, brewing and distilling, meat packing, tanning, and the sawing of lumber. In 1912 there were 1790 factories, employing 40,948 hands. The product was valued at £18,798,904.

The most valuable items of export are gold, wool, frozen meat, sugar, hides and skins, preserved and salted meats, and tallow. The largest imports are textiles and clothing, metal and metal goods.

In 1913 there were 4936 miles of railway in operation, of which 4524 miles were owned by the state and had been built and equipped at a cost of £29,758,652. The telephone and telegraph lines are controlled by the government.

The Governor is appointed by the British government. He has an executive council of 9 members. There is a parliament of two Houses —the Legislative Council and the Legislative Assembly. The members of the former are nominated by the crown for life, and in 1915 numbered 45. The 72 members of the Legislative Assembly are elected for three years. There is male and (since 1905) female suffrage, subject to 12 months' continuous residence but to no property qualification. Queensland sends 10 members to the commonwealth House of Representatives.



The ownership of public utilities on the part of the state has incurred heavy debt and a large annual revenue and expenditure. On June 30, 1914, the public debt stood at £55,023,506. In the fiscal year 1913 the revenue and expenditure amounted to £6,378,213 and £6,372,097 respectively. Of the revenue 12.65 per cent was derived from taxation, 54.11 from public works and services, 14.27 from land, and 12.16 from the commonwealth subsidy. Of the expenditure 28.91 per cent was for the public debt, 33.73 for the working expenses of railways and tramways, 7.65 for education, 5.44 for medical and charitable purposes, and 4.36 for police.

The population, exclusive of aboriginals, increased from 2257 in 1846 to 61,467 in 1864 and 213,525 in 1881. In 1891 the population was 393,718, the increase during the decade being 84.31 per cent; in 1901, 498,129, increase 26 52 per cent; in 1911, 605,813 (329,506 males, 276,307 females), increase 21.62 per cent. Of the total 74.09 per cent were born in Australia and 19.90 per cent in the United Kingdom. The total included 2508 half-caste aboriginals, 9123 full-blood and 940 half-caste Asiatics, and 2123 full-blood and 142 half-caste Polynesians. In addition to the total there were enumerated, in 1911, 8687 aboriginals living in a civilized or semicivilized condition. The total number of aboriginals is quite unknown, but has been estimated at 18,000 to 20,000. The population is confined chiefly to the coast region and is larger in the south. Estimated population, exclusive of aboriginals, June 30, 1914, 678,864. The capital is Brisbane.

In 1911 there were 212,702 adherents of the Church of England, 137,086 of the Church of Rome, 75,560 Presbyterians, 59,920 Methodists, 24,235 Lutherans. There is no state church. Education is compulsory between the ages of 6 and 12 years, but in some parts the law is not enforced. Primary education is free and nonsectarian. The amount of illiteracy is small. The expenditure of the state for education in 1913 was £487,500.

With the early history of Queensland are associated the Spaniard Torres, whose name is perpetuated in the strait separating that land from New Guinea, and the famous explorer Cook, who, in 1770, followed the coast from Moreton Bay to Torres Strait and made a chart of it. The explorations of Lieutenant Flinders, in 1799, opened the way for the settlement of the Moreton Bay district, but his work seems to have been neglected until Queensland was practically rediscovered by Oxley in 1823. In 1826 a penal settlement was established on Moreton Bay and the Brisbane River, but the convicts were soon removed and subsequent attempts to introduce a criminal population into the country failed before the strong opposition of the free inhabitants. The country was admirably adapted for grazing and drew a large immigration from the southern settlements, the population in May, 1859, when Queensland was set off as a separate colony, being about 25,000, mostly squatters. Brisbane and Ipswich were the only towns of importance. A severe financial panic in 1866 was followed by the discovery of gold in the years 1866–79, the mining interests henceforth playing a prominent part in the shaping of public policy. The importation of coolies for work on the sugar plantations led to many conflicts in Parliament. The Labor party exercised an important influence on affairs after 1890, though its power was not so fully developed as in the more southern colonies. In the winter of 1899 Queensland ratified the constitution for the new Australian commonwealth. See AUSTRALIA; AUSTRALIAN FEDERATION.

QUEEN'S (or KING'S) **TOBACCO PIPE.** The popular nickname of a peculiarly shaped kiln or furnace in the northeast corner of the tobacco warehouses belonging to the London docks, in which contraband goods, such as tobacco, cigars, tea, which had been smuggled, and books were burned. Damaged and worthless goods are still burned, but seized and unclaimed goods are now sold generally at the periodical "customs sales" or distributed among public institutions.

QUEENSTOWN, formerly COVE OF CORK. A seaport town on the south side of Great Island in Cork Harbor, Ireland, 18 miles east-southeast of Cork (Map: Ireland, C 8). It is important as the port of call of the American mail steamers. The town is built amphitheatrically in parallel streets on the sides of a steep acclivity. A fine Roman Catholic cathedral, 100 feet high, surmounted by a tower 230 feet high, is a conspicuous building. The famous yacht club, the Royal Cork, is the oldest in the world. The Cove of Cork became important during the Napoleonic wars as the port of embarkation for troops going on foreign service and is now an admiral's station. In honor of Queen Victoria's visit in 1849 the name was changed to Queenstown. Pop., 1901, 7909; 1911, 7864.

QUEENSTOWN. A town and railway station, capital of the district of the same name, in Cape Colony, about 100 miles northwest of East London (Map: Cape of Good Hope, H 8). It is the centre of a productive wheat and sheep farming region situated in the valley of the Great Kei River. Pop., 1911, 9107, of whom 3964 were whites.

QUEIROZ, JOSÉ MARÍA EÇA DE. See EÇA DE QUEIROZ.

QUELIMANE, kā'lē-mē'nā. A town of Portuguese East Africa. See QUILIMANE.

QUELLI'NUS, ARTUS (1609–68). A Flemish sculptor, born in Antwerp. He was the pupil of his father, the sculptor Erasmus Quellinus, and of Duquesnoy in Rome. His principal work was the decoration of the Town Hall in Amsterdam (now the Royal Palace), begun in 1648, for which he modeled two fine pediments celebrating the maritime power and colonial riches of Holland as well as numerous caryatides and bas-reliefs inside the building. There are works by him in the Museum and the churches of Antwerp, and he modeled the fine group of "Hercules and Fame," over the entrance of the Plantin Museum. Though baroque, and consequently somewhat exaggerated in style, his art is naturalistic, animated, and picturesque. His nephew and pupil, ARTUS (1625–1700), was also a sculptor and assisted his uncle in several of his undertakings. His best work is in St. James's Church, Antwerp. He excelled in modeling charming figures of cherubs and children.

QUELPART, kwĕl'pärt. The name by which the Korean island of Tamra is known to foreigners. It lies about 60 miles south of the mainland in lat. 33° 25′ N. and long. 126° 37′ E. (Map: Asia, O 5). It is nearly oval in form, measures 40 by 20 miles, and is covered almost entirely with mountains, which end steeply on the coast and culminate in Han-ra-san, or Mount Auckland, with a height of 6700 feet and visible far out at sea on account of its whiteness. On its summit are three extinct craters, within each of which is a lake of pure water, whence, according to local legend, issued the first three men of the world. Area, about 714 square miles. Pop., about 130,000. The chief industries are agriculture, fishing, straw plaiting, and the manufacture of the very fine split-bamboo hats which are peculiar to Korea. Quelpart is also noted for its fine breed of cattle. The island was first surveyed and mapped by the officers of the British ship *Samarang* in 1843. Consult: Sir E. Belcher, *Narrative of H. M. S. Samarang* (London, 1848); Hamel, "Narrative of Captivity in Korea," in W. E. Griffis, *Corea Without and Within* (New York, 1885).

QUENIULT, kwē'nī-ūlt' (properly *Kwinaiutl*). A small tribe of Salishan stock, formerly claiming the territory upon the river of the same name on the Pacific coast of Washington, where they still hold a reservation. They have greatly declined and number only 288. The Quaitso are a subtribe. See SALISHAN STOCK.

QUENSTEDT, kvĕn'stĕt, FRIEDRICH AUGUST (1809–89). A German mineralogist and geologist. He was born at Eisleben, studied at Berlin, and in 1837 became professor of geology and mineralogy at Tübingen. In geology Quenstedt made a special study of the sedimentary formations in Swabia, the basis of modern knowledge of the Jurassic system. His great contribution in mineralogy was in applying the analytic method to the study of crystalline systems. He published: *Methode der Kristallographie* (1840); *Handbuch der Petrefaktenkunde* (1851; 3d ed., 1882–85); *Handbuch der Mineralogie* (1854; 3d ed., 1877); *Grundriss der bestimmenden und rechnenden Kristallographie* (1873); *Die Ammoniten des schwabischen Jura* (3 vols., 1885–88; incomplete).

QUENTAL, kān-tāl', ANTHERO DE (1842–91). A Portuguese poet, born at Ponta Delgada on the island of San Miguel. He studied law at the University of Coimbra and early began to write verse. As a poet he belongs to the Romanticists, stands second only to João de Deus-Ramos, and Almeida-Garrett (qq.v.), and is perhaps the most individual of the Young Portuguese school. He also wrote critical and philosophical articles, like his poetry, deeply pessimistic in tone. His works include a collection of sonnets (1863); *Beatriz* (1864);

Odes modernas (1865), reprinted with additions (1875); *Primaveras romanticas* (1872); *Sonetos* (1881); *Os sonetos completos* (1886); and the critical and philosophical *Bom senso e bom gosto* (1865); *A dignidade das letras* (1865); *Considerações sobre a philosophia da historia literaria portugueza* (1872); *A poesia na actualidade* (1881). Consult: Björkman, *Anthero de Quental* (Upsala, 1894); Edgar Prestage, *Anthero de Quental, Sixty-four Sonnets* (London, 1894); *Anthero de Quental: In Memoriam* (Oporto, 1896), with studies of Quental by the leading Portuguese poets.

QUENTIN DE LA TOUR, MAURICE. See LA TOUR, M. Q. DE.

QUENTIN DURWARD, kwĕn'tĭn dûr'wērd. A novel by Sir Walter Scott (1823). The scene is France in the time of Louis XI.

QUÉRARD, kā'rär', JOSEPH MARIE (1791–1865). A French bibliographer, born in Rennes. He worked in a bookseller's shop in his native town as a youth and went to Paris in 1822. The next two years he spent in the printing and bookselling business in Vienna and then returned to Paris to begin the publication of *La France littéraire ou Dictionnaire bibliographique, etc.* (1827–42; 2 vols. of supp. 1854–64). This work is an invaluable bibliography of eighteenth-century French authors. A continuation, *La littérature française contemporaine* (1842–57), was taken from his hands by the publishers and given to others, and Quérard died in poverty. He was the author of other less important bibliographical works.

QUER'CETA'NUS. See DUCHESNE, ANDRÉ.

QUERCIA, qwĕr'chà, JACOPO DELLA (c.1369-77–1438). The principal Sienese sculptor of the Early Renaissance. He was born at La Quercia, near Siena, and was probably the pupil of his father, a goldsmith. His earliest surviving works are a series of sculptures at Lucca, the principal of which is the tomb of the wife of Paolo Guinigi, tyrant of Lucca, in the cathedral. Never has the motive of death as sleep been more beautifully portrayed than here. One of his most important works is the Fonte Gaia, probably the most beautiful fountain in Italy, erected in 1409–19 in the public square of Siena, at a cost of 2280 gold florins. The fine series of statues and reliefs which adorned it were replaced in 1858 by good modern copies and are now in the museum of Siena. A bronze relief for the font of the baptistery of Siena, "Zacharias in the Temple," was not executed until 1430. His most important achievement was the decorations of the portal of San Petronio, Bologna, commissioned in 1425 and left incomplete at his death. The series includes five reliefs from Genesis and five from the "Youth of Christ," nine small figures of prophets, and a large Madonna with St. Petronius above the portal. The reliefs from Genesis are his most powerful creation and had a determinative influence on the art of Michelangelo.

Jacopo della Quercia is the most prominent representative of the transition from mediæval to Renaissance sculpture in Italy. He was the true successor of Giovanni Pisano, and the precursor of Michelangelo. His figures are massive and imposing; the action is powerful and dramatic, the composition is excellent, but the execution of detail is often defective. Consult Carl Cornelius, *Jacopo della Quercia* (Halle, 1896), and G. Waters, in *Italian Sculptors* (London, 1911).

QUERCITANNIC (kwĕr'sĭ-tăn'ĭk) **ACID.** See TANNIN.

QUERCITRON, kwĕr'sĭt-ron (from Lat. *quercus*, oak + *citrus*, citron). The name both of a dyestuff and of the species of oak of which it is the bark. This oak (*Quercus tinctoria*), also called dyer's oak, is a native of North America—one of the noblest forest trees of the United States, found in New England and as far south as Georgia, although there only at a considerable elevation. The wood is reddish, coarse-grained, and porous, but much esteemed for strength and durability, and is used in America for shipbuilding. The bark is used for tanning as well as for dyeing. It is the inner bark which is the quercitron of dyers. Its dyeing properties are due to two principles, quercitrin, $C_{36}H_{38}O_{20}$, and quercetin, $C_{24}H_{16}O_{11}$. The quercitrin may be extracted by means of alcohol; the extract is precipitated with lead acetate, the excess of lead is eliminated with sulphureted hydrogen, and the filtrate is allowed to evaporate, yielding crystals. On the addition of alum its solution assumes a beautiful yellow color. When boiled with dilute acids, quercitron breaks up into glucose and quercetin, a yellow crystalline substance, soluble in alkaline solutions, to which it communicates a golden-yellow color. It is brought into commerce under the name of *flavin*. The decomposition shows that quercitrin belongs to the glucosides, or compounds which, when broken up, yield sugar. Quercitron is principally used in calico printing.

QUER'CUS. The generic name for oak (q.v.).

QUERES. See KERESAN STOCK.

QUERÉTARO, kā-rā'tà-rō. An inland state of Mexico (Map: Mexico, J 7). Area, 3556 square miles. Querétaro belongs geographically to the plateau of Anahuac (q.v.), is traversed by mountain ranges in the north part, while in the south, plains and valleys prevail. It is watered by a number of small rivers, and the climate is temperate, with moderate frost and rainfall. The valleys are very fertile, and the chief agricultural products are cereals, sugar cane, cotton, and fruits. Some stock raising is carried on. The mineral wealth is considerable, and mining of silver, gold, copper, antimony, and cinnabar is carried on to some extent. The most famous opal mines in Mexico are located here. There are also some manufactures of cotton and woolen goods. Pop., 1895, 224,848; 1900, 232,389; 1910, 244,663. Capital, Querétaro.

QUERÉTARO. The capital of the State of Querétaro, Mexico, situated on an elevated plateau 110 miles northwest of the city of Mexico, on the National Railways of Mexico (Map: Mexico, J 7). It is a pleasant and well-built city and has several fine avenues leading to the beautiful parks which surround it. There are two large squares, on one of which stands the city hall and on the other the cathedral, one of the finest of the Republic. Other notable buildings are the government palace, built of basalt, the customhouse, several fine churches and hospitals, the elegant and historic Itúrbide Theatre, and the bull ring. There is a good water supply brought by an old Spanish aqueduct of 74 arches and 80 feet high. The city is an important industrial centre and contains some of the largest cotton mills in the country. Pop., 1910, 33,062.

Querétaro is one of the most historic cities of the Republic. It was here that the movement

for independence began. It was the last place of refuge of Maximilian, and he and two of his generals were executed here in 1867.

QUESADA, kā-sä'dȧ, GONZALO DE (1868–1915). A Cuban diplomat and author, born in Havana. He was educated in the College of the City of New York and in New York and Columbia universities. In 1889 he attended the first Pan American Conference as secretary to Roque Saenz Peña (q.v.). He came under the influence of José Martí (q.v.) and aided the cause of Cuban independence by serving as secretary of the Cuban revolutionary party and the Cuban delegation in the United States. In 1898 he was chargé d'affaires of the Republic of Cuba in Washington. Quesada served as a delegate to the Cuba Constitutional Convention (1900) and as a member of the committee which drafted the constitution. Two years later he was elected to Congress, and later he was sent as Minister to the United States. In this last post he served till 1912, when he became Minister to Germany. He also acted as delegate of Cuba to the third and fourth Pan American conferences. His writings include: *Patriotismo* (1893); *Ygnacio Mora* (1894); *History of Free Cuba* (1898); *Cuba* (1905); *La patria alemana* (1913). He also edited the *Obras literarias* of José Martí (1900–11).

QUESADA, GONZALO XIMENEZ DE. See XIMENEZ DE QUESADA.

QUESNAY, kā'nā', FRANÇOIS (1694–1774). A French economist, born at Méré. He first distinguished himself as a surgeon and physician. His *Observations sur les effets de la saignée* (1730), in which he successfully opposed the theories of bleeding of the leading contemporary authority, led to his selection as secretary of the Academy of Surgery at Paris. Defective eyesight compelled him to abandon surgery for medicine. In 1749 he became physician to Madame de Pompadour, and he was appointed physician to the King in 1752. This position gave him leisure for philosophical and economic study, and in 1756 he published in the *Encyclopédie* articles on "Fermiers" and "Grains," in which he correctly analyzed the deficiencies of French agriculture and advocated the adoption of capitalistic methods in farming and the abolition of the vexatious taxes and restrictions which were impoverishing French agriculture. In these articles Quesnay advanced the doctrine that the sole source of national wealth is the surplus of agriculture, the *produit net.* In 1758 he published his *Tableau économique*, a work which disappeared in the early nineteenth century, but was found in 1890 and reproduced in facsimile at London in 1894. His chief influence upon economic thought was exercised through his disciples, who formed the sect afterward known as the Physiocrats (q.v.). Quesnay's works were collected and published in 1768 by Dupont de Nemours, under the title of *Physiocratie.* Consult: August Oncken, *Œuvres économiques et philosophiques de Quesnay* (Frankfort, 1888); H. Higgs, *The Physiocrats* (London, 1897); August Oncken, *Geschichte der Nationalökonomie* (Leipzig, 1902).

QUESNAY DE BEAUREPAIRE, *de* bō'r'pâr', JULES (1838–). A French jurist and author, born at Saumur. He became especially conspicuous during the Boulanger and Dreyfus affairs and was president of the Court of Cassation before which Dreyfus was tried in 1889 and 1899. (See BOULANGER, GEORGES ERNEST; DREYFUS, ALFRED.) In 1892, before the Court of Appeals, he represented the government in the Panama Canal affair (see LESSEPS, FERDINAND DE), but resigned rather than withdraw the accusation when political influence was brought to bear. From 1893 to 1901 he served as president of the Court of Cassation. He wrote: *Le Panama et la république* (1899); *Français et cosmopolites* (1901); *La conspiration de demain* (1906) He is also known, under the pseudonym Jules de Glouvet, as the author of several novels, among them *Le forestier* (1880); *Le marinier* (1881); *Le berger* (1882); *France* (1895). *Marie Fougère* appeared anonymously in 1886.

QUESNEL, kā'nĕl', JOSEPH (1749–1809). A Canadian poet and dramatist. He was born at St. Malo, France. As a seaman he visited India, Madagascar, Africa, French Guiana, Brazil, and the Mississippi valley. In 1779, while in command of a ship, he was captured by an English frigate and taken to Halifax, whence, after his release, he went to Montreal. Later he settled at Boucherville. He wrote poems, musical pieces, and dramas, most of his work appearing in the *Répertoire national.* His chief publications were: *Colas et Colinette* (1788); *Lucas et Lucille* (1789); *L'Anglomanie; Les républicains français.* Consult Abbé Camille Roy, "French-Canadian Literature," in *Canada and its Provinces* (Toronto, 1913–14). See CANADIAN LITERATURE.

QUESNEL, PASQUIER (1634–1719). A French Jansenist theologian. He was born in Paris, July 14, 1634, studied at the Sorbonne, and entered the Congregation of the Oratory (q.v.) in 1657. At 28 he was director of the Paris house of his congregation. It was for the use of the young men under his charge that he commenced his series (afterwards celebrated) of *Réflexions morales* on the New Testament. Soon afterward he published an edition of the works of St. Leo (1675), much criticized for Gallicanism, and in 1676 placed by the Pope among prohibited works. He was forced to flee to Orléans in 1681 and thence to Brussels, where he attached himself to the party of Arnauld, the Jansenists. In this order he quickly became a leader. He continued his *Réflexions morales*, and in 1693–94 they were published in complete form, with the approval of several ecclesiastical dignitaries, but on examination they were found to contain all the most obnoxious doctrines of Jansenius. Quesnel, after three months in prison, escaped to Amsterdam, where he died, Dec. 21, 1719. His book was condemned by the celebrated bull *Unigenitus*, in 1713. See JANSENISM.

QUETELET, kĕt'lȧ', LAMBERT ADOLPHE JACQUES (1796–1874). A Belgian statistician and astronomer, born at Ghent. He studied at the lyceum of his native city, where in 1814 he became professor of mathematics. In 1819 he was appointed to the same chair at the Brussels Athenæum, and in 1826 was chosen by William I to superintend the construction of the royal observatory in the capital, of which he became director in 1828. In 1836 he was made professor of astronomy and geodesy at the Brussels Military School. His numerous and valuable writings include: *Astronomie élémentaire* (1826; 4th ed., 1848); *Recherches statistiques sur le royaume des Pays-Bas* (1830); *Sur l'homme et le développement de ses*

facultés ou essai de physique sociale (1835); *Du système social et des lois qui le régissent* (1848); *Sur le climat de la Belgique* (2 vols., 1849–57); *Physique populaire de la chaleur* (1852); *Histoire des sciences mathématiques et physiques chez les Belges* (1865); *Météorologie de la Belgique, comparée à celle du globe* (1867); *Anthropométrie* (1872). He also published numerous papers on meteorology, astronomy, terrestrial magnetism, etc., in the *Mémoires* and *Bulletins* of the Belgian Royal Academy.

QUETLAVACA, kwĕt'lȧ-vä'kȧ. See CUITLAHUATZIN.

QUETTA, kwĕt'tȧ. The chief town of British Baluchistan, 104 miles north of Khelat. It is situated among high mountains in a position of great strategic importance, commanding the Khojok and Bolan passes (Map: India, A 2). There are extensive fortifications, with a strong garrison, an arsenal, the Indian Staff College, and a museum. The town is connected by rail with the railway system of India and is the centre of considerable trade. Quetta has grown rapidly since 1876, when a residency was established by Sir Robert Sandeman. Pop. (with cantonment), 1901, 24,584; 1911, 28,374.

QUETZAL, kĕt-säl' (Nahuatl *quetzalli*, green feather). A celebrated trogon (*Pharomacrus mocinno*) of Central America, adopted as the national bird or symbol of Guatemala, because in ancient times it was regarded with veneration and its decorative feathers were reserved for chiefs of the native tribes. It inhabits the higher districts of Guatemala and southern Mexico and has the general habits of the trogons (q.v.). It clings to trees and scrambles about like a woodpecker, as its feet are ill adapted to walking; and its utterance is described as two sibilant, plaintive notes, gradually swelling into a loud, discordant cry. Its upper plumage is brilliant, iridescent green, golden on the crested head and bluish on the soft tail coverts, the two central ones of which are elongated to from 28 to 30 inches, or about four times the length of the true tail, the outer feathers of which are white barred with black. The wing coverts are also enlarged into plumes draped over the upper parts of the wing, and all the under parts below the breast are blood red. (See Plate of TROGON, HOOPOE, ETC.) This magnificent creature has the further value of having its colors fast, i.e., their brilliance does not fade after death, as is usual with such plumage; and this fact, together with the bird's beauty and grace, made it so desirable for millinery trimmings that the quetzal is now very rare. The female is less brilliant and lacks the long plumes covering the tail and wings of her mate.

QUETZALCOATL, kĕts'ȧl-kō-ȧt''l. The Aztec god and culture hero who is the equivalent of the Mayan Kukulcan and the Quiché Gugumatz. The names in all instances mean plumed serpent. Quetzalcoatl was the particular deity of Cholula, one of the most ancient cities, still inhabited at the coming of the Spaniards. He was an older god whose vogue had largely passed away and he seems to have had a southern origin and to have come into Mexico during the so-called Toltec period. Quetzalcoatl was regarded as the special patron of works of art, such as fine textiles and jade ornaments. He was regent of the morning star and of the winds. His face was grotesque with reptilian characters. In the many myths connected with Quetzalcoatl he often appears a dupe to the wiles of Tezcatlipoca. Through this magician god he was forced to leave the fabulous Tula, promising to return again. The day Ce Acatl (one reed) was sacred to him, probably because one of the Venus revolutions began on this day. A late and popular version of the myth of Quetzalcoatl runs as follows:

Quetzalcoatl was an early king of mysterious and miraculous birth, the son of a virgin mother, who reigned at the ancient city of Tollan or Tula, about 40 miles north of the present city of Mexico. He was entirely unlike his people in appearance, being of fair skin, with a long white beard and flowing garments also of white and embroidered with the figure of the cross in red. He was mild and dignified in manner, took no wife, and founded convents of nuns devoted to the worship of the temple and vowed to chastity. He preached universal peace and brotherhood, and under his rule war became a thing unknown. He taught his subjects, known from their chief city as the Toltecs, the arts of agriculture, metal working, and architecture, and devised for them the calendar. At last by the evil wiles of Tezcatlipoca he was deprived of all his dignities at one blow. He made no resistance, telling his people that it was only the necessary accomplishment of a predestined fate and that he must leave them to go to the home of his father, Tlapallan, the Red Land in the southeast, but that he would return to them in some far future year of Ce Acatl. He started on his long journey, halting 20 years at Cholula, where he taught all his mysteries to the people, who thus became the priests of the Aztec religion and their city with its great temple pyramid the Mecca of the Aztec Empire. Arrived at the seashore, he sailed on a raft of twisting serpents out into the sunrise.

This version has been widely accepted as clouded history, disguised by poetic additions and lapse of time, and various writers have tried to identify the kingly teacher with St. Thomas, St. Brendan, or some other early Christian apostle; others have seen in it only another form of the universal myth of day and night, in which Quetzalcoatl is the god of light and sunshine, his rival the god of night and darkness. What is more likely is that Tezcatlipoca and his brother Huitzilopochtli were Aztec gods, and with the growth of Aztec power various explanations were made to explain why the old divinities of other tribes were replaced. The mildness of Quetzalcoatl harks back to the peaceful times before the Aztec idea of excessive human sacrifice to gods of war and conquest was developed

By one of the most extraordinary coincidences in history, the year 1519, in which Cortés landed, was the Mexican year of Ce Acatl. It is said to have been ushered in by omens. Three blazing comets swept across the sky, the waters of the lake rose without apparent cause, and a strange light appeared in the east. Montezuma was troubled with presentiments for his Empire, and sent for the priests, who gave him only the boding prophecy that some great calamity was at hand. When the news came to him that the white strangers had landed from the east he said, "This is Quetzalcoatl returned to Tula," and on his first interview with Cortés the Indian King addressed him as their lost ruler. See also AZTEC; KUKULCAN; MEXICO; NAHUATLAN STOCK; TOLTEC.

QUEUE ROUGE, kē rōōzh (Fr., red tail). A name given in the French West Indies and also in Jamaica to a spider of the genus *Latrodectus,* which is very poisonous and occasionally causes the death of human beings. See KATIPO; MALMIGNATTE.

QUEUX, WILLIAM LE. See LE QUEUX, WILLIAM.

QUEVEDO Y VILLEGAS, kā-vā'dō ē vē-lyā'-gäs, FRANCISCO GÓMEZ DE (1580–1645). A Spanish author. He was born in Madrid, studied at Alcalá de Henares, and became versed in theology, law, Hebrew, Greek, Arabic, and Latin, as well as in modern languages. Although a cripple and defective in eyesight, he figured in many duels, in one of which he mortally wounded a nobleman and had to flee the country in 1611. Soon, however, he was employed in connection with certain diplomatic missions, and when the Duke of Osuna was put at the head of the administration at Naples, Quevedo was made Minister of Finance under him. Osuna fell in 1620 and Quevedo shared in his misfortunes, being imprisoned for a good part of the next three years. Later he held a nominal appointment as secretary to King Philip IV. In 1639, suspected of having written some satiric verses attacking the extravagance of the King and his ministers, he was arrested and spirited off to the monastery of St. Mark in León, where he was kept for four years. At the fall of Olivares, the Prime Minister responsible for this last imprisonment, he was again set free, but his health was now undermined and he died at Villanueva de los Infantes, Sept. 8, 1645. A moralizing tone prevailed in his earlier prose works, but it is as a satirist that he best showed his powers, especially in the picaresque novel *Historia y vida del Buscón* (also called *El gran Tacaño*), published in 1626, and in his series of *Sueños* (Visions). The former work is excessively coarse, yet one of the most important of the Spanish romances of roguery. His prose writings are to be found in the *Biblioteca de autores españoles,* vols. xxiii and xlviii; for his verse, see vol. lxix. Consult Ernest Mérimée, *Essai sur la vie et les œuvres de Quevedo* (Paris, 1886), and Marcelino Menéndez y Pelayo, *Obras completas de Quevedo,* published by the Sociedad de Bibliófilos Andaluces (2 vols., Seville, 1897, 1903).

QUEZALTENANGO, kā-säl'tā-nän'gō. A city of Guatemala, capital of the department of the same name. It is situated on a plateau 7700 feet above sea level and 70 miles west of Guatemala city (Map: Central America, B 3). The town is built on the slopes of a steep ridge which divides it into two portions. It has a good water supply and a cool, healthful climate. It is the second city of the Republic in size and importance. It manufactures cotton and woolen fabrics and has a considerable trade in agricultural products. Pop. (est.), 30,000. Quezaltenango was an ancient Indian city and was settled by the Spaniards in 1524. In 1902 the town was destroyed by an earthquake, but was immediately rebuilt.

QUFT, kuft. See KOPTOS.

QUIANGAN, kē-äng-än'. See IFUGAO.

QUI'A TI'MET (Lat., because he fears). A legal phrase denoting a variety of common-law remedies of an equitable nature to prevent anticipated injury. There were formerly six writs which could be sued out *quia timet* before actual injury had occurred, set forth by Lord Coke as follows: "First a man may have his writ or mesne before he be distrained. Second, a *warrantio chartæ,* before he is impleaded. Third, a *monstraverunt,* before any distress or vexation. Fourth, an *audita querela,* before any execution issued. Fifth, a *curia claudenta,* before any default of inclosure. Sixth, a *ne injuste vexes,* before any distress or molestation." These writs, which were formerly of much importance, are now obsolete; but the same end is attained by filing a bill *quia timet* in equity. Consult the authorities referred to under EQUITY; PLEADING.

QUIBDO, kēb'dō. The capital of the Intendency of Chocó, Colombia, situated on the Atrato River, 30 miles from the Pacific coast and 90 miles southwest of Medellin (Map: Colombia, B 2). The town is built on piles and the houses are generally of poor construction. It is the residence of a United States consular agent. The surrounding district was formerly mined extensively for gold. Pop., 1912, 15,756

QUIBERON, kē'brôN'. A small fishing town and sea-bathing resort in the Department of Morbihan, France, at the extremity of a long narrow peninsula forming the western horn of the Bay of Quiberon, 22 miles south-southeast of Lorient (Map: France, N., B 5). Pop., 1901, 3299; 1911, 3651. Near the neck of the peninsula are the famous megalithic monuments of Carnac. In 1746, during the War of the Austrian Succession, an English force attempted a landing here, but was severely repulsed. In 1759 Admiral Hawke completely defeated a French fleet under Admiral Conflans in Quiberon Bay. A body of French emigrant Royalists, under D'Hervilly and Puisaye, landed here from an English fleet in 1795 and endeavored to rouse the people of Brittany and La Vendée against the Convention, but were defeated and driven back to their ships by General Hoche, all the prisoners taken being shot by order of the Convention.

QUICHÉ, kē-chā', or **KICHÉ.** An ancient civilized nation of Mayan stock (q.v.) occupying western Guatemala, with centres at Santa Cruz, Quiché, and Totonicapan, and speaking a Mayan language close to that of the Cakchiquel (q.v.). Their chronicles are said to date back to the beginning of the eighth century. Their national culture hero was Xbalanque, who was born of a virgin mother and whose deeds are recorded chiefly in their sacred book, the Popol Vuh (q.v.). Their culture was that common to most of the highland tribes of the Mayan stock. Their modern descendants still form a considerable part of the population of central and western Guatemala.

QUICHUA, kē-chōō'ä, **QQUICHUA, QUECHUA,** or **KECHUA.** One of the three important linguistic stocks of Peru, the others being the Aymara and the Yunca. From the Quichua stock came the famous tribe of the Inca, who in the last few centuries before the coming of Pizarro had spread their military rule from the present southern line of Colombia southward to the Mauri River in Chile and from the Pacific Ocean eastward across the Andes to the edge of the great tropical forest. Along the eastern edge of the Andes they extended their conquests far into Argentina. Inca traditions are far from uniform. It seems clear, however, that Cuzco was founded not earlier than the eleventh century. The founder of Inca power was Manco Ccapac, who is de-

scribed as the son of Viracocha (q.v.), the principal deity. This Viracocha was a sun god, and the Inca chiefs were popularly known as Children of the Sun, while sun worship was the state religion. Inca power was on the wane when the Spaniards entered Peru. It had been at its height under the Inca Yupanqui about the year 1460. The Inca chiefs were supposed to marry their own sisters, but the twelfth in line married also a princess of Quito, and on his death civil war ensued between the rival sons. This war was going on when the Spaniards arrived, and it was cleverly turned to their advantage.

It must be remembered, however, that the Inca were only a small part of the Quichuan stock. The earlier activities of the tribes making up this linguistic division are uncertain. It is not improbable, however, that earlier cultures had been developed by some of them. According to some writers the early remains at Tiahuanaco are to be accredited to the Aymara stock, while in the lowlands along the coast were cities built by the Yunca.

QUICHUAN (kē'chwan) **STOCK.** A linguistic group of which the Quichua (q.v.) are the most noted representatives and including most of the ancient or existing tribes along the Pacific coast and in the Andes region of South America from about 2° N., on the southern border of Colombia, to about 32° S. in the neighborhood of Valparaiso, Chile. Within this general area, however, are the Yunca, Aymara, Puquina, and Atacameño, all of alien lineage, but confined to limited territorial districts. The boundaries of the linguistic stock nearly coincide with those of the ancient Peruvian Empire, but include also a few wild tribes, as the Malaba of northern Ecuador, never brought under subjection to the Inca rule or civilization. So far as any linguistic evidence can show, the line of migration appears to have been from north to south. The Quitu of Ecuador maintained an independent kingdom under 19 successive rulers, according to their own tradition, until finally subjugated by the Incas. In physical type all the tribes of this stock are of low stature, heavy build, and very strong. With the exception of the few wild border tribes, they were all sharers in the same general culture that prevailed throughout the ancient Empire, although in some cases, as with the Quitu, this appears to have been of indigenous growth before the consolidation of the Empire. The colonizing policy of the Incas tended to reduce the various cognate languages to one dialectic standard, the Quichua proper, which is still the prevailing language of Peru and Ecuador outside of the large cities. The present number of persons belonging to the Quichuan stock is probably not far from 3,000,000. Consult: J. J. von Tschudi, *Die Kechua-Sprache* (Vienna, 1853); id., *Organismus der Khetšua-Sprache* (Leipzig, 1884); E. W. Middendorf, *Die einheimischen Sprachen Perus* (6 vols., ib., 1890–92); Spilsbury, *Lenguas indígenas de Sudamérica: el Quichua* (Buenos Aires, 1898).

QUICK, JOHN (1748–1831). An English comic actor, born in Whitechapel, London. He went on the stage when he was 14. His most famous rôles were Tony Lumpkin in *She Stoops to Conquer* (1773) and Bob Acres in *The Rivals* (1775). He retired in 1798. Quick was short in stature, quaint and whimsical, and especially famous for his personation of old men.

QUICK, ROBERT HERBERT (1831–91). An English educator, born in London. He graduated at Cambridge in 1854 and was ordained the following year. Afterward he was an assistant to Dr. Merriman at Cranley and assistant master at Harrow, and he was the first to lecture at Cambridge on the history of education (1881). His *Essays on Educational Reformers* (1868; 2d enlarged ed., 1890) is a valuable work. He also wrote on Fröbel, edited Locke's *Some Thoughts Concerning Education* (1880), and reprinted with notes Mulcaster's *Positions* (1888). Consult F. Storr, *Life and Memoirs of R. H. Quick* (London, 1899).

QUICKEN TREE. See MOUNTAIN ASH.

QUICK-FIRING GUNS. See ARTILLERY; MACHINE GUN; RAPID-FIRE GUN.

QUICKLIME. See CHUNAM; LIME.

QUICK MATCH. See PYROTECHNY.

QUICKSAND. A loose sand into which solid bodies readily sink. Quicksands are composed of very small rounded particles which under ordinary pressure do not pack together and when moistened behave like a fluid. They are especially common in glacial deposits and may be encountered almost anywhere within the region invaded by the continental ice sheet. Any heavy object placed upon quicksand is rapidly swallowed up, leaving no trace behind. In conducting mining and engineering operations it is sometimes necessary to freeze the quicksand by sinking pipes at intervals, which are then used for circulating brines or other liquids at low temperature. A more common method is to employ caissons, such as are used in excavating under water.

QUICKSILVER. See MERCURY.

QUI'DOR, JOHN (1800–81). An American figure and historical painter. He was born in Gloucester Co., N. J., and in 1826 removed to New York City, where he studied under Jarvis and Inman. Afterward he lived for a time on a farm near Quincy, Ill., but returned to New York City in 1851. He was not appreciated in his lifetime, was obliged to support himself by painting the panels of stage coaches and fire engines, and died in abject poverty. He was, however, a personal friend of Washington Irving, whose *Knickerbocker History of New York* gave him the subjects for the four paintings in the Brooklyn (N. Y.) Institute: "Dancing on the Battery" (c.1860), "Peter Stuyvesant's Wall Street Gate" (1864), "Voyage of the Good Oloff up the Hudson" (1866), and "The Voyage from Communipaw to Hell Gate" (1866). These show the mellow and harmonious color, poetic imagination, and naïve humor which have gained Quidor tardy recognition as one of the most gifted of early American painters. He also painted religious subjects, such as "Jesus Blessing the Sick." His work was usually on a large scale.

QUIDS. In American political history, the name applied to a faction of the Republican party, led by John Randolph (q.v.), which during the years 1805–11 opposed on many points the great majority of the party, led by Jefferson and Madison. The name Quid is said by some to have been taken from the phrase *tertium quid*, applied to Randolph and his supporters in allusion to their being unidentified with either of the then dominant parties; by others it is said to have been given to the faction in allusion to its having been cast out from the Republican party.

QUI'ETISM (Neo-Lat. *quietista*, from Lat. *quies*, quiet, rest). A type of mysticism (q.v.) which regards the most perfect communion with God as coming only when the soul is in a state of quiet in which it ceases to reason or to reflect either upon itself or upon God and, in a word, to exercise any of its faculties, its sole function being passively to accept the fellowship which God is ever ready to bestow. This type of effort for mystic experience is not confined to Christianity, but pervades all mysticism (q.v.), being especially visible in Hindu philosophy and Sufism (q.v.). In fact, the suppression of conscious will is the final stage in all preparation for the mystic trance; Quietism only lays more stress upon it. Essentially Quietistic elements are found in early Christian sects, such as the Euchites or Messalines of the fourth century and the Hesychasts among the Greek monks of Mount Athos in the sixth century. In the West the followers of Scotus Erigena in the ninth century taught a form of theosophy with Quietistic tendencies. Besides these there are the Beghards in the twelfth century, the followers of Master Eckhart in the thirteenth and fourteenth centuries, the Brethren of the Free Spirit, and later the Illuminati in Spain. In England the Quakers, in their doctrines of the inner light and of silent waiting before God, show Quietistic ideas.

The term is used as the particular name of a mystical movement in the Catholic church of the seventeenth century, mostly in Spain and France. It began with the Spaniard, Molinos (q.v.), but its most influential exponent was Madame Guyon (q.v.) in France. The great ecclesiastic Fénelon (q.v.) came under her influence and, while never going to the same extreme, defended Quietistic ideas. The Quietists held that God is always ready to speak directly to man, but that man can hear only when his soul is passive, when all desires and wishes are stilled and he waits in quiet for the voice of God. He is to lay aside reason and all passion, not to attempt to win for himself faith, hope, or love, not to desire heaven nor to fear hell, but to maintain an attitude of indifference to self and the world and allow God to play on the soul as an instrument only for His use. The Quietists were orthodox Catholics, but for them communion with God, once attained, had no need of the mediation of the Church. It was easy for the Church to find heretical elements in the movement, and it speedily fell under ecclesiastical condemnation. Bossuet (q.v.) employed his great talents against it, and as a distinct movement it disappeared; but wherever mysticism arises, Quietism is sure to appear in some form or other.

Consult the literature under MYSTICISM; also H. Heppe, *Geschichte der quietistischen Mystik* (Berlin, 1875); E. Murisier, *Les maladies du sentiment religieux* (Paris, 1903); Joseph Hilgers, "Zur Bibliographie des Quietismus," in *Centralblatt für Bibliothekswesen*, vol. xxiv (Leipzig, 1907).

QUIGLEY, kwĭg'lĭ, JAMES EDWARD (1854–1915). An American Roman Catholic archbishop. He was born at Oshawa, Canada, but was early taken by his parents to Lima, N. Y., and then to Rochester. Graduating from the Christian Brothers' Academy at Buffalo (1872), he studied at the Seminary of Our Lady of Angels (now Niagara University), at Innsbruck, and at the College of the Propaganda, Rome, where he graduated in 1879. Ordained a priest in the latter year, he was subsequently rector at Attica, N. Y. (1879–84), and in Buffalo of St. Joseph's Cathedral (1884–96) and St. Bridget's Church (1896–97). Father Quigley served as Bishop of Buffalo from 1897 to 1903 and as Archbishop of Chicago thereafter till his death.

QUILEUTE, kwĭl'ē-ōōt', or **QUILLAYUTE**, kĭl'lă-yōōt'. A tribe of Chimakuan stock, formerly residing near Lapush on the coast of Washington. They were noted for their skill in whale and seal fishery. In 1910 they numbered 306. Consult A. B. Lewis, *Tribes of the Columbia Valley and the Coast of Washington and Oregon* (Lancaster, Pa., 1906).

QUILIMANE, kē'lē-mä'nâ. A port in Portuguese East Africa, situated on the river Kwa-Rwa, about 6 miles inland (Map: Congo, Belgian, G 6). It lies in a low unhealthful region, but has a good harbor. Its commerce amounted in 1913 to over $1,250,000, one-third being exports. Pop. (est.), 3500, of whom some 100 are white.

QUILL (LG. *quicle, kiel*, MHG. *kīl*, Ger. *Kiel*, quill). One of the large feathers of the wings and tails of birds, remiges and rectrices. (See FEATHER.) Their hollow tubes, properly cleared of all oily or fatty matter and dried, are used as receptacles for gold dust and various purposes, but chiefly as writing pens, all of which were made from feathers until comparatively recently. Those plucked from geese were most generally used, but swan and turkey quills were not uncommon; and for very fine writing and for pen-and-ink drawing crow quills were preferred to all others. The conventional representation of a pen as a quill pen and such words as quill driver and penknife are relics of the custom.

QUILLARD, kē'yàr', PIERRE (1864–1912). A French poet, critic, and scholar, born in Paris. He allied himself with the school of Symbolists (q.v.), but differed from many of his colleagues in his thorough knowledge and appreciation of the humanities. He had attended the Lycée Condorcet and later, in 1886, had been sent to Lisbon upon a paleographical mission. Returning to France the same year, he founded a review, *La Pléiade*, in which he published his first poems and a mystery in two tableaux, *La fille aux mains coupées*. Quillard went to Constantinople in 1893 and taught in the Armenian College. During this period he wrote *L'Errante* and *Les vaines images*, and after his return to Paris in 1896 he published all his work in *La lyre héroïque et dolente*, a title intended to be symbolic of his life. A year later he again went to the Orient, where he spent several years. He died in Paris.

QUILLBACK. See SKIMBACK.

QUIL'LER-COUCH, -kōōch, SIR ARTHUR THOMAS (1863–). An English author. He was born in Cornwall, Nov. 21, 1863, and was educated at Clifton and at Trinity College, Oxford, where he remained for two years as classical lecturer after taking his degree. Then he removed to London and devoted himself to literary work. He was one of the original staff of the *Speaker* and retained his connection with it until 1899. After 1891, however, he resided chiefly in his native county of Cornwall, whose scenery, traditions, and characters he faithfully depicted in his books. He was knighted in 1910 and in 1912 was made King Edward VII professor of English literature at Cambridge.

His writings include: *Dead Man's Rock* (1887); *Troy Town* (1888); *The Splendid Spur* (1889); *The Delectable Duchy* (1893); *Wandering Heath* (1895); *Ia* (1896); *The Ship of Stars* (1899); *Old Fires and Profitable Ghosts* (1900); *The Westcotes* (1902); *The Adventures of Harry Revel* (1903); *Fort Amity* (1904); *Poison Island* (1907); *Hocken and Hunken: A Tale of Troy* (1912); *News from the Duchy* (1913); *Nicky Nan, Reservist* (1915). In all of these a vivid and dramatic imagination, free from any touch of morbidity, is shown. This quality, together with his mastery of style, led to his being selected after Stevenson's death to complete the latter's novel *St. Ives*. Quiller-Couch, who is widely known by his pseudonym of "Q," edited two anthologies of English verse and published *Poems and Ballads* (1896) and *The Vigil of Venus and Other Poems* (1912), and, in the field of essays, *Adventures in Criticism* (1896), *From a Cornish Window* (1906), and *On the Art of Writing* (1914). Consult William Archer, *Poets of the Younger Generation* (New York, 1902).

QUILLINAN, EDWARD (1791–1851). A British poet, born at Oporto in Portugal. Educated at a Roman Catholic school in England, he returned to Portugal and took a position, against his inclination, in his father's counting-house. On the French invasion (1807) the family fled to England. Edward entered the army and served for some time in the Peninsular War. Retiring from the army (1821), he settled in the Lake District near Wordsworth, whose daughter Dorothy became his second wife. He died at Ambleside. Quillinan wrote a good deal of mediocre verse and a military novel, *The Conspirators* (1841). His last years were given to a translation of the *Lusiad* of Camões, which was never completed. A volume of his selected *Poems* appeared in 1853. His wife, DOROTHY QUILLINAN (1804–47), was author of a charming book of travel entitled *A Journal of a Few Months' Residence in Portugal and Glimpses of the South of Spain* (1847).

QUILLOTA, kēl-yō'tȧ. A town in the Province of Valparaiso, Chile, situated in a pleasant plain on the Aconcagua River, 20 miles northeast of Valparaiso, and on the railroad between that city and Santiago (Map: Chile, E 4). It is the centre of a copper-mining district. Pop., 1907, 11,449.

QUILOA, kē-lō'ȧ. A seaport town of German East Africa. See KILWA KIVINJE.

QUILP. A repulsive and malicious dwarf in Dickens's *Old Curiosity Shop*.

QUIMBY, kwĭm'bĭ, PHINEAS PARKHURST (1802–66). An American mental healer. He was born in Lebanon, N. H., and after various attempts in business he became a watch and clock maker. In this occupation he had been engaged for some years when in 1840 mesmerism attracted his attention. Although not indebted to it for his first investigations in mental healing, he used mesmerism as a help in the treatment of his patients, discarding it after claiming the discovery that disease is primarily an erroneous belief, to be cured by truthful suggestion. For many years he practiced mental healing with great success in different towns in Maine. About 1858 he opened an office in Portland. In October, 1862, Mary Baker Eddy (q.v.), then Mrs. Patterson, became his patient, and many years afterward there was a warm controversy as to whether Mrs. Eddy was not considerably indebted to him for the foundations of Christian Science. Mrs. Eddy denied any obligation. Before his death, at Belfast, Me., Quimby had elaborated his method of cure into "a true science of life and happiness." It is from him and his adherents that the cult of metaphysical healing called Mental Science (q.v.) is chiefly derived. Consult A. G. Dresser, *The Philosophy of P. P. Quimby* (Boston, 1895), and J. A. Dresser, *The True History of Mental Science* (ib., 1899).

QUIMPANO. See PHILIPPINE ISLANDS.

QUIMPER, kăn'pâr' (Bret. *kemper*, confluence). The capital of the Department of Finistère, France, picturesquely situated at the confluence of the Steir and the Odet, about 68 miles south-southeast of Brest (Map: France, N., A 4). The cathedral of St. Corentin, a stately and richly ornamented Gothic edifice commenced in 1424, is the principal building. The eleventh-century church of Locmaria and the sixteenth-century church of St. Mathieu are interesting. The educational institutions include a lyceum, public library, and museum. Potteries, tanyards, breweries, and paper factories are the chief industrial establishments, and a coasting trade and sardine fishing are actively carried on. Quimper was the ancient capital of Cornouailles. Pop., 1901, 19,441; 1911, 21,051.

QUIMPERLÉ, kăn'pâr'lā'. The capital of an arrondissement in the Department of Finistère, France, on the Laïta, 12 miles northwest of Lorient (Map: France, N., B 5). Its chief buildings are the fourteenth-century church of St. Michel and the church of Ste. Croix, modeled after the Holy Sepulchre at Jerusalem. It has fisheries and carries on a coasting trade Pop., 1901, 9036; 1911, 8705.

QUIN, JAMES (1693–1766) A celebrated actor of Irish descent, born in London. He made his first appearance on the stage about 1714 at Dublin as Abel in *The Committee* In 1716 he appeared in London as Bajazet in *Tamerlane*. Next year he went to Lincoln's Inn Fields, where he remained as a principal actor for 14 years. In 1734–35 he returned to Drury Lane, and until the appearance of Garrick in 1741 he was, by universal consent, the first actor in England. In 1751 he withdrew from the stage as a regular actor and made his home at Bath, where he died. Consult an unreliable *Life of Mr. James Quin, Comedian, with the History of the Stage from his Commencing Actor to his Retreat to Bath, etc.* (London, 1766; reprinted, ib., 1887); also: Colley Cibber, *Apology* (ib., 1740; ed. by Bellchambers, ib., 1822; also by Lowe, ib., 1889); Thomas Davies, *Life of Garrick* (ib., 1780; new ed., 2 vols., ib., 1807); John Doran, *Annals of the English Stage* (3 vols., ib., 1887).

QUINAAN. See PHILIPPINE ISLANDS.

QUINAIELT. See QUENIULT.

QUINAULT, kē'nō', PHILIPPE (1635–88). A French librettist and dramatist, born in Paris. He wrote lyric tragedy, for which the music was furnished by Lulli. Quinault was precocious, his first play having been produced when he was 18, and his earliest comedies are among his best: *Les rivales; L'Amant indiscret* (1654); *Le fantôme amoureux* (1659); *La mère coquette* (1665). His tragedies and tragi-comedies are slight. *Psyché*, the first of his lyric dramas (1671), was written in collaboration with Molière and Corneille. After this he devoted him-

self almost entirely to libretto work, remarkable for its ingenious artistry. In this kind his masterpieces are *Amadis* (1684), *Roland* (1685), and, best of all, *Armide* (1686). In 1687 Lulli died and Quinault began to write on the *Destruction of Heresy*, a poem which he did not live to complete. His works were edited in five volumes (1739, 1778); *Selected Works* (1824–42). Consult F. V. Fournel, *Les contemporains de Molière* (3 vols., Paris, 1863–76), and Erich Richter, *Philippe Quinault: sein Leben, seine Tragodien, seine Bedeutung für das Theater frankreichs und das Auslandes* (Leipzig, 1910).

QUINCE (variant of obsolete Eng. *quine*, from OF. *coin*, Fr. *coign*, quince, from Lat. *cydonium*, from Gk. κυδώνιον, *kydōnion*, quince, Cydonian, sc. μῆλον, *mēlon*, apple, from Κυδωνία, *Kydōnia*, Κυδωνίς, *Kydōnis*, Cydonia, an ancient city of Crete), *Pyrus cydonia*. A shrub or

QUINCE.

small crooked tree of the family Rosaceæ, closely related to the apple and pear, which it resembles in leaf, flower, and fruit, but with solitary terminal flowers on the present season's growth. Since the quince cannot be eaten raw, it has a restricted use, and although cultivated for more than 2000 years, it has developed few varieties. It is employed chiefly as a preserve, for jellies, and for flavorings in other fruit preparations. Certain varieties, notably the Angiers, are extensively employed as a stock for dwarfing pears. The quince is propagated by cuttings or mound layers. It thrives best on strong, retentive, well-drained soil. The trees are set 15 feet apart each way, given clean culture, and headed in sufficiently to hold the leading branches in check and to thin the fruits, which, since they ripen late, should not be gathered until after early frosts. They must be as carefully handled as pears. The quince is especially subject to fire blight and is attacked by other diseases of the apple (q.v.). The most extensive and profitable orchards in the United States are located in western New York. Consult W. W. Meech, *Quince Culture* (New York, 1896).

QUINCE CURCULIO. See QUINCE INSECTS.

QUINCE INSECTS. The quince is attacked by many of the insects which have the general habit of feeding upon rosaceous plants, and especially very many of those forms which are found upon pears and apples, although it is rather less susceptible than either of these fruits. The quince scale (*Aspidiotus cydoniæ*) is found upon the quince tree in the southern United States. It is grayish in color, somewhat resembling the San José scale, but is more transparent and is very convex in form. The quince curculio (*Conotrachelus crataegi*) is a species closely related to the plum curculio, although differing in general appearance. It is a broad-shouldered snout beetle, larger than the plum curculio and having a longer snout. It is ash gray in color, mottled with ochre and whitish, and with a dusky subtriangular spot at the base of the thorax above. It is indigenous to the United States, and appears in the month of June, puncturing the young fruit and making a cylindrical hole in which the egg is placed. The egg hatches in a few days and the larva burrows in the fruit near the surface. It becomes full-grown in a month and falls to the ground, burying itself to a depth of from 2 to 3 inches, remaining there through the winter and transforming to pupa early in May. The pupa stage is short and the adult beetle emerges almost as soon as the fruit is set. The adult also feeds upon the quince, burying itself completely in the pulp of the fruit. It occasionally attacks the pear.

Among the caterpillars which feed upon quinces the bagworm (q.v.) is perhaps the most destructive. Consult Slingerland and Crosby, *Manual of Fruit Insects* (New York, 1914).

QUIN'CKE, GEORG HERMANN (1834–). A German physicist, born at Frankfort-on-the-Oder. He received his Ph.D. in 1858 at Berlin, having previously studied also at Königsberg and Heidelberg. He became privatdocent at Berlin in 1859, was appointed professor in the University of Würzburg in 1872, and in 1875 was called to be professor of physics at Heidelberg, where he remained until his retirement in 1907. His doctor's dissertation was on the subject of the capillary constant of mercury, and his investigations of all capillary phenomena are classical. He also did important work in the experimental study of the reflection of light, especially from metallic surfaces, and carried on prolonged researches on the subject of the influence of electric forces upon the constants of different forms of matter, modifying the dissociation hypothesis of Clausius (q.v.). Quincke received a D.C.L. from Oxford and an LL.D. from Cambridge and from Glasgow and was elected an honorary fellow of the Royal Society of London. His contributions to physics and other fields of science are numerous. He published also a *Geschichte des physicalischen Instituts der Universitat Heidelberg* (1885).

QUINCY, kwĭn'sĭ. A city and the county seat of Gadsden Co., Fla., 24 miles northwest of Tallahassee, on the Seaboard Air Line and the Georgia, Florida, and Alabama railroads (Map: Florida, B 1). It is in a rich agricultural and tobacco region, which contains also the most extensive deposits of fuller's earth found in the United States. A considerable trade is carried on in the product of these mines and in wrapper tobacco. Pop., 1900, 847; 1910, 3204.

QUINCY, kwĭn'zĭ. A manufacturing city and the county seat of Adams Co., Ill., 263 miles southwest of Chicago, on the Mississippi River.

here spanned by a fine railway and wagon bridge, and on the Chicago, Burlington, and Quincy, the Wabash, and the Quincy, Omaha, and Kansas City railroads (Map: Illinois, B 6). It has a large and deep harbor, is regularly laid out on limestone bluffs, 160 feet above high water, and has 50 miles of paved streets and 15 miles of boulevards. There are many fine parks, including South, Riverside, Washington, Madison, Indian Mounds, and Primrose. Among the educational institutions are St. Francis Solanus College (Roman Catholic), opened in 1860, Chaddock Boys' School (Methodist Episcopal), St. Mary's Institute (Roman Catholic), Gem City Business College, 12 public schools, and a free public library containing 40,000 volumes. Other noteworthy features are the Illinois State Soldiers and Sailors Home, occupying 250 acres and consisting of 60 buildings, Blessing and St. Mary's hospitals, the Quincy Historical Society, Cheerful Home Settlement, Woodland Orphans Home, courthouse, Federal building, Masonic Temple, State Armory, city hall and various business structures.

Quincy is admirably equipped with transportation facilities for an industrial and commercial centre. It carries on an active trade, and its industries, according to a local estimate made in 1915, represented an invested capital of $18,000,000, with an annual production valued at $23,000,000. Important manufactures are stoves, engine governors, show cases, store fixtures, incubators, elevators, pumps, agricultural implements, vehicles, tobacco, air compressors, dyes, optical goods, shoes, cereals, machinery, stationery, etc.

The government is vested in a mayor, elected biennially, and a unicameral council, and in administrative officials who are, for the most part, appointed. Quincy spent in 1913 for maintenance and operation $369,000, the chief items of expenditure being: $34,000 for the police department, $59,000 for the fire department, and $152,000 for education. The water works, which have a modern filtration system, are owned by the city. Pop., 1900, 36,252; 1910, 36,587; 1914 (U. S. est.), 36,730. Quincy was settled in 1821 and founded on May 1, 1825, by John Wood, subsequently Governor of Illinois. It was incorporated in 1834 and five years later received a city charter. Consult: Tillson, *History of Quincy* (Quincy, 1869); Henry Asbury, *Reminiscences of Quincy, Illinois* (ib., 1882); Collins and Perry, *Past and Present of Quincy and Adams County* (ib., 1905).

QUINCY, kwĭn'zĭ. A city, including within the municipal limits several villages, in Norfolk Co., Mass., adjoining Boston on the south, on Quincy Bay, between the Neponset River on the north and Fore River on the south, and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 4). Its area is more than 26 square miles, 2530 acres of which are in public parks, the most prominent being Merrymount and Faxon. Quincy has the Thomas Crane Public Library, Adams Academy, the Quincy Mansion Girls' School, the Woodward Girls' School (public), and a city hospital. There are many points of historic interest in this vicinity, and here was constructed in 1826–27 the first railroad in New England, built for carrying granite for building Bunker Hill Monument and operated by horses. Quincy is primarily a residential suburb of Boston, but has extensive granite quarrying and cutting interests, a large shipbuilding plant, scales and electrical goods factories, and rivet and stud works. The government, under a revised charter of 1900, is vested in a mayor, annually elected, and a unicameral council. The mayor controls appointments of the heads of all departments excepting that of the school committee. The school committee is chosen by popular vote. Pop., 1900, 23,899; 1910, 32,642; 1914 (U. S. est.), 36,366.

Settled in 1625 as Mount Wollaston, Quincy is one of the oldest permanent settlements in Massachusetts. About 1629 Thomas Morton (q.v.) gained control and established his famous "New English Canaan," Merrymount. Becoming obnoxious to the Puritans at Boston because of his encouragement of Maypoles and other reprehensible "idolls," and because of "his great licentiousness of life in all profaneness," he was captured by Miles Standish and shipped off to England. Until 1792, when it was incorporated under its present name in honor of John Quincy, the settlement formed part of Braintree. It was chartered as a city in 1888. It was the birthplace of John Hancock, John Adams, and John Quincy Adams, the last two being buried here under the old Stone Temple. Consult: W. S. Pattee, *History of Old Braintree and Quincy* (Quincy, 1878); D. H. Hurd (ed.), *History of Norfolk County* (Philadelphia, 1884); C. F. Adams, *The Centennial Milestone: An Address* (Cambridge, Mass., 1892); id., *Three Episodes of Massachusetts History* (Boston, 1892); D. M. Wilson, *Where American Independence Began* (ib., 1902).

QUINCY, EDMUND (1808–77). An American author and reformer, prominent as an Abolitionist during the antislavery struggle. He was a son of Josiah Quincy (1772–1864), and was born in Boston and graduated at Harvard in 1827. After the killing of Elijah P. Lovejoy (q.v.) by a mob at Alton, Ill., in 1837, he became an ardent Abolitionist of the radical or Garrisonian school, frequently spoke in public, was secretary, for some years, of the American Antislavery Society, coöperated with Garrison and Mrs. Chapman in issuing the *Non-Resistant*, a short-lived antislavery paper, and wrote many articles and pamphlets in favor of abolitionism. He wrote a novel, *Wensley: A Story without a Moral* (1854); an excellent *Life of Josiah Quincy* (1867); and *The Haunted Adjutant and Other Stories* (published posthumously, 1885); and edited *Speeches Delivered in the Congress of the United States* (1874).

QUINCY, JOSIAH (1744–75). An American patriot, born in Boston, Mass., Feb. 23, 1744. He graduated at Harvard in 1763, read law with Oxenbridge Thacher, and was admitted to the bar, rising to a high rank in his profession. He denounced the Stamp Act through the press and at public meetings in Boston and took strong ground against the exactions of Parliament. In 1770 he and John Adams conducted, in the face of an excited popular feeling, the defense of British soldiers implicated in the Boston massacre, and in the same year he prepared the address of the merchants of Boston on the nonimportation agreement and also wrote a number of essays for the Boston *Gazette*. Both in 1770 and in 1772 he drafted the instructions of the town of Boston to its representatives in the Legislature, and throughout 1771 and 1772 he was a frequent contributor to the *Gazette*, chiefly under the signatures Mentor and March-

mont Nedham. During all these years he maintained a large practice, though finally his health failed, and in 1773 he went to Charleston, S. C., taking advantage of his journey to enter into relations with the Patriot leaders in the Southern and Middle States and to arrange for a system of communication between them and the leaders of the same party in Massachusetts. In May, 1774, appeared his *Observations on the Boston Port Bill*, which clearly indicated war as the only means of settling the disputes between Great Britain and the colonists and intimated that independence must be the result. In September of the same year he went to England as the agent of the Patriot party and there lived on friendly terms with Barré, the Earl of Shelburne, Priestley, and other friends of the Colonies, and had interviews with Lords Dartmouth and North. He sailed for home in the spring of 1775, but died on the voyage, April 26. His *Life* was written by his son Josiah (2d ed., Boston, 1874), and his *Reports of the Supreme Court of Massachusetts Bay, 1761–72*, edited by his great-grandson, Samuel M Quincy, appeared in 1865.

QUINCY, JOSIAH (1772–1864). An American lawyer, orator, and man of letters, son of Josiah Quincy (1744–75). He was born in Boston, graduated at Harvard in 1790, studied law, and took an active interest in politics as a leading member of the extreme wing of the Federalist party in New England. He was a member of the State Senate in 1804, and in 1805 entered Congress, where he became distinguished as a ready, earnest, and fervent orator, in opposition to the policy of Jefferson and Madison. He was one of the earliest to denounce slavery in Congress, and declared in a notable speech of June 4, 1811, that the purchase of Louisiana was a sufficient cause for the dissolution of the Union. He opposed the war with England. Disgusted with the triumph of the Republican party and its advocacy of the War of 1812, he declined a reëlection to Congress and devoted his attention largely to scientific agriculture. He became, however, Speaker of the Massachusetts House of Representatives in 1821, a member of the Senate in the following year, and also judge of the municipal court of Boston. In 1823 he was elected mayor of Boston, his administration being signalized by many notable municipal reforms. In 1829 he accepted the presidency of Harvard College, which he held until 1845. Among his published works are a memoir of his father (1825); *History of Harvard University* (2 vols., 1840); *The Municipal History of the Town and City of Boston* (1852); a *Memoir of the Life of John Quincy Adams* (1858). Consult Edmund Quincy, *Life of Josiah Quincy* (Boston, 1867), and Mellen Chamberlain, "Josiah Quincy, the Great Mayor," in Massachusetts Historical Society, *Publications* (ib., 1889).

His son of the same name (1802–62) was President of the Massachusetts Senate in 1842 and mayor of Boston in 1845–49, and his great-grandson, also named Josiah (1859–), was Assistant Secretary of State of the United States in 1893 and mayor of Boston in 1895–99.

QUINCY, kăn'sē', QUATREMÈRE DE. See QUATREMÈRE DE QUINCY.

QUINET, kē'nā', EDGAR (1803–75). A French poet, publicist, and historian of literature. He was born at Bourg, Feb. 17, 1803, and died at Versailles, March 27, 1875. He was educated for the army, but refusing a soldier's life, he published at 20 his justification in *Les tablettes du juif errant* (1823). His next work was a translation of Herder's *Ideen zur Philosophie der Geschichte der Menschheit* (1827), to which he prefixed an introduction that won him the friendship of Cousin and Michelet. After travel in Germany, Italy, and England, he was sent by the French Institute to Greece (1829) and wrote *La Grèce moderne* (1830). He now began to contribute political essays to the newly founded *Revue des Deux Mondes* and recurred to the legend of the Wandering Jew in *Ahasvérus* (1833). This was followed by the less successful poems, *Napoléon* (1835) and *Prométhée* (1838). His *Examen de la vie de Jésus* is a philosophy of religion as the substance of humanity and the apotheosis of personality in answer to Strauss's *Leben Jesu*. His *Génie des religions* (1842) brought him a call to the Collège de France, where he roused great enthusiasm by lectures on the Jesuits, ultramontanism, and Christianity in relation to the French Revolution. At this period Quinet's partisanship began to bias his historical judgment. Michelet shared in his attack on the Jesuits, which was silenced by the government in 1846. Quinet took an active part in the revolution of 1848, sought to unmask Napoleon, and was banished (1852). At Brussels he wrote *Les esclaves* (1853) and *La révolution religieuse au XIXme siècle* (1857). Removing to Veytaux, on the Lake of Geneva, he published *Merlin l'enchanteur* (1860), the autobiographical *Histoire de mes idées* (1860), and *Histoire de la campagne de 1815* (1862) and *La révolution* (1865), both tracing national disaster to a disregard of righteousness. The fall of Napoleon III brought him back to Paris. He was active during the siege and in the National Assemblies at Bordeaux and Versailles. During this period he wrote *La création* (1870), *La république* (1872), and *L'Esprit nouveau* (1874). His *Mémoires d'exil* were published in 1870 and *Le livre de l'exilé* posthumously with two volumes of letters in 1877 and four others (1884–86). Quinet's complete works are in 26 volumes (Paris, 1877–79).

Bibliography. C. L. Chassin, *Edgar Quinet: sa vie, ses œuvres* (Paris, 1859); Richard Heath, *Edgar Quinet: His Early Life and Writings* (Boston, 1881); Emile Montégut, in *Mélanges critiques* (Paris, 1887); Madame Quinet, *Edgar Quinet depuis l'exil* (ib., 1889); Edward Dowden, in *Studies in Literature* (6th ed., London, 1892); G. E. Saintsbury, "A Paradox on Quinet," in *Miscellaneous Essays* (ib., 1892).

QUINETTE DE ROCHEMONT, kē'nĕt' dẽ rôsh'môN', EMILE THÉODORE, BARON (1838–1908). A French engineer, born in Soissons and educated at the Ecole Polytechnique and at the Ecole des Ponts et Chaussées. He was appointed engineer in chief of the port of Havre in 1883, inspector general of bridges and roads in the Ministry of Public Works in 1892, and the same year took the chair of maritime works at the Ecole des Ponts et Chaussées. His writings include: *Mémoire sur le Clyde, Glasgow, Port Glasgow, et Greenock* (1869); *Notes sur les phares électriques de la Hève* (1870); *Notice sur le port de Havre* (1877); *Les ports maritimes de l'Amérique du Nord sur l'Atlantique* (3 vols., 1898–1903); *Cours de travaux maritimes* (2 vols., 1900–01); and books on various European ports.

QUINHAGAK. See KUSKOKWIM RIVER.

QUINIC (kwĭn'ĭk) **ACID.** See KINIC ACID.

QUINIDINE, kwĭn'ĭ-dĭn. See ALKALOIDS; QUININE.

QUININE, kwī'nĭn *or* kwĭ-nēn' (Neo-Lat. *quinina,* from Sp., Portug., Quichua *quina,* quinine). A white, amorphous or crystalline powder with a very bitter taste, alkaline, very faintly soluble in water, but soluble in alcohol, dilute acids, ether, or chloroform, and derived from the bark of *Cinchona calisaya, Cinchona rubra,* and other varieties of Peruvian bark. The symbol of quinine is $C_{20}H_{24}N_2O_2 + 3H_2O$. There are five official salts. *Quinine sulphate* is the white, crystalline powder commonly called quinine, extremely and persistently bitter, slightly soluble in water (1 in 740 parts), moderately soluble in alcohol, soluble in weak acids. Its symbol is $(C_{20}H_{24}N_2O_2)_2:H_2SO_4 + 7H_2O$. *Quinine bisulphate* occurs in clear, colorless crystals or needles, very bitter and with an acid reaction, and is soluble in water and alcohol. The symbol is $C_{20}H_{24}N_2O_2.H_2SO_4 + 7H_2O$. *Quinine hydrobromide* occurs in colorless needles, bitter, soluble in 54 parts of water, freely in alcohol. Symbol, $C_{20}H_{24}N_2O_2.HBr + H_2O$. *Quinine hydrochloride* occurs in white needles arranged in tufts, bitter, soluble in 34 parts of water, freely soluble in alcohol, and suitable for hypodermic use. Its symbol is $C_{20}H_{24}N_2O_2.HCl + 2H_2O$. *Quinine salicylate* occurs as colorless needles, soluble in 77 parts of water, 11 of alcohol. It combines the therapeutic virtues of salicylic acid and quinine. Its symbol is $2C_{20}H_{24}N_2O_2.C_7H_6O_3 + H_2O$. *Quinine valerianate* was formerly official and occurs in white pearly crystals with the characteristic repulsive odor of valerian, bitter, soluble in alcohol and in 100 parts of water. Its symbol is $C_{20}H_{24}N_2O_2(C_5H_{10}O_2 + H_2O$.

Among the unofficial salts of quinine are the amorphous borate and euquinine (the ethyl carbonate). There is also a compound, *quinine and urea hydrochloride,* freely soluble in water, suitable for hypodermic use, and much employed as a local anæsthetic.

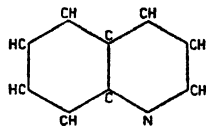
Quinine is used in medicine as a bitter tonic, an antiperiodic, and antipyretic. It has antiseptic properties also. It depresses the heart when given in large doses, and after long-continued use it affects the auditory nerve. It is excreted with the urine and occasionally produces renal and vesical irritation. Small doses produce hyperæmia of the brain, with a feeling of exhilaration, while large doses cause cerebral congestion, with vertigo, staggering, headache, deafness, delirium, and even coma, constituting the condition termed cinchonism.

The principal use of quinine is in malarial affections, in which it reduces the fever, increases the number of white blood corpuscles, prevents the destruction of the red blood cells, and inhibits the growth of the plasmodia which cause the disease. The custom of taking quinine frequently for catarrhal attacks or as a prophylactic is very harmful. In chronic malarial states quinine is advantageously combined with arsenic.

Imports of quinine into the United States in 1915 amounted to 1,829,000 ounces, valued at $452,348.

Warburg's tincture (*tinctura antiperiodica*), a famous preparation, originally containing more than 60 ingredients, but now much less complex, is valuable in chronic malaria and as a tonic. Its principal ingredients are, besides quinine, opium, aloes, rhubarb, and camphor, together with a number of aromatics. See ALKALOIDS; AGUE; INTERMITTENT FEVER; MALARIA AND MALARIAL FEVER.

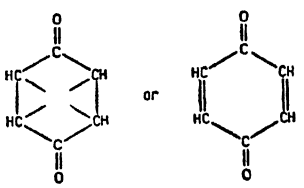
QUIN'ISEXT (from Lat. *quini,* five each + *sextus,* sixth). The name given in Church history to a council which, being regarded as a sort of supplement of the fifth and sixth general councils, is called by a title which combines both. The Fifth General Council, held in 553, on the subject of the three chapters, enacted no canons of discipline. In like manner the sixth, held against the Monothelites in 680–81, was confined almost entirely to doctrinal decisions. In order to supply the want a numerous body of bishops, more than 210 in number, assembled in 692, in a hall of the Imperial palace at Constantinople, called the Trullus, from which the council is sometimes known as the Trullan Synod. It was a purely Oriental council and was not approved by the Western Church and the Pope. Its decrees are purely disciplinary and it is important chiefly for its broad distinction between the legislation of the East and that of the West on the subject of clerical celibacy. The Quinisext Council, while prohibiting the marriage of any one who is in priest's orders, permits a married man to receive after marriage the order of subdeacon, deacon, or priest, but not of bishop (canon three). Against this the Roman pontiffs vigorously protested. Another peculiar canon of this synod (fifty-fifth) prohibits fasting on Saturday, even in Lent, and another, by decreeing that the ecclesiastical rank of a city followed its civil rank, gave Constantinople precedence over Rome. Consult H. K. von Hefele, *History of the Christian Councils,* vol. v (Eng. trans., Edinburgh, 1896).



QUINNAT (kwĭn'ăt) **SALMON** (North American Indian name). The principal and typical species (*Oncorhynchus tsohawytscha*) of Pacific coast salmon. See SALMON.

QUINN RIVER. See GREAT AMERICAN DESERT.

QUINOA, kē'nō-à (Quichua name), *Chenopodium quinoa.* An annual plant, native of Chile and the high table-lands of Mexico, cultivated for its seeds, which, as meal, form an important food of the people where it is indigenous. See CHENOPODIUM.



QUIN'OLINE, or LEUCOLINE, C_9H_7N. An organic base to which many vegetable alkaloids are chemically more or less closely related. It may be obtained by the distillation of quinine, cinchonine, or similar substances with caustic potash. It occurs, together with isoquinoline, a substance of the same molecular composition as quinoline, in coal tar and in bone oil, and may be isolated in a somewhat impure state from the fraction distilled over between 236° and 243° C. (457° and 469.4° F.). It is now prepared on a large scale by an artificial method, known as Skraup's method. Pure quinoline has a specific gravity 1.095 at 20° C. (68° F.) and boils at 239° C (462° F.). It is scarcely soluble in water, but dissolves freely in alcohol and in ether. It is a tertiary aromatic base and combines with acids to form crystallizable salts. The peculiar odor of quinoline is characteristic. Quinoline is used in the arts, especially in the manufacture of dyestuffs. In medicine it is used as an antiseptic and as a substitute for quinine.

The chemical constitution of quinoline is represented by the following graphic scheme:

It may be seen that the molecule of quinoline is composed of two nuclei, the benzene nucleus and the pyridine nucleus. The substance isoquinoline, mentioned above, has a much similar constitution and its chemical properties are much the same as those of quinoline itself; its boiling point is, however, 241° C. (466° F.); besides, at ordinary temperatures it is solid, its melting point being about 22° C. (71.6° F.). See ALKALOIDS.

QUINONES, kwĭn'ōnz (from Neo-Lat., Sp., Portug., Quichua *quina*, quinine). An interesting group of carbon compounds belonging to the so-called aromatic series. Theoretically the quinones may be defined as benzene derivatives in whose molecules two oxygen atoms are directly linked to the benzene nucleus. (See CARBON COMPOUNDS.) The simplest member of the group is the substance called benzoquinone, which may be readily prepared by the action of potassium bichromate and sulphuric acid on aniline. Benzoquinone has a peculiar, irritating odor; it melts at 116° C.; its molecular formula is $C_6H_4O_2$ and its chemical constitution is represented by one of the following graphic formulæ:

See COAL-TAR COLORS.

QUIN'OTAN'NIC ACID. See TANNIN.

QUIN'QUARTIC'ULAR CONTROVERSY. See ARMINIANISM.

QUINSY, kwĭn'zĭ (formerly also *quincy*, *squincy*, from OF. *squinancie*, *esquinance*, Fr. *esquinancie*, from Lat. *cynanche*, from Gk. κυνάγχη, *kynanchē*, sort of sore throat, from κύων, *kyōn*, dog + ἄγχειν, *anchein*, to choke), PERITONSILLAR ABSCESS. An acute inflammation of the loose tissue surrounding the tonsil, terminating usually in suppuration. Quinsy is most prevalent between the ages of 15 and 40, children and old persons seeming to be exempt. The exciting cause is sudden and unequal exposure of the body to cold or wet. The affection is usually confined to one tonsil, but both may be successive or simultaneously involved. One attack predisposes to others. The disease is ushered in with feelings of chilliness and exhaustion, followed by a temperature of 102° or 103° F. These symptoms are accompanied by severe pain in the region of the tonsil. The latter becomes so swollen as to interfere with deglutition. The mouth can be only partly opened and with great pain, and the taking of food, except in liquid form, becomes impossible. The peritonsillar tissues become swollen and painful. The voice is muffled and indistinct, and sleep is almost impossible. Severe cases are marked by an intensity of all these symptoms, successive chills and sweats, delirium at night. Although the disease is acute and painful, it rarely proves fatal. Cases have occurred in which bursting of the abscess into the larynx during sleep produced instant death. The ordinary duration of suppurative tonsillitis is from five to eight days. At the end of this time the abscess bursts, all the symptoms disappear, and prompt recovery ensues. In its early stage the affection may often be cut short or aborted if prompt measures for relief are taken. These consist in rest, free purgation by a saline cathartic, followed by a single large dose of quinine; in addition the application of warmth and the use of antiseptic anodyne and astringent gargles. When suppuration has become inevitable, hot turpentine stupes or poultices applied over the angle of the jaw will hasten the formation of pus. When an abscess has definitely formed it should be freely incised and the pus evacuated. This procedure is attended with immediate relief. Chronically diseased tonsils should be removed to prevent future attacks, but some persons will have one or two attacks even after thorough enucleation of the tonsil.

QUIN'TAIN (OF. *quintaine*, *cuintaine*, from ML. *quintan*, quintain, Lat. *quintana*, street in the camp between the fifth and sixth maniples, containing the market and place for exercise, from *quintanus*, fifth, from *quinque*, five), or QUINTIN. An instrument used in the ancient practice of tilting on horseback or on foot with the lance. It consisted of an upright post surmounted by a crossbar turning on a pivot, which had at one end a flat board, at the other a bag of sand. The object of the tilter was to strike the board at such speed that he was past before the bag of sand, as it whirled round, could hit him on the back.

QUINTANA, kēn-tä'nä, MANUEL JOSÉ (1772–1857). A Spanish author and statesman, born at Madrid. He studied law at Salamanca and became a lawyer in Madrid, where his house was a resort of the advanced Liberals of the time. Among his earliest productions were his patriotic "Odes," which gave him a place in the first rank of Spanish poets and which were highly popular at the outbreak of the War of Spanish Independence. He also acted as secretary of the Cortes and regency and distinguished himself as editor of the *Semanario Patriótico* and as author of the manifestos of the insurrectionary juntas and of most of the official statements of the Cortes. On the restoration of Ferdinand VII in 1814, Quintana's liberalism caused his imprisonment at Pamplona for six years. Released in 1820, he was received in Madrid with acclamations, was appointed President of Public Instruction (1821), tutor of the Infanta Isabella (1833), and Senator (1835). He was also Director General of Public Instruction up to 1851. He died at Madrid. He will be longest known for his great work *Vidas de Españoles célebres* (3 vols., 1807–34). In addition he wrote several tragedies and edited a collection of Castilian poetry. The most complete edition of his works is that of Gonzales Rojas (3 vols., Madrid, 1897–98). Consult: *Obras inéditas de . . . D. M. J. Quintana precedidas . . . de un juicio crítico por . . . D. Manuel Cañete* (Madrid, 1872); Marcelino Menéndez y Pelayo, *D. Manuel José Quintana*, vol. iii of the *España del siglo XIX* (ib.,

1887); Piñeyro, *Manuel José Quintana* (ib., 1892).

QUINTET' (It. *quintetto*, from *quinto*, Lat. *quintus*, fifth, from *quinque*, five). A musical composition for five voices or for five instruments, all the parts of which are real. The instruments composing a quintet may be of various kinds, most frequently the regular string quartet with pianoforte. Quintets have been written also for two violins, two violas, cello (Boccherini); for two violins, viola, and two cellos (Schubert, op. 163); for two violins, viola, cello, and double bass (Onslow); and for one violin, viola, cello, double bass, and piano (Schubert, Trout quintet, op. 114). Often wind instruments also are introduced, as the string quartet with clarinet (Mozart). Mozart has written also a quintet for wind instruments only (oboe, clarinet, horn, bassoon) with piano. An effective quintet was written by B. O. Klein for voice (soprano), violin, cello, horn, and piano. The music written for a quintet is of the same character as that for a quartet (q.v.).

QUINTIL'IAN (MARCUS FABIUS QUINTILIANUS (c.35–c.97 A.D.). A Roman rhetorician, born at Calagurris (the modern Calahorra) in Spain. He attended in Rome the lectures of Domitius Afer, who died in 59. After this date Quintilian revisited Spain, whence he returned in 68 to Rome, in the train of Galba, and began to practice as an advocate. He was distinguished as a teacher of elocution and his instruction was eagerly sought after among his contemporaries. Among his pupils were Pliny the Younger and the two grandnephews of Domitian. He was the first public teacher who benefited by the endowment of Vespasian and received a fixed salary from the Imperial exchequer, and as a mark of Imperial favor he was invested with the insignia and title of consul. His professional career as a teacher of eloquence, commencing probably in 69, extended over a period of 20 years, after which he retired into private life. The reputation of Quintilian in modern times is based on his great work entitled *De Institutione Oratoria Libri XII*, a complete system of rhetoric, which he dedicates to his friend Marcellus Victorius. In the first book he discusses the preliminary training through which a youth must pass before he can begin those studies which are requisite for the orator. The second book treats of the first principles of rhetoric and contains an inquiry into the essential nature of the art. The subjects of the five following books are invention (i.e., the determination by the orator of what he shall say) and arrangement; while those of the eighth, ninth, tenth, and eleventh are composition (embracing the proper use of figures of speech) and delivery. The last book is devoted to the various requisites for the formation of a finished orator. The entire work is remarkable for its sound critical judgments, its purity of taste, and the perfect familiarity it exhibits with the literature of oratory. The declamations, amounting to 164, which have been ascribed to Quintilian, are now believed to be spurious, as they evidently belong to different authors and even to different epochs. Early editions of Quintilian are those of Gronovius (Leyden, 1665); Burmann (ib., 1720); Spalding and Zumpt (Leipzig, 1798–1829), containing a lexicon. The best modern editions of the *Institutio Oratoria* are by Hahn (2 vols., Leipzig, 1868–69); Meister (2 vols., Prague, 1886–87); Bonnell (2 vols., Leipzig, 1896). Book I alone is edited by Fierville (Paris, 1890), Book III by J. A. Hild (Paris, 1885), Book X by Meister (Leipzig, 1887) and Peterson, with good introduction on Quintilian's life and style (Oxford, 1892), Books X and XII by Frieze (New York, 1889). The last English translation is by Watson (London, 1856). The *Declamationes* are published by Ritter (Leipzig, 1884) and Lehnert (1905). There is a complete edition by Spalding-Zumpt-Bonnell (1798–1834; 5th ed., by Meister, 1882). Consult: Henry Nettleship, *Lectures and Essays: Second Series* (Oxford, 1895); W. S. Teuffel, *Geschichte der romischen Literatur*, vol. ii (6th ed., Leipzig, 1910); Martin Schanz, *Geschichte der romischen Litteratur*, vol. ii, part ii (3d ed., Munich, 1913).

QUINTILIUS VARUS, PUBLIUS. See VARUS, P. Q.

QUIN'TIN. See QUINTAIN.

QUIN'TUPLET, or **QUIN'TOLE** (from Lat. *quintus*, fifth + *-plus*, -fold). In music, a group of five notes, formed of a note divided into five instead of its proper complement of four parts, the five notes having collectively the value usually expressed by four such notes. Thus, the five semiquavers of the following group are equivalent in value to a quarter note or four sixteenth notes:

QUIN'TUS CUR'TIUS RU'FUS. A Roman historian. See CURTIUS, QUINTUS.

QUIN'TUS ICIL'IUS. See GUICHARD, KARL GOTTLIEB.

QUINTUS SMYRNÆ'US (or OF SMYRNA). A Greek epic poet, probably of the close of the fourth century A.D. He wrote in 14 books the *Posthomerica*, which completes the story of the *Iliad*, drawing his material from the cyclic poets (q.v.) and patterning closely no doubt on the work of Arctinus and Lesches. Quintus is sometimes called Calaber, from the circumstance that a manuscript of his work was discovered at Otranto in Calabria. His poem, which is stiff and frigid, is best edited by Köchly (1850) and Zimmermann (1891). There is a translation by A. S. Way in the Loeb Classical Library (New York, 1913). Consult G. W. Paschal, *A Study of Quintus Smyrnæus* (Chicago, 1904), and Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part ii (Munich, 1913).

QUINZE JOYES DE MARIAGE, kănz zhwä de mä'rē-äzh', LES (Fr., The Fifteen Joys of Wedlock). A satire composed, in all likelihood, by Antoine de La Sale (q.v.) and written before 1461. It gets its title, profanely, from a prayer then widely known, *Quinze Joies de Notre Dame*. It is a kind of litany on the miseries of married life. Consult the edition by Henckenkamp (Halle, 1901).

QUIR'INAL (Lat. *Collis Quirinalis*). 1. One of the hills on which ancient Rome stood. It lies due north of the Palatine, and its western slope looks down on the Campus Martius, which stretches from its base to the banks of the Tiber. It was not included in the early Septimontium, or city of the seven *montes*, but was part of the city of the four regions and was of course included in the so-called Servian Wall. (See ROME.) The most notable ancient structures on the Quirinal were the temples of Quirinus (q.v.), Flora (q.v.), and Salus (Safety); and on the plateau from which both the Quirinal and the Viminal project, near the

Colline Gate, there was an ancient shrine of Fortuna. In Imperial times the great thermæ (or baths) of Diocletian and Constantine were built on the hill. Consult K. Baedeker, *Central Italy and Rome* (15th Eng. ed., Leipzig, 1909), and S. B. Platner, *The Topography and Monuments of Ancient Rome* (2d ed., Boston, 1911).

2. The residence of the King of Italy since 1870, previously a summer residence of the popes, which occupies a commanding situation on the Quirinal Hill. It was begun in 1574 by Pope Gregory XIII and was completed under Paul V. The architect was Domenico Fontana (q.v.). It was one of three papal palaces erected by him, the other two being those of the Vatican and the Lateran. The palace is modern in its arrangements and decoration. It contains a large ceiling painting, made by Overbeck (1859), commemorating the flight of Pius IX in 1848, a cast of Thorvaldsen's "Procession of Alexander the Great," and an "Annunciation" by Guido Reni.

QUIRI'NUS. In the early Roman religion, the name of the third great god, ranking next to Jupiter and Mars. Whatever the origin of the god, he seems to have been regarded as a parallel to Mars, representing rather the war god as in time of peace ready for the fray. The original prominence of Quirinus is shown by the fact that the third great flamen was devoted to his worship, which does not, however, seem to have been very exacting, as the flamen appears assisting at several other services unconnected with Quirinus. He was also honored originally by the Colline Salii (q.v.), as was Mars by the Palatine. His old temple lay on the Quirinal (q.v.), near the Porta Quirinalis. We hear of a new building in 293 B.C. and, after its destruction by fire, of the erection by Augustus of a splendid structure, which was dedicated in 16 B.C. Early in the first century B.C. the belief arose that Quirinus was the deified Romulus, a theory which was fostered by Cæsar and Augustus and led also to the association of an old goddess, Hora Quirini, with Hersilia, the wife of Romulus. The annual festival of Quirinius, the Quirinalia, was held on February 17, the supposed date of the translation of Romulus to heaven. Consult W. W. Fowler, *Roman Festivals* (London, 1899), and Georg Wissowa, *Religion und Kultus der Romer* (Munich, 1912). See ROMAN RELIGION.

QUIRITES, kwī-rī'tēz (Lat. nom. pl., probably from Sabine *quiris*, spear). The collective name of the Romans in their civil relations, while in connection with foreign affairs they were known as Romani. Quirites was, perhaps, the original name of a Sabine tribe, and the Roman nation, made up of Latin and Sabine elements, was called by the name of either of its component parts. The full official designation was *Populus Romanus Quirites.*

QUI TAM ACTION (Lat., who so well). An action brought under the provisions of a statute permitting an informer against an offender to receive a portion of the penalty prescribed for the offense and authorizing him to sue on behalf of himself and the government to recover the same. Offenders liable for a statutory penalty early sought to evade the law by procuring a friend to bring the action, under a collusive agreement not to enforce the judgment. To remedy this the Statute of 4 Hen. VII, c. 20, was enacted, providing that all such actions should be brought in the name of the King. This became the common law of the United States, and unless a statute expressly provides that the action shall be in the name of the informer, it must be in the name of the State, on relation of (*ex rel.*) the informer. These actions are to be distinguished from the so-called popular actions where the informer is entitled to the whole penalty. See PENALTY.

QUITCH. See AGROPYRON; COUCH GRASS.

QUITCLAIM. A deed of conveyance, deriving its title and in large part its form from the ancient instrument of release, whose operative words were "remise, release, and forever quitclaim." Though this language continues to characterize the quitclaim deed, it is in its operation, in many of the United States, much more than a deed of release and is in fact the form of conveyance usually adopted to make a grant of lands, answering the purpose of either a release or a grant. It is, indeed, the simplest form of transfer of a freehold. So far as the conveyance of the title is concerned it has all the effect of the more usual warranty deed, the advantage of the latter being that it adds to the mere conveyance the personal obligation of the grantor to warrant and defend the title transferred. See DEED; GRANT; RELEASE; WARRANTY.

QUIT'MAN. A city and the county seat of Brooks Co., Ga., 250 miles southeast of Atlanta, on the Atlantic Coast Line and South Georgia and West Coast railroads (Map: Georgia, C 5). It is the centre of a cotton-raising, lumbering, stock-raising, and farming territory and carries on an extensive trade in ham and bacon. Pop., 1900, 2281; 1910, 3905.

QUITMAN, JOHN ANTHONY (1799–1858). An American soldier and politician, born in Rhinebeck, N. Y. He was admitted to the bar in 1821 and removed at once to Natchez, Miss. In 1827 he was a member of the State Legislature, to which he presented the draft of a new militia system. From 1828 to 1834 he was Chancellor of the State, but resigned and was elected to the State Senate, of which he became President. For a few months he was acting Governor. Brigadier general of volunteers from the outbreak of the Mexican War, Quitman, when under discretionary orders, forced his way into the heart of the city of Monterey with 500 men, for which act a sword was later presented to him by Congress. He was brevetted major general in 1846 and subsequently led the assault at Vera Cruz, commanded the expedition against Alvarado, was with General Worth in the capture of Puebla, and served with distinction at Chapultepec, where he carried the Belen Gate. Upon the capture of the city of Mexico he was made its governor by General Scott. He had already become major general (1847). After his election as Governor of Mississippi in 1849, negotiations were carried on between Quitman and General López relative to a filibustering expedition to capture Cuba. Although the Governor, it appeared, had refused to head such a raid, he was indicted, resigned office, and was tried. The jury disagreed. In 1854 he was again interested in an expedition against Cuba and was arrested but not tried. From 1855 to 1858 he was a member of Congress and served as chairman of the Military Committee. Consult J. F. H. Claiborne, *Life and Correspondence of John A. Quitman* (2 vols., New York, 1860).

QUITO, kē'tō. Capital of Ecuador and of the

Province of Pichincha and see of the archbishopric of Ecuador, in lat. 0° 14′ S. and long. 79° 45′ W., about 165 miles in a direct line northeast of Guayaquil and 114 miles from the Pacific (Map: Ecuador, B 4). The city is built on very uneven ground in a lofty plateau surrounded by some of the highest peaks of the Andes. Its west part stands on the lower slopes of the volcano Pichincha. The climate is healthful, mild, and equable. The plan of the city is rectangular, with outlying suburbs. The streets, which run nearly with the cardinal points of the compass, are steep and generally impassable for wagons. Traversing the city east and west are two deep ravines, one of which is arched over. The bulk of the city consists of low, mean adobe houses, the better houses being covered with stucco or plaster. The style of the public buildings is characteristically Spanish. Of the several plazas the principal and largest is the Plaza Mayor, whose elevation above sea level is 9343 feet. Occupying the south side of this plaza is the cathedral; on the north side is the Archbishop's palace, on the west the government palace, and on the east the city hall. The Jesuits' church, with elaborately carved façade, is regarded as the best edifice in the city. There are various other churches and 11 large monastic establishments, of which 6 are for nuns. The convent of San Francisco is one of the largest in the world. At the head of the educational system is the university, an antiquated institution, which maintains faculties of law, medicine, and theology for a few students. Connected with the university are a library, a museum, an astronomical observatory, and a technical school. There are several seminaries, secondary schools, etc. There are a few manufactures, such as leather, saddles, shoes, ponchos, blankets, carpets, etc. The railway, 297 miles in length, connecting Quito with Durân, opposite Guayaquil, was completed in June, 1908. Various modern improvements, including electric lighting, have been installed. Pop., 1906, 50,841 (22,763 males, 28,078 females); of the total 1365 were foreigners, mostly Colombians. Estimated population in 1915, 70,000.

Quito is one of the oldest cities of South America. It was the capital of an ancient Indian nation before it was captured in 1470 by the Inca Tupac Yupanqui. It was the northern capital of the Incas until it was taken by the Spaniards in 1534. The city remained the capital of the Presidency of Quito till the end of Spanish rule in 1822. It has suffered repeatedly from severe earthquakes, notably in 1797, 1844, 1859, and 1887, and has also been ravaged by civil wars. Consult: Ternaux-Compans, *Histoire du royaume de Quito* (Paris, 1840); Herrera, *Apuntes para la historia de Quito* (Quito, 1874); C. R. Enock, *Ecuador* (London, 1914).

QUITRENT. Originally a fixed rent due from a freehold tenant to his feudal superior, so called because received in lieu of all other rents or services. It was a common feature of socage tenure and came in course of time to designate any fixed rent due from a socage tenant. Quitrents were protected from abolition by the provisions of the Statute of Military Tenures. It is probable, however, that they have become entirely obsolete in the United States, excepting in Pennsylvania, where they survive to a limited extent, though there is no legal objection to their survival elsewhere in the States formerly subject to socage tenure. Quitrents still exist to a considerable extent in England, though they have largely been redeemed under the provisions of the Conveyance Act of 1881. Consult the authorities referred to under REAL PROPERTY.

QUIT'TOR (connected with LG. *kwater, kwader*, rottenness). A fistulous wound at the top of the horse's foot resulting from bruises, and other wounds of the coronet, neglected corns, and unknown causes.

QUIX'OTE, *Sp. pron.* kē-hō'tā, DON. See CERVANTES.

QUOD'LIBET (Lat., what one pleases). A humorous combination of several melodies in use extensively during the sixteenth and seventeenth centuries. To-day it is a favorite amusement at a *commers* (a students' gathering) in Germany to continue the singing of a popular folk or drinking song until a certain word is reached, which happens to be the first word of another well-known song. The air is then broken off suddenly and the new air begun at that word, until another word again affords an opportunity to pass into a new air.

QUOITS, kwoits *or* koits (from OF *coiter, coitier, quoitier*, to press, incite; probably from Lat. *coactare*, to constrain, frequentative of *coagere, cogere*, to urge, from *co-*, together + *agere*, to lead). A game played on a green at each end of which, 18 yards apart, a mark is placed. In formal matches it is required by some rules that this mark shall be an iron bar sunk into a bed of clay to the level of the surface. At this mark the quoits, iron concave rings not to exceed 8½ inches in diameter (of which the rim must not be more than 2½ inches in breadth), are pitched. Each player pitches two quoits in succession. The game is won by the side which, in a given number of pitches, gets the greatest number of quoits nearest the marks or pins. No quoit counts unless fairly delivered on the clay, free from the outer rim, and no quoit on its back counts unless it holds clay or is knocked out by another quoit. No quoit rolling on to clay counts unless it has first struck another quoit or the pin. In counting the two quoits nearest to the pin count one point each, a ringer, i.e., a quoit which has been pitched so that the pin shows through the open centre of the quoit, counts two points. These rules are modified to some extent by various associations. The sport is common in Europe and Scotland, and in the United States has been organized into an annual contest for the Bell quoit medal, given by David Bell, of Buffalo, N. Y., in 1868. Consult *How to Pitch Quoits*, Spalding's Athletic Library, Group 11, No. 167 (New York, issued annually).

QUORATEAN, kwō'rā-tē'an. See KAROK STOCK.

QUO'RUM (Lat., of whom, abbrev. of the ML. phrase *quorum A. B. unum esse volumus*, of whom we wish A. B. to be one). A legal and parliamentary term denoting the number of members of a public or private assembly whose presence is necessary for the transaction of business. In the case of private corporations the quorum necessary to enable the directors to transact business legally is fixed by the charter. In the case of private organizations it is fixed by their constitution or by-laws. In the case of legislative assemblies and constituent bodies it is generally fixed by the constitution, but is sometimes left to the determination of the assemblies themselves. The quorum is usually fixed at a majority of the legal number of members elected, although there are notable excep-

tions to this rule. In the Parliament of Great Britain the quorum is determined by each chamber for itself. In the House of Commons it is fixed at 40 members; in the House of Lords at 3. In the German Empire the Constitution fixes the quorum of the Imperial Diet at a majority of the legal number of members. The Federal Council is left to fix its own quorum and the practice requires simply the presence of the chairman, the Lord Chancellor. In France the determination of the quorum in the case of the French Parliament is left to each Chamber separately. By a rule of procedure it is fixed at a majority of the legal number of members of each House. In the United States the Federal Constitution fixes the quorum of the Senate and the House of Representatives at a majority of the whole number of members elected to each House. Until the Fifty-first Congress (1890) it was the practice in the House of Representatives, in ascertaining the presence of a quorum, not to count those present but not voting. This enabled the minority to obstruct the legislative procedure quite frequently and the practice became so annoying to the majority that Speaker Thomas B. Reed (q.v.) introduced the policy of counting, for the purpose of making a quorum, all members present and refusing a vote.

QUOTID'IAN FEVER. See AGUE; MALARIA AND MALARIAL FEVER

QUO VADIS, kwō vä'dĭs (Lat., Whither goest thou?). An opera by Nouguès (q.v.), first produced at Nice, Feb. 9, 1909; in the United States, March 25, 1911 (Philadelphia).

QUO VADIS. A story of Rome in the time of Nero by Henryk Sienkiewicz (q.v.), named from the legend of St Peter at Rome. Published in 1895, it has been translated into more than 30 languages, and was first dramatized in 1901.

QUO WARRAN'TO (Lat., by what warrant). A legal action or proceeding brought to determine the right of an individual or corporation to exercise a public office, franchise, or privilege, and to have a usurper removed by order of a court of competent jurisdiction. This remedy is said to have originated in the twelfth century in England, and was originally commenced by a writ issuing in the name of the crown and commanding the alleged usurper to show by what warrant he claimed the right or privilege in question. The inquiry was made by a royal commission, and the person named in the writ was often deprived of the rights he claimed without judicial proceedings. To remedy this a statute was enacted in the reign of Edward I requiring that such cases should be tried by a judicial action. This was begun by an "information in the nature of a quo warranto" filed by a public prosecutor on behalf of the crown. By a statute in the reign of Anne private individuals were permitted, on obtaining leave from court, to file such informations.

In most of the United States such proceedings are brought in the name of the Attorney-General of the State in his official capacity or in his name on relation of a private individual. These proceedings can only be brought in the highest courts of original jurisdiction or, in some instances, in appellate courts. In most States quo warranto proceedings may be brought against persons wrongfully claiming to occupy public offices; against the officers of private corporations where the latter assume unlawful privileges and powers; against the officers of public or municipal corporations, where franchises are unlawfully exercised by them; or against any person unlawfully claiming and exercising control over a public franchise or privilege such as a ferry franchise or banking privileges. The right of a foreign corporation to do business in a State may be questioned in this manner. Defeated candidates sometimes cause an investigation into the election returns and the rights of their successful opponents by quo warranto proceedings, but many States have provided special statutory proceedings for determining contested elections. A quo warranto proceeding can only be brought to try a right or eligibility to an office and not to remove a lawful incumbent for official misconduct. Consult: J. L. High, *Treatise on Extraordinary Legal Remedies* (3d ed., Chicago, 1896); T. C. Spelling, *A Treatise on Injunctions and Other Extraordinary Remedies* (2d ed., 2 vols., Boston, 1901); also statutes of the various States for details.

QVIGSTAD, kvĭg'städ, JUST KNUD (1853–). A Norwegian philologist and educator, born in Lyngen. Educated at the University of Christiania, he was rector of Tromsö Seminary for Teachers (1883-1909) and Minister of Public Instruction in W. Konow's ministry until 1912, when he resigned and returned to his rectorship. Qvigstad gained an international reputation by his knowledge of the Finno-Ugrian and Lappish languages and of the ethnography of these peoples, fields in which he published many works.

QVISTGAARD, kvĭst'gärd, J. W. VON REHLING (1877–). A Danish miniature painter, active chiefly in the United States. He was born at Örsholtgaard, Tikjob Parish, of a noble Danish family, and graduated from the Royal Agricultural College at Copenhagen. Against the wishes of his family he became a painter, studying for a short time with Johan Rohde in Copenhagen, after which he removed to America (1901). Although he was virtually self-taught, his art is distinguished by a superior technique, especially in draftsmanship. In an unusual manner he combines the excellent color and stippling methods of the old miniaturists with the broad and flowing brushwork of contemporary art. In 1906 he removed to London and thence to Paris. In 1909 he was summoned to Copenhagen to portray the King and Queen and other members of the royal family, including Prince Hans and Princess Marie. In 1912 he returned to New York, where he resided thereafter. Qvistgaard participated in the chief miniature exhibitions of Europe and the United States and held special exhibitions at Ghent (1913) and New York (1914). His best work comprises the miniatures of Dr. George C. Williamson (1907), the well-known authority on miniatures; Countess Danneskiold-Sansoe (1910); Mr. and Mrs. Charles M. Pratt of Brooklyn (1914); Mrs. Paul Reinhardt (1915); and an oil portrait of Theodore Roosevelt (1913).

R

R The eighteenth letter and fourteenth consonant of the English alphabet. It is the Latin form of the Greek *rho*, which corresponded to the Semitic *rēsh*, meaning head, the letter rudely representing a face in profile. For the development of the form of the letter, see ALPHABET.

In phonetic value *r* may be either consonantal or vocalic, and in Sanskrit this distinction was denoted by different symbols. *R* is a consonant only when it immediately precedes a vowel, as *rill, ran, crack.* As a consonant it is a continuous spirant, voiced or voiceless, and is produced by allowing the breath to pass between the raised tongue point and the ridge of the upper gums. Initial English *r* is pronounced thus in such words as *ring, ribbon.* Trilled *r*, common to French and German, is produced by the vibrations of the tongue point or of the uvula. The latter is called the uvular *r* and is found only in French, where it has gradually replaced the lingual *r*. After vowels *r* is often sounded as the obscure vowel *ə* (= *a* in *sofa*), *care, hire, four.* English *r* in *red* is the medium alveolar sound, but after *t* in *try* and, to a less degree, after *d* in *dry*, the opening is so restricted that the sound is distinctly buzzed. *R* may be voiceless in combination with other voiceless letters, as *pride, try.* The so-called cerebral or cacuminal *r*, found in the modern Hindu dialects and in various parts of south England and America, is produced by elevating the tongue point towards the roof of the mouth. Sometimes the *r* is of a purely vocalic nature, forming syllables by itself. This vowel, found in Sanskrit and many of the Slavic dialects, forms the last syllable in the English *mother* and *father.* It is believed by many scholars to have existed in Indo-European.

R represents an original Indo-Germanic *r*, as Skt. *rudhira*, Gk. *ἐρυθρός*, Lat. *ruber*, Eng. *red;* Skt. *dvar*, Gk. *θύρα*, Lat. *fores*, Eng. *door.* It may also represent a Germanic *z* (Indo-Germanic *s*), which became *r* by the operation of Verner's law (q.v.). It is closely related to *l* (q.v.), with which it frequently interchanges, as in Skt. *rabh* and *labh*, to seize, especially as a result of dissimilation, as Gk. *κεφαλαλγία*, beside *κεφαλαργία*, headache, Latin *turtur*, English *turtle dove*, Lat. *luscinìola*, Fr. *rossignol.* The Greeks had two types of *r*, *ῥ* (rough breathing) and *ῥ* (soft breathing). The Romans transliterated the former (spiritus asper) by *rh*, whence the *rh* in words from the Greek through the Latin, as *rheumatism, rhetoric.* Words derived directly from the Greek, if recently acquired, usually disregard this Latin spelling, as *raphe.*

As a mediæval Roman numeral R = 80, $\overline{\text{R}}$ = 80,000. R. A. = Royal Academy, Royal Arch, Royal Artillery; R. M., Royal Marines; R. N., Royal Navy; R. C., Roman Catholic.

In prescriptions ℞ (*recipe*) = take.

• Consult: Maurice Prou, *Manuel de paléographie* (3d ed., Paris, 1910); Victor, *Elements of Phonetics*, translated by Rippmann (5th ed., London, 1910); Daniel Jones, *Outlines of English Phonetics* (Leipzig, 1914); Passy, *Petite phonétique comparée des principales langues européennes* (2d ed., Leipzig, 1912).

RA, rä. An Egyptian deity. See RÊ.

RAAB, räp. A royal free city in Hungary. See GYÖR.

RAABE, rä'be, HEDWIG (1844–1905). A German actress, born in Magdeburg She began to appear upon the boards in childhood and at 14 became connected with the Thalia Theatre at Hamburg, then with Wallner's Theatre in Berlin, and in 1864–68 was engaged at the Imperial German Theatre in St. Petersburg, whence she visited Germany annually on starring tours. Her great success on these occasions induced her to devote herself exclusively to this mode of professional life, in the course of which she acted also in the United States (1886-87). In 1871 she married Albert Niemann (q.v.) Although she did more than full justice to classical rôles, her forte lay in the representation of naïve parts and the youthful characters of modern French and German comedy.

RAABE, WILHELM (1831-1910). A German novelist. He was born at Eschershausen, Brunswick, Sept. 8, 1831, and studied in Berlin. He first became known as Jakob Corvinus, the surname being a Latinization of his own. In 1901 the University of Jena conferred upon him the degree of Ph.D. *honoris causa.* He began his career with the very successful idyl *Die Chronik der Sperlingsgasse* (1857; 60th ed., 1912), which in the estimation of some remains his best work, and during the succeeding half century produced many novels and short stories which have become famous. Raabe died in Brunswick, Nov. 15, 1910. His work shows the influence of Jean Paul, E. T. A. Hoffmann, and K. Immermann, but his style, somewhat diffuse, is distinctly his own. In depth of feeling, richness of emotion, fullness of thought, and serious humor he is surpassed by few. He excels in the delineation of eccentric characters. Among his novels the most prominent are: *Der Hungerpastor* (3 vols., 1864; 30th ed., 1912); *Unseres Herrgotts Kanzlei*

(2d ed., 1879); *Abu Telfam, oder die Heimkehr vom Mondgebirge* (3 vols., 1867; 2d ed., 1901); *Der Schüddcrump* (3 vols., 1870; 3d ed., 1901); *Alte Nester* (1879; 2d ed., 1903); *Das Odfeld* (1888). Among his tales may be mentioned *Horacker* (1876; 15th ed., 1910); *Im alten Eisen* (1887); *Stopfkuchen: eine See- und Mordgeschichte* (1891); *Die Akten des Vogelsangs* (1895); *Des Reiches Krone* (1896); *Die Gänse von Butzow* (1906). The tale *Altershausen* was published from his literary remains in 1911. Consult: Paul Gerber, *W. Raabe* (Leipzig, 1897); W. Brandes, *W. Raabe* (Wolfenbüttel, 1901, 1906); H. Hoffmann, *W. Raabe* (Berlin, 1907); H. A. Krüger, *Der junge Raabe* (Leipzig, 1911), bibliography in appendix; H. Spiero, *W. Rabbe* (Bielefeld, 1911); also R. M. Meyer, in *Die deutsche Litteratur der 19. Jahrhunderts* (Berlin, 1900).

RAASH, ra-äsh'. See ELECTRIC FISH.

RAB. See ABBA ARIKA.

RABAH ZOBEIR, rä'bä zō-bār' (c.1846–1900). An African chieftain and the conqueror of Bornu (now in British Nigeria). At first he was a follower of Zobeir Pasha, whose slave-raiding forces he commanded in 1879 in Bahr el Ghazal. Defeated by the soldiers of the Khedive in that year, he then established himself in the southern part of Wadai. In 1891 he obtained 300 rifles that had been taken from a French explorer, Paul Crampel, who was killed; two years later he conquered the Sultanate of Bornu on the shores of Lake Chad, and in 1897 he forced the newly installed French resident at Lake Chad to flee. In 1899 and 1900 he fought three battles with a French expedition, and in the last engagement was killed.

RAB AND HIS FRIENDS. A touching short story of a dog by Dr. John Brown (q.v.), a Scottish physician, published in his *Horæ Subsecivæ* in 1855.

RABA'NUS (or HRABANUS) **MAURUS** (c.776–856). A great ecclesiastic and teacher of the ninth century. He was born at Mainz of noble family, began his education at Fulda, entered the Benedictine Order at an early age, and in 801 received deacon's orders. The following year he was sent to continue his studies at Tours, under Alcuin, from whom he received his surname, Maurus, after St. Maur, the disciple of Benedict. In 803 he became head of the school at Fulda, which flourished greatly under his direction. In 814 he was ordained priest; in 822 he was chosen abbot of Fulda, and performed his duties with much ability till 842, when he resigned and withdrew to the cloister of St. Peter to devote himself to literature. In 847 he became Archbishop of Mainz. He died at Winkel on the Rhine, Feb. 4, 856. Rabanus took an active part in opposing Gottschalk (q.v.) and his theories about predestination, and also the doctrines of Paschasius Radbertus with regard to the Eucharist. His voluminous writing, upon most diverse subjects, include a Latin-German glossary on the Bible, a sort of encyclopædia, *De Universo Libri XXII*, commentaries on the books of the Old and New Testaments, and poems. They are reprinted in Migne, *Patrologia Latina*, cvii.–cxii. His writings on education have been edited in German by Freundgen (Paderborn, 1889); his *De Institutione Clericorum Libri III* by Knoepfler (Munich, 1901). Consult for his poems, E. Dümmler, *Poetæ Latini Ævi Carolini*, vol. ii (Berlin, 1884); for his life, Friedrich Kuntsmann, *Hrabanus Magnentius Maurus* (Mainz, 1841); T. Spengler, *Leben des heiligen Rhabanus Maurus* (Regensburg, 1856); also A. F. West, *Alcuin and the Rise of Christian Schools* (New York, 1893), and Hastings Rashdell, in *Universities of Europe in the Middle Ages* (ib., 1895).

RABASA, rä-bä'sä, EMILIO (1856–). A Mexican statesman. He was educated for the legal profession at the University of Mexico and devoted himself exclusively to international jurisprudence, in which field he became the leading Mexican authority. During the Díaz régime he was one of the founders and a leader of the Científico party, which exerted a powerful influence in the politics of Mexico. Besides works on law he wrote numerous novels. In 1914 he was one of the Huerta delegates to the conference at Niagara Falls called to discuss the relations of the United States and Mexico.

RABAT, rä-bät', or NEW SALLEE (also REBAT, RBAT, ARBET, ETC.). A seaport and fortified town of Morocco, situated at the mouth of the Bu Regreg opposite Sallee (Map: Africa, D 1). It has numerous European houses, an arsenal, and a high minaret of the old Hassan mosque. The town is famous for its manufactures of carpets, mats, cloth, pottery, and morocco leather. The port is not easily accessible, but there is considerable import trade and a foreign trade in olive oil, wool, skins, and bones, the total exports in 1913–14 being valued at $177,705, while the imports totaled $4,839,040. Pop., 30,000, with 160 Europeans.

RABBAH, rä'bä, or RABBATH BENE AMMON (Heb. *Rabbath bĕnē 'Ammōn*, Rabbah of the Ammonites). The chief city of the Ammonites, now known as Amman (Map: Palestine, D 4). It was east of the Jordan, about 25 miles northeast of the Dead Sea, in the valley of the Jabbok. In Deut. iii. 11 the iron bedstead of Og, King of Bashan, is mentioned as being at the time of the author in Rabbah of the sons of Ammon. The city was attacked and after a long siege captured by David and Joab (2 Sam. x–xii), who made the Ammonitish King a vassal (Amos i. 13–15; Jer. xlix. 2–3; Ezek. xxi. 20, xxv. 5). In the eighth and seventh centuries it was independent. Ptolemy II Philadelphus (285–247 B.C.) captured it, rebuilt it and called it Philadelphia, and for a long time it was a flourishing city. (See PHILADELPHIA.) Amman is to-day a prosperous town inhabited by Arabs and Circassians. There was another Rabbah or Rabbath in Moab, which was known to the Greeks and Romans, although not mentioned in the Bible; and still a third in the mountains of Judæa (Josh. xv. 60).

RABBI, răb'ī (Heb., Aram. *rabbī*, my lord). An honorary title applied to Jewish teachers of the law and, in general, to those versed in the law. In the days of Jesus the title had not yet acquired a strictly technical sense and is properly to be interpreted in the New Testament as a courteous title indicative of respect. Jesus himself is frequently addressed by his disciples as Rabbi (Matt. xxvi. 25, 49; Mark ix. 5, xi. 21, xiv. 45), and in John iii. 26 John the Baptist is called Rabbi. Rabboni, which is applied to Jesus in Mark x. 51 and John xx. 16, has the same force, but implies somewhat more of respect. In later times, in consequence of the dissolution of the temple cult, authority in religious matters fell into the hands of the scholars, and the title Rabbi acquired an official significance and became restricted to those authorized to decide ritualistic and legal questions. This

usage arose in Palestine, apparently in the second century; in Babylonia the corresponding title was *Rab* or *Mar*. Through Palestinian influence the usage spread to other countries. Rabbi is still maintained, though not strictly, as the official designation of Jewish ministers; formerly it was applied to any scholar, whether engaged in the active ministry or not, and this is, in a measure, still the case in eastern Europe. For the education of rabbis academies were established in ancient times in Jamnia and Tiberias, in Sura, Nehardea and Pumbadita; and in 1915 there were seminaries and colleges at Breslau, Berlin, Vienna, London, Paris, Padua, Budapest, Cincinnati, Philadelphia, and New York. Consult: Emil Schürer, *History of the Jewish People in the Time of Christ*, vol. ii (Eng. trans., New York, 1896); G. H. Dalman, *Die Worte Jesu* (Leipzig, 1898); P. W. J. Fiebig, in *Die Religion in Geschichte und Gegenwart* (Tübingen, 1913).

RAB'BIT (connected with dialectic Fr. *rabotte*, ODutch *robbe*, Dutch *rob*, rabbit, Ger. *Robbe*, seal). A European animal (*Lepus*, or *Oryctolagus, cuniculus*) of the same group as the hare, but smaller and with shorter and more equal limbs, which differs essentially from all hares in the fact that the young are born blind and almost hairless, and in its gregarious and fossorial habits. The ears of the wild rabbit are only about as long as the head and show little black at the tips; the fur is grayish brown, growing whitish on the under part; the tail rather large and conspicuous, brown above, white beneath, and ordinarily held upright. The rabbit delights in sandy heaths, dry grounds covered with scattered bushes, and similar situations, where it digs burrows in colonies called warrens. It feeds mainly in the dusk of the morning and evening. It is monogamous and wild pairs are said to remain attached during life, but in domestication it ceases to pair. The fertility of rabbits is proverbial. They begin to breed when six months old and are capable of producing several litters of five to eight young in a year, so that in favorable circumstances they multiply with prodigious rapidity, and were they not killed off would inflict great injury upon crops, gardens, and orchards, especially by barking young trees. The flesh of the European rabbit is excellent food, and the hides and hair may be made useful. They do not become a pest, and in some places not suited to agriculture are raised as a commercial product. This species is a native of the western countries on the Mediterranean Sea, whence it has spread north in Europe. Its introduction and spread in Australasia furnish an extraordinary example of the effect which may follow naturalizing animals to a new country. About 1850 a gentleman living in New South Wales imported and turned loose three pairs of rabbits in that colony. They multiplied and flourished so rapidly that they quickly became a public plague. In New Zealand, indeed, where the rabbit obtained a foothold about 1875, it soon became a serious question whether farmers should not abandon some districts altogether. In order to combat the plague weasels and mongooses were extensively introduced, but these made comparatively little impression upon the hordes of rabbits, while they attacked the poultry, which was almost the only article of farm produce the rabbits had left untouched. An attempt was made to introduce epidemics of parasitic disease among the rabbits, but this also failed to reduce their numbers sufficiently. The only way to meet the pest has been to erect around every garden or farm a rabbit-proof wire fence.

An old English name for the rabbit is "cony," which has led to the application of this term in English versions of the Bible and in common speech elsewhere to quite different animals of small size and burrowing habits. In the United States the word is used interchangeably with "hare"—or, rather, replaces "hare" in popular speech, all the American wild species being called rabbits, though none of them are truly of that species.

Domestic Rabbits. There are 10 well-established varieties of domesticated rabbits, the original stocks of which were derived from almost as many countries. These are Angora, Belgian, Dutch, Himalayan, lop, Siberian, Patagonian, silvertip, Polish, and Flemish. Their characteristics are as diverse as their origin. They vary in color through every grade, shade, and mixture, from pure white to all black; in coat from the closest fur to long silky hair, capable of being woven; in style of ears from the prick ear, erect, small, and almost as stiff as metal, to the floppy, broad, soft-skinned ear of the lop, which hangs to the ground. The development of particular characteristics and markings and their maintenance are made possible by the animal's remarkable fecundity and adaptability. Their food is simple; a meal of whole oats in the early morning, a midday meal of greens and vegetables, and an evening one of a mixture of cornmeal, bran, and oatmeal, kneaded in warm water, meet nearly all their requirements. They are good mothers, need no attention, and the less they are then disturbed the better. The breeding hutch necessarily requires an inner room, dark except for such light as goes through the little round door. In that box, or room, she will make her own nest, and when her young have acquired their sight and fur (about the eighteenth day), they will come peeping out of the door. They should be taken away, one or two a day, when two months old. They can then run together until the fourth month, when the sexes must be separated.

The lop-ear is the oldest variety of the fancy rabbit, having been bred from the English wild rabbit and shown in England considerably over a century. Its most marked feature is the abnormal ears, each 11 to 12 inches in length and 6 in width. The ears fall gracefully from behind the inner corner of the eye, with the convex surface outward; towards the root the ear is narrow and thick, and becomes abruptly broader and proportionately thinner towards the tip. The body in this breed is rather low at the shoulder, and there is a dewlap. The color varies, but the markings should be uniform. A large lop weighs 11 pounds. This is the only variety which requires artificial heat for its full development, and, although the oldest breed, is so entirely artificial that it is maintained and perfected only by the utmost care.

The Belgian, although commonly called Belgian hare, is a true rabbit. It is of large size (10 pounds) and lustrous sandy brown in color. Its body is longer in proportion to its weight than that of any other rabbit, and the hind legs are long, strong, and straight. The head is rather broad, tapering to the nose, the ear about 5½ inches long, thin and transparent, and the eye brown and bright. The flesh is excellent.

Between 1895 and 1900 this rabbit was extensively introduced into the western United States.

The Dutch rabbit, derived from Holland, is one of the smallest of the fancy breeds, not averaging above four pounds. Its hind quarters are solid black, or blue, or lemon, or, rarely, tortoise-shell, except the toes of the hind feet, which are white; its forebody and forelegs are white; it has a white nose and white blaze narrowing to a point on its face between the ears. Its ears and the patch all round the eye and its side face are the color of its hind quarters. The whole-color areas must be absolutely free from black or white hairs, and their borders clear and sharply defined. They are a very hardy race and excellent mothers. The Angora, a curious long-bodied rabbit, is a native of Asia Minor and, like the Angora goat and cat, has a long silky coat, which is so long that it can be combed or clipped periodically and the wool woven. The hair is all white in typical examples, though sometimes black or fawn, and of two lengths, the first woolly and short, the second long and hanging in semicurls all over the body. When the wool is white the eye is pink; in other varieties it shades accordingly. They average about nine pounds in weight and are hardy. The Siberian rabbit, bred mainly in France and very prolific, is a cross between the Angora and the Himalayan, having the long silky hair of the one and the dark points of the other. The Himalayan's native home is northern China and Tibet, and he is bred in Europe for the value of his skin. His limbs, nose, ears, and tail are black, the rest of the body white. This black tipping has caused his skin, the coat of which is short and glossy, to be sometimes called mock ermine. The eye is a singularly rich golden crimson, bright and fiery. These rabbits breed as a rule very true, are smart, neat, hardy, and docile. They vary in weight from four to six pounds. The Patagonian derives its name from its great size alone, since it is really little else than a wild rabbit, bred up to 12 to 16 pounds in weight. The same may be said of the Flemish giants, some specimens of which weigh 18 pounds. They grow quickly and are profitable for market sale.

The silvertip is a fancy breed, characterized by upright ears, large prominent eyes, well-formed body, and a coat evenly silvered, with about 25 per cent of light hairs. When first born the silver grays are a slate blue, and after about a month they look quite black, but at their first molt this changes to a real silvering or light color, which is perfected by the second molt, when they show the much-desired blue tint. The silver browns are bred from the silver-gray bucks, crossed with deep-colored Belgian does. The cream or fawn varieties result from other cross breedings. They are medium-sized rabbits, seven pounds being the approved weight. The Pole is a delicate little all-white rabbit, often weighing only three pounds, which inhabits Poland in its wild state, but is distributed all through Switzerland and France, especially in Provence. The ears are short, upright, and soft, and the eyes are light red. See Plate of HARES AND PIKA.

Lane, *Rabbits, Cats, and Cavies* (New York, 1903); W. E. Castle and others, *Studies of Inheritance in Rabbits*, published by the Carnegie Institution (Washington, 1909); B. A. Bensley, *Practical Anatomy of the Rabbit* (Philadelphia, 1910); G. A. Townsend, *Practical Rabbit Keeping* (New York, 1912).

RABBIT BOT. The larva of one of the bot-flies (*Cuterebra cuniculi*) which is commonly found under the skin of rabbits, where it forms a large tumor. The adult insect is a large fly, almost as large as a bumblebee and having some resemblance to that insect. The head is black and the thorax is covered with yellow-brown hair, the first segment of the abdomen with yellow hair, and the rest of the abdomen is blue black. See BOT.

RABBIT FISH (so called because the front teeth resemble the incisors of a rabbit). A rather large, coppery-brown fish (*Promethichthys prometheus*) of the Middle Atlantic, especially frequent about Madeira and the Bermudas. It is one of the escolars (see ESCOLAR) and is known to Bermudans as catfish, but about Madeira is called coelho or conejo. Although it cannot be caught except on the bottom at depths of from 100 to 400 fathoms, it is one of the commonest and cheapest market fishes in the islands mentioned.

This name is given also to the common bur fish of the southern United States. See PORCUPINE FISH.

RABBITMOUTH. See CUTLIPS.

RABELAIS, rȧ'b'-lȧ', FRANÇOIS (c.1495–c.1553). A great French satirist and humorist, born at La Devinière, near Chinon, in Touraine. Rabelais's life has been so surrounded by legend that until the past few years it has been very difficult to distinguish facts from mere inventions. Thanks to recent discoveries, however, we are able to a certain extent to reconstitute the biography of this remarkable man. Though many dates have been assigned to his birth, 1495 is now generally accepted as the most probable, in spite of the fact that there are still some biographers who, following De Thou, prefer 1490. His father, Antoine Rabelais, lord of Lerné, was a prosperous lawyer of Chinon and had four children, three sons and a daughter. Tradition records that François began his studies at the Benedictine abbey of Seuilly about 1505 and passed thence to a similar institution at La Baumette, near Angers, where he made the acquaintance of the three Du Bellay brothers (see BELLAY) and of Geoffroy d'Estissac, afterward Bishop of Maillezais. According to a legal document dated April 5, 1519, he entered that year the Franciscan monastery at Fontenay-le-Comte in Poitou, where he won the friendship of the influential lawyer André Tiraqueau and where, with another monk named Pierre Amy, he continued with enthusiasm the study of Greek, which, however, was frowned upon by the ecclesiastical authorities. The annoyances to which they were subjected by the other monks probably led the two enthusiasts to seek the protection of the distinguished scholar Budæus or Budé (q.v.) with whom they carried on a correspondence in Latin and Greek. But as the persecutions did not cease, Amy left the monastery, and Rabelais prevailed upon D'Estissac to secure from Clement VII permission to return to the Benedictines. This permission being granted him in 1524, he entered at once the abbey of Maillezais, and soon after became the secretary of his friend and protector D'Es-

tissac, who lodged him in his château in the near-by village of Ligugé. This position afforded the young monk sufficient leisure to acquire the encyclopædic knowledge which characterizes his work. But after about four years of this quiet life he began to grow restless and, putting aside his habit, took up the life of a wandering student, visiting all the important university towns of the South for the purpose of improving his knowledge of medicine in which he had become greatly interested. He was welcomed everywhere not only because of his gay spirit, but especially because he knew six languages and was well versed in law, astronomy, and natural history. He finally went to Paris, probably early in 1529, with the intention of continuing his medical studies, but disappeared soon after the execution of Louis de Berquin, who was burned for heresy on April 17 of that year. We next hear of Rabelais as a medical student at Montpellier, where he matriculated on Sept. 17, 1530, and received his bachelor's degree on the first of the following November. Being required by the regulations of the medical school to deliver a course of lectures for three months, he chose the *Aphorisms* of Hippocrates and Galen's *Art of Medicine*. He brought his lectures to a close on June 24, 1531, and passed the summer of that year playing in a comedy entitled *The Dumb Wife*. On Oct. 23, 1531, he was again at Montpellier, but remained only a short time, going thence to Lyons, which at that time rivaled Florence as the great book centre of Europe. Here he issued his first important publications—the *Medical Letters* of Giovanni Manardi of Ferrara in June, 1532, a reprint of the *Aphorisms* of Hippocrates in July, and the *Last Testament* of Lucius Cuspidius in September. At the same time his humor was finding expression in popular almanacs, the underlying purpose of which was to make sport of astrologers and their art. One of these burlesques which he edited under the title *Les grandes et inestimables cronicques du grand et énorme géant Gargantua* was so successful that it led him a few months later (October, 1532) to write a sequel developing in a more elaborate form the account of Gargantua's son Pantagruel. This work, which was destined to form the second book of Rabelais's great satire, was entitled *Les horribles et espouvantables faicts et prouesses du très renommé Pantagruel, roy des Dipsodes*. Two years later, after having paid a visit to his native land, he developed the story of Gargantua, mingling in it some events which had recently transpired at La Devinière. Thus, the *Vie inestimable du Grand Gargantua, père de Pantagruel*, which is logically the first book of his great satire, was posterior chronologically to the second book.

Thanks to his learned publications, Rabelais was appointed in November, 1532, physician in the public hospital of Lyons, notwithstanding the fact that he did not yet have his doctor's degree. The esteem in which he was held by his contemporaries is shown by the letter that he addressed to Erasmus (q.v.) on the thirtieth of that month. It was probably about this time also that occurred the death of Rabelais's son Théodule, that mysterious "child of two months," eulogized in the Latin verses of the learned Toulousan jurist Boyssonné. The condemnation of *Pantagruel* by the Sorbonne on Oct. 23, 1533, probably inspired Rabelais to seek foreign climes. Anyhow in January, 1534, he accompanied Jean du Bellay, Bishop of Paris, on a special mission to Rome. Letters written by him during his sojourn in Italy contain interesting data on the plants and natural curiosities of the country. He also gathered materials for a topography of Rome in which he was unfortunately anticipated by a Milanese antiquarian named Marliani. However, immediately after his return to Lyons on April 11 of that year, Rabelais began to prepare a new edition of the work of Marliani, which appeared in September following. But the affair of the placards of Oct. 18, 1534, followed by months of severe persecution, interrupted the tranquil life of Rabelais. The expiatory procession of Jan. 21, 1535, in which the King and the royal family took part, served as a warning to all those suspected of heresy. Finding his situation precarious, Rabelais disappeared suddenly from Lyons, and accordingly the rectors of the public hospital were obliged, after waiting in vain for a month, to fill his position by electing a successor. In the middle of the summer of 1535 he was again in the retinue of Bellay, who was on his way to Rome to receive the red hat. After visiting Ferrara and Florence, the party reached Rome towards the middle of August. Rabelais corresponded diligently during his second Italian sojourn with the Bishop of Maillezais on matters of horticulture, politics, and Roman gossip, but chiefly concerning his efforts to secure from the Pope an indulgence to resume the Benedictine garb and to practice medicine, excluding surgery. This indulgence was finally granted him on Jan. 17, 1536, and before the end of the month of April Rabelais was back in France. It is quite probable that before August 17 following he was admitted as canon in the monastery of Saint-Maur-des-Fossés, of which Jean du Bellay was abbot. In February, 1537, he visited Paris and attended a banquet given in honor of the printer Dolet (q.v.), who had just been pardoned for having killed the painter Compaing. Two months later (April 3) he was back in Montpellier, where he received his doctorate from the faculty of medicine on May 22, returning in August to Lyons, where he came under the strict surveillance of the Cardinal de Tournon. Before the 27th of September he took up his duties as professor at Montpellier and began his courses on Hippocrates on October 18. After the close of his lectures on April 14, 1538, Rabelais took part as *maître des requêtes* in the interview between Francis I and the Emperor Charles V at Aigues-Mortes (July, 1538). He then seems to have followed the King and his court to Lyons, where we lose sight of him for some time. It is quite possible that he returned to Montpellier some time during the year 1539, for on August 13 of that year a student of the medical school chose him as his patron. However that may be, in July, 1540, he was at Turin, where he served as physician to the Viceroy of Piedmont, Guillaume du Bellay, brother of the Cardinal. According to the letters of Bishop Pellicier, Ambassador to Venice, Rabelais was then engaged by him to seek Hebrew, Syriac, and Greek manuscripts for the royal library at Paris. Accused, however, of having revealed important diplomatic secrets, he was obliged to return to France in December of that year in order to justify himself. Returning to Italy in March, 1541, he seems to have spent his leisure time in

botanical expeditions and in studying the fortifications which were being constructed about Turin. His interest in military science led him to write a work in Latin on that subject which his friend Massuau translated into French and published in 1542 as *Stratagèmes*. Returning once more to France in November, 1541, this time in company with Guillaume du Bellay, he spent some time at Lyons preparing an expurgated edition of his *Gargantua* and *Pantagruel*, which had enjoyed a somewhat dangerous popularity. He then paid a short visit to his friend Etienne Lorens at the château of Saint-Ayl in March, 1542, and in May returned with Bellay to Piedmont, where he remained until the following December, when he was obliged to accompany his great patron, who had so generously remembered him in his testament, on his last journey to France. In spite of the attentions of the Honor of Medicine, as Rabelais was called by his contemporaries, Bellay died en route near Roanne on Jan. 9, 1543. Rabelais embalmed the body and accompanied the funeral cortège to Le Mans, where the obsequies took place on March 5. Notwithstanding the renown that was attached to his name by this important event, Rabelais disappeared entirely from view; and the next time we hear of him is Sept. 19, 1545, when Francis I granted him the privilege to print the *tiers livre* of Pantagruel, showing that even at that time the *Gargantua* was accounted the first and the original *Pantagruel* the second book. The auto-da-fé of Dolet (q.v.) on Aug. 3, 1546, frightened Rabelais, and he took refuge at Metz, where, according to a letter to Cardinal du Bellay dated Feb. 6, 1547, he was employed as a physician in the public hospital. But after April 10 he left that position and again disappeared. In January, 1548, he issued at Lyons the first 11 chapters of the *quart livre*, and in June accompanied Cardinal du Bellay to Rome, where he wrote a description of the great fête organized by the Cardinal to celebrate the birth of the Duke of Orléans on March 14, 1549. This was published during the same year as *La sciomachie et festins faits à Rome*. Soon after Bellay's return to France Rabelais was nominated curé of Meudon and Jambet (Jan. 18, 1550), obtaining at the same time (August 6) from Henry II the privilege to print the entire *quart livre*. What is probably the last book of his romance appeared finally on Jan. 28, 1552, but it immediately fell under the censorship of the Parlement of Paris (March 1) in spite of the eulogy of the King in the preface. The last years of Rabelais's life are involved in obscurity. It seems that he resigned his curacies on Jan. 9, 1553, and died the ninth of April following, although this date is not very certain. What purported to be a continuation of his masterpiece appeared in 1562 separately as *L'Isle sonante*, and in 1567 was incorporated with the rest as a fifth book. A recension of this book, differing considerably from the others and bearing the date 1549, was discovered in 1900. Though it is regarded as genuine by many of the best authorities, some recall that about that time Rabelais obtained a royal injunction against spurious works issued in his name and think this may be one of them. Parts of it are, however, fully worthy of him.

In *Gargantua* and *Pantagruel* broad humor is mingled with keen social satire, political insight, and pedagogic wisdom, but the work is conspicuously lacking in continuity. Rabelais was neither a drunken buffoon nor a profound philosopher as different legends have represented him, but a genius who expresses in a remarkable way, even though at times under the veil of nonsense, what his contemporaries were thinking and talking about. Though probably begun as a mere piece of humor, his masterpiece assumed in his hands a more serious tone as time went on. The first book treats of Gargantua, son of Grandgousier, a mighty giant who held sway over an insignificant district near Rabelais's birthplace. But along with the farcical adventures of that giant in his war with a neighboring monarch Picrochole, said to be a portrait of a member of the well-known Sainte-Marthe family, and the notable deeds of Frère Jean des Entommeures, the mighty eater and drinker, we have the founding of the abbey of Thélème and the quintessence of Rabelaisian social and pedagogical philosophy. The second book treats of Pantagruel, son of Gargantua, now called King of Utopia, and his faithful friend Panurge, a delightful creation, accomplished, shrewd, but without moral character. The third book contains less humor and more discussion. The debate of Panurge with himself and his counsel-taking with others as to whether he shall marry is perhaps the most famous passage of the romance. It naturally concerns the much mooted question of the position of women. As the heroes decide to consult the oracle of the Holy Bottle, the fourth and fifth books relate the trip to this oracle, based geographically, as M. Lefranc has shown, on the search for the Northwest Passage. When they finally reach the island they learn that the answer of the oracle is "Trinq" (drink). As nearly as may be Pantagruel is Rabelais, in whom humanism is opposed to modern faith. His very uncleanness of speech is the expression of a lusty animalism in revolt against mediæval asceticism, of a militant faith in nature and instinct, in whose sturdy humor and destructive satire is to be found the point of departure of eighteenth-century ethics and of modern realism. Notwithstanding, Rabelais was never in open opposition to the Catholic faith; he was a heretic *jusqu'au feu exclusivement*, who had no use for the severe puritanism of Calvin. Rabelais's influence on the development of prose literature was slight, but his Pantagruel, Panurge, Picrochole, and Frère Jean are imperishable creations.

Bibliography. The first annotated edition of Rabelais was by Le Duchat and La Monnoye (5 vols., Paris, 1711). Among subsequent editions may be noted those by Esmangart and Johanneau (variorum ed., 9 vols., ib., 1823–26); Burgaud des Marets and Rathery (2 vols., ib., 1857); Jannet (6 vols., ib., 1867); Montaiglon and Lacour (3 vols., ib., 1868–72); Marty-Laveaux (6 vols., ib., 1868–1903); and especially the critical edition by Abel Lefranc in collaboration with many others, of which only the *Gargantua* has appeared (2 vols., ib., 1912–13). This edition is to be complete in eight volumes. The best English translations are those of Urquhart and Motteux (London, 1653–94), of which the latest reprint is of 1904, and of W. F. Smith (2 vols., ib., 1893). For a bibliography of the early editions of Rabelais consult Baudrier, *Bibliographie lyonnaise* (11 vols., Lyons, 1895–1914), and P. P. Plan, *Bibliographie rabelaisienne, 1532–1711* (Paris, 1904). For his biog-

raphy, consult Paul Stapfer, *Rabelais sa personne, son genie, son œuvre* (2d ed., ib., 1889); Emile Gebhart, *Rabelais: la renaissance et la réforme* (ib., 1895); Charles Whibley, in *Literary Portraits* (New York, 1904); A. A. Tilley, *François Rabelais*, in "French Men of Letters Series" (Philadelphia, 1907). Other works of importance are: Ligier, *La politique de Rabelais* (Paris, 1880); Le Double, *Rabelais: anatomiste et physiologiste* (ib., 1899); Coutans, *La pédagogie de Rabelais* (ib., 1899); Austin Flint, *Rabelais as a Physiologist* (New York, 1901); Abel Lefranc, *Les navigations de Pantagruel* (Paris, 1904); Louis Thuasne, *Études sur Rabelais* (ib., 1904); Lefranc and Boulenger, *L'Isle sonante* (ib., 1905); V. L. Bourrilly, *Lettres écrites d'Italie, 1535–1536* (ib., 1910); Jean Plattard, *Le quart livre de Pantagruel* (ib., 1910); id., *L'Œuvre de Rabelais: sources, invention, et composition* (ib., 1910); Louis Thuasne, *Villon et Rabelais* (ib., 1911); Pierre de la Juillière, *Les comparisons dans Rabelais* (Halle, 1911); id., *Les images dans Rabelais* (ib., 1912). For detailed bibliography and other special data consult *La revue des études rabelaisiennes*, ed. by Lefranc and others (10 vols., Paris, 1903–12), now continued as the *Revue du seizième siècle* (ib., 1913 et seq.).

RABENER, rä'be-nēr, GOTTLIEB WILHELM (1714–71). A German satirist. He was born at Wachau, near Leipzig, went to school in Meissen with Gellert and Gärtner, and after finishing his studies in Leipzig, in 1741 entered the employ of the tax collector. He wrote for the popular periodicals of the day and especially for the *Bremer Beitrage* and Schwabe's *Belustigungen*. His papers are satiric, but neither bitter nor personal, and marked by clearness and force. While Goethe admired him he criticized the too frequent use of "direct irony." Several common proverbs may be traced back to Rabener. His papers were published at Leipzig (1751–55); with his *Satirische Briefe*, his personal correspondence, and a biography, they were edited by Weisse (1777); other editions followed down to 1840; selected satires (Leipzig, 1888).

RABENHORST, rä'ben-hōrst, LUDWIG (1806–81). A German botanist, who contributed greatly to the systematic study of cryptogams. He was born at Treuenbrietzen, Brandenburg, and after studying at Berlin bought a pharmacy at Luckau, where he lived and worked for 10 years (1830–40). Then, to devote himself entirely to botany, he removed to Dresden and afterward to Meissen. Rabenhorst wrote: *Deutschlands Kryptogamenflora* (1844–53); *Kryptogamenflora von Sachsen, der Oberlausitz, Thüringen und Nordbohmen* (1863–70); *Flora Europæa Algarum Aquæ Dulcis et Submarinæ* (1864–68); *Mycologia Europæa* (1869–82), with Gonnermann; as well as works on general botany. In 1852 he founded the journal *Hedwigia*.

RABIES, rā'bī-ēz. See HYDROPHOBIA.

RABSHAK'EH (Heb. *Rabshākēh*, Bab.-Assyr. *rab-shākē*, chief of the captains). A word which occurs in the Old Testament (2 Kings xviii–xix and the parallel passage, Isa. xxxvi–xxxvii) as the title of the officer sent by Sennacherib with Tartan and Rabsaris (likewise titles of high officials) to demand of Hezekiah the surrender of Jerusalem. The Rabshakeh is represented as delivering his message in Hebrew, in the presence of the people, and when requested to speak Aramaic, at the time the language of diplomatic interchange, so as not to alarm the people by the threats of the Assyrian King, insolently declines to do so. It follows from the choice of the Rabshakeh to convey the message of Sennacherib that he was a high dignitary in the Assyrian army, though not the highest, and this view is confirmed by the occurrence of the title both in Assyrian historical texts and in legal documents and also in lists of officials (e.g., Rawlinson, II, pl. 31, no. 5, 34a). Exactly what position the Rabshakeh occupied is not known, though it is probably not far wrong to regard him as a general staff officer, subject only to the Tartan. The old rendering, "chief cupbearer," is certainly wrong and must be abandoned. Consult Schrader, *Cuneiform Inscriptions and the Old Testament* (Eng. trans., London, 1885–86), and the commentaries on Isaiah and the Books of Kings.

RABUTIN, rà'bụ'tăN', ROGER, COUNT DE BUSSY-. See BUSSY-RABUTIN.

RABUTIN-CHANTAL, MARQUISE DE. See SÉVIGNÉ, MARIE DE RABUTIN-CHANTAL.

RACALMUTO, rä'kal-mōō'tô. A town in the Province of Girgenti, Sicily, situated on the crest of a hill, 12 miles by rail northeast of Girgenti. There are salt, sulphur, and quicksilver mines and a trade in wine and oil. Pop. (commune), 1901, 15,938; 1911, 16,028.

RACAN, rà'kăN', HONORAT DE BUEIL, MARQUIS DE (1589–1670). A French poet, born at La Roche Racan, Touraine. He was a page to Henry IV and in that capacity met Malherbe, whose disciple he became. He served in the army for several years and then retired to his estates. *Les Bergeries*, perhaps the best pastoral play in French, appeared in 1625. It is studied from nature and is his best production. But he had not the sustained force to write a great work and he had little education. This becomes apparent in *Les sept psaumes* (1631), *Odes sacrées tirées des psaumes de David* (1651), and *Dernières œuvres et poésies chrétiennes* (1660), where his limited knowledge of Latin is evident.

RACCONIGI, rák'kô-nē'jê. A town in the Province of Cuneo, Italy, situated on the Maira, 21 miles by rail south of Turin (Map: Italy, A 2). Its palace, surrounded by a park, is the country residence of the King of Italy. The town has a Gymnasium, a technical school, and a large hospital. Silk fabrics, woolen cloths, and shoes are manufactured. Pop. (commune), 1901, 9009; 1911, 10,605.

RACCOON' (from American Indian *arathcone, arrathkune*, raccoon). A small American carnivore (*Procyon lotor*), closely related to the bears. The family (Procyonidæ) is American, with the single exception of the Himalayan genus *Ælurus*. (See PANDA.) The raccoon is to be found all over the wooded parts of temperate North America and most of Mexico, and a second species frequents tropical America. It is about the size of a cat, but more robust in appearance because of its long fur and the semiplantigrade feet. The general color is a grizzle, as the grayish hairs are tipped with black; but on the nose and cheeks there are black and white patches, which, with the erect ears, give the countenance a shrewd expression, well justified by the cunning and mischief-loving activity of the little beast. Although it spends much of its time on the ground in search of small animals, insects, and vegetable dainties, it climbs well and makes its home in the hollow of a tall tree, where it sleeps during the day, and hibernates in the colder parts of the country. In the late summer

and early fall the raccoon shows a special fondness for ripening corn. At this season also frogs, crayfish, and wild oysters form a large part of their fare. A singular practice of the raccoon is that of washing everything it eats before putting it into its mouth. Should there be no water at hand, the animal will go through the motions of washing it, rubbing the morsel between its hands until it considers it perfectly clean. It is fond of water and is a good swimmer.

The hunting of raccoons, which usually is done with dogs, is one of the favorite American sports, especially in the Southern States. This chase is more a matter of sport than of profit, although the fur of the raccoon has a considerable value. In Europe the hair also is extensively used in the manufacture of hats. South America has a similar species of raccoon (*Procyon cancrivorus*), locally called the crab-eater, which is found in all parts of that continent east of the Andes. It takes its name from its great fondness for the land crabs which abound in South America and upon which it mainly exists.

Robinson, *In New England Fields and Woods* (Boston, 1896); Ernest Ingersoll, *Wild Neighbors* (New York, 1897); E. T. Seton, *Life-Histories of Northern Animals* (ib., 1909); Stone and Cram, *American Animals* (new ed., 1914). See COATI, and Plate of AMERICAN MINOR CARNIVORES, with article CARNIVORA.

RACCOON DOG. A small, short-eared wild dog (*Canis procyonoides*) of Japan and the Chinese coast, which has a curious resemblance in form and color to the raccoon. It haunts the banks of rivers and the seacoast and feeds at night mainly on fish in winter and on mice in summer. It lives in burrows and is said to hibernate, but this assertion needs confirmation. It is not shy, is easily trapped, and its fur and flesh are highly esteemed, especially in Japan.

RACCOON OYSTER. A name given to oysters which grow above low-water mark, where they become stunted by daily exposure to the air.

RACCOON PERCH. See PERCH.

RACE, CAPE. See CAPE RACE.

RACE HORSE. See STEAMER DUCK.

RACES OF MANKIND. See MAN, SCIENCE OF; LIVING RACES.

RA'CHEL (Heb. *Rāhēl*, ewe). A daughter of Laban and the favorite wife of Jacob (Gen. xxxix. 6 et seq., 30), mother of Joseph (ib. xxx. 22 et seq.) and Benjamin (ib. xxv. 16 et seq.). Jacob served Laban seven years for her, and then, receiving Leah in her stead, was obliged to serve seven years more for Rachel. As Rachel was barren, she gave her husband Bilhah, a servant, for concubine, and thus became the putative mother of Dan and Naphtali (ib. xxx. 1–8). Through mandrakes obtained from Reuben her womb was finally opened (ib. xxx. 14 et seq.). She died in Canaan after giving birth to Benjamin (ib. xxxv. 18). Her tomb is said to have been at Zelzah in the border of Benjamin not far from the sacred tree of Tabor, in the neighborhood of Bethel (1 Sam. x. 2), between Bethel and Gibeah and in the direction of Migdol Eder, which, according to Mic. iv. 8, seems to have been Jerusalem. It is evident both from 1 Sam. x. 2 and Jer. xxxi. 15 that her sepulchre was near Ramah. In Gen. xxxv. 19 and xlviii. 7 she is said to have been buried "in the way to Ephrath, which is Bethlehem." Many interpreters regard "which is Bethlehem" as a later gloss and think that an Ephrath north of Jerusalem is meant. The existence of a tribe in Bethlehem by the name of Ephrath would account for the gloss. There is likely, however, to have been a tomb of Rachel in Bethlehem as the reference of the passage in Jeremiah to the massacre of infants in Matt. ii. 18 would show. Whether the other passages all refer to the same place or to different tombs cannot easily be determined. It is thought by some scholars that Rachel = Ewe originally was the totem of an important clan and as such may have been worshiped at more than one tomb, both within the territory of the tribes Joseph and Benjamin and at Bethlehem, which once may have belonged to Benjamin (*Bĕnē Yamin*, sons of the south). The Rachel clan itself was probably absorbed in Joseph and Benjamin, though families in Dan and Naphtali may have claimed the same descent. There is a *Kubbet 'Abd el 'Aziz* north of Jerusalem also called *Kubbet Rachil* (tomb of Rachel); the structure at Bethlehem called *Ḳubbet Rachil* dates from the twelfth century A.D., but may be on the site of an earlier tomb. Consult Eduard Meyer, *Die Israeliten* (Halle, 1906), and H. Gunkel, *Genesis* (3d ed., Gottingen, 1910).

RACHEL, rȧ'shĕl' (1821–58). A French tragic actress, whose real name was Elisabeth Rachel-Félix. She was born of Jewish parents at an inn in the Swiss village of Mumpf (Feb. 28, 1821). Her father was a peddler. The family settled for a time at Lyons, where she and her elder sister Sarah used to sing in the streets and cafés. In 1830 they went to Paris. There her singing attracted the attention of Choron, an eminent teacher of music, and he took her as a pupil. Her voice at first was not very promising, but her dramatic gifts were evident, and she began studying under Saint-Aulaire, the actor. Later she was a pupil in the Conservatoire. In 1837 she secured a position at the Gymnase and made a début which excited no great attention. A few critics, however, perceived her genius, among them Jules Janin, and Mademoiselle Mars (q.v.) likewise foresaw her future greatness. On June 12, 1838, she made her appearance upon the stage of the Comédie Française as Camille in Corneille's tragedy of *Horace*. In this rôle and in a series of other impersonations from the classic repertory she achieved great success, and popular admiration of her performances grew to such enthusiasm that for years she was without a rival in the great tragic rôles of Corneille, Racine, and Voltaire. It was in Racine's *Phèdre* that the zenith of her artistic career was reached (1843). Another of her triumphs was in *Adrienne Lecouvreur*, which was written for her by Scribe and Legouvé, but in other modern rôles she was less fortunate. Her relations with her colleagues at the Théâtre Français were not always pleasant. In her tours abroad she met with great success, especially in England in 1841 and later and in Russia in 1852. Her health and popularity in Paris were both failing when in 1855, the year of Adelaide Ristori's first Parisian appearance, Rachel undertook a tour to America with her brother Raphael as manager. She was warmly greeted, though the financial returns were disappointing. Soon utter physical prostration necessitated her return to France. A visit to Egypt failed to restore her, and she died of consumption at Canet, near Toulon, Jan. 3, 1858.

As an artist, within the limits prescribed by

her genius, Rachel was perhaps never equaled. "She does not act—she suffers," one said of her. Her *Phèdre* was a portrayal of human agony never to be forgotten.

Matthew Arnold's three sonnets upon her are well known. Consult the *Memoirs of Rachel, by Madame de B——* (Eng. trans., New York, 1858), which are not, however, altogether reliable; Janin, *Rachel et la tragédie* (Paris, 1858); D'Heylli, *Rachel d'après sa correspondance* (Paris, 1882); Kennard, *Rachel* (Boston, 1888); De Mirecourt, "Rachel," in *Les contemporains* (Paris, 1854); De Faucigny-Lucinge, *Rachel et son temps* (Paris, 1910); F. H. Gribble, *Rachel: Her Stage Life and her Real Life* (New York, 1911).

RACHITIS, rȧ-kī'tĭs. See RICKETS.

RACHMANINOV, rȧĸ-mä'nê-nôf, SERGEI VASILYEVITCH (1873–). A Russian composer of the new school. He was born on a small estate in the Government of Novgorod and very early showed his musical bent. At the age of four he studied the piano under his mother, and at nine, after some professional private instruction, he entered the St. Petersburg Conservatory. From there he went to the Conservatory of Moscow, studying piano under Zvyerev and Siloti (pupils of Liszt and Rubinstein) and composition with Taneiev and Arensky (q.v.). His graduation thesis was the one-act opera *Aleko* (libretto after Pushkin), which was honored by almost immediate production (1893). Thereafter he taught piano at a Moscow girls' institute for 10 years (1893–1903), conducted the Moscow Private Opera for two seasons (1897–99) and the Moscow Imperial Theatre for two more (1904–06), severing all these connections because they hindered his creative work. He traveled extensively, however, appearing as pianist and conductor in the principal cities of Europe and America. In 1907 he settled in Dresden. Rachmaninov's music is remarkable for rhythmic variety, richness of color, and harmonic effects, while in power of thematic invention he surpasses all living Russian composers. His strong individuality saves him from the allurements of impressionism, to which many of his contemporaries have yielded. His works comprise three operas, *Aleko*, *The Niggardly Knight*, and *Francesca da Rimini;* two symphonies; a symphonic poem, *The Isle of Death;* a fantasia for orchestra, *The Cliff;* a Bohemian caprice, *Gypsy Capriccio;* considerable chamber music, including the *Elegiac Trio* in memory of Tschaikowsky; three piano concertos and much other music for the piano; songs and mixed choruses, and two cantatas, *Springtime* and *The Bells*, the latter after Edgar Allan Poe.

RACINE, rȧ-sēn'. A city and the county seat of Racine Co., Wis., 23 miles south-southeast of Milwaukee, on Lake Michigan, at the mouth of the Root River, and on the Chicago and Northwestern and the Chicago, Milwaukee, and St. Paul railroads (Map: Wisconsin, F 6). Among the institutions of the city are St. Luke's Hospital, St. Mary's Hospital, the Taylor Orphan Asylum, two public libraries, Luther College, and Racine College (Protestant Episcopal) and St. Catherine's Academy (Roman Catholic), with their noteworthy libraries. The post office, Y. M. C. A., and Horlicks, Washington, and Riverside parks are among the other noteworthy features. Racine possesses a good harbor and is connected by steamship lines with other lake ports. Its trade is chiefly in the principal manufactured articles and in farm and dairy products. It ranks second among the cities of the State in manufactures, the output of its varied industries in the census year 1914 having had an aggregate value of $43,632,000 and the invested capital having amounted to $67,635,000. The leading manufactures include agricultural implements, carriages and wagons, boilers, foundry and machine-shop products, boots and shoes, leather, trunks and valises, automobiles, clothing, infant foods, steel springs for cars and carriages, hardware, lumber products, tires, gas engines, furniture, etc. Settled in 1834, Racine became a village in 1843 and a city in 1848. The government, under a revised charter of 1905, is vested in a mayor, elected every two years, and a unicameral council. Of the administrative officers the fire and police commissioners are appointed by the mayor and the board of education by the mayor with consent of council. Pop., 1900, 29,102; 1910, 38,002; 1915 (U. S. est.), 45,507.

RACINE, rȧ'sēn', JEAN (1639–99). One of the greatest of French dramatic poets. He was born Dec. 21, 1639, at La Ferté-Milon (old Duchy of Valois), and died April 26, 1699, in Paris He received his primary education in Beauvais, at a school affiliated with the Jansenists of Port-Royal; then he passed at 15 to the more immediate direction of the Port-Royalist teachers at l'Ecole des Granges, where he was taught by the noted Greek scholar Lancelot, the Latinist Nicole, who was a distinguished moralist, and others skilled in the pedagogy of their time. They left indelible marks, not alone on Racine's mind, but on his character as well, for the great fact that dominates his whole life is his relation, intellectual and moral, to those solitaries of Port-Royal in whom persisted the Puritan element in the French church. Sometimes an obedient, sometimes a revolting disciple, he was never indifferent to these influences of his youth. He died in their fold, and his grave bore the inscription, "Poet, Recluse of Port-Royal."

At l'Ecole des Granges and later at the Collège d'Harcourt Racine "read and annotated all the ancient classics" He learned by heart long passages from Greek romances and declaimed to astonished friends the choruses of Sophocles, who, with Euripides, remained his dramatic model. He acquired also a puritanic tenacity of mind and uncompromising uprightness and a reasoned devotion. Yet he had brilliant social gifts, and on his graduation (1658) worldly attractions so prevailed on him that his kindred took alarm. They sent him into a kind of exile at Uzès in Languedoc, where he hoped for a benefice from his uncle, vicar-general of the diocese. His faults, from a Jansenist point of view, appear to have been intimacy with La Fontaine, Chapelain, other men of letters, and some actors and actresses, and the directing of his talent to dramatic composition and to poems for the court, especially *La nymphe de la Seine* on the marriage of Louis XIV.

Fifteen months in Languedoc brought Racine no benefice, but he completed his literary education. He read diligently the Greek, Latin, and Italian poets and historians and the Church Fathers. He returned to Paris (1662) an accomplished scholar, dominated by social and poetic ambition. He was presented to the King, became a fashionable poet and the intimate of Chapelle, Furetière, Molière, and, above all, of Boileau, who formed in the successful poet a new and fruitful theory of dramatic art. In

1664 he obtained a pension and he was a frequent recipient through life of "gratifications" from the court. His earliest play, *La Thébaïde*, on the strife of Eteocles and Polynices, was acted by Molière's company in 1664. His second play, *Alexandre le Grand*, was first performed Dec. 4, 1665, by the comedians of the Palais Royal. December 18 they were astonished to find out that it was being given by a rival company at the Hôtel de Bourgogne. How this came about is unknown, but it ended in a complete breach between Molière and Racine, the latter of whom seems to have been in the wrong, and who presently showed himself as an unfriendly rival to Corneille and as an unseemly satirist of his old teachers, the Port-Royalists, in a reply to Nicole's *Lettres visionnaires* on the evils of the stage. He wrote also a second reply which Boileau saved him from printing, telling him that it might be a credit to his wit, but was surely none to his heart. He later repented deeply this most discreditable incident in his life. But his irritation at the attitude of his kinsfolk at Port-Royal made his thought more tragically sombre, and while the poet in him was wrestling with the Puritan he wrote *Andromaque* (1667), the first of his seven great plays.

Of Racine's life from 1667 to 1677 we know very little. He lived in close intimacy with at least one actress and produced his only comedy, *Les plaideurs* (1668), and the tragedies *Britannicus* (1669), *Bérénice* (1670), *Bajazet* (1672), *Mithridate* (1673), *Iphigénie* (1674), and *Phèdre* (1677). This last was opposed by a cabal who supported a rival and worthless *Phèdre* by Pradon. Nettled at this or because of a moral dissatisfaction with the result of his theory of dramatic art, Racine withdrew from the stage, made his peace with Port-Royal, and married a worthy woman with more money than culture and more good nature than either. Racine's domestic life was happy. He had seven children and a sufficient income from sinecure offices and from the post of royal historiographer, which he shared with Boileau. This involved the duty of accompanying the King to his various "sieges," but what Racine wrote was accidentally burned. In 1685 he pronounced in the Academy, of which he had been a member since 1673, a fine eulogy on Corneille, and in 1689 made a kind of return to the stage with *Esther*, written to be acted by the girls at Madame de Maintenon's school at Saint-Cyr. It was a biblical dramatic poem and very successful. *Athalie*, a similar and greater piece (1691), was much less successful. Neither was publicly produced in Racine's lifetime. In his last years he grew ever more devout, wrote four *Cantiques spirituels* and an *Histoire abrégée de Port-Royal*. For this or some other reason he lost court favor. Tradition says it was for preparing a memoir on the miseries of the people. In March, 1698, he sought to clear himself of complicity in the Jansenist heresy in a long letter to Madame de Maintenon.

A careful examination of Racine's life and letters reveals a puzzling duality, a serious soul and a mobile mind. He was not merely religious; he was credulous and superstitious. He was more than loyal to the King; he was his toy. He was vain, irritable, timid, easily influenced by those he loved or feared. He was gentle and lovable, but the kind of moral goodness that he had was wholly consistent with moral weakness. His mind was keen, supple, strong, with good power of psychic analysis, remarkable delicacy of sentiment, and an exquisite though narrow sense of literary art. The best of him is in his work, a rare combination of wit and feeling, energy and poise, imagination and self-restraint, eloquence and repose.

The production of *Andromaque* makes Nov. 17, 1667, one of the great dates in the history of the French stage. It marked a new conception of the tragedian's art. For Corneille's heroic tragedy is at that moment contrasted with Racine's tragedy of love. Corneille stands for the triumph of will, Racine for the inevitableness of destiny and of passion. This conditions his dramatic form. Since he deals with the universals of human nature, he chooses a conventional environment, whatever least distracts attention and least binds the development and play of passion. With comedy it is different. He puts the scene of *Les plaideurs* in the Paris of his day.

The dominance of passion over will is accepted more readily in women than in men, and Racine's great characters are nearly all women. This is preëminently true of *Phèdre*, *Andromaque*, and *Iphigénie*, his three most popular tragedies. It is true, too, though in a different way, of *Athalie* and *Esther*.

Racine's plays are simple. Each is a problem which the dramatist solves in a way often more consistent with logic than with psychology. Thus the dramatic element is enhanced, for Racine touches only such features in his characters as shall make them stand out clearly and do nothing to hinder the development of his plot. Every person behaves with the utmost decorum; not one of them says anything inelegant or unrefined; there are no visible bloody deeds, no roughness even, and no jesting nor comedy. Herein Racine's men and women constitute an ideal or rather an unreal society; perhaps it were better to say a society from which such features as did not fit Racine's æsthetic theories are absent. Again, Racine took all his tragic themes from ancient history or legend, but his tragedies are nevertheless of the seventeenth century. Frenchmen in French apparel are called Nero and Achilles. *Iphigénie* is French to the core. Indeed, little remains of the old heroes and heroines, villains, and saints, save their names and the thread of historic tradition. Racine's tragedies teem with anachronisms, but these anachronisms are precisely what quickens the Racinian characters and makes them national or racial. They are not restorations, but vivid adaptations.

Racine's tragedies and his *Plaideurs* are written wholly in Alexandrine verse. In *Athalie* and *Esther* other measures are employed in the choruses. His vocabulary is limited. There are very few allusions to visible nature, to hills, rivers, plants, animals, etc. The whole interest, in a word, is centred in man, and mostly in the aristocracy. The mob, the lowly folk, even middle-class people, are conspicuously absent. Racine is therefore the poet of the highborn. He has never appealed to the French nation as a whole, but rather to the most cultivated and fastidious classes, who find in him a precise and poetic interpretation of the loftier, more general sides of life.

Bibliography. Of many editions of Racine the best is by Paul Mesnard (10 vols., Paris, 1865–73). That by Girodet (3 vols., ib., 1801–05) is remarkable for its typography. That of Anatole France is also noteworthy (5 vols.,

ib., 1874). The first edition is dated 1675–76; the last revision by Racine, 1697. There is an English translation (metrical) by R. B. Boswell, in Bohn's Library (2 vols., London, 1889–91). *Andromaque* was adapted as *The Distressed Mother* by Ambrose Philips in 1712. *Phèdre* was acted in London in English in 1707. For Racine's life we have *Mémoires*, edited by his son Louis (q.v.) (Lausanne, 1747). Consult the popular biographies by E. A. E. M. Deschanel (Paris, 1884); Paul Monceaux, *Racine* (ib., 1892); also: Roy, *Racine: sa vie intime* (ib., 1871); Stendhal, *Racine et Shakespeare* (ib., 1882); Ferdinand Brunetière, in *Histoire et Littérature*, vol. ii (ib., 1884); Jules Lemaître, in *Impressions du théâtre*, vols. i, ii, iv (ib., 1888–90), containing useful criticism of Racine's dramatic art; Pierre Robert, *La poétique de Racine* (ib., 1890); Ferdinand Brunetière, *Les époques du théâtre français* (ib., 1892); Felix Deltour, *Les ennemis de Racine* (ib., 1892); De Grouchy, *Documents inédits rélatifs à Jean Racine* (ib., 1892); Delfour, *La Bible dans Racine* (ib., 1893); Paul Stapfer, *Racine and Victor Hugo* (4th ed., ib., 1894); J. H. Hallard, in *Gallica and Other Essays* (London, 1895); Gustave Larroumet, in *Les grands écrivains* (Paris, 1898); D. F. Canfield, *Corneille and Racine in England: Study of English Translations* (New York, 1904); Jules Lemaître, *Jean Racine* (18th ed., Paris, 1908); C. A. Sainte-Beuve, *Port Royal* (new ed., 7 vols., ib., 1908); Masson-Forestier, *Autour d'un Racine ignoré* (ib., 1911).

RACINE, Louis (1692–1763). A French writer, second son of Jean Racine. Strongly influenced by Jansenism, he wrote much religious poetry, not appreciated by his contemporaries. However, such verse as *La grâce* (1720) and *Religion* (1742) shows sincere piety. Racine also wrote many epistles and odes, such as *Ode sur l'harmonie* (1736). His *Mémoires* of his father (1747) are especially valuable for the insight they give into the great dramatist's literary activities. In 1755 he made a prose translation of *Paradise Lost*. His complete works, in eight volumes, were published in 1808.

RACK (Goth. *uf-rackjan*, OHG., Ger. *recken*, to stretch; connected with Lat. *regere*, to stretch, rule, Gk. *ὀρέγειν*, *oregein*, Lith. *ráizyti*, Skt. *arj*, to stretch). An instrument of torture, formerly used for extracting confessions from criminals and suspected persons. It consisted of a large oblong frame of wood, with four beams, slightly raised from the ground, on which the sufferer was stretched and bound. Cords were attached to his ankles and wrists and gradually strained by means of a lever and pulleys, or gears, till—unless the prisoner confessed and was released—dislocation of the limbs ensued. The rack was in use among the Romans in the first and second centuries, and many of the early Christians underwent its tortures. Coke mentions its introduction into the Tower of London by the fourth Duke of Exeter, constable of the Tower, in 1447, when it came to be called the Duke of Exeter's daughter; its use is mentioned by Hollinshed in 1647, and it became common in the time of Henry VIII as an implement of torture for prisoners confined in the Tower. The infliction of the punishment of the rack took place during the reign of the Tudor sovereigns by warrant of council or under the sign manual. In 1628 it was proposed in the Privy Council to put Felton, the murderer of the Duke of Buckingham, to the rack, in order that he might confess as to his accomplices, but the judges resisted the proceeding as contrary to the law of England. In various European countries the rack was frequently used both by the civil authorities in cases of traitors and conspirators and by members of the Inquisition to extort a recantation of heresy.

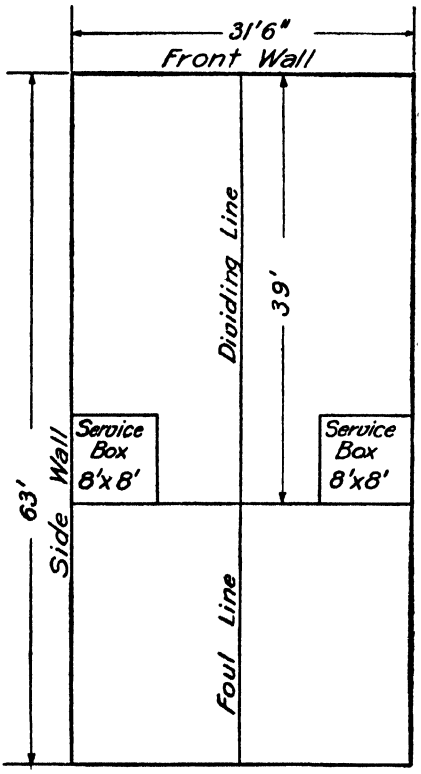
RACK. A liquor. See Arrack.

RACK'AROCK'. See Explosives.

RACKETS. See Racquets.

RACKET-TAIL. A name for certain humming birds (q.v.) two or more of whose tail feathers are greatly elongated, bare of webs towards their tips, and then suddenly broadly webbed, suggesting the shape of a tennis racket. Several species of extraordinary brilliance inhabit the Andean region, of which the species (*Steganura underwoodi*) illustrated on the Plate of Humming Birds is a characteristic example. The name puff-leg is sometimes given to these hummers on account of the mass of loose white feathers about their tarsal joints. Similar tail feathers occur in other species, as the magnificent *Loddigeria mirabilis* of northern Peru.

RACKHAM, răk'am, Arthur (1867–). An English illustrator and water-color painter, born in London. He studied at the Lambeth Art School, but was mainly self-taught. In the early nineties he began to contribute drawings to the *Pall Mall Budget*, the *Graphic*, and other periodicals, but soon found his true field as an illustrator of the fantastic. With sympathy and understanding Rackham interprets the American legend, the English fairy story, and the German folk tale. His technical ability and sense of beauty, combined with a rich and quaint imagination, give him a unique position among British artists. His favorite medium is a combination of pen line and tinting in color washes, but he excels equally in black and white and water color, his work being always delicate, graceful, and at the same time broad and finished. His illustrations include those for *Rip van Winkle* (1905); *Peter Pan* (1906); *Alice in Wonderland* (1907); *Ingoldsby Legends* (1907); *Midsummer Night's Dream* (1908); *Grimm's Fairy Tales* (1909); a wonderful series for Wagner's *Ring of the Nibelung* (1910–11); *Æsop's Fables* (1912); *Mother Goose* (1913); Dickens's *A Christmas Carol* (1915). He became a member of the Royal Water Color Society, where he frequently exhibited. There are drawings by him in the Tate Gallery and in the national collections at Barcelona, Vienna, and Melbourne. He received gold medals at Milan (1906) and Barcelona (1911) and a medal at Paris in 1912.



RACK RENT. A rent that is equivalent to the full net annual value of the real property out of which it issues, or approximately so. By statute in England to-day rack rent is defined to be "not less than two-thirds of the full net annual value of the lands out of which it arises." Rack rent in the ancient sense has probably never been exacted in the United States. See Rent.

RACOONDA. See Coypu.

RACO'VIAN CATECHISM. A catechism first printed at Rakow, or Racovia, Poland, in 1605 in Polish and in 1609 in Latin. It was based on the writings of Socinus (q.v.) and pre-

sented his doctrines. An English translation was published in London in 1818. Consult W. D. Curtis, *A History of Creeds and Confessions of Faith* (Edinburgh, 1911).

RAC'QUETS, or **RACK'ETS** (Fr. *raquette*, from OF. *rachete, rachette, rasquete, rasquette*, from Sp. *raqueta*, racquet, battledore, from Ar. *rāḥat*, palm of the hand). A modern legitimate descendant of the old game of tennis (q.v.). It is probably of British origin and arose about the beginning of the nineteenth century, being at that time played chiefly in the English debtors' prisons by men who were tennis players, but in their incarceration had to make shift with a less elaborate court. It began as an open-court game, the ball being batted against a single wall so as to rebound within a marked space upon the ground. Other walls were added as the game developed, and it is

PLAN OF RACQUET COURT.

now mostly played within a closed court surrounded by four walls and covered with a high roof. The game in America is substantially the same as in Europe, excepting that the courts are somewhat slower and sometimes a trifle smaller and the balls slightly softer. The game is played by two or by four divided into pairs, on a covered court having an asphalted or stone-paved floor space 63 feet long by 31 feet 6 inches wide, surrounded by plain plastered walls about 40 feet high at one end and both sides. The other end wall is usually utilized as a gallery for onlookers. On the front wall, on one line, the service line is drawn across 8 or 10 feet from the floor. The play line, marking the limit for low balls after the serve has been delivered, is 2 feet, 2½ inches from the floor, and the space from this line to the floor is called the board. The floor is divided by lines into six spaces, two of which are called service boxes. At the start one player, called the hand in, stands in the service box and the other, the hand out, in one of the spaces. The hand in drops a ball and strikes it with a racket (like a long-handled tennis racket). If he serve from the left box the ball must strike first the front wall over the service line and rebound into the court on the right side marked off by the cross-court and half-court lines. These conditions are reversed if the service is from the right box. The server's opponent may return the ball to any part of the front wall above the service line. The server (hand in) scores when his opponent fails to return the ball to the front wall above the play line before it has bounded twice (except in case of a let), or when he knocks the ball out of court, or if he interferes with the ball. He loses his serve if the ball touches him before he sends it into the proper court, or if the ball strikes the board or out of the court, or if the ball strikes any part of the court before it strikes the front wall, or if he fail twice to strike properly the front wall, or if the ball he returns fails to strike the wall above the play line, or if he return the ball out of court, or if the ball strikes his body or his clothing. Fifteen points, or aces, constitute a game. Consult *Racquets, Court Tennis, Hand Tennis, Squash*, in Spalding's Athletic Handbooks, No. 50 R (New York, annually), and F. C. Tompkins, *Court Tennis, with Notes on Racquets and Squash-Rackets* (Philadelphia, 1909).

RADA, RODRIGO JIMÉNEZ DE. See JIMÉNEZ DE RADA, RODRIGO

RADAUTZ, rä'douts. A town of Bukowina, Austria, 32 miles south of Czernowitz (Map: Austria, J 3). Its manufactures include machinery, paper, leather, and wagons. An Imperial stud with about 1500 horses is located here. Pop., 1911 (district), 80,974

RADBER'TUS, PASCHASIUS. See PASCHASIUS RADBERTUS.

RAD'CLIFFE. A cotton-manufacturing and coal-mining town in Lancashire, England, on the Irwell, 2 miles southwest of Bury (Map: England, D 3). Pop., 1901, 25,368; 1911, 26,084.

RADCLIFFE, ANN (1764–1823). An English romancer, born in London, July 9, 1764. Her maiden name was Ward. At 23 she married William Radcliffe, afterward editor and proprietor of the *English Chronicle*. The group of romances by which she became famous comprise: *The Castles of Athlin and Dunbayne* (1789); *A Sicilian Romance* (1790); *The Romance of the Forest* (1791); *The Mysteries of Udolpho* (1794); *The Italian, or the Confessional of the Black Penitents* (1797). These were translated into French and Italian and two of them dramatized. After 1797 Mrs. Radcliffe lived in retirement, and there were false rumors that she had gone insane over the horrors conjured up in *Udolpho*. After her death, Feb. 7, 1823, appeared an historical romance, *Gaston de Blondeville* (1826). Of interest also is *A Journey through Holland and Germany* (1795). Mrs. Radcliffe's writings, with their mysteries, horrors, and tumultuous nature, were exceedingly popular in their day. Establishing as they did the vogue of the so-called Gothic romance introduced by Horace

Walpole, they assured her of a secure place in the Romantic movement. For *Udolpho* she received £500 and for *The Italian* £800—unprecedented sums before the advent of *Waverley*. Consult the brief memoir prefixed to *Gaston de Blondeville* (1826); Scott's introduction to her romances in Ballantyne's Novelists Library (London, 1824); H. A. Beers, *History of English Romanticism in the Eighteenth Century* (New York, 1899); and see NOVEL.

RADCLIFFE, or **RADCLYFFE,** JAMES. See DERWENTWATER, third EARL OF.

RADCLIFFE, JOHN (1650–1714). An English physician, the founder of the Radcliffe Library at Oxford. He was born at Wakefield, Yorkshire, and was educated at University College, Oxford (M.A., 1672). In 1675 he began to practice medicine at Oxford. In less than two years his skill had made him famous, and in 1684 he removed to London, where he soon became the most popular physician of his time. In 1686 the Princess Anne of Denmark made him her physician, and after the Revolution he was consulted by the court. From 1690 to 1695 he sat in Parliament for Bramber. He died at Carshalton and was buried at Oxford in St. Mary's Church. He left £40,000 for the erection of a public library in Oxford, since known as the Radcliffe Library, which he also endowed. The Radcliffe Observatory and the Radcliffe Infirmary at Oxford were also erected and endowed through his gifts, and legacies went to St. Bartholomew's Hospital and to University College, London.

RADCLIFFE COLLEGE. An institution for the higher education of women at Cambridge, Mass., founded in 1879 as the Society for the Collegiate Instruction of Women. It was popularly known as the Harvard Annex until 1894, when by Act of the General Court of Massachusetts its name was changed to Radcliffe College in honor of Anne Radcliffe, the first woman to give a money endowment to Harvard. It had in 1914–15 a faculty of 136, all of whom were instructors in Harvard University, and 628 students. The requirements for admission and for the degrees of bachelor of arts, master of arts, and doctor of philosophy are identical with those of Harvard University. The institution had in 1915 a working library of 32,000 volumes, buildings and grounds valued at $900,000, and an income of $160,000, including annual receipts from tuition fees and income from endowment. Forty-two scholarships, each sufficient to meet the tuition fee of $200, are awarded annually. The president in 1915 was Le Baron R. Briggs, LL.D. Consult H. P. Dowst, *Radcliffe College* (Boston, 1913).

RADDE, rädʹde, GUSTAV FERDINAND RICHARD (1831–1903). A German-Russian naturalist and traveler, born at Danzig. After accompanying the Russian expedition to southeast Siberia (1855–60) and going with Von Baer on his scientific trip through southern Russia (1862), he founded at Tiflis the Museum of the Caucasus, of which he became director. In this capacity he traveled through upper Armenia (1871), northern Persia (1879), Daghestan (1885, 1894), Khorassan (1886), along the eastern coast of the Black Sea (1890), and accompanied the Grand Duke Sergei Mikhailovitch on his travels in Asia (1891) and the Grand Duke George Alexandrovitch on two trips to the Mediterranean (1895–97). His works deal with his experiences in different parts of the world.

RADE, rä'de, PAUL MARTIN (1857–). A German Lutheran theologian, born at Rennersdorf, Silesia. After studying at Leipzig he was pastor at Schönback-bei-Löbau (1882–92) and at St. Paul's, Frankfort (1892–99), and served as privatdocent (1900–04) and thereafter as associate professor of systematic theology at Marburg. In 1886 he founded and thenceforth edited the *Christliche Welt* and was associate editor of *Zeitschrift für Theologie und Kirche*. His writings include: *Damasus, Bischof von Rom* (1882); *Dr. Martin Luthers Leben, Taten, und Meinungen* (3 vols., 1884–87); *Die Konfessionen und die soziale Frage* (1891); *Der rechte evangelische Glaube* (1892); *Zu Christus hin* (1897); *Religion und Moral* (1898); *Die Wahrheit der christenlichen Religion* (1899); *Unbewusstes Christentum* (1905); *Das religiose Wunder und anderes* (1909); *Die Stellung des Christentums zum Geschlechtsleben* (1910); *Jatho und Harnack* (1911); *Mehr Idealismus in der Politik* (1911); *Unsere Pflicht zur Politik* (1913).

RADEBERG, rä'de-bĕrk. A town in the Kingdom of Saxony, Germany, situated about 10 miles northeast of Dresden (Map: Germany, F 3). It has glass works, paper mills, and manufactures of nails, safes, furniture, etc. Pop., 1900, 12,918; 1910, 13,413.

RADECKE, rä'dĕ-ke, ROBERT (1830–1911). A German composer. He was born in Dittmannsdorf in Silesia and received his musical training in the Conservatory of Leipzig. In 1853 he became musical director of the Court Theatre of that city. He removed to Berlin soon after, played second violin in Laub's quartet, and gave many successful concerts. He was royal kapellmeister from 1871 to 1887 and from 1892 to 1907 director of the Royal Institute for Church Music. An artist of ability on pianoforte, organ, and violin, Radecke is best known for his compositions, which include two orchestral overtures, *König Johann* and *Am Strande*, the operetta *Die Mönkguter* (1874), and, above all, for his many songs.

RAD'EGUN'DIS, SAINT (519–87). The patron saint of Poitiers in France. She was the daughter of Berthar, a prince of Thuringia. Having been carried as a prisoner to the country of the Franks in the twelfth year of her age by Clotaire I, King of the district whose capital was Soissons, she was educated in the Christian religion, and when she reached a mature age was induced, reluctantly, to become the wife of Clotaire. Her own wish having been to become a nun, her married life was in great measure given up to works of charity and religion. In 544, her husband having murdered her brother, she fled from the palace and retired to the monastery at Noyon. Afterward she founded a monastery at Poitiers, in which she lived merely as a sister. Her feast day is August 13. Consult Otto Bardenhewer, *Patrology*, English translation by T. J. Shahan (St. Louis, 1908).

RADETZKY, rä-dĕtsʹkĕ, JOSEPH WENZEL, COUNT (1766–1858). An Austrian field marshal, born in Trzebnitz, Bohemia. In 1784 he became a cadet in an Hungarian cavalry regiment. His first campaign was against the Turks in 1788–89. He fought in the wars of the French Revolution and the Napoleonic wars, attaining the rank of major general in 1805 and

lieutenant field marshal in 1809. In 1813–14 and 1815 he was chief of staff of Prince Schwarzenberg. In 1831 he commanded in Italy and in 1836 he became field marshal. On the outbreak of the insurrection in Lombardy in 1848 Radetzky was driven from Milan after five days of desperate fighting and fell back on Verona. His position was for a time precarious, but having received reënforcements he was enabled to assume the offensive and inflicted a crushing defeat on the Sardinian King Charles Albert at Custozza, July 25, 1848. A six months' armistice was agreed to, and war was not resumed by the Piedmontese till March, 1849. Radetzky was this time better prepared, and at once invaded Piedmont. He totally routed the enemy at Novara, March 23, 1849. Peace was concluded with Sardinia, and Radetzky besieged Venice, which surrendered after a long siege (August 23). He was then appointed Governor-General of Lombardy and Venetia, and ruled until February, 1857. There are biographies of Radetzky by Krones (Vienna, 1891) and Schönhals (Stuttgart, 1858). Consult also Kunz, *Die Feldzüge des Feldmarschalls Radetzky in Oberitalien* (Berlin, 1890).

RADFORD. A city in Montgomery Co., Va., 45 miles west by south of Roanoke, on the New River and on the Norfolk and Western Railway (Map: Virginia, D 4). Chiefly a manufacturing place, Radford has iron furnaces, veneering, cast-iron pipe, and sand-lime-brick works, and flour mills. There is an extensive fair ground where a yearly fair is held. Radford was first settled in 1756. Pop., 1900, 3344; 1910, 4202.

RADFORD, William (1808–90). An American naval officer, born at Fincastle, Botetourt Co., Va. He entered the navy in 1825 and rose through successive grades to the rank of rear admiral, which he attained in 1866. He distinguished himself at Mazatlan in 1847 during the Mexican War, and commanded the *Cumberland* in 1861, but was on court-martial duty at Old Point Comfort when the vessel was sunk by the *Merrimac*. He served in both attacks on Fort Fisher in 1864–65, was in command of the *New Ironsides* under Admiral Porter, and in 1869–70 commanded the European squadron.

RA'DIAN. See Circle.

RA'DIANT STAR, Order of the. An order of Zanzibar, founded by Sultan Bargash ben Said in 1875. It has two classes, of which the first is given only to sovereigns, the second forming an order of merit with four divisions. The decoration is a red cross with five arms edged with white on a green wreath. The circular medallion bears the Sultan's name. The cross is suspended by a wreath from a red ribbon edged with white.

RA'DIA'TA (Lat. nom. pl., having rays). The lowest of Cuvier's four great divisions of the animal kingdom. It derived its name from the organs of sense and motion being disposed as rays around a centre and included (1) the Echinodermata, (2) the Entozoa (or intestinal worms), (3) the Acalephæ (or sea nettles), (4) the Polypi, and (5) the Infusoria. See Classification of Animals.

RA'DIA'TION (Lat. *radiatio*, a shining, from *radiare*, to shine, from *radius*, ray). The name given to the energy emitted by material bodies and also by electric oscillations. In accordance with the classical theory of physics this energy is in the form of waves in the ether (q.v.). Since wave motion involves both the vibration and the displacement of the medium carrying the waves, there is always both kinetic and potential energy associated with the advance of a train of waves.

Waves in the ether are produced in many ways. Thus every portion of matter is emitting these waves; e.g., when we see a source of light, like a candle flame, the sensation is due to ether waves which are sent out by the white-hot particles of carbon in the flame; when we are exposed to sunshine and feel warm, the sensation is due to ether waves sent out from the white-hot sun; etc. Again, the waves with which we are familiar in wireless telegraphy (q.v.) are ether waves. They are produced by electrical oscillations over the surface of charged conductors. The ether waves which produce the sensations of light and warmth are emitted in consequence of the vibrations of the electrons in the atoms which make up the matter.

If the waves are short they may produce vibrations of the electrons in the matter in accordance with the principle of resonance. Thus, if the waves of a certain period enter a material body whose electrons have a natural period the same as this, they will be set in vibration by the waves and will therefore absorb them, gaining their energy. When this absorption takes place further changes occur, determined by the nature of the matter. Thus, certain ether waves falling upon the eye produce changes which result in vision; again, if certain ether waves are absorbed by photographic films, chemical action goes on which may be detected later; but in general the energy gained by the matter is diffused among the molecules themselves and is manifested by the appearance of heat effects. To measure the energy of the radiation the absorbing instrument should absorb all the energy, and the corresponding change produced should be one which is in direct proportion to the energy added to the body. It is well known that polished bodies like bright metallic surfaces absorb very little energy, while blackened ones absorb nearly all of it, provided the waves are not too long. Consequently radiation as produced by material bodies is detected and measured by instruments which are sensitive to heat changes and whose surfaces are covered with a layer of lampblack, copper oxide, or platinum black. (Among such instruments may be mentioned bolometers, radiomicrometers, radiometers, etc.)

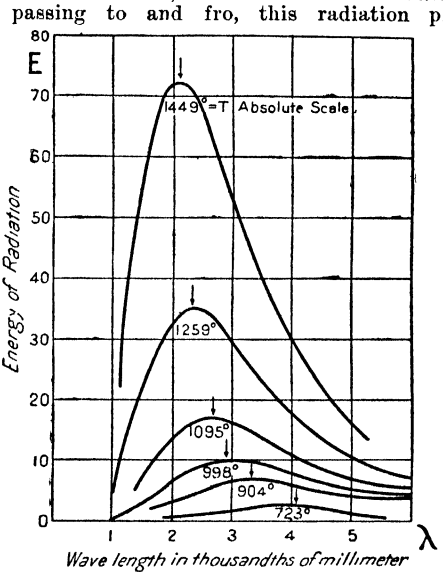
By using a prism, grating, or interferometer to disperse the radiation into trains of definite wave length, many interesting facts have been established. All material bodies in the universe, so far as we know, are producing waves in the ether. Solid and liquid bodies emit what is called a continuous spectrum, i.e., one made up of waves of all wave lengths between certain limits; gases on the other hand emit isolated trains of waves of definite wave lengths. Radiation from gases is as a rule brought about by some electrical discharge, and it is treated more fully under Spectrum Analysis. There are many cases of the emission of radiation by solids and liquids which involve chemical changes in the solid. This phenomenon is called *luminescence*. The most interesting case, however, of radiation from solids is that in

which there are not any molecular changes but the emission is conditioned by the temperature of the body.

Pure ether waves have a velocity 3×10^{10} centimeters per second, i.e., about 187,000 miles per second. Those waves which affect our sense of sight lie between wave lengths 0.00007 centimeter and 0.000038 centimeter. The longest of these produce the sensation red, those slightly shorter, orange, etc., through yellow, green, blue to violet, which is caused by the shortest of the visible waves. Photographic action has been produced by waves as long as 0.0001 centimeter and also by all the waves shorter than this so far observed. Waves produced by ordinary matter, such as hot and cold bodies, luminous gases, etc., have wave lengths extending over a wide range. The longest so far observed has a wave length 0.014 centimeter and the shortest 0.000009 centimeter. It was shown in 1913 by Laue, Bragg, and Moseley that X rays (q.v.) might be analyzed by a crystal, acting as a space grating, into trains of extremely short waves ranging in length from 0.00000001 centimeter to 0.000000-055 centimeter depending upon the metal which serves as the anticathode in the X-ray tube. As noted before, electrical oscillations will also produce waves in the ether; those in use in wireless telegraphy have a wave length of many thousand feet or miles, but by using very small electrical conductors electrical oscillations upon them have produced waves whose lengths were as small as 0.2 centimeter.

The most interesting work both by theory and by experiment has been done in connection with the temperature radiation of solids. Further, since this radiation is due to vibrations of the electrons in the atoms and since absorption is due to resonance on the part of the electrons in the matter, it is obvious that there must be some connection between the radiation emitted by a body and its absorptive properties. By coating a body with lampblack or finely divided platinum it becomes a very good absorber, practically all the incident radiation being taken up by the body and spent in producing heat effects. If in a hollow body made up of any material, e.g., iron or copper, there is made a small opening so that radiation from without can penetrate to the interior, it is evident that any such incident radiation will, after a series of internal reflections to and fro inside the hollow body, be totally absorbed, with the exception of a minute amount which may escape through the opening. Such a body makes an almost perfect black body. It can be shown by theory that, if such a body be maintained at a constant and uniform temperature, the radiation inside it is definitely characteristic of the temperature alone and is independent of the nature of the matter which makes up the hollow inclosure. If this radiation were to be dispersed by a prism or grating into trains of waves of varying wave length, theory shows us that there is a definite amount of energy associated with each train of waves of a definite wave length, i.e., if the energy carried by those waves whose wave lengths lie between λ and $\lambda + d\lambda$ is measured, it is characteristic of the temperature of the inclosure. This means that not only the total energy in the inclosure is characteristic of the temperature but also the partial energy carried by trains of different wave length.

When one considers bodies other than a black body it is possible to state a certain general law which bears the name of Balfour Stewart or of Kirchhoff. Before stating the law it is convenient to define two terms. The absorptive power of a body for a train of waves of a definite wave length is defined as being the fraction of the incident radiation of that wave length which the body absorbs; thus, the absorptive power of a black body is 1 and that of all other bodies is less than this. The emissive power of a body for a train of waves of a definite wave length is defined as the ratio of the energy radiated by 1 square centimeter of the surface of the body in the form of waves of the specified wave length to that emitted by 1 square centimeter of a black body under the same conditions of temperature and of the same wave length. The statement of the law connecting radiation and absorption is, then, that the emissive power of any body is identical with its absorptive power at the same temperature. Thus, let E be the energy emitted by 1 square centimeter of a black body at a given temperature in the form of waves of a definite wave length; let e be the corresponding energy emitted by 1 square centimeter of any body at the same temperature; let a be the absorptive power of this body for these waves at this temperature. The law states that



$$\frac{e}{E} = a.$$

This may also be written $\frac{e}{a} = E$; and since E is, as said above, conditioned only by the temperature of a black body, it follows that $\frac{e}{a}$ is a function of the temperature, the same for all bodies. This exact mathematical relation indicates that if a body has the power to absorb to a marked extent, it will also be a good radiator. The law gives an exact relation which holds for a definite temperature, but the general relation holds with more or less truth even when we consider the radiating power and the absorbing power of the body at different temperatures. Thus, a polished silver surface, which is a poor absorber, is also a poor radiator. A transparent body is also a poor radiator. Glass, which is transparent at low temperatures, becomes more or less opaque at high temperatures, and under these conditions is able to emit radiation. Tourmaline has the property of absorbing a certain type of polarized light (see LIGHT); when a piece of this crystal is raised to a temperature sufficiently high, it is found to emit this same type of light.

Among the conclusions which may be drawn from Kirchhoff's law, $e = aE$, in which E is a constant, is that e has its greatest value when a has its greatest, i.e., when it equals 1. In this case e is the same as E; i.e., for the particular train of waves under consideration the emission of the body is the same as that of a black body at the same temperature, provided it absorbs completely such waves when they are incident upon it. In no case can the body emit more intensely than a black body at the same temperature. When a body of any kind is put in a flame whose temperature is kept constant, the body does not necessarily come to the temperature of the flame; it is receiving energy from the flame, but is

losing energy by radiation, and so its own temperature is conditioned by the balance between its gain and its loss of energy. Its emission is governed by Kirchhoff's law. In a Welsbach mantle, which consists of a framework of thorium in which is a small quantity of cerium, Rubens has shown that the presence of the latter makes the mantle an excellent absorber of the shorter (i.e., blue) waves if the temperature is high, but it absorbs only slightly the waves longer than the red.

It is seen that the fundamental quantity in all radiation problems is the emission of a black body. It is necessary to know, not alone the total emission of energy at any one temperature, but also the partial radiation, i.e., the amount of energy associated with waves whose wave lengths lie between λ and $\lambda + d\lambda$. The total emission can be deduced from thermodynamical considerations, as was done by Boltzmann. Bartoli had previously shown that in a hollow inclosure, where of course radiation is passing to and fro, this radiation pro-

BLACK BODY RADIATION. (After Lummer and Pringsheim.)

duces a mechanical pressure upon the walls equal in amount to the energy per unit volume, provided the radiation is normal to the absorbing surface. (See RADIATION PRESSURE.) (In the general case, when the radiation is not normal, the pressure is one-third of this.) The law deduced by Boltzmann was that the total radiation per square centimeter of a black body at a temperature T on Thomson's absolute scale (see THERMODYNAMICS) is proportional to the fourth power of the temperature, i.e., total $E = aT^4$, where a is a constant. This same law had been deduced before empirically by Stefan as the best mathematical expression of the experimental results of many observers on the radiation from ordinary bodies, although, of course, the value of the constant in his equation was less than in Boltzmann's. Stefan's law is by no means true except for a black body, being only an approximation for other bodies. The true law for a black body is referred to as the Stefan-Boltzmann law. It can evidently serve as a means of determining the temperature of a body which approximates a black body, e.g., a furnace or oven, provided the value of the constant is known. (See THERMOMETRY.) The accepted value is 1.71×10^{-5} in ergs and degrees Centigrade, or 0.408×10^{-12} in calories, although there is some uncertainty as to its accuracy.

The partial radiation from a black body has been studied by many observers, notably by Lummer and Pringsheim. Their results may best be shown by drawing curves, with energy as ordinates and wave lengths as abscissæ, each curve applying to any one temperature.

Several facts are obvious, among them that the curves for higher temperatures are entirely outside those for lower; i.e., as the temperature is raised the partial radiation for any one wave length is increased; that the maximum ordinate of any curve shifts towards the shorter wave lengths as the temperature is raised; this explains why the temperature of a body must be high before it becomes self-luminous. A most important problem is to deduce a mathematical formula which will apply to these curves, i.e., to be able to express the partial energy E as a function λ and T, so that when the mathematical curves are plotted they will agree with the experimental ones. Planck succeeded in doing this on theoretical grounds, making certain assumptions to which reference will be made later. His formula is

$$E = \frac{c\lambda^{-5}}{e^{\frac{b}{\lambda T}} - 1}$$

where c and b are constants, e is the base of the natural system of logarithms, and $E\lambda$ is the energy associated with waves whose wave-lengths lie between λ and $\lambda + d\lambda$. This law of Planck's leads at once to the Stefan-Boltzmann law. Further, if for any one temperature T the wave length which corresponds to the maximum amount of energy is called λ_m and if the value of E for this value of λ is called E_m, the following two formulæ may be deduced from Planck's, viz.:

$$\lambda_m T = \text{a constant for all temperatures,}$$

$$\frac{E_m}{T^5} = \text{a constant for all temperatures.}$$

(These two laws had been deduced previously, and are verified by experiment. They also can serve as means of determining the temperatures of black bodies.)

If in practice only the shorter waves are observed, a simpler formula than that of Planck's may be used. It is obtained by making λ very small in his formula. It then becomes

$$E = \frac{c}{\lambda^5} e^{-\frac{b}{\lambda T}}.$$

This law had been proposed previously by Wien and is called by his name. The accepted values of the constants are: $c = 1.26 \times 10^{27}$; $b = 145 \times 10^6$; if energy is measured in ergs, temperature in degrees centigrade, and wave lengths in Angström units (i.e., 1 such unit $= 10^{-8}$ centimeter) $e = 2.718$. It is used as a basis of determining temperature by certain instruments. With these light of a definite color is used, i.e., λ is constant. Under these conditions

$$E = Ae^{-\frac{B}{T}},$$

where A and B are constants. Hence

$$\log E = \log A - \frac{B}{T}.$$

Thus, if curves are plotted having log E as ordinates and $\frac{1}{T}$ as abscissæ, we obtain a series of straight lines for different values of λ, which are called isochromatics. For any definite wave length there will be a definite isochromatic, and if the energy E is known, it will correspond to a definite point of this line, i.e., it will fix the value of T. This is the principle made use of in applying the above formula as a means of thermometry.

As noted above Planck deduced his radiation formula from theoretical considerations and in the course of this deduction made certain assumptions which are of the utmost importance. Since his original investigation he has modified these, but has kept the one of greatest interest. This is equivalent to stating that radiation of energy from any body is a discontinuous process; each elementary radiator emits energy in equal amounts called quanta, the value of the quantum for any radiator being hN, where h is a universal constant and N is the natural frequency of the vibrations of the radiator. This theory of Planck's is supported by many experimental facts from widely different fields of science, e.g., photo-electric action, specific heats at low temperatures, etc. What is perhaps the most important conclusion to be drawn from it is one to which attention has been called by Jeans, viz., if it is true, then the laws of nature—of mechanics and electricity—cannot be expressed in the form of differential equations, because they imply continuous processes.

A matter of fundamental importance is the nature of the disturbance in the ether (assuming its existence), which constitutes radiation: is it a train of periodic waves or is it a series of sudden more or less irregular pulses? Such a motion as an infinite train of waves is of course impossible, and our knowledge of the mechanism of emission of radiation, viz., the acceleration of electrons, makes it certain that the radiation must be considered as composed of pulses. Of course these may be analyzed by Fourier's theorem into trains of waves, and these can then be discussed separately. The phenomena of interference, diffraction, dispersion, etc., are all discussed on the wave theory of radiation, but it has been shown by Gouy, Schuster, and others that gratings and prisms will impress a periodicity upon pulses, even when in the latter there is no periodicity originally. Within the years 1910–14 there were several most important investigations upon the nature of the pulses emitted by material bodies so that they may give rise to the laws of radiation (e.g., Stefan-Boltzmann law) and the ordinary phenomena of light. The passage of pulses through prisms has been discussed specially by Houstoun and by Green (*Proceedings of the Royal Society of London*, 1913, 1914). For many years a sharp distinction was made between the phenomena of light and those of X rays, it being said that the former were due to periodic wave trains, the latter to pulses. This is now known not to be a true difference All radiation consists of pulses, but in some there are periodicities owing to the nature of the vibrations of the radiators.

RADIATION OF HEAT. See HEAT.

RADIATION PRESSURE. It was shown by Maxwell in 1873 on theoretical grounds that a beam of electromagnetic radiation, e.g., light, incident on an absorbing or reflecting surface exerts a mechanical pressure on the surface and that the pressure per unit area normal to the beam is equal to the energy per unit volume in the space next the surface. Bartoli arrived at the same result in 1876 from thermodynamic arguments. A number of physicists tried to verify this experimentally by suspending on a torsion fibre a light arm carrying a vane, in a vessel exhausted of air, and sending a beam of light against the vane. Deflections of the vane were easily obtained, but they were due mainly to the action of the remaining gas molecules (see RADIOMETER), and it was not easy to separate the effect of light pressure from this gas action. Finally, in 1901, Lebedew, by having the vacuum around his suspended vane so good that the gas action was very small, was enabled to detect and measure the pressure of a beam of light on the vane. Nichols and Hull were at work on the problem at the same time and were able to make more exact measurements, which confirm very exactly the Maxwell-Bartoli theory. In their experiments the vane was surrounded by air at such a pressure that two opposing actions of the gas neutralized each other.

The fact that radiation produces a pressure is equivalent to saying that it has momentum; and it follows at once that a body emitting radiation experiences a recoil. (When a bullet is expelled from a rifle the latter suffers a recoil, and when the bullet strikes a target the latter receives momentum from the former.) This momentum of radiation must be taken into account in Newton's laws of motion, but under ordinary circumstances—that is, with portions of matter of ordinary size—it is extremely small compared with the momentum of the matter.

The recognition of the existence of this radiation pressure has aroused much interesting astronomical and cosmical speculation. For example, it is probable that the observed action of comets' tails in swinging farther away from the sun than their heads, therefore out of their proper orbits on the gravitation theory simply, is due to the pressure of the sun's radiation on the small particles that compose the tails. The force of radiation pressure on a particle that is not small in comparison with the wave length of the radiation depends on the surface exposed, while the gravitational force is proportional to the volume; so as the ratio of surface to volume becomes greater as the size of the particles decreases, it is evident that the repellent force exerted by the radiation from the sun on small particles will become comparable with the attracting force of gravitation. Kepler, in the days of the corpuscular theory of light, proposed much the same theory to account for the strange behavior of comets' tails. Consult Nichols and Hull, *Physical Review* (New York, 1901), and Lebedew, *Annalen der Physik* (Halle, 1901). On application to cometary theory, consult Nichols and Hull, *Physical Review*

(1903), also Poynting, Royal Philosophical Society, *Transactions* (London, 1903).

RAD'ICAL. See RADICLE.

RADICAL AXIS. See CIRCLE.

RADICAL EMPIRICISM. See EMPIRICISM.

RAD'ICALISM (from *radical*, from Lat. *radicalis*, relating to a root, radical, from *radix*, root; connected with Gk. *ῥάδιξ*, *rhadix*, root, *ῥάδαμνος*, *rhadamnos*, branch, Goth. *waúrts*, root, OHG. *wurz*, Ger. *Wurz*, AS. *wyrt*, Eng. *wort*, weed). In modern history generally, the temper of mind which is most opposed to the conservative and aims at constant and progressive reform of political institutions. The word was first used of a political party in England about 1819, though a Radical party, marked off by clear distinctions from the Whigs, may be said to have originated in 1769 with the first concerted movement to reform and control Parliament by pressure without. Oddly enough the efforts of the first Radicals were directed, not against the crown or the House of Lords, but against the House of Commons. Radicalism in its origin was a middle-class movement; its active men were a limited class of voters who conceived that their rights were being infringed. Their first popular leader was Wilkes.

A second period extends from 1789 to 1831. The mighty influence of the French Revolution brought up a new class of Jacobinical Radicals. Under Thomas Paine and Godwin significant changes took place in their attitude. The crown and the House of Lords were attacked, complaints of oppressive taxation were heard, and the leaders of the school were most of them men who rejected religious creeds. The first quarter of the nineteenth century was a discouraging time for the Radicals, but they were not disheartened. This period witnessed the rise of the most profound and systematic philosophy of Radicalism that had yet been formulated. The scientific or philosophical Radicals now came forward, with Bentham and James Mill, with Ricardo and Grote and Joseph Hume. They gained a powerful organ when in 1824 they founded the *Westminster Review*. But there were also practical reformers, and the party was beginning to be recognized as having a definite existence. The working classes now began to take a greater part in the movement, and the first hints of modern Socialism were given by Spence and Owen.

The third period opens with the definite agitation for reform of parliamentary representation, which is part of general English history. While the Radicals lent their support to the movement for the passage of the Reform Bill, they regarded its results with disappointment and tended to become more and more sharply dissociated from the Whigs who had passed it. The hope of further enfranchisement of the people seemed slight, and the feeling of despair thus engendered gave rise to one of the most important phases in the history of English Radicalism, the Chartist movement. (See CHARTISM.) The Anti-Corn Law agitation, though the work of Radicals, especially of their two brilliant leaders, Cobden and Bright, was not an essential part of their campaign. Yet the Manchester school of politicians may be called the dominant type of Radicals from say 1840 to 1885, the connecting link between those of the beginning and the end of the century. Under the strong leadership of Chamberlain the Radicals succeeded in becoming the controlling force in the Liberal party.

On the Continent there is a strong tide of Radicalism. France has had a strong Radical party, under one name or another, ever since the outbreak of the Revolution. Its tenets are those of the party wherever it is found—the widest possible liberty for the individual. In addition the French Radicals have been the most persistent opponents of monarchy, and to their efforts the success of the revolutions of 1830 and 1848 may be attributed. To-day they are a strong party. In Germany the rise of the Radicals is of a comparatively recent date. The Socialists, both in Germany and France, must be considered as closely allied to the Radicals. Consult: *The Radical Programme* (London, 1885); A. L. Lowell, *Governments and Parties in Continental Europe* (Boston, 1896; abridged and revised ed. under title *Governments of France, Italy, and Germany*, Cambridge, Mass., 1914); Kent, *The English Radicals* (London, 1899); W. P. Hall, *British Radicalism, 1791–1797* (New York, 1912). See POLITICAL PARTIES.

RAD'ICLE, or RAD'ICAL, IN CHEMISTRY. See CARBON COMPOUNDS.

RA'DIOACTIV'ITY. The name given to the property possessed by uranium, thorium, and other similar bodies of emitting certain radiations spontaneously. Immediately after the discovery of X rays by Professor Röntgen in 1895 many physicists began investigations in order to see whether phosphorescent bodies in general would not emit rays of the same character. Among these was Prof. H. Becquerel, of Paris. In the first months of 1896 he made the great discovery that the salts of uranium emitted spontaneously certain radiations which would affect a photographic plate. He also found that these radiations would, like X rays, discharge electrified bodies, produce phosphorescence, and traverse many bodies which were opaque to ordinary light. The name Becquerel rays was given to these radiations. They were investigated immediately with the greatest care by many others, particularly by Ernest Rutherford, who was then a student in the laboratory of J. J. Thomson, Cambridge, England; and their properties will be described below. In the search for other substances which would emit radiations similar to those described above, it was discovered, almost simultaneously by Professor Schmidt and by Madame Curie, of Paris, in the year 1898, that the salts of thorium emit rays similar to those of uranium. M. and Mme. Curie began a prolonged investigation of all metals and metaloids, the rare earths, and a great number of rocks and minerals, in the hope of discovering other radioactive bodies, and were rewarded by discovering that pitchblende, which is a mineral containing the oxide of uranium and other substances, was much more active than pure metallic uranium. By a series of chemical separations they were able to isolate two substances, radium and polonium, which were most intensely radioactive, in some cases several thousand times more so than uranium. The discovery of these substances was made in 1898, and in 1899 another radioactive substance was discovered by M. Debierne which he called actinium and which accompanies certain bodies of the iron group contained in pitchblende.

The radiations from the radioactive substances produce effects which may be grouped under various heads—chemical, fluorescent, physiological, and electrical. Among the chemical actions it may be sufficient to mention the photographic action of the rays and their power to color glass and porcelain and in certain cases to produce ozone. The action of the rays on the skin is to produce a burn similar in some ways to that produced by the X rays. The radiations are able to destroy the germinating power of seeds. They have been applied to the treatment of cancer and lupus with good results in some cases. It has not been established definitely which type of radiation from radium has the beneficial action, but it is much the same as that of the X rays. See RADIUM, *In Medicine.*

Under the action of these radiations many substances emit light by fluorescence, among which may be mentioned especially platinobarium cyanide, the mineral willemite, zinc sulphide (Sidot blende), and the diamond. Even the skin and other parts of the body show a faint fluorescence under strong radiations, so that the sensation of light felt when radium is brought near the closed eye is probably to be accounted for by the fluorescence of some part of the eyeball. The radium salts continually emit light, owing to the fluorescence of the radium salt itself, or impurities therein, under its own radiations, though it is an interesting fact that the purest radium salts do not shine so brightly as those which contain some impurity. It is an electrical effect, viz., the ionizing of a gas by the radiation (see ELECTRICITY, *Discharge through Gases*), that has been made most use of as a measure of the intensity of the radiations. The radiations break down some of the gas molecules into positive and negative ions, which remain in the gas for a short while before recombining. If now an electric potential difference is maintained between two electrodes in this ionized gas, a current will flow between them, and under proper conditions this current may be taken as a measure of the amount of radiation sent into the gas. A simple apparatus that is much used is a vessel containing strips of gold leaf arranged as in the ordinary gold-leaf electroscope and charged. If now the radiations are allowed to pass into the vessel, the air inside is ionized and the gold leaves lose their charge, the rate at which the leaves come together serving as an indication of the amount of radiation entering the vessel.

To discuss more fully the properties of the radiations it is necessary to distinguish between the three important types. All these radiations have the property of passing, with more or less loss by absorption, through opaque substances, but it was soon discovered that there were differences in this power which could only be explained by assuming that the radiations are complex in their nature, being made up of two groups, one very easily absorbed, the other extremely penetrating. The attempt was made to see whether either of these groups of radiations could be reflected, refracted, diffracted, or polarized, but it was found that they possessed none of these properties. It was discovered, however, that although in this last respect the radiations were similar to X rays, they differed from them in being deviated by a magnetic field. This proves that these radiations from radioactive bodies are not disturbances in the ether similar to X rays or light, but are electrified particles of matter moving at a rapid rate. It was discovered by several observers that the penetrating rays were easily deflected by a magnetic field, and in such a direction as to prove that they were carriers of negative electrical charges. It has been shown that an electrically charged body, if in rapid motion, is equivalent to an electric current, and since an electric current, if free to move in a magnetic field, is acted upon mechanically by the field, therefore an electrified particle in motion will have the direction of its path changed if subjected to a strong magnetic field, and the direction of the deflection will depend upon whether the particle is charged positively or negatively. Such a moving particle will also have the direction of its motion changed if it is made to pass through a strong transverse electrostatic field, and from the mathematical relation existing between the quantities involved the magnetic and electric deflections are the data necessary for the determination of the velocity and ratio of the charge to the mass for a particle.

The penetrating radiations, easily deflectable by a magnetic field, are called the β rays. The β particle is a negative charge, has a mass about $\frac{1}{1800}$ that of the hydrogen atom, and moves with high velocity. In other words, it is an electron, the natural unit of negative electricity. (See ELECTRON.) The β particles, even from the same radioactive substance, vary in velocity, ranging from a velocity too low to produce ionization to a speed 0 9995 that of light, the penetration depending on the velocity.

The law of absorption for homogeneous β rays is like that for ordinary light: if a screen of certain thickness absorbs half the radiation, the addition of a second screen of the same thickness will absorb half of what is left, and so on. The β rays from uranium are half absorbed in passing through 0.05 centimeter of aluminium, and for different materials the absorption is nearly proportional to the density of the material. Radiographs obtained by using β rays are less distinct than when X rays are used, since with X rays the variation in absorption is generally much greater than the variation in density of the objects whose shadows are obtained on the plate.

The fact that the β particles are negatively charged has also been shown by arranging for them to impinge on an insulated metal screen surrounded by a vacuum, in which case the screen receives a negative charge, as may be proved by having it connected to a suitable electroscope or electrometer.

Although anticipated earlier, it was not until 1902 that it was proved, by Rutherford, that the easily absorbed radiations, called the α rays, which are so active in ionizing, are deflectable by a magnetic field, and in such a direction as to prove that they are positively charged particles. Measurement of the magnetic and electric deflections shows that the α particles are emitted with a velocity about one-tenth that of light and are of mass about twice that of the hydrogen atom. In fact the α particles become, when they lose their charges, helium atoms. This has been proved by allowing the particles to penetrate into a closed glass tube and showing that helium gas accumulates, the mass of helium being equal to the mass of α particles.

The α rays are much like the canal rays in a

vacuum tube, while the β rays are exactly like the cathode rays. The α rays, involving a large amount of energy as compared to the β rays, play a much more important part in radioactive processes than the β rays, although the latter may seem of more striking interest on account of their penetration. These two types of radiation are not necessarily given off by the same substance, but are in fact produced quite independently of each other; polonium, e.g., gives only α rays. The α rays from a given substance are quite homogeneous, so that the substance may be recognized by the penetration of its α rays. In passing through matter, air, e.g., the α particles are gradually retarded until their speed is no longer great enough to produce ionization or other effects, and indeed this point where the ionizing power is lost is very sharply defined. As an experiment to show this a screen of zinc sulphide may be brought near to a thin layer of radioactive matter giving off α rays of only one kind. When the screen comes within a few centimeters of the active matter the fluorescence of the screen begins; if it is moved away the disappearance of the fluorescence is just as abrupt, the point of disappearance marking the distance at which the α particles have lost so much of their velocity by collision with the molecules of the air that they can no longer cause fluorescence. This range in air at 15° C. for the α particles from radium itself is 3.3 centimeters from radium C, 6.94 centimeters. This indicates that the α particles emitted from radium atoms have a much less velocity than do those emitted from atoms of radium C. Calculations prove that in the former case it is 1.61×10^9 centimeter per second and in the latter 2.06×10^9. An α particle has to travel with an enormous velocity before it can produce ionization, and Rutherford has shown that the α particles have lost only about half their speed when they cease ionizing, so that they are still going at a speed about one-twentieth that of light. It would be difficult to detect an α radiation with a velocity less than this. The range of α rays in different materials than air is, roughly speaking, inversely proportional to the density. Thus the α rays are generally entirely absorbed by the container when radium is kept in a glass tube or other capsule.

That there is considerable energy in the α rays is shown by the fact that if radium is suitably insulated from loss of heat it reaches a temperature several degrees above its surrounding, owing to the stopping of the α particles by the radium salt itself and whatever vessel contains it and the conversion of their kinetic energy into heat energy. Thus the energy emitted by radium bromide is sufficient to melt its own weight of ice every hour, and this emission of energy is not changed by a change in temperature or any physical or chemical conditions.

Crookes discovered a peculiar phenomenon in the fluorescence caused by α rays. On examining under a lens zinc sulphide while fluorescing he noticed that there was not a uniform glow over the surface, but that the fluorescence came from a succession of tiny sparks appearing and lasting only for an instant, as if each α particle struck a little spark when it impinged on the sulphide. An instrument for showing this interesting spectacle of atoms at work is called the spinthariscope. The photographic action of the α rays is very weak. By taking advantage of the great ionizing effect of the α particles Rutherford and Geiger devised a method for actually counting the number of particles emitted per second in different radioactive processes. Their measurements give the number of α particles expelled per second from one gram of radium itself as 3.4×10^{10}, and from radium in equilibrium 13.6×10^{10}. This method has been extended also to the counting of the β particles.

Besides the α and β radiations there is, always accompanying the β radiation, a third type of very penetrating radiation, not deflectable by a magnetic field and in all respects like X rays of greater penetration than those we ordinarily produce. It would be strange, in fact, not to find such a type of radiation accompanying the β rays, for as in the X-ray tube the X rays are produced by the sudden stopping or change of direction of the cathode particles by the anticathode, so we should certainly expect ether disturbances or pulses to result from the sudden expulsion of the β particles from their atoms, and as the change of velocity of the β particle is certainly more sudden than the stopping of the ordinary cathode-ray particle, we should expect the γ rays to be more penetrating than the X rays. Very little photographic action is produced by the γ rays, since they pass through matter so readily that very little of their energy can be given up to the thin film of a dry plate. The γ rays are approximately half absorbed by a screen of aluminium of 8 centimeters thickness, and their absorption in different materials is closely proportional to their densities.

The α, β, and γ rays all produce a secondary radiation when they impinge on matter, the more abundant the denser the matter. This secondary radiation consists mainly of electrons like the β particle, which are torn loose from the matter and projected with greater or less velocity from the surface. They are of course deflectable in a magnetic field, and their velocity can be measured. The α rays cause only a weak secondary radiation, while the β and γ rays give rise to radiation comparable in penetration and other properties to cathode rays. This secondary radiation, which ceases on the removal of the primary rays, must not be confused with what was formerly called induced or excited radioactivity, which continues after removal of the original radioactive matter.

Early experiments showed that radioactivity is an atomic property, unchanged in total amount by any chemical combination or change in molecular state of the radioactive element, and that temperature changes do not affect it; yet it was found that a chemical separation could be made of radioactive substances from radium, uranium, and thorium, different from the elements themselves. For example, by adding an excess of ammonium carbonate to a solution of uranium a small amount of precipitate very active in β rays was obtained, while the uranium had lost the β-ray activity that accompanied it at first, though the total amount of β-ray activity was unchanged. Within a year the precipitate had lost its activity, while the uranium had regained its β activity. Similarly a small amount of radioactive substance chemically free from thorium may be obtained from the filtrate after precipitation of thorium from a solution by ammonia. This active matter, thorium X, emits α rays and loses its activity at the rate of half in four days. Radium and thorium both give off minute quantities of radioactive gas

or emanation. In the case of radium the emanation loses its activity at the rate of half in about four days, the thorium emanation half in one minute. If the thorium emanation is allowed to stand in a vessel for a few minutes, until it loses practically all of its activity, the walls of the vessel will be found to have an invisible radioactive substance on them, which loses its activity at the rate of half in 11 hours. These and many kindred phenomena demanded explanation and have received it through the disintegration theory of Rutherford. According to this theory, now generally accepted, the atoms of the radioactive substances are subject to disintegration, and when an atom disintegrates it does so violently, throwing off the particles that constitute the radiation and from the wreck of the old atom giving rise to a new atom, which may in turn be subject to radioactive disintegration; this process goes on until only stable atoms are formed. That is, radioactivity is an accompaniment, not however a necessary one, of atomic disintegration. The quantitative law according to which this goes on is like that for monomolecular chemical changes; the mass of substance disintegrating in a given time is always the same fraction of the mass of the unchanged substance; e.g., half of a quantity of thorium X disintegrates in four days, half of what is left in the next four days, and so on. Since the radioactivity is proportional to the number of atoms, or mass of substance, disintegrating in a given time, it is by the above law proportional to the amount of undisintegrated radioactive substance, which is an experimental fact. In the case of radium the list of hese transformation products includes at least eight different substances, which have been investigated by getting them separated as well as possible by chemical and physical means and studying their radiations and rates of decay into the succeeding products. These transformation products are so small in amount that they can be followed only by observing their radioactivity, not at all by ordinary chemical tests; yet so carefully has the work been done that the existence of transformations unaccompanied by radiations has been proven through their influence on the process of succeeding changes.

The foregoing statement of the essentials of the disintegration theory prepares the way for a list of the several families of radioactive transformation products and descriptions of these substances. Radium itself disintegrates at the rate of half in about 2000 years into the next number of the radium series, the radium emanation, the disintegration being accompanied by α rays only. All radium compounds therefore produce continually radium emanation, which is a gas that may be liquefied under atmospheric pressure at $-150°$ C. Chemically it is quite inert, like the gases of the argon group. When it is generated in solid radium salts it is for the most part occluded and held by them, though it may be released by strong heating or by bringing the radium into solution. This emanation, though procurable in such small amount that its presence, mixed with air or other gas, is ordinarily detected only by its radioactivity, has still been obtained in sufficient quantity to have its volume measured. Ramsay and Soddy purified some of the emanation and examined its spark spectrum, finding that after a few days had elapsed helium lines appeared, though at first there were none present, thus confirming a conjecture of Rutherford that helium, which is found in most radioactive minerals, is a result of the disintegration of radium. (As noted above the α particles form helium gas.) In 1911 Gray and Ramsay succeeded in measuring the atomic weight of the emanation, finding it to be 223, which is in complete accord with Rutherford's theory.

The emanation disintegrates at the rate of half in 3.8 days, accompanied by α rays. The first product of its disintegration is radium A, which is deposited on the walls of the vessel. When first formed radium A gets a positive charge, so that it may all be readily collected from the vessel containing the emanation by putting a negatively charged wire in it. Radium A changes, with emission of α particles, into radium B at the rate of half in 3 minutes, while radium B changes into radium C, with accompanying β radiations only, at the rate of half in 26.8 minutes. A certain proportion of radium C atoms break down by emitting α particles, forming radium C_2; while the remaining radium C atoms are transformed into radium C′ with the emission of β particles, and radium C′ forms radium D with the emission of α particles. The active deposit on the walls of a vessel in which the radium emanation has been standing is a mixture of radium A, B, and C. They are all soluble in acids and may be vaporized by heat. Radium D changes into radium E, half in about 16.5 years, without emission of rays, radium E into radium F, half in five days, with emission of β and γ rays. Radium F is the polonium of Madame Curie, or the radiotellurium of Marckwald. It expels only α particles and disintegrates at the rate of half in 136 days. It is deposited from a solution on a bismuth rod, which serves as a ready means of separating it from the other members of the series. The final product is in all probability the well-known element lead.

Radium bromide in the solid state generally contains all the members of the series, and if it has stood undisturbed for a month or two in a sealed tube, it contains the first five members in radioactive equilibrium, i.e., the quantities of the occluded emanation of radium A, B, and C are such that as fast as one transforms into the succeeding element the quantity is restored by the disintegration of the preceding element. If a radium salt is put in solution the emanation escapes, the radium A, B, and C rapidly decay, and its activity is reduced to about a sixth of its original activity. It however, if sealed up again, regains its activity at the rate of half in about four days at first, then continues to increase very slowly in activity as radium E and F are formed. Since radium itself decays at the rate of half in 2000 years, it is certain that the present supply of radium, in pitchblende, e.g., cannot have existed for more than a few thousand years; so we must believe that radium itself is only a disintegration product of some other element. Many circumstances point to uranium as the parent element, especially the fact that careful analyses have shown that the proportion of radium to uranium in all uranium minerals is substantially the same. Experiments on finding radium after the lapse of a year or more in uranium salts carefully freed from radium at the beginning of the experiment, indicate that uranium is

not transformed directly into radium, but that the change must be of slow period and through a series of intermediate radioactive substances. (See below.) This idea has been confirmed by the direct experiments of Soddy (1915).

The thorium series is the next longest. Thorium is the well-known element, atomic weight 232. It changes by three stages into radiothorium, a very active substance first separated from the mineral thorianite. Radiothorium is not easily separable from thorium. It changes into ThX, accompanied by α rays. ThX may be easily separated from thorium or radiothorium solutions. It is soluble in ammonia, and changes into thorium emanation, half in 3.6 days, giving α rays. The emanation is a gas condensing at about —120° C. It is chemically inert. At the rate of half in 54 seconds it changes into thorium A, which, like radium A, is deposited on the walls of the vessel, but can be collected on a negatively charged electrode. Thorium A changes, emitting α rays, into thorium B, half in 0.14 seconds; thorium B, half in 10.6 hours, with β rays, into thorium C, which disintegrates half in a few seconds, giving α, β, and γ rays. Thorium A and B are soluble in acids; thorium A is more volatile than thorium B, and they may be separated by electrolysis in solutions.

The uranium series consists of the heavy element uranium, atomic weight 237, which disintegrates very slowly into uranium X, giving α rays; this into uranium X_2; this into uranium$_2$; and this in turn disintegrates at the rate of half in 24.6 days, giving β and γ rays, into ionium, which in turn disintegrates, forming radium.

The actinium series begins with actinium, which is precipitated by ammonia. It is undoubtedly a disintegration product of uranium. It changes into radioactinium and this into actinium X, losing both α and β particles. Actinium X changes, half in 10.2 days, with emission of α rays, into the actinium emanation, a chemically inert gas. It changes, half in 3.9 seconds, with α rays, into actinium A. Actinium A results from the emanation, and like RaA and ThA it is deposited on bodies and may be concentrated on a negatively charged conductor. It changes, with α rays, into actinium B, half in 0.002 seconds. Actinium B disintegrates at the rate of half in 36 minutes into actinium C; etc.

According to the disintegration theory the liberation of energy by radioactive matter is at the expense of the internal energy of the atoms, and it appears that within the atoms there is a store of energy great in comparison to the energy stored in the molecular heat motion of matter or in its so-called chemical potential energy. For instance Rutherford computes that the energy liberated by one pound of the radium emanation during its disintegration would amount to 60,000 horse-power days. On the other hand, it is not yet possible to set free atomic energy of this sort from ordinary atoms, as it seems beyond the reach of our ordinary influences. Temperature change, which has so great an influence on chemical transformations, has little, if any, effect on the rate of radioactive disintegration, which goes on uniformly at the temperature of liquid air or in a white-hot furnace. As to the form in which this energy exists within the atom there is only hypothesis; yet as it would be hard to conceive of forces great enough to project the α and β particles with such enormous velocities, being suddenly generated in the atom, the view generally held is that the particles are already in rapid orbital motion within the atom and that at the moment of disintegration they leave the atom with the speed already possessed. This view of the atom corresponds well with the facts of spectroscopy and magneto-optical effects. Thomson has shown that a system of many charged particles revolving around a common centre would exhibit many of the properties of the atoms of the elements. It would be in accord with this view to find all matter radioactive, differing greatly in degree, and in fact much work has been done to find out whether radioactivity is a property of matter in general, but the question is still open. Certainly no substance has been found absolutely free from radioactivity, though possibly due to the presence in minute amount of some of the well-known radioactive substances. It may be that all atoms are losing energy by radiation and that the loss of energy is accompanied finally by instability and disintegration, yet it is to be remembered that such disintegration is not necessarily attended by any such violent ejection of particles as we have in the case of radioactive change. It is worthy of note in this connection that the principal radioactive elements, uranium, thorium, and radium, have the highest atomic weights of all the elements, and we might well expect high atomic weight to mean that the atomic structure is complex and most likely to disintegrate.

The distribution of radioactive matter in nature is very extended. Nearly all soils contain a measurable amount; many natural waters, especially those from deep wells and hot springs, contain radioactive gases in solution, and even in the atmosphere there is present everywhere a certain quantity of radioactive gas, doubtless exhaled from the soil, which varies in amount with locality and weather. The radioactive gas in the air and in natural waters is mainly the radium emanation, yet the thorium products also are found. By hanging out in the air a wire charged negatively to a potential of 1000 volts or so, the radioactive deposit from the disintegration of the emanations in the air may be collected and the surface of the wire so charged with it that the rays from it will affect a photographic plate. The active deposit is collected by objects on the surface of the earth, all the more readily since the earth is generally charged negatively with respect to the atmosphere. In laboratories in which experiments on radioactivity are carried on it is difficult to get rid of radiation from undesirable sources, and in fact it cannot be entirely avoided, so thoroughly is radioactive matter disseminated.

The development of heat by radium has already been referred to, so it is obvious that if radium or other active matter is present in as large a proportion throughout the mass of the earth as on the surface, the heat developed from the radioactive energy is considerable. A computation shows that if there is present only 4.6×10^{-14} gram of radium per gram of earth the heat generated by the radium will compensate for the heat lost from the earth by radiation. In many specimens of soil the proportion of radium is of about this

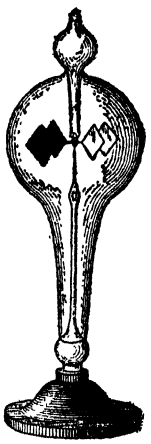
order, or even higher. The amount of radium cannot be much greater, or the temperature gradient as we go down into the earth would be higher than it is. A consideration of this source of internal heat for the earth allows us to estimate the time during which the earth has not been too hot for the existence of vegetable and animal life on it as very much greater than it would be on the simple theory of cooling by radiation.

As has been noted above, the α particles are positively charged atoms of helium, while the β particles are negatively charged corpuscles, i.e., electrons. The charge carried by the former is twice in amount that carried by the latter; so if any radioactive atom loses one α particle and the new atom loses two β particles, the atom thus formed will be electrically neutral if the original atom was, because the latter will have lost equal amounts of positive and of negative charges. But the mass of the atom formed by these two radioactive processes will be less than that of the original atom by an amount equal to the mass of the helium atom, i.e., 4, when expressed in units of atomic weights. A most interesting and important fact has recently been brought to light through the investigations of Soddy and others: the chemical properties of the original atom and the one formed as described, as the result of the loss of one α particle and two β particles, are identical; they are called isotopes.

This statement may be developed further. If the elements are arranged in a series of rows and columns as in the periodic table, the radioactive atoms all find their proper places according to their atomic weights. But it is known that all the elements in any one column of the table have similar chemical properties; so that isotopes would be expected to fall into the same column, and they do. Soddy has shown, in fact, that the loss of one α particle by any atom shifts the resulting atom two columns to the left in the table and the loss of one β particle shifts it one column to the right. Thus, a loss of one α particle and two β particles brings the resulting atom back into the same column as the original atom.

Cameron, *Radium and Radioactivity* (ib., 1912); Ernest Rutherford, *Radioactive Substances and their Radiations* (ib., 1913); Frederick Soddy, *The Chemistry of the Radio-Elements* (2 vols., London, 1911–14); E. A. Letts, *Some Fundamental Problems in Chemistry* (New York, 1914).

RA'DIOLA'RIA (Neo-Lat. nom. pl., from Lat. *radiolus*, dim. of *radius*, ray). A group of minute marine animals forming an order of rhizopodous Protozoa (q.v.). About 85 families, including many thousand species, are known, most of them microscopic. They live in the surface water of the ocean and their shells, after death, sink to the bottom and form siliceous deposits known as radiolarian ooze. (See OOZE.) They are distinguished from all other Protozoa by their complex and generally very beautiful shells, which are composed of silicon, except in a few cases where either the material is a horny substance called acanthin or the shell is entirely wanting. The radiolarians are further distinguished by the presence of a peculiar, membranous, inner capsule. This is either spherical and perforated by numerous small openings or it is ovoid with a single large opening. Within it are some clear transparent cytoplasm and the nucleus, while outside is a layer of protoplasm which is covered by a gelatinous envelope known as the calymna. The skeleton or shell consists of one or more fenestrated spheres; when more than one are present they are concentric. They are connected with each other by radiating rods and spicules which are usually continued outside the outermost sphere as projecting spines and may be continued inwardly to meet within the centre of the capsule. The pseudopodia are usually very flexible and anastomose freely, but in some cases they are stiff and not inclined to fuse. Contractile vacuoles are not present, but in most radiolarians are very small yellowish spheres, supposed to be parasitic algæ; it is possible that these are concerned with the process of excretion. Reproduction takes place either by fission or by spore formation. In the latter case both macrospores and microspores are formed, and it is supposed that one of each must fuse together to give rise to a new individual. Radiolarians play an important part in the economy of the ocean, furnishing food for countless hosts of minute crustaceans and other animals, which in turn supply the fishes. All recent investigations into the biology of the ocean give an important place to this order.



Fossil Forms. Radiolaria are abundant in a fossil state; they have been found in rocks of most of the geological systems, and in many cases they have formed siliceous rocks of considerable thickness. These latter, described from Brittany, England, and New South Wales, recall the radiolarian ooze of the modern ocean bottom. They are among the oldest known organisms, for they are found in quartzites interbedded with Pre-Cambrian gneiss in Brittany. They occur in abundance in phosphate nodules in the lower Cambrian of New Brunswick, Canada, and in Cambrian rocks of other regions. Cherts and jaspers of Ordovician, Silurian, Devonian, and Carboniferous age in Europe, Asia, and Australia have been found to contain them, often in abundance. The Mesozoic and Tertiary flint-bearing deposits, like the chalk of Europe and America, yield them, and the polishing earths known as Barbados earth and tripoli owe their abrasive powers to them.

Challenger* (London, 1887); Von Zittel and Eastman, *Text-Book of Palæontology*, vol. i (New York, 1900).

RADIOLITES, rā'dĭ-ō-lī'tēz (Neo-Lat. nom. pl., from Lat. *radiolus*, little ray). A very peculiar fossil pelecypod of Cretaceous age, allied to Rudistes. See RUDISTÆ.

RA'DIOM'ETER (from Lat. *radius*, ray + Gk. *μέτρον, metron*, measure). An instrument invented by Crookes and improved by Rubens and E. F. Nichols. It consists essentially of a framework carrying one or more mica vanes supported and free to turn around an axis in an inclosed space from which practically

all the air has been exhausted; one face of each vane is coated with lampblack, while the other is polished. In the radiometer of Crookes there are four such vanes carried on a little framework, not unlike a windmill with four arms; and this being pivoted can revolve around an axis. In the form as used by Nichols there are several modifications, the most important of which is that the mica vane is suspended by a torsion fibre and so can no longer revolve freely, but can simply turn through a small angle. In a space so exhausted as that around the mica vanes the particles of the gas are few in number comparatively, and their mean free path may be over a centimeter. If, now, ether waves fall upon the polished surface of the mica, they are reflected and have no action, but if they fall upon the blackened surface they are absorbed and the temperature of this surface is raised. As the particles of the gas now impinge on this heated surface they rebound with an increased velocity, and therefore produce an increased reaction against the surface, pushing it backward. If a Crookes radiometer be exposed to a match, or even the hand if sufficiently close, the mica vanes are set revolving at a high speed. If the gas around the vanes was at ordinary pressures, the molecules would be so close that any increased velocity of the rebounding particles would be transmitted almost instantly throughout the whole gas and so be felt on the polished side as well. Thus there would be no resultant force on the vanes. The above explanation is not to be considered as at all complete, for the action is really most complicated.

CROOKES RADIOMETER.

In the form of instrument used by Nichols it becomes one of the most sensitive thermometers known and it can measure most accurately the energy of the ether waves which its vane absorbs.

Radiomicrometer, or **Microradiometer.** An instrument invented by Vernon Boys to measure the energy of ether waves. It is a combination of a thermopile and a galvanometer with fixed magnets and movable coils. A loop of wire is suspended between the opposite poles of a horseshoe magnet with its plane parallel to the line joining the poles; the two ends of this loop are prolonged out of the magnetic field and joined by a wire of a different conductor. Only one junction of the two different metals is coated with lampblack (if the waves in question are due to ordinary thermal radiations) and exposed to the radiation, the other junction being shielded. The radiation being absorbed by the lampblack produces a rise of temperature; this causes a thermoelectric current, and thus the loop of wire is turned through an angle which may be measured by ordinary means. If the instrument is to be used for measuring the radiation of waves produced by electrical oscillations, a slightly different plan is adopted at the thermal junction. Consult Thomas Preston, *Theory of Heat* (2d ed., New York, 1904).

RA'DIOTELLU'RIUM. A radioactive element, the same as polonium. See RADIOACTIVITY.

RAD'ISH (OF., Fr. *radis*, from Prov. *raditz*, It. *radice*, radish, root, from Lat. *radix*, root). A garden vegetable, *Raphanus sativus*, of the family Cruciferæ, probably a native of Asia, cultivated in temperate regions for its fleshy roots, which are eaten raw. The plant attains a height of about 3 feet and bears white or lilac-colored blossoms on a branched flower stalk. There are two main types of radishes. The summer varieties are annuals and the winter perennials. Both types produce turnip or carrot shaped white or red roots with intermediate forms. Many winter kinds are black. The flesh of all sorts is white. Under favorable conditions the small, summer varieties, which are most used for forcing, may produce edible roots in three weeks or even less. They are commonly grown between the rows of slower-growing crops like lettuce or beets. In beds the seeds are grown in rows about 8 inches apart with one or two seeds to the inch. Radishes grow best on a rich sandy loam soil. Winter radishes are sown in July or in early August. They are usually larger than summer sorts and have much firmer flesh. Another species of radish (*Raphanus caudatus*) is cultivated as an esculent in Japan, where it is native. The wild radish (*Raphanus raphanistrum*) is a troublesome field weed in the eastern United States. Horseradish (q.v.) is a near relative. See Plate of FLOWERS.

RADISH INSECTS, which affect the radish plant in the United States, are for the most part the same species which are found on cabbage and turnips. One important insect enemy is the cabbage maggot, or radish maggot (*Phorbia brassicæ*), which infests the roots of many oleraceous plants. The maggots puncture the fleshy root of the radish and make channels through it in every direction, safely beyond the reach of any insecticide application. The best remedy consists in a combination of nitrate of soda, ground rock, and muriate of potash. This fertilizer should be applied soon after the plants are up and when the leaves are about an inch long, at the rate of 500 pounds to the acre, and before or during a rain. If the application be made at this time it seems to reach the maggots just when they are hatching. The adult flies, which are small brown creatures, lay their white and slender eggs in little masses on the surface of the ground near the infested plants. See CABBAGE INSECTS; ONION INSECTS.

RADISHTCHEV, rȧ-dĭsh'chĕf, ALEXANDER NIKOLAIEVITCH (1749–1802). A Russian author and reformer. He was born in Moscow and, after several years as a page, was educated at Leipzig University. There he spent four years, in which he was more deeply influenced by French philosophy and the Encyclopædists than by his university curriculum. He returned to Russia in 1771 and received a post in the customs administration. In 1790, under the influence of his liberal convictions, he wrote his famous *Journey from St. Petersburg to Moscow* (a work largely modeled after Abbé Raynal's *History of the Indies* and Sterne's *Sentimental Journey*), which, with all its humor and excursive sentimentality, is a terribly vivid picture of Russian serfdom and contains a frank, bold programme of emancipation. Empress Catharine exiled the author to Ilimsk, whence he was permitted to return to Russia

in 1796 by Czar Paul. On the coronation of Alexander he was fully pardoned, becoming a member of the legislative commission in 1801. A year later he committed suicide. Radishtchev's *Journey*, the precursor of Turgenev's *Notes of a Sportsman* in its picture and indictment of serfdom, was forbidden in Russia till 1890, while his name could not be mentioned even unfavorably. Necessarily he remained unappreciated for many years.

RA'DIUM (Neo-Lat., from Lat. *radius*, ray). A remarkable chemical element discovered by Monsieur and Madame Curie in 1898. It occurs in all ores containing the element uranium and is generally conceded to be a product of the transmutation of that element. It is obtained from the mineral pitchblende (uraninite), in which a ton of uranium is usually associated with 320 milligrams of radium. After the uranium of the ore has been removed, the residue is washed with hot caustic soda and with water, then with hydrochloric acid and again with water, and then treated with a hot strong solution of sodium carbonate. The solid remaining undissolved contains the radium in the form of carbonate, but associated with relatively very large amounts of barium carbonate and with certain amounts of lead, calcium, polonium, and actinium. After the removal of these last four elements by a more or less complex series of chemical steps, the radium and barium are obtained in the form of chlorides, and the radium chloride is separated out of the mixture by an extended series of fractional crystallizations, advantage being taken of the fact that the chloride of barium is somewhat more soluble than that of radium. Chemically radium behaves so much like barium that an attempt to separate the two elements by a chemical process would be hopeless. In 1910 Madame Curie and Debierne succeeded in isolating metallic radium itself from its chloride. The metal is white as silver and in the absence of air retains its brilliant lustre; in the air it tarnishes rapidly. Water is energetically decomposed by it. The melting point of the metal is about 700° C. (1292° F.). The atomic weight of radium is 226; its chemical symbol is Ra. Radium itself and all its salts continually evolve heat and light. The amount of heat produced by one one-hundredth of a gram of radium, whether isolated or combined with other elements, is 1.18 calories per hour. This radioactivity of the element is the manifestation of a change far deeper going than any chemical change can be, consisting in an actual transmutation of radium into the elements niton and helium (qq.v.). Yet that radium itself is a true element is indicated by everything known about it, among other things by its possessing a spectrum of its own different from that of any other known substance. A gram of radium was valued in 1915 at $37,000. In the United States uranium minerals (mostly carnotite) have been obtained in Colorado and in Utah, the first considerable quantity of pure radium bromide, containing about 300 milligrams of radium, having been prepared in 1914. During the preceding year radium salts valued at $16,218 were imported into the United States.

Extensive work has been carried on by the United States Bureau of Mines, in coöperation with the National Radium Institute, an organization founded by Dr. Howard A. Kelly, of Baltimore, and Dr. James Douglas, of New York, who were deeply interested in the production of radium for hospital use. The Radium Institute secured the right to use carnotite from certain claims in Colorado, and it made a proposition to the Bureau of Mines whereby it would assume the expense of an exhaustive scientific investigation provided that the bureau would supply chemists and mineral technologists to supervise the mining and concentration of the ore as well as the extraction of the radium. An extraction plant was erected at Denver, and not only were known methods of extracting radium from the ore studied, but entirely new methods were developed. One object of this investigation was to secure for American hospitals an adequate supply of radium. The new methods were patented for the benefit of the American people and could be used freely by any one in the United States who could secure the raw material and could carry on under intelligent technical control the various chemical processes involved. In December, 1915, the Bureau of Mines published a bulletin, *Extraction and Recovery of Radium, Uranium, and Vanadium from Carnotite*, which described in detail the different methods of treating radium ores, including the nitric-acid method which was developed in the course of the investigation. This method consisted in first treating the ore with nitric acid, producing an acid solution, and precipitating radium-barium sulphate. The radium-barium sulphate was reduced with carbon, and the resulting radium-barium sulphide was treated with hydrochloric acid, giving a radium-barium chloride from which barium chloride and radium chloride were produced. Up to the time of the publication of the report 4131 milligrams of radium were obtained in the form of high-grade salts, making an average cost of one gram of radium element $37,599, of which the value of the ore was $16,889 and the cost of extraction $20,710.

Rosanoff, in *Journal of the American Chemical Society* (ib., 1911); Frederick Soddy, *Interpretation of Radium* (3d ed., ib., 1912); Moore and Kithil, "A Preliminary Report on Uranium, Radium, and Vanadium," in *United States Bureau of Mines, Bulletin No. 70* (Washington, 1913); Wyatt Malcolm, "Notes on Radium-Bearing Minerals," in *Canada Geological Survey, Proprietor's Handbook, No. 1* (Ottawa, 1914); Lind and Whittemore, "The Radium-Uranium Ratio in Carnotites," in *United States Bureau of Mines, Technical Paper No. 88* (Washington, 1915), and other papers descriptive of the experimental work of the United States Bureau of Mines; also *Radium: A Monthly Journal* (Pittsburgh, Pa., 1913 et seq.). See ALCHEMY; CHEMISTRY, *Chemical Elements;* RADIOACTIVITY.

In Medicine. Radium is employed successfully for the removal and prevention of certain forms of cicatrices, in pruriginous affections of the skin, removal of hairy and pigmented moles, papilloma of the skin, corns, warts, especially those occurring on the hands of X-ray workers, angioma, keloid, rodent ulcer, some forms of epitheliomas, exophthalmic goitre, some forms of sarcoma and carcinoma. Radium is either applied directly to the part to be treated or is given internally in the form of the emanation.

In direct application radium is used in the

form of the metal or as a salt, inclosed in a platinum tube and applied to the surface or inserted into the growth. This method of application may be made also by means of applicators, consisting of plates of metal with radium or salts of radium spread on the plate and covered with a special protective varnish. In both methods of application the rays are filtered through a sheet of aluminium to absorb the slow β rays, which, being absorbed by the skin, produce excessive inflammatory reaction without proportionate benefit. If the deep-penetrating γ rays are to be employed for the treatment of deep-seated growths, a filter of lead is used.

Internal treatments are given by the administration, by mouth or injection, of a radioactive solution of radium emanation and water. This method increases tissue oxidation and aids the activity of body ferments. Certain forms of rheumatism have been benefited by this form of treatment. The dose of radium applications is regulated by the amount of radium element and the thickness of the filter used, a large amount of the element applied for a short time producing better results than a smaller quantity applied for a longer time. The strength of radioactive water or the concentration of radium emanation is usually expressed in Maché units per liter. One Maché unit is defined as the saturation ionization current due to the radium emanation, free from decay products, from a liter of solution or gas expressed in electrostatic units multiplied by 1000. Thus radioactive water of 2700 Maché units contains per liter as much emanation as is emitted in 30 days by one microgram of radium. In other words, one Maché unit equals 0.001 electrostatic units, one of which equals 3.33 multiplied by 10^{-10} amperes. Consult: Charles Baskerville, *Radium and Radio-Active Substances: Their Application Especially to Medicine* (Philadelphia, 1905); Dawson Turner, *Radium: Its Physics and Therapeutics* (New York, 1911); N. S. Finzi, *Radium Therapeutics* (London, 1913); also the following papers presented at the International Congress of Physicians and Surgeons at San Francisco, June, 1913, and published in the *Journal of the American Medical Association* for that year: Robert Abbe, "Roentgen-Ray Epitheliomas Curable by Radium: An Apparent Paradox"; Henry Schmitz, "Primary Results of Radium Therapy on Uterine and Rectal Cancers"; Burnham and Kelly, "Radium in the Treatment of Carcinomas of the Cervix Uteri and Vagina"; E. S. Lain, "Radium Energy in the Treatment of Diseases of the Skin." See RADIOACTIVITY.

In Agriculture. That radium affects the physiological processes of plants was early realized, though the results of various early investigators were discordant in many respects. That under certain conditions it acted as a stimulus was shown by Gager, of the New York Botanical Garden (1908), but he also stated that it might retard or prohibit development, or even kill the plant, if used in too great strength or for too long a time. That root development was retarded was reported by Acqua, of Italy, who noted little or no direct effect upon the stems or leaves. Fabre, in France, found beneficial effects from radioactivity corresponding to emanations of one and one-half microcurie for each two liters of air, but injury from greater strength. Rusby, of Columbia University College of Pharmacy, has reported a series of experiments from which he concludes that "the yield of most crops can be increased by the addition of some amounts of radioactive fertilizer, the amount differing with different crops, the beneficial effects continuing over successive crops probably for many years. The largest amount required by any one crop would cost less than the increased market value of such crop of the first year. . . . The fertility of any used ground will increase spontaneously at a much greater rate when treated by radium."

The various experiments on record were carefully examined by Hopkins and Sachs of the Illinois Agricultural Experiment Station, who conclude that the conclusions and claims of the various experimenters are not justified by the facts presented. Two years' field trials made at the station showed that radium applied at a cost of $1, $10, or $100 per acre produced no effect upon the crop yield either the first or the second season.

Experiments at the New Jersey Experiment Station showed no appreciable effects from the use of radioactive material one way or the other.

Ross of the Bureau of Soils of the United States Department of Agriculture, reviewing the results of experiments with radioactive manures in Europe and elsewhere, concludes that while radioactive substances used in botanical research, and possibly in greenhouse practice, might prove of considerable value, the data now available do not warrant the belief that they have any economical and practical application as a fertilizer in general farming. He thinks it "still less credible that the so-called radioactive manure has any value, as far as its radioactivity is concerned, since the radium present on an average in an acre foot of soil is about one hundred times greater than is contained in the quantity of radioactive manure commonly recommended for application to an acre." Consult: C. S. Gager, *Effects of the Rays of Radium on Plants* (New York, 1908); H. H. Rusby, in *New York Botanical Gardens, Journal*, vol. xvi (ib., 1915); also *Experiment Station Record* (Washington, monthly).

RADIUM EMANATION. See RADIOACTIVITY.

RA'DIUS (Lat., rod, staff, spoke, semidiameter, ray). A straight line from the centre to any point on the circumference of a circle (q.v.).

RADIUS OF CURVATURE. See CURVE.

RADIUS VECTOR (Neo-Lat., semidiameter carrier). The linear coördinate in a system of polar coördinates. See COÖRDINATES.

RA'DIX (Lat., root). In mathematics, the base of a scale of notation or a system of powers. See LOGARITHMS; SCALES OF NOTATION.

RADLOFF, rät'lôf, WILHELM (1837–). A German-Russian traveler and philologist. He was born in Berlin, studied there, at Halle, and at Jena, and in 1858 became instructor at Barnaul in western Siberia, a position which he held until 1870. After acting (1871–84) as departmental inspector of Mohammedan schools in Kazan, Radloff was appointed curator of the Asiatic Museum in St. Petersburg. In 1886 he traveled in the Crimea and in 1887 in Lithuania for research in local dialects. In 1908 he received the German Order "Pour le Mérite." His publications include: *Proben der Volkslitteratur der türkischen Stämme Südsibiriens* (10 vols., 1866–1904); *Das Schamanentum und*

sein Kultus (1885); *Versuch eines Wörterbuchs der Türkdialekte* (1888–1905); two great works in Russian on "Siberian Antiquities" (1888) and the ethnology of the Siberian Turkish peoples (1888); *Atlas der Altertümer der Mongolei* (1892).

RAD'NORSHIRE. A southern inland county of Wales, Great Britain (Map: Wales, C 4). Area, 471 square miles. Groups of mountains, of which Radnor forest (2163 feet high) is the loftiest, cover the greater part of the country. The southeastern district is flat, with a gradual slope towards the east. Of the rivers, the chief of which flow southward, the principal is the Wye, which forms the greater part of the southern boundary. The county formerly comprised large tracts of bog and moor land, which are in course of being gradually reclaimed and cultivated. In the east and southeast districts excellent wheat, barley, oats, and potatoes are grown. Capital, Radnor. Pop., 1901, 23,281; 1911, 22,589.

RADOM, rä'dôm. A government of Poland. Area, 4769 square miles (Map: Russia, B 4). It is somewhat hilly in the south and level in the north. In the latter part are found also considerable stretches of marsh land. The principal river is the Vistula, which forms a considerable part of the boundary. The climate is damp and unhealthful in the marshy districts. Agriculture is the principal industry. Cereals are raised for export. There are a large number of ironworks. Pop., 1913, 1,155,900, mostly Poles. Capital, Radom.

RADOM. The capital of the Government of Radom, in Poland, situated on the Mleczna River, about 60 miles south of Warsaw (Map: Russia, B 4). It is a well-built town and has manufactures of machinery and leather. Pop., 1910, 49,194. Radom was the scene of a number of diets in the history of Poland. It was allotted to Austria at the third partition of Poland, and became part of the new Kingdom of Poland in 1815. It was captured by the Germans in the European War which began in 1914. See WAR IN EUROPE.

RADOWITZ, rä'dô-vits, JOSEPH MARIA VON (1797–1853). A Prussian general and statesman, born at Blankenburg, Brunswick, the son of a nobleman of Hungarian descent. He entered the Westphalian army in 1812 and was wounded and taken prisoner at the battle of Leipzig. In 1830 he became chief of the Prussian general staff of artillery. In 1836 Radowitz was sent as Prussian military commissioner plenipotentiary to the German Diet at Frankfort. In 1842 he was appointed Envoy at the courts of Karlsruhe, Darmstadt, and Nassau, and in 1845 he was raised to the rank of major general. His lively interest in the contemporary politics of Germany is shown in his writings, *Gespräche aus der Gegenwart über Staat und Kirche* (1846) and *Deutschland und Friedrich Wilhelm IV.* (1848). In the Frankfort Parliament Radowitz was the leader of the ultraconservatives, but he subsequently modified his views and favored a constitutional monarchy and a united Germany under Prussian leadership. In September, 1850, he became Prussian Minister of Foreign Affairs, but resigned in November on the failure of his anti-Austrian policy and retired to Erfurt, where he wrote his *Neue Gespräche aus der Gegenwart* (1851). He died at Berlin. Consult Frensdorff, *Joseph von Radowitz* (Leipzig, 1850). His collected works in five volumes were published in Berlin (1852–53).

RADULESCU, rä'dōō-lĕs'kōō, JOAN HELIADE-. See HELIADE-RADULESCU.

RADZIWILL, rät-zĕ'vĭl. An old Lithuanian-Polish family, descended from NICHOLAS I (1366–1446), Palatine of Vilna, who was equally distinguished as warrior and statesman. The most distinguished modern member of the family was MICHAEL JEROME (GERON) (1778–1850). He served as lieutenant in the war of independence under Kosciuszko until 1794, joined Napoleon on his march into Russia (1812), and was made by him brigadier general. During the revolution of 1830–31 he was for a short time general in chief of the Polish army and after its defeat was transported into central Russia and detained there until 1836, when he retired to Dresden.

RAE, rā, CHARLES WHITESIDE (1847–1908). An American naval engineer, born at Hartford, Conn. He graduated from the Rensselaer Polytechnic Institute in 1866 and from the United States Naval Academy in 1868, becoming third assistant engineer in the navy and being promoted through the various grades to chief engineer in 1893. He was a member of the Nicaragua and Tehuantepec surveying expeditions in 1870–71. During the Spanish-American War he served on the *Iowa*. He attained the rank of commander in 1899 and of captain in 1903 and in the latter year became engineer in chief of the navy and chief of the Bureau of Steam Engineers with the rank of rear admiral.

RAE, JOHN (1813–93). A British Arctic explorer, born in the Orkney Islands. He studied medicine at Edinburgh and in 1833 became surgeon at one of the stations of the Hudson's Bay Company, where much of his time was devoted to scientific study. In 1846–47 he explored 700 miles of the coast of Committee Bay. In the following year he joined the land expedition under Richardson to search for Sir John Franklin. In 1850 Rae was again sent out by the government of Great Britain in quest of the lost explorers. During that year the party traveled 5380 miles, covering Wollaston Land and Victoria Land, concerning which nothing had been known, and mapped out 700 miles of new coasts. In 1853 Rae set out with another party, under the Hudson's Bay Company, with the object of completing the survey of the west coast of Boothia. During this journey he obtained definite news of Franklin's fate, and upon returning to civilization with the news found that his party had earned the reward of £10,000 offered for the first accredited information of the lost explorer. In 1858, 1860, and 1864 he took a prominent part in various expeditions in Arctic America. His activity and endurance bordered upon the marvelous. He walked 23,000 miles in the course of his various journeys and explorations and discovered more than 1700 miles of coasts. In 1852 he was awarded the Founder's gold medal of the Royal Geographical Society and he was also honored by other learned bodies. During the later years of his life he held offices in corporations and institutions concerned with colonial matters. Rae published, in 1850, *Narrative of an Expedition to the Shores of the Arctic Sea in 1846 and 1847*. Consult also Richardson, *Arctic Expeditions* (London, 1852–53), and id., *Polar Regions* (ib., 1861).

RAE, JOHN (1845–1915). A British economist, born at Wick, Scotland, and educated at the University of Edinburgh. He wrote for English periodicals, made a special study of the history of economics and of modern economic tendencies, and published: *Contemporary Socialism* (1884; 4th ed., 1908; It. trans. by Angelo Bertolini, 1895), a valuable study; *Eight Hours for Work* (1894); *Life of Adam Smith* (1895).

RAEBURN, rā'bûrn, SIR HENRY (1756–1823). A Scottish portrait painter. He was born at Stockbridge, near Edinburgh, March 4, 1756, and at the age of 15 was apprenticed to a goldsmith at Edinburgh, painting water-color miniatures during his leisure hours. From David Dencliar, an etcher, and David Martin, a local portrait painter, he received some inspiration and learned to adopt a broader treatment in miniatures. Encouraged by his success in this branch of art, he began to fit himself for portrait painting by copying portraits in oil. After contracting a fortunate marriage in 1778, he was enabled to study abroad, to which he was urged by Reynolds, whom he met on a visit to London. After studying for two years at Rome, he returned to Edinburgh in 1787 and soon attained great popularity and exercised marked influence on the development of Scottish art. He was elected president of the Society of Artists in Scotland in 1812 and Royal Academician in 1815. On a visit of George IV to Edinburgh in 1822 he was knighted and the following year was appointed the King's limner for Scotland. He died at Edinburgh, July 8, 1823. Raeburn occupies a position in Scottish art similar to that of Reynolds (q.v.) in English. His portraits are strikingly realistic and intense and are painted in full light. His work has been compared to that of Frans Hals and Velazquez, whom he resembles in this regard and in his facile brushwork. The most notable Scotchmen were among his sitters, such as Robertson, Hume (Parliament House, Edinburgh), Jeffrey, Dugald Stewart, Braxfield, John Erskine, and Sir Walter Scott. He is best represented in the public galleries at Edinburgh and Glasgow. The former contains the masterpieces Mrs. Campbell of Balliemore, Lord Newton, and the portrait of himself. He is also represented in the National Portrait Gallery of Edinburgh and of London, in the National Gallery, London, and the Royal Academy, London. In the Metropolitan Museum, New York, is a fine portrait of James Forsythe, and in the J. P. Morgan collection are portraits of Isabella Ross (Mrs. Bell) and Lady Maitland, two masterpieces. Among his finest portraits in British private collections are Sir John Sinclair, Lord President Dundas, Lady Stewart of Coltness, and the MacDonalds of Clanranald. Consult: Sir W. Armstrong, *Sir Henry Raeburn* (London, 1901), containing a descriptive catalogue of his works by J. L. Caw; *Masters in Art*, vol. vi (Boston, 1905), containing an exhaustive bibliography; R. S. Clouston, *Sir Henry Raeburn* (New York, 1907); James Greig, *Sir Henry Raeburn: His Life and Works* (London, 1911).

RAE PROCESS. See GOLD, *Metallurgy*.

RÆTIA. See RHÆTIA.

RAFF, räf, JOACHIM (1822–82). A German composer, born at Lachen, Switzerland. He first engaged in scientific studies, but studied music under Mendelssohn and in 1850 followed Liszt to Weimar. He published *Die Wagnerfrage* (1854), in which he advocated Wagner's theories. In 1856 he went to Wiesbaden, where he gave all his time to composition until 1877, when he was called as director to the new Conservatory of Music at Frankfort-on-the-Main, where he remained till his death. Raff was a prolific writer, his compositions, numbering over 200, including notable examples of nearly every musical form. He was possessed, however, of a facility of invention which poverty frequently drove him to employ to the detriment of his reputation; hence the uneven character of his work. By the end of the century his works had practically disappeared from the concert programmes. Among his 11 symphonies the third, *Im Walde*, and the fifth, *Lenore*, once were among the most popular works of their kind. He also wrote four suites for orchestra, five overtures, a concerto for piano, two concertos for violin, two for cello, an oratorio, *Weltende, Gericht, neue Welt*, a great quantity of chamber music, and works for piano solo and four hands. Of his six operas only two, *Kònig Alfred* (1851) and *Dame Kobold* (1870), were performed. Consult R. Gandolfi, *La musica di Gioacchino Raff* (Florence, 1904).

RAFFAELINO DEL GARBO, rä'fä-ĕl-ē'nô dĕl gär'bô (1466–1524). A Florentine painter of the early Renaissance, whose real name was Raffaello Capponi. He was born in Florence, studied under Botticelli and Filippino Lippi, and was influenced by Ghirlandaio and Perugino. In his earlier period he was a promising though somewhat affected follower of Lippi, but he was not sufficiently gifted to adopt the High Renaissance, and finally degenerated into a mere craftsman. Among his chief works are the "Resurrection," Florentine Academy; a "Madonna," Museum of Naples; "Madonna and Angels," Berlin Museum. A notable portrait of a "Young Man" is in the Layard Gallery at Venice.

RAFFAELLI, rä'fä'ĕ'lē', JEAN FRANÇOIS (1850–). A French painter, sculptor, and etcher, born in Paris. He began his career as a singer, then studied art under Gérôme, and first exhibited in 1870. But he did not fully reveal himself until an exhibition of his works held in 1884, for which he wrote a catalogue, *Etude des mouvements de l'art moderne et du beau caractérisme*. Though powerfully influenced by the Impressionist movement and by the purely naturalistic school, he was, like Degas, rather an independent in his own methods. He is especially a student of character, and in his early works deals mostly with low life in the suburbs of Paris, often in winter. The backgrounds are long straight roads, bordered by slender trees, and the typical suburban buildings beneath a melancholy lowering sky. Good examples of this style are "The Absinthe Drinkers" (Mrs. Potter Palmer, Chicago) and "The Old Convalescents" (1892, Luxembourg). Afterward his range became wider and his later works are more happily conceived. Spring takes the place of winter in delicate luminous landscapes, and he paints such pictures as the series of views of Notre Dame, the "White Horse"; the charming portrait of his daughter Germaine (1896); "Young Girl Regarding herself in a Mirror" (1897); "Portrait of Mademoiselle Marie Louise" (1898); "Young Girl with the Cornflower." Other pictures by him are: "At Gonon's Foundry" (Lyons Museum); "Old Ragpicker" (Nantes); and the portrait of Edmond

de Goncourt (Nancy). He is represented in all the public museums for modern painting in Paris and in several provincial museums; also at Berlin, Dresden, Brussels, Rome, in the Metropolitan Museum, New York, and in the museums of Philadelphia, Pittsburgh, Rochester, and Buenos Aires. His medium is generally oil or pastel, and he is the inventor of a new method of using solid oil tubes in painting, which has so far proved successful. His work as a sculptor includes bas-reliefs, portraits, and character studies in plaster and bronze. His drawings were published in the *Revue Illustrée* and as *Types de Paris* (1889). He also became known as an able etcher. In 1889 he received a gold medal at the Universal Exposition and also the Legion of Honor. He wrote a charming guide to the paintings of the Louvre (Paris, 1913). Consult Gustav Coquiot, in *Gazette des beaux arts*, 4th series, vol. v (Paris, 1911).

RAFFAELLINO, räf'fä-ĕl-lē'nō. See COLLE, RAFFAELLO DAL.

RAFFAELLO, rä'fä-ĕl'lō. See RAPHAEL.

RAFFALOVICH, rä'fä-lō'vĭch, ARTHUR (1853–). A French economist, born at Odessa, Russia. He was educated in France at the Collège Sainte-Barbe and at the Lycée Louis-le-Grand. For distinction in his special field he was decorated by various foreign governments and was made a Grand Officer of the Legion of Honor. He wrote: *Le logement de l'ouvrier et du pauvre* (1887); *Les coalitions de producteurs et le protectionnisme* (1889); *Mémoire sur la conférence de la paix* (1899); *Les primes et subventions à la marine marchande* (1903); *Le marché financier*, 2d series (1905–14). Raffalovich also translated works of various English and American economists. Much of what he wrote was contributed to the *Journal des Economistes* and other periodicals.

RAFFET, rä'fä', DENIS AUGUSTE MARIE (1804–60). A French lithographer and illustrator. He was born in Paris and studied with Cabanel, Charlet, and Gros. His earliest efforts are imitations of Vernet and Charlet. His individuality appeared in a series of lithographs glorifying the soldiers of the Revolution and the First Empire, with Napoleon for the central figure. Among the best of these are "The Capture of Fort Mulgrave," "The Last Charge of the Red Lancers," and the poetically imaginative masterpiece "The Midnight Review." "The Battle of Oued-Alleg" is the finest of his drawings of the French soldiers of Algeria. In 1850 he began his superb series on the siege of Rome. His 100 lithographs, called *Voyage dans la Russie méridionale et la Crimée* (1833–49), show his talent in still another direction. Raffet was a precise and remarkably gifted draftsman and a master of composition, excelling particularly in rendering the multitude of an army. Among the many works illustrated by him are the *Musée de la Révolution* (1843), Norvin's *History of Napoleon*, and Thiers's *History of the Revolution* and *History of the Empire*. A complete catalogue of Raffet's works was published by Giacomelli (Paris, 1862). Consult: Armand Dayot, *Les peintres militaires, Charlet et Raffet* (Paris, 1892); the monographs by Bry (ib., 1874) and M. F. Lhomme (ib., 1892); Atherton Curtis, *Auguste Raffet* (New York, 1903).

RAF'FIA. See JUPATI PALM.

RAFFINASE, räf'ĭ-nās. See ENZYME.

RAFFINOSE, räf'ĭ-nōs. See SUGARS.

RAFFLES, SIR THOMAS STAMFORD (1781–1826). A British colonial administrator, born July 5, 1781, at sea off the island of Jamaica, on board the ship commanded by his father. At the age of 14 he got employment in the East India House as an extra clerk. He soon attracted attention and in 1805 received an assistant secretaryship in Penang, mastered the Malay language on the voyage out, and in 1807 became secretary and registrar of the Recorder's Court. He visited Malacca, studied its resources and persuaded the company to reverse its decision to abandon that post. In 1810 he proceeded to Calcutta, where he met Lord Minto, the Governor-General. For rendering important service Raffles was made Governor of the island of Java, and for five years he administered the affairs of the island with marked vigor, wisdom, and success. He abolished forced labor, regulated taxation, and remodeled the administration of justice, while retaining the Dutch colonial laws. On the restoration of the island to the Dutch in 1816 he returned to England and published his great work on the *History of Java* in 1817. He was knighted, and by request visited Holland to advise with the King in regard to the policy to be pursued in Java. In 1818 he became Governor of Benckulen in Sumatra. In 1819 he founded Singapore, a master stroke to insure the success of the British in trade competition with the Dutch. Compelled by ill health to return home, he set sail in 1824, but the ship having caught fire, he lost everything, including his great natural-history collection, his manuscripts, drawings, and notes, valued at $100,000. He reached Plymouth later in the same year, and died suddenly on his birthday, 1826, near London His portrait is in the National Portrait Gallery, London. Consult his *Memoir by Lady Raffles* (London, 1830); D. C. Boulger, *The Life of Sir Stamford Raffles* (ib., 1899); H. E. Egerton, *Sir Stamford Raffles* (ib., 1900).

RAFFLE'SIA. A genus of 8 or 10 species of plants of the small parasitic family Rafflesiaceæ, the visible parts of which consist merely of a flower. The species attack *Cissus*, making their appearance at first as hemispherical swellings of the bark of the root and, after the bark has broken, rising in the form of a cabbage head, while the perianth is covered with imbricated bracts, which are more or less recurved after it has opened. The vegetative part, which ramifies in the tissues of the host, resembles the mycelium of a fungus After the flower has expanded it diffuses a carrion-like smell, which induces flies to deposit their eggs.

RAFIN, rä'făN', CATHERINE JOSÉPHINE. See DUCHESNOIS, CATHERINE.

RAFINESQUE, rä'fē-nĕsk', CONSTANTINE SMALTZ (1783–1840). An American botanist, of French-German descent, born at Galata (Constantinople). On his first visit to the United States in 1802 he spent three years in Pennsylvania and Delaware collecting botanical specimens. Afterward he went to Sicily and was there 10 years, during which time he continued to study botany and wrote several scientific works in Italian. He was shipwrecked off the coast of Long Island in 1815, on his way to New York, and lost his collection of manuscripts and books. In 1818 he became professor of botany at Transylvania University, Lexington, Ky. Ultimately he settled in Philadelphia. Though a man of wide learning, his works are

marred by his tendency to multiply species and by frequent inaccuracies. They include: *Ichthyologia Ohioensis* (1820); *Annals of Kentucky* (1824); *Medical Flora of the United States* (1828–30); *Atlantic Journal and Friend of Knowledge* (8 numbers, 1832–33); *The Complete Writings of C. S. Rafinesque on Recent and Fossil Conchology* (1864, ed. by W. G. Binney and G. W. Tryon). Consult: Asa Gray, "Botanical Writings of Rafinesque," in *Silliman's Journal* (New Haven, 1841); R. E. Call, *The Life and Writings of Rafinesque* (Filson Club Publications, Louisville, 1895); T. J. Fitzgerald, *Rafinesque: A Sketch of his Life with Bibliography* (Historical Department of Iowa, Des Moines, 1911).

RAFN, räf'n, CARL CHRISTIAN (1795–1864). A Danish critic and archæologist. He was born at Brahesborg in Fyn and was educated at the University of Copenhagen, of which he was appointed sublibrarian in 1821. In 1825 he founded the Society of Northern Antiquities, as secretary of which he edited and published many ancient Norwegian-Icelandic manuscripts occupying about 70 volumes. His most widely known work is *Antiquitates Americanæ* (1837), discussing the question of the discovery of America by the Norse. This he followed up with *Historical Monuments of Greenland* (3 vols., 1838–45), with Finnur Magnûsson. He was also a collaborator on other voluminous and important compilations of sagas and historical manuscripts.

RAGATZ, rä'gäts, or **RAGAZ.** A tourist resort in the Canton of Saint-Gall, Switzerland, 11 miles northwest of Chur (Map: Switzerland, D 1). It is attractively situated at the mouth of the Tamina Gorge above the confluence of the turbulent Tamina with the Rhine, and commands a fine view of the Rhine valley. Its chief features are the Kursaal and gardens, the mineral springs and baths, and Bad Pfäfers (q.v.). There is a monument to Schelling in the cemetery. Ragatz attracts annually an average of 50,000 visitors. Permanent pop., 1910, 2063

RAGGED ROBIN. See LYCHNIS.

RAGGED SCHOOLS. Schools maintained by private philanthropy in various English cities. It is not certainly known who first suggested them, but credit for a successful experiment is due to a poor shoemaker, John Pounds, of Portsmouth, who for 20 years prior to his death, in 1839, gathered poor children about him and taught them as he worked. In 1838 London had a ragged Sunday school, which later became a free day school. The school at Field Lane was opened in 1843. The first free boarding school was started by Sheriff Watson in Aberdeen in 1841. In 1845 Dr. Robertson opened a similar school in the Vennel, Edinburgh. In 1847 Dr. Guthrie published his well-known *Plea for Ragged Schools.* The movement spread and in a few years ragged schools were to be found in most of the cities. The further development of the English school system, particularly under the Acts of 1870 and 1872, which introduced compulsory school attendance in England and Scotland, merged many of the ragged schools into the public schools. After 1851 the ragged schools received small grants from the general funds and a capitation grant of £2 10s. was allowed by the Privy Council from 1856 to 1859. Consult Cornwallis, *Philosophy of the Ragged Schools* (London, 1851).

RAGGEE, răg'ē (from Hind. *rāgī*), *Eleusine corocana.* An Indian grain. See ELEUSINE.

RAGHUVAMŚA, rūg'hụ-vŭn'shȧ (Skt., family of Raghu). The title of a celebrated Sanskrit poem by Kālidasa (q.v.). In 19 cantos it describes the life of Rama (see RAMAYANA) and his forefathers and descendants. The first nine cantos treat of Rama's four immediate ancestors, the next six contain the story of Rama, agreeing in the main with the *Ramayana,* and the last four deal with his nearest descendants as well as the 24 kings of Ayodhya who, according to the myth, traced their ancestry to him. The work is one of considerable beauty, especially in its similes, and is characterized by rapidity of movement, simplicity of style, and poetic charm. Of the more than 20 commentaries on the text the best known is Mallinatha's *Samjīvanī,* which contains an explanation for every word of the poem. The text of the Raghuvamśa has been edited repeatedly. The most important editions are those of Stenzler with a Latin translation (London, 1832), by Pandit with the best native commentary on the poem, that of Mallinatha (Bombay, 1869–74), and also by Parab (ib., 1892), by Jvalaprasad with an English translation (ib., 1895), and English translations by Patankar (Poona, 1896) and by Johnstone (London, 1902). Consult Mark Collins, *The Geographical Data of the Raghuvamśa and Daśakumāracarita, Considered More Especially in their Bearing upon the Date of these Works* (Leipzig, 1907), and A. A. Macdonell, *History of Sanskrit Literature* (London, 1913).

RAGLAN, LORD FITZROY JAMES HENRY SOMERSET, first BARON (1788–1855). An English field marshal, eighth son of the fifth Duke of Beaufort, born Sept. 30, 1788. He entered the army in 1804 and went to the Peninsula in 1808 as aid-de-camp of Sir Arthur Wellesley (later the Duke of Wellington), whose military secretary he became three years afterward. He took part in all the great actions of the Peninsular campaign and gained special distinction at the storming of Badajoz (1812). In 1815 he served under the Duke of Wellington in Belgium and lost his right arm at Waterloo. From 1815 to 1818 he was secretary of the British Embassy at Paris. He was member of Parliament for Truro in 1818–20 and 1826–29. When Wellington was appointed master of the ordnance in 1819, he again chose Somerset as his secretary; and three years afterward Somerset accompanied his chief to the Congress of Verona. In 1827 the duke was appointed commander in chief of the British army and called Somerset to the Horse Guards as his military secretary. This office he held till the death of Wellington in 1852. He was then made master general of the ordnance, and in October was called to the House of Peers as Baron Raglan of Raglan in Monmouthshire. In 1854 he was appointed, with the rank of general, commander of the English forces dispatched to operate against Russia, and was subsequently made a field marshal, but died June 28, 1855.

RAGNARÖK, răg'nȧ-rök'. In Scandinavian mythology, the end of the world and the fall of the gods before the combined demon hosts of the world. The word *ragnarök* really means judgment of the gods, but through confused etymology appears in the Younger Edda as *ragnarökr,* twilight of the gods, which as the Götterdämmerung has formed the basis of the

Wagnerian music drama *Der Ring des Nibelungen*. The fundamental conception of the *ragnarök* is the end of the Golden Age, brought about by the conflict of the two types of Norse gods, known respectively as Æsir and Vanir, and by the Æsir's violation of their oaths. The chief source of these conceptions is the poem of the Elder Edda, called the *Völuspá*, a mixture of heathen and Christian conceptions. The battle between the gods and demons is ushered in with the appearance of the divine war maidens, the Valkyries. Balder, the beautiful god, is dead, through Loki's malignant treachery, and his fate seals the doom of the other gods. The giant watchman Eggther strikes his harp, and in each of the three worlds, that of the giants, the Æsir, and Hel, a cock crows calling the warriors to the battle. The hell-hound Garmr bays aloud; the wolf Fenrir tears his chain. On the earth men are engaged in bloodshed and incest. Floods rise everywhere. The old world tree, the ash Yggdrasill, sways to its roots. Then the god Heimdalr sounds his horn, calling the gods to the fray. In mighty array the demon hosts come marching against the gods from the east, north, and south. Odin engages in combat with Fenrir; Freyr with Surtr; Thor with the serpent Midgard; all the three gods fall in the struggle. The demons are masters of the battle field. The sun grows black, the earth sinks into the sea, the stars fall from heaven. Vapor and fire rage, the high flame licks the sky. The world and the gods are gone. But from out of the flood rises a new earth which unsown grows grain, and the Æsir come again. Consult R. B. Anderson, *Norse Mythology* (7th ed., Chicago, 1901), and P. D. Chantepie de la Saussaye, *The Religion of the Teutons* (Eng. trans. by B. J. Vos, Boston, 1902). See MYTHOLOGY.

RAG'TIME'. The popular title given to the humorous dance or vocal music of negro origin and characteristics which has had great vogue since the early nineties of the last century. Theoretically the music of such compositions is an excessive exaggeration of syncopation. The general lack of instruments other than of percussion among the different African races of necessity inclined them to punctuate their melodies with strongly marked pulses or accents. Crude emotional effects are gained by increased noise and abrupt syncopation. The very exaggeration of ragtime proved its strongest appeal to the general public. See NEGRO MELODIES.

RAGUENEAU, rȧg'nō', PAUL (1608–80). A French missionary and explorer, born in Paris. He became a Jesuit priest in 1626 and in 1636 was sent as a missionary to Canada, where for a time he labored among the Hurons. In 1640 he went among the hostile Iroquois in an unsuccessful attempt to secure the release of some French prisoners. Ten years later, as father superior, he was active in gathering the remnant of the Hurons who had escaped the massacres by the Iroquois. In 1657 with another priest and a few lay companions he visited the Onondaga tribe of Iroquois; while among them a plot was formed to murder him, and he escaped with great difficulty. In 1662 he returned to France, where he labored as the agent for the missions in New France. His writings give a good picture of the conditions under which the Jesuits of New France labored, and one of his *Relacions* (that for 1648) contains the first mention of Niagara Falls. Besides these accounts (7 vols., Paris, 1647–57), he wrote *Vie de la mère St. Augustine, religieuse hospitalière de Quebec en la Nouvelle France* (Paris, 1672), etc. Consult: *The Jesuit Relations and Allied Documents*, edited by R. G. Thwaites (73 vols., Cleveland, Ohio, 1896–1901); Francis Parkman, "The Jesuits in North America," in *France and England in North America*, part ii (Boston, 1902); T. J. Campbell, *Pioneer Priests of North America* (Baltimore, vol. i, rev. ed., 1913; vol. iii, 1911).

RAGUET, rȧ-gā', CONDY (1784–1842). An American merchant and political economist. He was born in Philadelphia and studied at the University of Pennsylvania. In 1804–05 he visited Santo Domingo twice and wrote on conditions in that island. He took part in the War of 1812, was admitted to the bar in 1820, and from 1822 to 1827 was United States Consul at Rio de Janeiro. When subsequently made chargé d'affaires he negotiated a treaty with Brazil. He was an exponent of free trade and wrote on that subject *The Principles of Free Trade* (1835). His other works include *An Inquiry into the Causes of the Present State of the Circulating Medium in the United States* (1815) and *On Currency and Banking* (1839; Fr. trans., 1840).

RAGU'LY. A term applied to an irregular line employed in heraldry (q.v.).

RAGUSA, rȧ-gōō'zȧ (Slav. *Dubrovnik*). An episcopal city and fortified seaport in the Crownland of Dalmatia, Austria, situated at the foot of San Sergio, 50 miles south-southeast of Mostar (Map: Austria, E 5). It is a walled city with many towers and intersected by the Corso, once an arm of the sea and now containing the most interesting features of the town, including the Palazzo Rettorale, the former residence of the rectors of the Republic, the old mint, the customhouse, and the cathedral completed in 1713. Among other buildings may be mentioned the Palazzo Communale, the museum, and the theatre. The harbor is small and unprotected and most of the heavier vessels anchor at Gravosa, about 4 miles from the town. The chief products are oil, silk, leather, and liqueurs. There is some transit trade with Herzegovina. Pop., 1900, 13,174; 1910, 11,561.

Ragusa is believed to have been founded about the middle of the seventh century by refugees from Ragusa Vecchia, or Old Ragusa (the ancient Epidaurus), probably destroyed by the Slavs. Although successively subject to Constantinople, Venice, Hungary, Servia, and Bosnia, Ragusa enjoyed a considerable degree of autonomy and repeatedly fought against every encroachment on its independence. At the close of the Middle Ages it became tributary to Turkey, and under Turkish overlordship rose to the position of one of the principal centres of commerce in south Europe. Its territory embraced over 500 square miles. Its institutions were aristocratic. The plagues during the sixteenth century and the frequent earthquakes, especially that of 1667, when the town lost one-fifth of its inhabitants, put an end to the prosperity of the little Republic. Seized by Napoleon in 1806, it was deprived of its independence in 1808 and awarded to Austria by the Congress of Vienna in 1814. From the fifteenth to the eighteenth century Ragusa was a great seat of South Slavic literature. The most famous of the Ragusan poets was Gundulič (q.v.), who died in 1638. In 1915 the town was

bombarded by the Italian fleet from the Adriatic and it was also threatened by an invading force of Montenegrins. See WAR IN EUROPE. Consult T. J. Jackson, *Dalmatia*, vol. ii (Oxford, 1887), and F. H. Jackson, *Shores of the Adriatic* (New York, 1908).

RAGUSA. A city in the Province of Syracuse, Sicily, situated on a steep ridge, on the right bank of the Ragusa, 15 miles from the sea and 32 miles by rail west-southwest of Syracuse (Map: Italy, E 6). The city has a Gothic church, a Gymnasium, and a technical school. There are manufactures of silk, cotton, woolens, and furniture, and a trade in wine, oil, cattle, and cheese. Remains of a Greek colony of the sixth century B.C. have been found near the town. Pop. (commune, including Ragusa Inferiore), 1901, 31,922; 1911, 39,850.

RAGUSA, DUKE OF. See MARMONT, AUGUSTE.

RAHBEK, rä'bĕk, KNUD LYNE (1760–1830). A Danish poet and author, born in Copenhagen. He was educated at the University of Copenhagen and was appointed professor of æsthetics there in 1790. From 1785 to 1809 he directed the *Minerva*, a literary periodical of great influence, and he also edited *Den Danske Tilskuer* (The Danish Spectator) in 1791–1808 and in 1815–22. His own works include numerous editions of the Scandinavian poets, particularly Holberg; the critical *Ludvig Holberg som Lystspildigter* (3 vols., 1815–17); *Danske Læsebog* (1791–1804); *Bidrag til den danske Digtekunsts Historie* (4 vols, 1800–08), with Nyerup; *Erindringer* (6 vols., 1824–29).

RAHL, räl, KARL (1812–65). An Austrian historical and portrait painter. He was born in Vienna, son and pupil of the engraver Karl Heinrich Rahl (1779–1843). He also studied at the Vienna Academy and in Munich and Stuttgart and in 1836 went to Italy. There he cultivated an eclecticism which borrowed color and technique from the Venetians and composition from Raphael and Michelangelo. He returned to Vienna at intervals, but lived mostly in Rome until 1847. The most important works of his early period are: "The Finding of Manfred's Body" (1838); "Persecution of Christians in the Catacombs of Rome" (1844, Kunsthalle, Hamburg; replica, 1849, National Gallery, Berlin); "Entry of Manfred into Lucera" (1846, Vienna Museum). In 1848 he took up his abode in Munich, where he remained till appointed to a temporary professorship at the Vienna Academy in 1850. He resigned after one term and opened a private school of painting which gave a new impetus to Austrian art. He won deserved recognition in 1856 through the patronage of Baron Sina, the Greek banker, who commissioned him to decorate the Greek church in Vienna, and for whose palace in Vienna he painted in 1861 four "Episodes from the Heroic Age of Greece" and the "Four Elements." The façade of the Heinrichshof he decorated in 1862 with 12 allegorical figures of "The Arts of Peace," and the staircase of the Arsenal in 1863 with a series of fine allegories. He had shortly before been appointed professor at the academy. Among more than 400 portraits attributed to him are those of many contemporary celebrities in art, literature, and science. Much of his later work has a healthy robustness reminiscent of Rubens. Consult Hottner, *Karl Rahl* (Vienna, 1863), and George-Mayer, *Erinnerungen an Karl Rahl* (ib., 1882).

RAHU, rä'hōō (Skt. *Rāhu*, the seizer, from *rabh*, Gk. λαμβάνειν, *lambanein*, to seize). In Indian mythology, the son of Vipracitti and Simhika and the demon who is the cause of the eclipses of sun and moon. At the churning of the milk ocean Rahu, one of the Daityas or demons, came unnoticed among the gods and obtained a portion of the ambrosia thus produced. His head was cut off by Vishnu; but the nectar had reached his throat and consequently his head had already become immortal. Out of hatred for the sun and moon, who had informed on him, he now pursues them with implacable hatred, seizing them at intervals and thus causing their eclipses. According to a later form of the legend both the head and the tail of the demon called Ketu ascended to heaven and there still produce the eclipses of sun and moon either by swallowing them or by making them unclean by his approach. Rahu was accordingly reckoned among the planets which, on account of their wanderings, are regarded as of evil omen. In modern India he is the godling of two low-caste tribes, the Dusadhs and Dhangars, in the eastern districts of the Northwest Provinces, where he is propitiated by the rite of passing through a fire kindled in his honor. Rahu is a post-Vedic demon, his Vedic predecessor as the fiend who eclipses the sun being Svarbhānu. In Hindu astronomy Rahu is the moon's ascending, and Ketu is its descending node. Consult A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897), and W. J. Wilkins, *Hindu Mythology, Vedic and Purānic* (2d ed., London, 1900).

RAHWAY, rȧ'wȧ. A city in Union Co., N. J., 20 miles southwest of New York City, on the Rahway River and on the Pennsylvania Railroad (Map: New Jersey, D 2). An attractive suburban city, Rahway is well laid out and has many handsome residences of business men of the greater cities in the vicinity. There is a public library. As an industrial centre Rahway is of considerable importance, its establishments including an extensive printing house and manufactories of automobile bodies, cereals, vacuum cleaners, shellac, oils, clothing, chemicals, felt goods, music boxes, carriages, electrical supplies, and shirts. Pop., 1900, 7935; 1910, 9337; 1915 (U. S. est.), 10,077.

RAIBOLINI, rī'bō-lē'nē, FRANCESCO. See FRANCIA.

RAIFFEISEN, rīf'ī'zen, FRIEDRICH WILHELM (1818–88). A German economist, founder of the German agrarian loan funds, born at Hamm an der Sieg. In 1835 he entered the army, but was compelled to abandon that profession because of an affection of the eyes, and entered the civil service. The agricultural crisis of 1846–47, which Raiffeisen believed to be due to the difficulty with which the small landowner secured credit, led him to establish in Heddesdorf and Weyerbusch mutual credit associations, through which the small farmer might obtain loans at a low rate of interest, thereby escaping his former dependence upon usurers. Raiffeisen carried on an extensive propaganda for his idea, organizing numerous mutual credit associations, until in 1866 his health was so shattered by overwork that he was compelled to retire from public service. After he had partially recovered he founded in 1878 the *Landwirtschaftliches Genossenschaftsblatt*, published at Neuwied. Before his death the agricultural loan associations had become numerous and had proved of the greatest value to the small farmers. Raiffeisen wrote: *Instruktion zur*

Geschäfts und Buchführung der Darlehnskassenvereine (1869); *Die Darlehnskassenvereine* (1887); *Kurze Anleitung zur Gründung von Darlehnskassenvereinen* (1888).

RAIKES, rāks, ROBERT (1735–1811). The founder of Sunday schools. He was born at Gloucester, England, Sept. 14, 1735, succeeded his father as printer and proprietor of the Gloucester *Journal* (1757), and so continued till 1802. He is first heard of in connection with volunteer jail visitation (1768), and called public attention to the pitiable condition of the prisoners. In July, 1780, he opened in Gloucester his first school on Sunday for the instruction of children, designed at first to teach poor children the rudiments of education. Consult: G. Webster, *Memoir of R. Raikes* (Nottingham, 1873); A. Gregory, *Robert Raikes, Journalist and Philanthropist* (London, 1877); J. H. Harris (ed.), *Robert Raikes: The Man and his Work* (New York, 1899). See SUNDAY SCHOOLS.

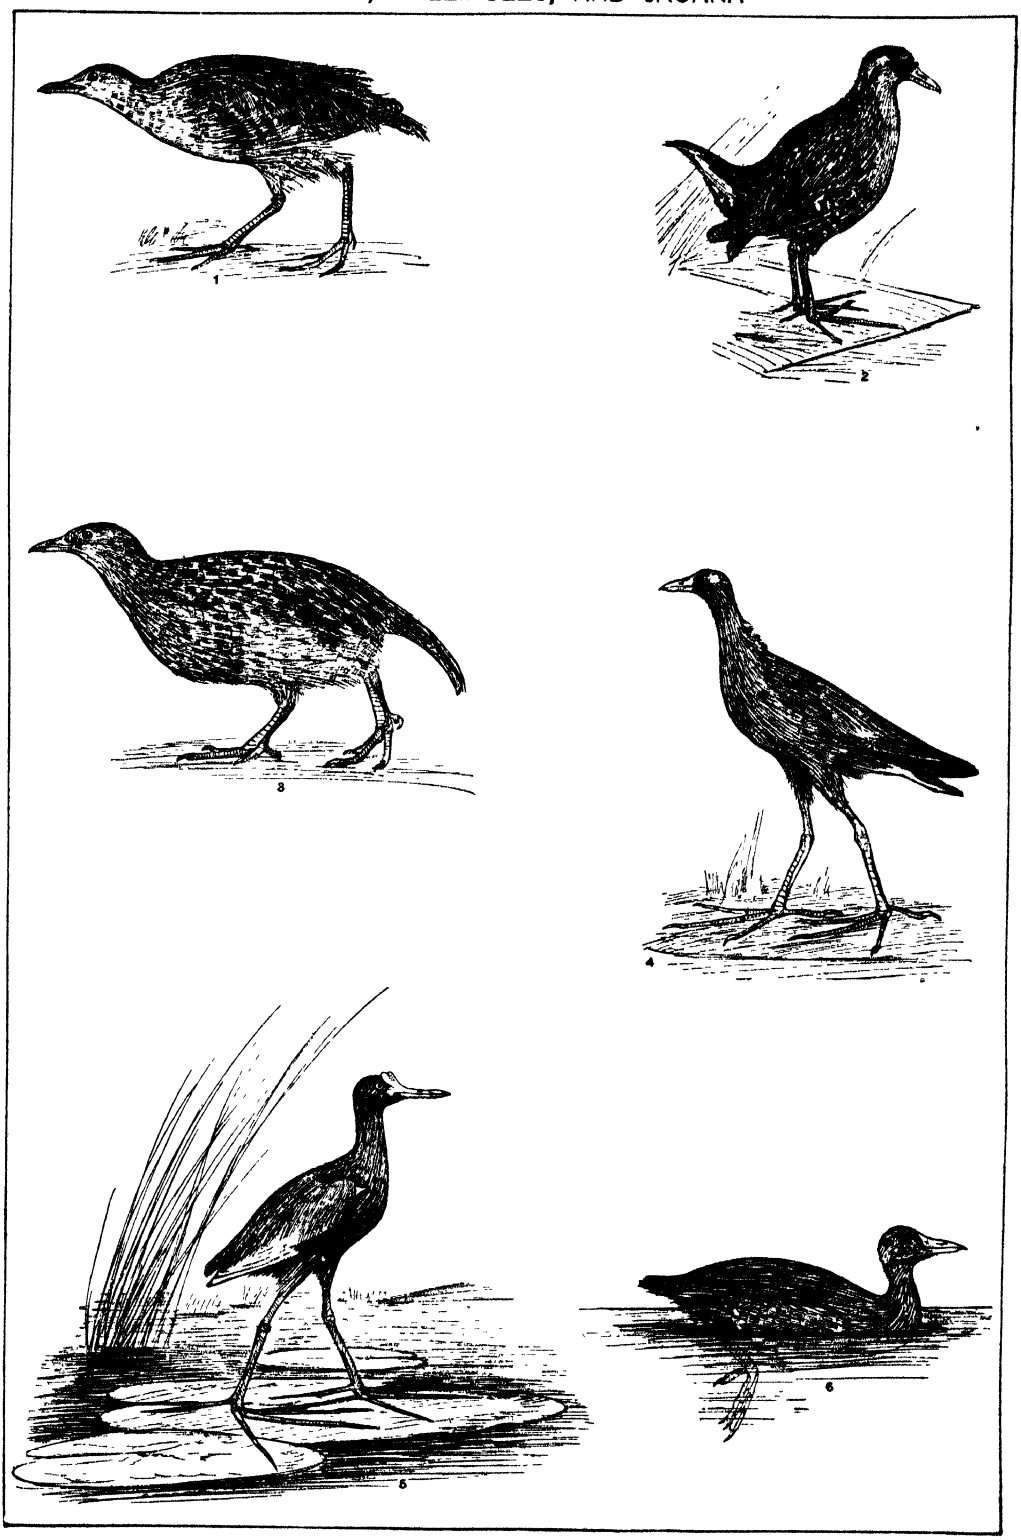
RAIL (OF. *raale, rasle,* Fr. *râle,* rail, rattling in the throat, from OF. *raller,* Fr. *râler,* to rattle in the throat, from MDutch *ratelen,* Ger. *rasseln,* to rattle; connected with Gk. *κραδαινειν, kradainein,* to swing; so called from its cry). A bird of the subfamily Rallinæ, especially of the genus *Rallus,* related to the coots and gallinules and more remotely to the cranes. Rails have a slender bill, usually longer than the head, the body of a very compressed form, wings of moderate length, a short tail, long and strong legs, and long toes. The only European species is the common or water rail (*Rallus aquaticus*), which dwells in marshes and the reedy margins of lakes and rivers. It is generally a bird of passage, breeding in the north and migrating southward on the approach of winter. The bird is about 11½ inches long. The sexes are similar in plumage, olive brown marked with black above, bluish ash color beneath, with white transverse markings on the belly. The water rail feeds on worms, mollusks, and soft vegetable substances. It is in high esteem for the table.

In the United States six or seven species are known. The Virginia rail (*Rallus virginianus*) is numerous in many parts of the Eastern States, but is not often seen, because of its great shyness. It is rather smaller than the water rail of Europe, but much resembles it in appearance, haunts, and habits, which are those of the rails in general. (See Colored Plate of GAME BIRDS accompanying article GROUSE and also Colored Plate of EGGS OF GAME AND WATER BIRDS.) The king rail, or fresh-water marsh hen (*Rallus elegans*), is a much larger bird, inhabiting marshes throughout the eastern United States, while the clapper rail, or salt-water marsh hen (*Rallus crepitans*), is extremely abundant in the salt-water marshes of the Atlantic coast. Each of these is about 15 inches long, and both are shot in great numbers for the table, while their eggs also are regarded as a delicacy. The mangrove hen (*Rallus longirostris*) is a similar species of the West Indies, and a close ally (*Rallus obsoletus*) belongs to California. All these species are much alike in the compressed shape of the body, long bill, and large feet. The prevailing colors are olive, gray, fuscous, cinnamon brown, black, and white; the sides and under parts are handsomely barred. The name "rail" is often given to certain American coots and is universally extended to those raillike birds of the genus *Porzana* which inhabit drier lands and in England are called crakes (see CRAKE). The most abundant and best known of these is the sora, or Carolina rail (*Porzana carolina*), which is a favorite object of sport, with dogs, in the Southern States. Two other species, the yellow and the black rails, occur in eastern North America. The black is rare and noted for small size, dark color, and seclusive habits.

The rails form a highly generalized family, with a numerous fossil ancestry going back to the Eocene. They are distributed throughout the world, and many peculiar forms are or were inhabitants of the East Indian and South Sea islands. Many of these were restricted to one group or even to a single island, and had lost the use of their wings long before they became known to ornithologists; they were thus defenseless and several species have become extinct. Prominent examples are the genus *Notornis* of the New Zealand region and the strange little wingless rail of Tristan d'Acunha. Consult: Newton, *Dictionary of Birds* (New York, 1896); A. H. Evans, "Birds" in *Cambridge Natural History,* vol. ix (ib., 1900); and for the American species, H. K. Job, *Among the Water Fowl* (ib., 1902), and W. W. Cooke, "Distribution and Migration of North American Rails," in *United States Department of Agriculture, Bulletin No. 128* (Washington, 1914). See EXTINCT ANIMALS; FLIGHTLESS BIRDS; WEKA; and Plate of RAILS, ETC.

RAILROAD, UNDERGROUND. See UNDERGROUND RAILROAD.

RAILROADS. See RAILWAYS.



RAILROAD TELEGRAPHERS, ORDER OF. See RAILWAY BROTHERHOODS.

RAILROAD WORM. A popular name in New England for the apple maggot, the larva of a trypetid fly (*Trypeta pomonella*), given because it spread along the lines of the railroads. It is a native of the northern United States and Canada, extending south along the Appalachian Mountains. The larva is a footless maggot, which lives in the pulp of the apple and tunnels it with winding channels, making here and there discolored excavations about the size of a pea. When ready to transform the maggot leaves the apple, falls to the ground, and beneath the surface enters the pupal state, in which condition it remains until the middle of the following summer, when the perfect fly escapes. The fly is shining black, with a rust-red head and legs and whitish wings with dusky bands. The eggs are inserted into the flesh of the apple, and frequently fruit is attacked which has previously been perforated by the codling moth. Thin-skinned summer and fall apples are preferred by it to the winter varieties.

RAILWAY, SHIP. See SHIP RAILWAY.

RAILWAY BEETLE. A curious beetle of the family Malacodermidæ and probably of the tribe Phengodini, the female of which is wormlike or larviform and is said to give out a strong red light from the two extremities and a green light from numerous points along the sides of the body, giving it the appearance of a miniature railway train. These beetles occur not infrequently in parts of South America, and the name originated apparently in Paraguay. In the United States very rare representatives of the genera *Phengodes* and *Zarhipis* have similar larviform luminous females. Cf. LUMINOSITY OF ANIMALS.

RAILS, GALLINULES, AND JACANA

1. CORN CRAKE (Crex crex)
2. SORA or CAROLINA RAIL (Porzana Carolina).
3. WEKA or FLIGHTLESS RAIL (Ocydromus australis).
4. PURPLE GALLINULE (Ionornis Martinica).
5. JACANA (Jacana jacana).
6. AMERICAN COOT (Fulica Americana).

RAILWAY BROTHERHOODS. Organizations of railway employees for the protection of their interests and the advancement of their condition in so far as dependent on themselves. The Grand International Brotherhood of Locomotive Engineers (organized 1863), the Order of Railway Conductors of America (organized 1868), the Brotherhood of Locomotive Firemen (1873), the Brotherhood of Railway Trainmen (1883), and the Order of Railroad Telegraphers (1886) are commonly referred to in the trade-union world as the great railroad brotherhoods, and they are clearly distinguished from the other trade unions of the United States by unusual conservatism, a highly perfected form of government, and the great emphasis which they place upon the character of their members. While the railway brotherhoods are on an exceptionally friendly footing with the railway managers and have secured written contracts with most of the railroads fixing wages and other conditions of employment, they regard themselves as preëminently protective associations and each maintains a large protective or strike fund. They also differ from the ordinary American union in the importance which they attach to the feature of mutual insurance. Affiliated with each of the brotherhoods is a ladies' auxiliary society. These societies maintain, with assistance from the brotherhoods themselves, a joint home for aged and disabled railroad employees at Highland, Ill.

The railway brotherhoods are very similar in organization and government. The supreme powers are vested in a biennial national convention. The most striking feature which these brotherhoods have in common, however, is their system of legislative and adjustment boards. 1. The legislative board constitutes the lobby of the railway laborers. Whenever a majority of the divisions of any State or province so desire, their representatives assemble at the State or provincial capital and effect a general organization, usually selecting one or two delegates—the chairman and secretary-treasurer—as a permanent legislative committee. A plan has been devised by which the chairmen of the legislative boards of the several organizations may combine in a railroad brotherhoods' legislative board, and such boards exist in several States. 2. The boards of adjustment, also known as protective boards, are charged with the investigation of grievances and the collective bargaining concerning wages and other conditions of employment. In general each division or local union elects a local grievance committee or board of adjustment, and the chairmen of the local boards on each system of railways constitute a general board of adjustment for that system. Where two or more separate systems are controlled by a single syndicate, the Locomotive Engineers provide for a still higher board or executive committee of adjustment covering all the roads included in the syndicate. The adjustment system makes it extremely difficult to declare a strike. The local grievance committee, the general board of adjustment, and the chief executive officer must all attempt to settle the grievance by peaceable negotiations with the railroad officials before a proposal to strike may be considered, and then, in most of the brotherhoods, it must be indorsed by the chief executive, the board of adjustment, and two-thirds of the members who will be involved.

With the exception of the Telegraphers and the International Association of Car Workers, the railroad organizations are not affiliated with the American Federation of Labor, and, notwithstanding the essential similarity of their interests, the frequent attempts to create a general federation of railway employees have failed.

RAILWAY HUMP YARD. See HUMP YARD, RAILWAY.

RAILWAY MAIL SERVICE. See RAILWAYS.

RAILWAYS. In its broadest use the word "railways" includes all roads which are used for the operation of vehicles on tracks by some form of motive power, be this motive power draft animals, a cable, some application of electricity, internal-combustion, or compressed-air motor, or the steam engine. In the present article, however, there will be considered only the railway which is operated by steam or electric locomotives for both freight and passenger service and such early forms of railways as were part of the development of the modern steam railway. Under separate headings will be found discussions of electric railways, both urban and interurban, cable railways, etc. A railway consists of the fixed plant and the rolling stock, which is usually called equipment and is used in connection with this plant to provide transportation for both passengers and freight.

EARLY HISTORY

The development of the steam railway is ordinarily dated from the opening to traffic of the Stockton and Darlington Railway, in England, in 1825. The railway, however, had a history long before this date. Indeed, the Stockton and Darlington Railway and its immediate successor, the Liverpool and Manchester Railway, were comparatively perfect developments of the art of railway transportation.

Early in the sixteenth century rails of timber were laid at the collieries near Newcastle-on-Tyne, England, over which by means of bulky carts provided with rollers one horse could draw four or five tons of coal. The first notable improvement of this crude railway consisted in securing these wooden rails by pegs to crossties placed 2 or 3 feet apart and in fastening on top of the rails proper, which were about 6 inches square, strips of hard wood which could be removed when worn and replaced with new strips without disturbing the remainder of the structure. In the year 1735 flat iron bars were substituted to some extent for this upper strip of wood, and in 1767 cast-iron bars were generally substituted for the entire wooden rail. At first these bars were flat and about 4 inches wide, 1¾ inches thick, and 4 or 5 feet long, with holes for the spikes; but after a few years they were made with a ridge along the outside edge to prevent the wheels from leaving the track. Subsequently the flange was transferred to the inside edge of the rail. In 1789 William Jessup introduced a new form of cast-iron rail in which the depth was greater than the width, which led to the name of edge rail being given to it. These rails were cast with a head 1¾ inches wide carried by a thin web deeper at the middle of the rail than at the ends. At first these rails were bolted or pinned directly to the ties, but soon afterward

they were arranged to be supported by cast-iron pedestals or chairs spiked to the ties and having a slot at the top in which the web of the rail was set and secured by a wedge. The rails were made without flanges and instead flanges were placed on the wheels. Owing to the short lengths in which these rails had to be cast, the joints were numerous, a very important objection in railway track, and besides this the material was too brittle to carry safely heavy loads at high speed. The development of the iron industry partly remedied these faults about 1820 by furnishing malleable or wrought iron from which tough rails could be rolled up to lengths of 15 feet. At the end of the first quarter of the nineteenth century, therefore, the standard railway track consisted of wrought-iron edge rails about 15 feet long, fastened by keys into cast-iron chairs, which were in turn bolted down to stone blocks or wooden sills spaced about 3 feet apart. The gauge of the track, i.e., the distance apart of the rails measured between the inner edge of their heads, was 4 feet, 8½ inches, which ultimately became the standard gauge of railway track in England and America. There was at one time in the United States very bitter discussion of the relative merits of the narrow gauge, 2 feet, 8½ inches, and the standard gauge, 4 feet, 8½ inches. The result of this discussion, however, was the almost universal adoption of the standard gauge, although, as is shown in the table of mileage of railways in operation in the United States, there is a considerable mileage of narrow-gauge roads, mostly in mountainous country, in the United States. On some Western lines a third rail outside of the narrow-gauge track is laid at the standard distance so that rolling stock of both gauges may be used. In Russia for military reasons a gauge different from that of Germany was maintained, while in India and Australia many different gauges are employed, though in both the last-named countries and especially in connection with the Australian transcontinental railroad, progress towards a single gauge for the more important lines was being made.

It will be observed that the essential characteristics of the modern steam-railway track had been established by 1825 and that it only remained for future knowledge and experience to develop and perfect these features.

Development of Motive Power. The great advance of the wrought-iron edge rail over previous forms of rails gave the first strong impetus to the development of a means of motive power for railways which would be superior to haulage by horses. The possibility of using steam locomotives at once suggested itself. Steam carriages for operation on common roads had been constructed long previous to 1825. (See AUTOMOBILE; LOCOMOTIVE.) As early as 1804 Richard Trevithick had built a locomotive engine, which at its first trial upon the Merthyr and Tydvil Railway, in Wales, had hauled wagons containing 10 tons of coal at the rate of 5 miles per hour. In 1812 locomotives were used by Blenkinsop to haul coal between the Middleton collieries and Leeds, and also by Blackett at Wylam. None of these locomotives were satisfactory. In 1814 George Stephenson built his first engine and put it in operation on the Killingworth Railway, where it hauled a load of 35 tons at the rate of 4 miles per hour on a grade of 1 in 450. Stephenson continued to build locomotives, each of them an improvement over its predecessor, and had them working regularly on the Killingworth Railway, although they did not supersede the work of horses.

The next step in advance in the use of the locomotive was made on the historic Stockton and Darlington Railway, the construction of which marked the advent of a new era in railway transportation. Before passing from the early history of railways to this new era it will be interesting to summarize briefly the status of railway transportation at the time. In 1825 the existing railways of Great Britain were 28 in number, ranging in length from 4 to 35 miles and amounting in the aggregate to about 400 miles. These roads were used almost exclusively for the transportation of mineral products. With the few exceptions previously noted, the universal motive power employed was haulage by horses.

Period of Development. The Stockton and Darlington Railway, 25 miles long, was opened for traffic in 1825, the line having been constructed under the direction of George Stephenson as chief engineer. Considering Stephenson's previous work with steam locomotives on the Killingworth Railway, it was not surprising that he should attempt to use similar motive power on the new line. His success in the attempt was considerable. On the opening of the road the Stephenson engine hauled a train composed of 22 wagons filled with passengers and 12 wagons loaded with coal, making an aggregate weight of about 90 tons, at an average speed of 5 miles per hour and a maximum speed of 12 miles per hour. Notwithstanding the flattering showing made by the locomotive engine in this trial trip, that form of motive power was employed only to a small extent in the immediate future operation of the railway. It could not compete in economy with haulage by horses, and for some time all passengers and mixed freight were so hauled, the locomotive being used only to handle a portion of the coal traffic. The important rôle played by the Stockton and Darlington Railway, therefore, consisted less in any advance in the mechanical features of railway transportation than in establishing the possibility of the railway as a common carrier of passengers and freight. Railway transportation in the modern meaning of the term began, thus, with the Stockton and Darlington Railway.

The success of the Stockton and Darlington Railway revived another railway enterprise which was destined to accomplish more in some respects for railway engineering than did the earlier road. This enterprise was the project for a railway line between Liverpool and Manchester, a distance of 30 miles. Construction was begun upon the road in 1826, with George Stephenson as chief engineer. Considerable difference of opinion existed as to the best method of operating the road when completed. Stationary engines had many advocates, including some of the most noted engineers of the day; others were in favor of horse power aided by stationary engines at the steep inclines, but few had any faith in locomotives, and Stephenson stood practically alone in openly advocating their use. His persistent earnestness, however, influenced the board of directors to offer a prize of £500 for the best locomotive engine which on a certain day should be produced on the railway and perform certain specified duties in the most satis-

factory manner. The date of the test was Oct. 1, 1829, and on this date four locomotives appeared to compete. One of these was the *Rocket*, built by Stephenson, and another was the *Novelty*, built by the Swedish engineer John Ericsson, afterward famous as the designer of the United States ironclad *Monitor*. The trials of these locomotives lasted until October 14, when the prize was awarded to Stephenson's locomotive, the *Rocket*, which undoubtedly ranks as the first high-speed locomotive of the modern type. (See LOCOMOTIVE for description.) The success of the *Rocket* determined the motive power for the Liverpool and Manchester Railway and incidentally for railways throughout the world. On Sept. 15, 1830, the Liverpool and Manchester Railway was opened for traffic and on December 4 of the same year the locomotive *Planet* hauled the first load of freight, consisting of 18 wagon loads of cotton, 200 barrels of flour, 63 sacks of oatmeal, and 34 sacks of malt, from Liverpool to Manchester in 2 hours and 39 minutes. As the model railway of its time the track construction of the Liverpool and Manchester Railway deserves some mention. Upon the graded surface was placed a layer of broken stone 2 feet deep. Stone blocks 2 feet square were set 3 feet apart, and upon them and upon the wooden cross-ties used on embankments were fastened cast-iron chairs in which the rails were secured by wedges. The rails were of wrought iron 15 feet long and were rolled with the web deeper at the middle than at the ends. They weighed 35 pounds per lineal yard.

In addition to establishing the practicability of the steam railway as a means of transportation for passengers and freight, the Liverpool and Manchester Railway proved the commercial value of such thoroughfares so satisfactorily that projects for railway lines sprang up all over the world. In Great Britain in 1840, 10 years after the opening of the Liverpool and Manchester Railway, there were 1331 miles of railway. These figures had increased to 6635 miles in 1850, to 10,410 miles in 1860, to 15,310 miles in 1870, to 17,935 miles in 1880, to 20,873 miles in 1890, and to 21,855 in 1900. In Austria the railway from Budweis to Linz, 80 miles, was begun in 1825 and 40 miles were completed in 1828; it was operated by horse power. In France the first railway, from Saint-Etienne to Andrézieur, 13 miles, was also completed in 1828 The first steam railway in Germany, that between

Nuremberg and Fürth, 4½ miles, was opened in 1835. For other foreign countries it must be sufficient to state the year in which the first important railway line was opened for traffic, as follows: Belgium, 1835; Germany, 1837; Russia, 1838; Netherlands, 1839; Italy, 1839; Switzerland, 1844; Denmark, 1844; Canada, 1847; Spain, 1848; Mexico, 1850; Sweden, 1851; Peru, 1851; Chile, 1852; India, 1853; Norway, 1853; Brazil, 1854; Portugal, 1854; Australia, 1855; Egypt, 1856; Turkey, 1860; Paraguay, 1863; Argentine Republic, 1864; Venezuela, 1866; Uruguay, 1869; Greece, 1869; Colombia, 1880. The articles relating to these countries give further details concerning the history of railway development in them, and the latest available statistics of mileage are summarized in the accompanying Table I.

The two earliest recorded railways in the United States were a short tramway on Beacon Street in Boston, built in 1807 with wooden rails, and a tramway, also with wooden rails, built by Thomas Lieper in 1809 in Delaware Co., Pa. These were followed by several tram roads of similar character, the most important of which was one in the town of Quincy, Mass. (q.v.), 3 miles long, and one at Mauch Chunk, Pa., 9 miles long, both built in 1827. These roads had a track consisting of an iron strap on wooden rails, supported by stone blocks or wooden sills, and were operated by horses. The first attempt made in the United States to use locomotive engines, otherwise than for mere experiment, was made on the railway from Carbondale to Honesdale, Pa., 16 miles, built by the Delaware and Hudson Canal Company. The *Stourbridge Lion*, a locomotive built in England, was placed upon the road in August, 1829.

The first charter for a railway granted in America was obtained by John Stevens, of New Jersey, in 1815 for a road to be built from the Delaware to the Raritan, but this project was never carried out. In 1830 construction was begun on the South Carolina Railroad, and the road was designed and built to be operated by steam locomotives. This was the first railway in America built with the purpose from the beginning of using steam locomotives. See LOCOMOTIVE.

TABLE II

SHOWING THE NUMBER OF MILES OF RAILWAY CONSTRUCTED AND IN OPERATION BY DECADES, IN THE UNITED STATES, FROM 1830 TO 1910 INCLUSIVE AND FOR 1913 *

(From Interstate Commerce Commission Statistics of Railways)

YEAR	Miles in operation
1830	23
1840	2,818
1850	9,021
1860	30,626
1870	52,922
1880	93,262
1890	166,654
1900	194,321
1910	240,439
1913	249,803

*Excluding Hawaii and Alaska.

The Baltimore and Ohio Railroad, commenced in 1828 and completed from Baltimore to Ellicott's Mills, Md., 15 miles, in 1830, came next in the use of steam locomotives. Indeed, in 1830 a small engine was built by Peter Cooper and made experimental trips on this road, but the first locomotive to be put in actual operation was installed in 1831. In 1831 the *De Witt Clinton*, a locomotive built by the West Point Foundry, was put into service on the Hudson and Mohawk Railroad. The next railway to mark a step in the development of the railway system of the United States was the Camden and Amboy Railroad, begun in 1831 and completed from Bordentown to South Amboy, N. J., 34 miles, in 1832. The president of this road, Col. Robert L. Stevens, conceived the idea that an all-iron rail would be preferable to the iron-strapped wooden rails employed on all previous

TABLE III

SHOWING MILEAGE * OF VARIOUS CLASSES OF RAILWAY IN THE UNITED STATES ON JUNE 30, 1913

CLASS OF TRACK	Miles
Single track	244,418
Second track	26,271
Third track	2,589
Fourth track.	1,964
Yard track and sidings	94,338
Total track	369,580

*Excludes companies earning less than $100,000 a year.

American roads. There was no rolling mill in America capable of rolling such rails, however, and Mr. Stevens went to England to secure them. His request of the English ironmasters was for a rail having a head similar to that then in use

TABLE IV

SHOWING NUMBER OF EACH CLASS OF RAILWAY CARS IN OPERATION IN THE UNITED STATES ON JUNE 30, 1913

CLASS OF SERVICE	Number
Passenger	51,700
Freight	2,273,564
Company's	120,244
Total	2,445,508

upon the principal British roads, but with a wide flat base to the web, which he proposed to secure to the supporting blocks or sills by hook-headed spikes. Considerable difficulty was experienced in getting this request fulfilled, but in May, 1831, the first 500 rails, 15 feet long and weighing 36 pounds per yard, reached Philadelphia and were placed in the track, thus recording the first use of the flanged T rail, which has since become universal in America and is extensively employed abroad. It is important to note here that the flanged T rail was reinvented in England in 1836 by Mr. Charles B. Vignoles and that rails of this form are known abroad as Vignoles rails. Mr. Stevens invented the fishplates and the hook-headed spike.

RAILWAY LOCATION AND CONSTRUCTION

Surveys. The first consideration in the undertaking of building a railway is that of the economic necessity for the line. In the majority of cases American railways were built to develop the natural resources and to aid in the settlement of territory which was undeveloped and sparsely settled. On the other hand, in Europe and in Great Britain railways were built to supply a more efficient form of transportation than that already in use. In other words, the English railway was built to meet a need, while the American road was built to create a need which it could meet. This led to the fundamental difference in the theories on which American and European railways were built. The American idea until comparatively recently was to build a line as cheaply as pos-

sible and then gradually to rebuild it as the traffic which the road itself created justified more costly construction. The English and continental practice was to make the original construction of a permanent nature. The American practice was justified in early railway building in the United States and Canada, but it was more rather than less expensive in the long run than it would have been to build in the first place with higher standards.

Railway building naturally divides itself into new main-line and branch-line building. In either case the first consideration is as to the possibility of the development of sufficient traffic to support the new line. In main-line building enough traffic must be in sight to justify the entire cost. Branch lines, which act as feeders to the main line, may be built through territory that will not develop enough traffic to pay for their operation if a haul only as long as the branch line itself were to be considered. The character of the traffic which may be developed is the most important factor in determining the standards on which the line is to be built. After these standards have been determined preliminary surveys are made to form the basis of an estimate of the cost of obtaining the line with the standards which it has been decided the traffic will warrant. A few examples of what is meant will make this point clearer than would a considerable discussion of the theory. A 300-mile line is to be built which will open up timber land which in time will become agricultural land; there is some mineral land along the line and there are opportunities for the establishment of small manufacturing plants. Such a line, we will assume, can never hope to have either a very dense freight or passenger traffic or any very large quantity of low-grade freight which permits of heavy car loading. The traffic, therefore, would not necessitate the building of a line with easy grades at any heavy expense. Accordingly the surveys are made with the idea that wherever the nature of the country seems to require it 1 per cent grades will be adopted and six-degree curves. Possibly two or three preliminary surveys will be made to determine which is the best route using these standards.

Another line is to be built from the coal fields to two or three existing trunk lines. The territory to be traversed is capable of being developed into a rich manufacturing community and the coal itself assures a heavy freight traffic. The country may be very difficult for railway building, but the nature of the traffic which is to be developed demands that a line be laid out which shall have low grades and no sharp curves and which shall be capable of operation at a low ratio of expense to total earnings even when the rate received per ton per mile for the freight is low. Such a line must have its ruling grades five-tenths of 1 per cent, with nothing higher than four-degree curves. Here again preliminary surveys are made and estimates of the cost are submitted by the engineers.

Technically this preliminary work is known as engineering to distinguish it from construction. Until comparatively recently American railway engineers gave their attention to reducing construction costs so entirely that the cost of operation of the line became to them a secondary consideration. Recent railway construction has been carried on with more consideration for the costs of operation, not, however, always with success. The Atlanta, Birmingham, and Atlantic was built from Birmingham, Ala., to Charleston, S. C., with modern standards, low grades, permanent structures, heavy rail and ballast, but the character of the traffic which could be developed was not sufficient, at least immediately, to justify such character of construction and the company went into the hands of a receiver shortly after it began operation. On the other hand, the Carolina, Clinchfield, and Ohio, built from the West Virginia coal fields to a connection with the Norfolk and Western, Southern Railway, and Seaboard Air Line, was built through a very difficult country, maintaining a low grade, with structures throughout which permitted the use of the heaviest types of engines and cars. Apparently the traffic almost from the beginning justified this type of line, and although the rate received per ton per mile on this road is low, its expense of operation has been at a low ratio to its earnings. While it is true that the engineer does not generally decide the standards which shall be adopted, but can simply recommend these standards, he should have so thorough a knowledge of the economics of operation of a railway that he can avoid making a saving in construction costs at the expense of economical operation.

When the engineer has chosen his route and has selected a combination of grades and curves for this route, his next task is to establish its centre line on the ground with all the grades and curves properly indicated. In plan the centre line consists of a combination of straight lines or tangents and of curves. The curves may be simple curves, i.e., plain circular curves; or compound, i.e., consisting of two or more circular arcs of different radii; or reverse curves, i.e., two simple curves so joined as to form a curve like a flat letter S. Curves are further designated by their degrees of curvature. The degree of a curve is determined by the angle at the centre subtended by a chord 100 feet long. For example, if on any curve a chord 100 feet long subtends an angle of 5° at the centre, that curve is known as a five-degree curve. In profile the centre line is composed of a combination of level or horizontal lines and of inclined lines or grades ascending or descending from the horizontal. Grades are designated by stating the number of feet either of rise or fall in a horizontal length of line of 100 feet or of 1 mile. For example, a grade having a rise of 1 foot in a horizontal length of line of 100 feet is known as a 1 per cent grade. The same grade defined in terms of feet rise per mile of length would be known as a grade of 52.8 feet per mile. When two grade lines meet or when a grade line and a level meet, the junction is marked by an angle more or less abrupt This angle is always replaced by a vertical curve which is convex upward at a summit and concave at a valley.

PERMANENT WAY

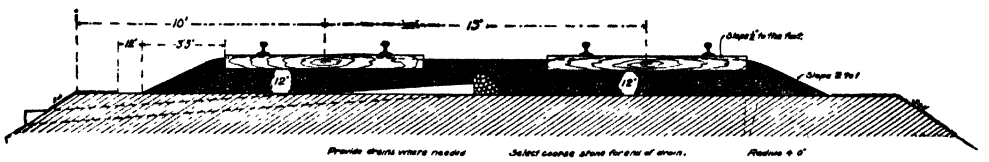
Roadbed Construction. After the line has been surveyed and decided upon, the next work after the right of way has been obtained is to begin excavating the cuts and making the fills. Wherever it is possible an attempt is made to use the material removed from cuts in making fills. There is, however, of course, a limit to the distance which this material can be hauled, beyond which limit it becomes cheaper to get material for fills especially for this purpose.

Making cuts and fills and grading generally are covered by the term "earthwork." Earth may be handled with plow and pick or plow, pick, and explosives for loosening, and moved with wheelbarrows, scrapers, or carts. Where the amount of work at a single cut or fill justifies it earth may also be loosened with explosives and handled with steam shovels. The American Railway Engineering Association classifies grading as between solid rock, loose rock, and common excavation, and defines each class as follows:

"Solid rock shall comprise rock in solid bed or masses in its original position which may best be moved by blasting, and bowlders or detached rock measuring 1 cubic yard or over.

"Loose rock shall comprise all detached masses of rock or stone of more than 1 cubic foot and less than 1 cubic yard, and all other rock which can be properly removed by pick and bar without blasting, although steam shovel and blasting may be resorted to on favorable occasions in order to facilitate the work.

"Common excavation shall comprise all other materials of whatsoever nature that do not come under the classification of solid rock, loose rock, or such other classification as may be established before the award of the contract."



A man with a pick will loosen from 15 to 30 yards of earth in a 10-hour day, depending on whether it is stiff clay or common loam. A two-horse team with a plow will loosen from 250 to 400 cubic yards in a 10-hour day. Steam shovels are usually operated by three men. It takes about 10 to 30 seconds to load a cubic yard by use of the steam shovel, depending, of course, on the nature of the material, the quickest material to load being iron ore and sand and the slowest rock. The capacity of steam shovels varies widely. The average for rockwork is 1 cubic yard, for earth and sand 1¼ cubic yards, and for clay and iron ore 1½ to 2½ cubic yards.

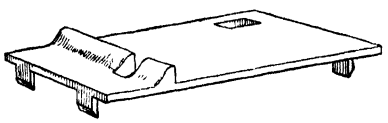
For standard gauge (4 feet, 8½ inches) the embankment for single track measures 14 feet at the top. The width of the base of the fill depends directly on the height and on the nature of the material used in making the fill. The standard slope for earthwork is 1½ to 1.

and culverts made, the next step is to lay the ties, rails, and ballast. The principal materials that are used for ballast on American railways are stone, gravel, burnt clay (often called burnt gumbo), slag, cinders, and chats. The advantages of stone ballast are that it will stand up under the heaviest traffic, that it drains well, and that there is no dust from it. It is the most expensive ballast to maintain, and its original cost depends on the distance from a source of supply and the expense of excavation. It is generally considered that the so-called Sherman Hill disintegrated granite, which is not really rock ballast at all, which was found on the Union Pacific, is, from all points of view —cost of working, resistance to pulverizing, drainage, etc.—the best ballast that is used on American railways. Gravel is comparatively inexpensive to work, is often washed to free it from dust, and makes a comparatively easy riding roadbed; but even when washed is, compared to stone, dusty and does not give the rigid track under heavy traffic that stone ballast gives. It is in use on a greater mileage of American railways than any other form of ballast.

Burnt clay is quite extensively used in the southwestern United States, where neither gravel nor rock ballast is easily obtainable. A pit of clay is selected and a bed is made of alternate layers of clay and fuel and this bed is then burnt. The process takes a number of months, varying with the size of the bed, and the clay is then allowed to cool and is loaded on to cars with steam shovels. It makes a fairly good ballast, which does not drain as well as rock and pulverizes more easily, but is comparatively cheap to work under track. Slag is used for ballast where it is readily obtainable from furnaces. It makes a good roadbed, drains fairly well, but ordinarily pulverizes rather quickly and therefore has to be renewed frequently. Cinders makes the easiest-riding roadbed of all forms of ballast, but it is dusty, and quickly pulverizes. Chats, the waste product of ore concentration, is used as ballast in the Southwest.

Ties. Ties in the United States and Canada are generally of wood, although the Bessemer and Lake Erie uses a steel tie almost exclusively

SECTION OF DOUBLE TRACK ROCK-BALLASTED EMBANKMENT, AMERICAN STANDARD PRACTICE.

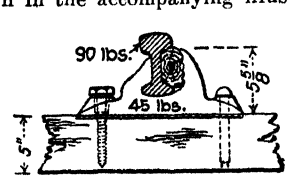


Bridges, Trestles, and Culverts. The type of bridges, trestles, and culverts that are to be adopted is in the first place dependent on the weight which is to be placed on them; secondly, as to whether or not they are to be permanent structures; and thirdly, on the nature of the opening which must be bridged. The standard for the heaviest locomotives and cars now in use on American railways requires bridges built for Cooper E-60 loading, i.e., the weight of two of the heaviest locomotives followed by a uniform weight of the heaviest cars, or about 6000 pounds per lineal foot. (See BRIDGE.) Permanent structures are now almost exclusively of steel and concrete.

Ballast. After the roadbed has been graded, the tunnels (see TUNNEL) driven and bridges

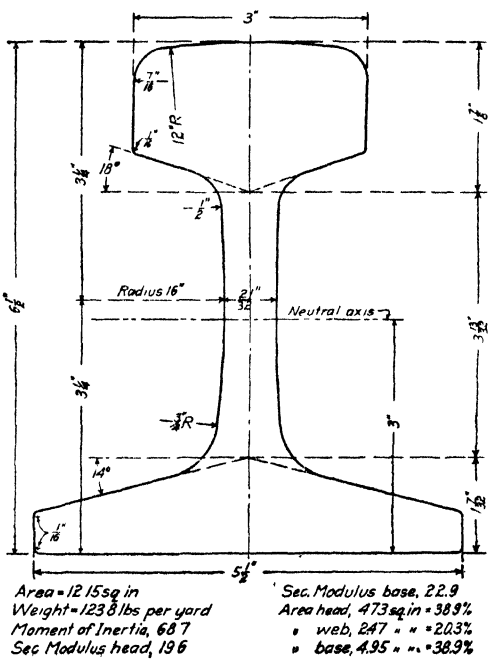
and a number of other roads have at various times experimented with steel ties. Steel ties are employed in Germany and in other continental countries. The difficulty in developing a steel tie for use on North American roads is, in the first place, that wood is cheap and that it admirably performs the function for which the tie is intended: it gives sufficient elasticity to permit the rail to take a natural curve under the moving wheel and when properly embedded in good ballast gives all the rigidity of alignment and surface that is required. Steel ties are in general far more rigid and less elastic than wooden ties and have the further difficulty of having to be fastened in some rigid way to the rail.

Various kinds of hard wood are used for ties,



white oak being one of the best. Hard pine is in common use. Soft woods are used for ties, but are not desirable for a road with heavy traffic and are usually protected by a tie plate and treated with preservative. A great many American roads are now using treated ties. There are various treating processes, the most common being creosoting and burnettizing. The creosoting process consists of impregnating the tie with a mixture consisting largely of creosote. The tie is first subjected to a vacuum process and creosote is then forced into the pores under pressure. Burnettizing consists of impregnating the tie with a zinc solution. The cost of untreated ties varies from 40 cents for a pine tie in the southeastern part of the United States to $1.50 for an oak tie delivered in Arizona or New Mexico. Many American railways have started the preservation of certain tracts of timber along their route to provide for the future supply of ties at a reasonable price. Creosoting adds from 30 to 50 cents to the cost of a tie and burnettizing about 15 cents. The life of a tie depends on the weather conditions and the character of the traffic. A pine tie under a traffic density (see *Railway Operation*) of 500,000 tons one mile per mile of track in a moderately dry climate will last about seven years. A creosoted tie protected with tie plates will last, it is estimated, about 15 years, which is slightly longer than the life that is ordinarily given to a white-oak tie.

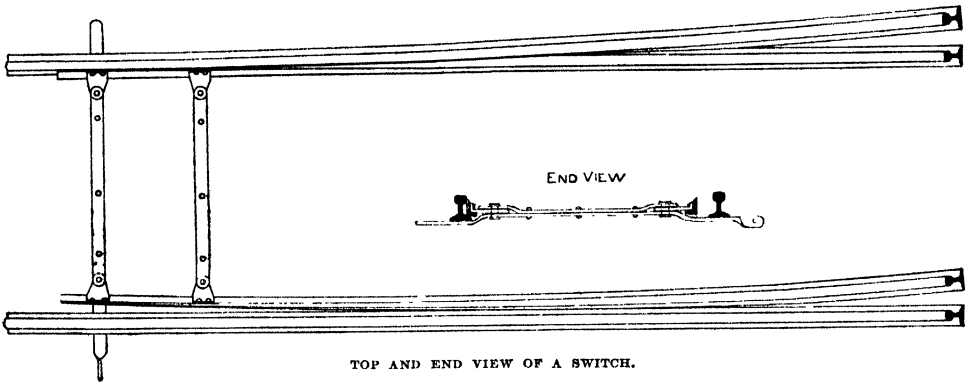
TIE PLATE.



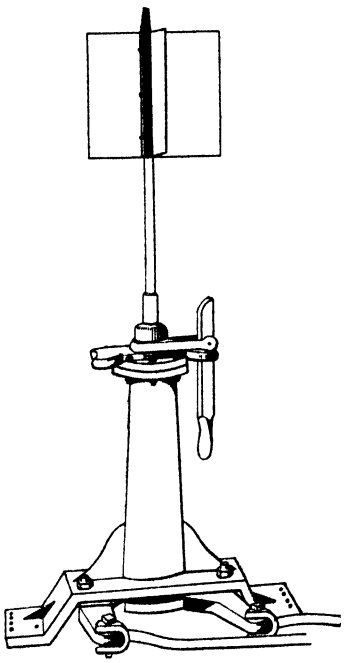
Ties are generally from 7 to 10 inches wide, 6 inches thick, and 8 to 9 feet long, and they are spaced from 18 inches to 2 feet apart in the track. An immense amount of timber is consumed annually for railway ties, as a brief estimate will demonstrate. Assuming that 2500 ties per mile of track are employed on the average, then the 250,000 miles of railway track in the United States require 625,000,000 ties. The annual consumption is about 76,000,000 ties for renewals and 14,000,000 ties for new construction, a total of 90,000,000 ties, or nearly 300,000,000 cubic feet of timber.

Rails. For a description of the metallurgical and other processes involved in manufacturing rails, see IRON AND STEEL; ROLLING MILL. The T-section rail, invented by Col. R. L. Stevens in 1830, is in universal use in the United States and Canada, although the so-called bullheaded rail, shown in the accompanying illustration, is used in England. Rails are generally 30 feet long and are classified according to the weight in pounds per yard On branch lines and on lines on which there is a small traffic density with light locomotives and cars, 65 and 70 pound rail is in use, but on the great majority of main-line American railways 85 or 90 pound rail is now the standard, with which lighter rail is replaced as it wears out. On roads of very heavy traffic, such as the main line of the Pennsylvania, the New York Central, the New York, New Haven, and Hartford, etc., a 100-pound rail generally has been standard, and rails on curves often have some alloy such as titanium. The Pennsylvania in 1914 began the use of a 125-pound rail. Manganese rails are being experimented with for use on curves, as the rail wear there is very much greater than on tangent track.

ENGLISH BULLHEAD RAIL AND CHAIR.



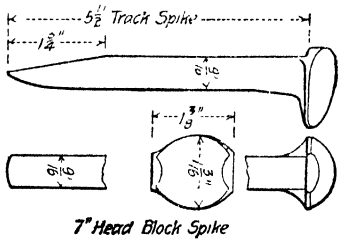
The distance apart of the rails is the gauge. The standard gauge, as has already been mentioned, in America, England, and most European countries is 4 feet, 8½ inches, or approximately the equivalent in meters. In England the rail is held in a chair, which chair rests on the ties or sleepers, as they are called there. In North America the base of the rail rests either directly on the tie or on a tie plate, and the rail is held in line by spikes driven into the tie. The object of this spike is not to hold the rail from moving vertically, but to keep it from moving laterally. The three parts of the rail are the head, the web, and the base. A cross section of a 125-pound rail of the Pennsylvania standard is shown in the accompanying drawing.



PENNSYLVANIA 125-POUND RAIL, SECTION.

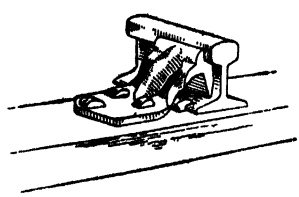
Frogs and Switches. A switch is a device for directing the wheels of a train from one track to another. The switch itself consists of the frog and so much of the track as is connected with the device for turning the train from one track to the other, together with the switch stand and its accompanying levers, etc. The two switches and track connecting parallel tracks by which a train can be sent from one track over on to the other track are known as a crossover. The sharpness of this crossover is

determined by the angle of the frog to the main track. The shortest crossover in general use on main track is what is known as a No. 8, the angle being 7° 10′; the longest is No. 2, with an angle 4° 46′, on which a train can go from one main track to another at a speed of from 25 to 30 miles an hour.



TOP AND END VIEW OF A SWITCH.

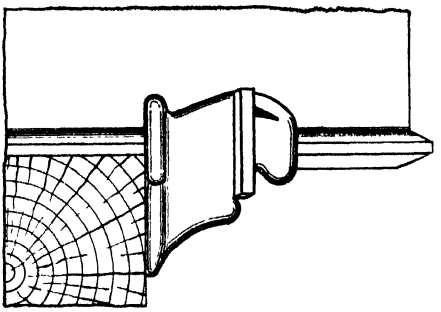
SWITCH STAND.



Track Fastenings and Appurtenances. The rail is fastened to the tie with a spike the head of which projects over the base of the rail. This may be either a smooth spike driven into the tie or a screw. With the screw spike a hole slightly smaller than the spike is generally bored in the tie and the spike is screwed into it. For boring this hole there are various machines, some of which necessitate the boring of a hole before the tie is laid; others, being worked by hand, bore the hole after the tie is in place. On tangent track with hardwood ties one spike is usually driven on either side of the rail in each tie. This is true also if tie plates are used. On curves when tie plates are used—and it is now considered good practice to use tie plates on all curves of more than four degrees—two spikes are almost always driven on the outside of the rail, and practice varies as to whether one or two spikes are driven on the inside of the rail. A tie plate is a flat or corrugated piece of metal with four holes through which the spikes are driven. The tie plate is placed between the rail and the tie. Some tie plates have ribs or other projections on the underside which bite into the tie, and

SPIKES FOR FASTENING RAIL TO CROSSTIE.

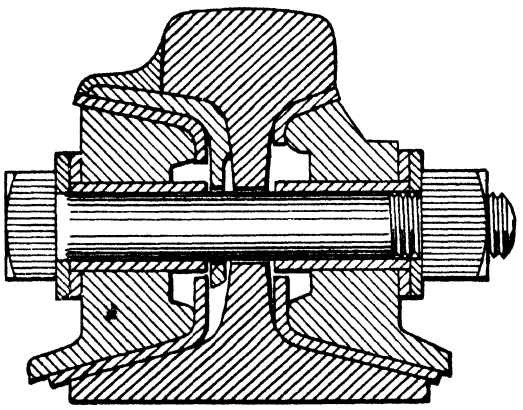
nearly all designs of tie plates have a shoulder which engages the base of the rail on the outer side.



The tie plate preserves the tie, distributing the wear over a broader surface than the surface of the base of the rail, preventing the cutting of the tie by the rail, and helps to hold the rail in line by making the spike more effective. It is this latter function which has made the use of tie plates on curves of over four degrees general practice. With a soft-wood tie a tie plate is almost a necessity. With a hardwood tie there is difference of opinion as to how much its use on tangent track adds to the life of the tie, as there is also difference of opinion as to whether

RAIL BRACE FOR HOLDING RAILS ON CURVES.

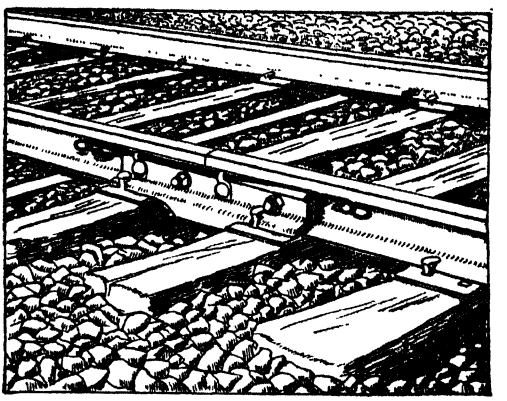
or not the projections on the underside of the tie plate by cutting into the fibre of the wood tend to make decay more rapid. In addition



to the spike and tie plate to keep the rail in line, there are also various types of rail brace for use on curves. Such a brace is shown in the accompanying drawing. On a double-track railway where all traffic on one track is in the same direction, rails have a tendency to creep, owing

RAIL ANCHOR.

to the undulating motion caused by the passage of the wheels. To prevent this creeping there are various rail anchors in use, one of which is shown herewith, the principle of most of these rail anchors being that the creeping tendency is prevented by the reflex action of the anchor pressing against the tie.



In the early stages of railway development rails were joined by a simple fishplate or bar of metal bolted through the web of the rail. This left the joint much the weakest part of the track. To overcome this various rail joints were devised, the idea being to support not only the web but also the head or the base, or both head and base, of the two rails, and when sufficient metal is put into the rail joint the joint is almost, if not quite, as strong as the rest of the rail length. Some railways have their own standard joint, while others use joints designed by manufacturing concerns. The accompanying illustrations show a side view of a rail joint in track and a cross section of an insulated joint. The Ameri-

CROSS SECTION OF AN INSULATED RAIL JOINT.

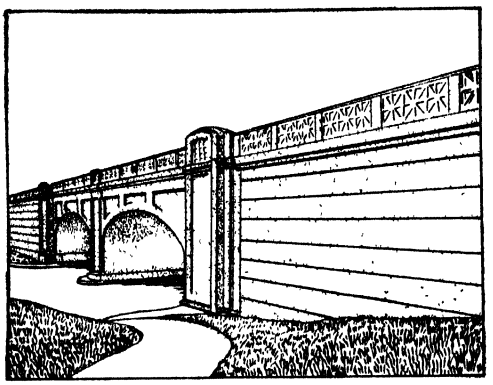
can Railway Engineering Association has the following general requirements for a rail joint: it should connect the rails into a uniform continuous girder; it should be strong enough to resist deformation or permanent set; it should prevent deflection or vertical movement of the ends of the rails and permit movement for expansion; it should be as simple and of as few parts as possible to be effective; and its cost should not be prohibitive.

When the type of construction is such that the joint comes between two ties it is known as a suspended joint, and when the joint comes squarely on top of a tie it is known as a supported joint. Suspended joints are considered rather the better standard, although there is considerable difference of opinion among railway

PENNSYLVANIA RAILWAY STANDARD RAIL JOINT.

engineers on this point, and the Lake Shore and Michigan Southern is an example of a road with the highest American standards using the supported joint.

Track Laying and Surfacing. Before actual track laying is begun the subgrade is surfaced and drainage is provided for. Where the track is on grade it may be necessary only to ditch along each side of the shoulder of the subgrade. Where, however, the track is laid on level roadbed, ditches have to be dug so as to carry the water to the channel below grade. This may require a gradually deepening ditch to procure the proper slope or it may be necessary to drain into the cut and enlarge one of the side ditches. Slopes are often protected by sowing grass on them or even by sodding. Sometimes, however, it is necessary to pierce slopes with drainage pipes and to make subdrains of tiles.

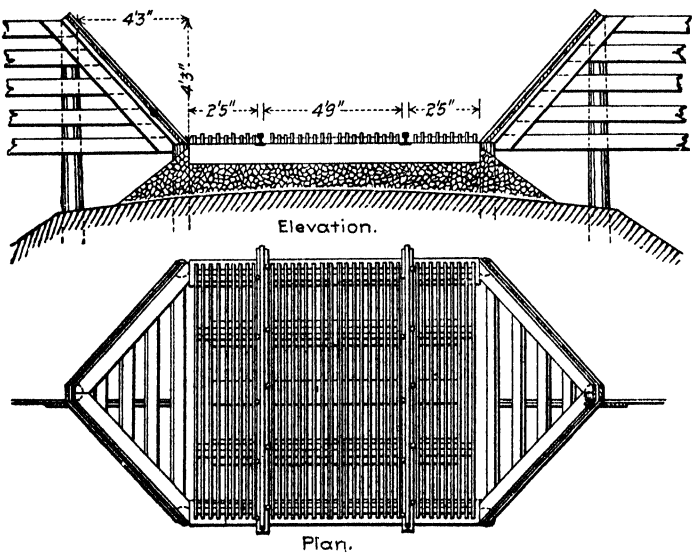


The material for the track may be either hauled by wagons and dumped at intervals along the right of way or the materials may be carried on a supply train and by means of machinery run forward on this train and track laid at the head of the supply train, so that by keeping the front car up to the last rail joint, ties, rails, and fastenings are unloaded at the proper point for use. In other cases the force doing the track laying is divided so that ties are laid and spaced ahead of the gang which is placing the rail on the ties, and the rail-laying gang is followed by one which spikes the rails. In laying rails each is carried forward until the rear end can be placed between the loose angle bars of the rail already placed. It is then pushed back to place, aligned, half bolted, and partially spiked to gauge. The rail is sometimes held by a clamp gauge and the spiking all done behind the rail car. Camp, in his work on *Track*, estimates that where track is laid without the use of machinery 56 laborers, 3 foremen, and 11 teams with drivers should lay a mile of track in 10 hours.

There are various machines used for track laying with the object of saving labor costs. With track-laying machines the ties and the rail, with angle bars attached, are brought to the forward car from the supply cars of the construction train. By some form of conveyer the ties are carried over a trestle projecting a rail length in advance of the car and delivered where they can be placed without disturbing the rail men. Each rail is carried forward and lowered so that it can be guided to a position in front of the splice bars of the rail in place and then pushed back by hand and spiked or otherwise temporarily held in place. It is estimated that about 2 miles per day can be laid with the more modern of these machines with 1 foreman, 4 men to operate the machine, 6 men to space ties, and 17 additional laborers. After the skeleton track is laid ballast is brought in and dumped on top of the ties. The track is then jacked up, aligned, and tamped to surface. Even with the rock ballast, however, new track sinks unevenly, and for the first year or more tamping to surface has to be done at frequent intervals.

Surface and alignment are the two objective points of good track. Alignment is defined by the American Railway Engineering Association as the horizontal location of a railway with reference to curves and tangents; surface, as the condition of track as to vertical evenness or smoothness over short distances. It must be remembered that alignment is obtained primarily by proper spiking and that surface is obtained by the proper tamping of the ballast under the ties.

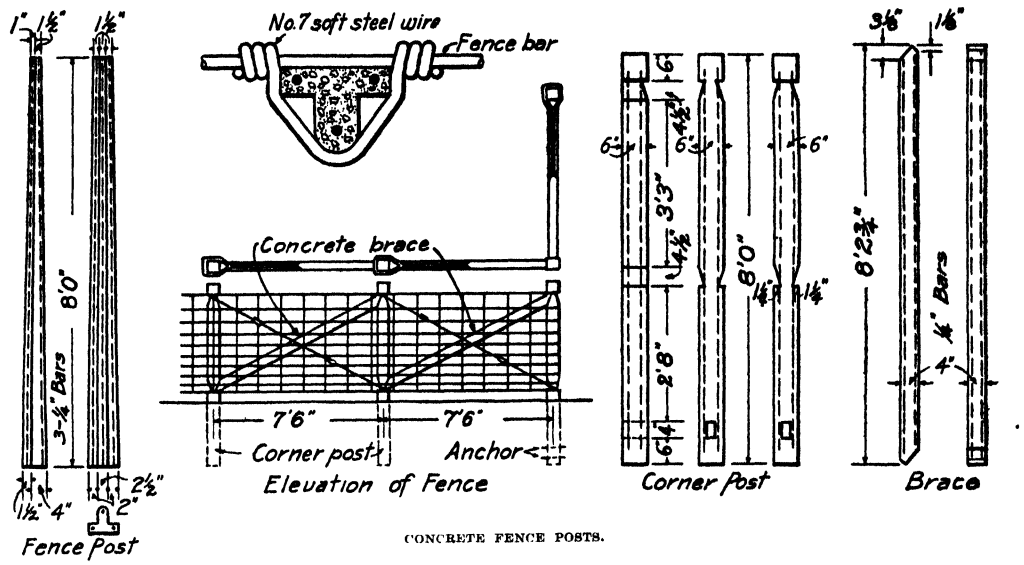
Roadway Machinery and Tools. The principal roadway tools that are peculiar to railway work as distinguished from highways are ballast forks, the ballast being cleaned by the use of a fork rather than a shovel; tamping bars, which are generally somewhat lighter than the ordinary crowbar, but of much the same shape; tamping picks, which have a hammer face on one end of the head; jacks for raising the track when tamping ballast under it; gauges, of wood or steel; hand cars or motor cars, used for section gangs (motor cars are now being introduced quite extensively on American railroads and are generally either gasoline or gas-electric motors fitted on a light car); rail benders; rail tongs, for handling the rail; and track levels.



Crossings, Fences, and Snowsheds. Crossings may be divided as between crossings of a railroad with a highway and crossings of one railroad with another. Crossings with highways were usually on grade in America until comparatively recently. In England and on the continent of Europe crossings at grade between railroads and highways were very seldom made, even in the early history of railroad construction. As the crossing with a highway has to conform with some paving, treated ties and stone ballast are usually employed and the paving is limited by the top of the rail on the outside and by the filler between the tracks, about ¼ inch low on the inside. Where no paving is required plank is usually laid alongside the rail on both inside and out-

CONCRETE OVERHEAD CROSSING.

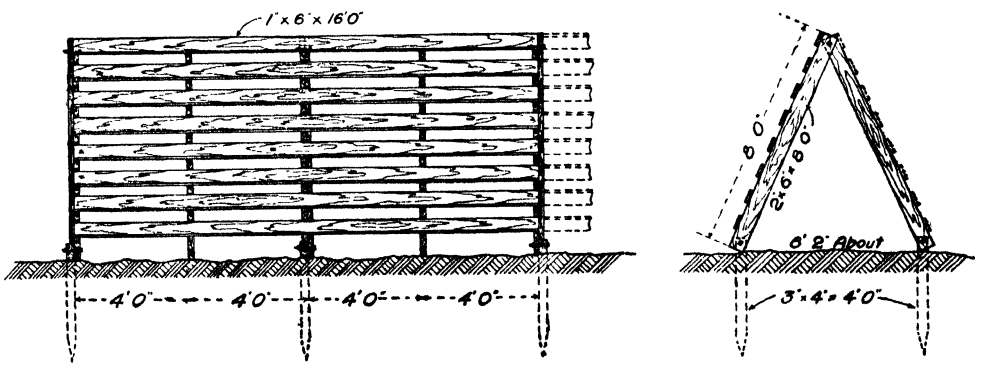
side, with its surface about ¼ inch below the top of the rail.



Many States have passed laws requiring the elimination of grade crossings in cities of a certain size, and the work of grade-crossing elimination is sometimes paid for in part by the State, town or city, and the remainder is paid by the railroad company. The highway may either be sunk so as to cross underneath the railroad track or raised so as to cross on an overhead bridge. A modern example of a concrete overhead crossing is shown in the accompanying illustration. Crossings at grade with other railroad lines are usually protected with interlocking switches and signals on railroads where there is any great density of traffic.

CATTLE GUARD WITH METAL SURFACE.

Cattle guards may properly be classed with crossings, fences, etc., and are of various designs, the simplest being an open pit with ties omitted and rails supported directly on stringers. This effectively prevents cattle from wan-



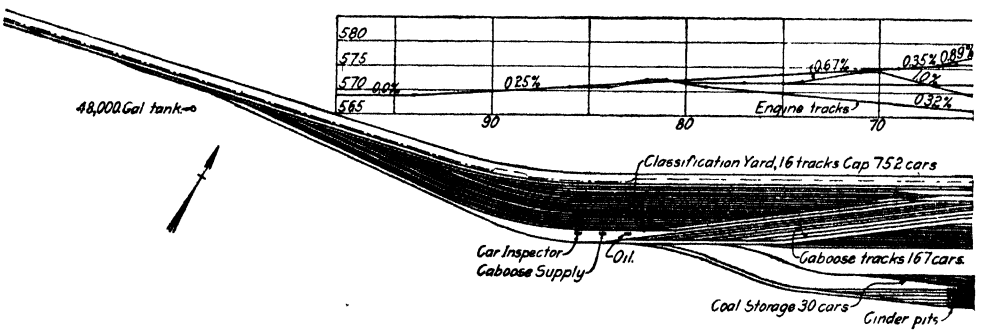
dering down the right of way, but is dangerous to employees walking on the track at night, and a derailment at such a place is likely to be serious. Ties are sometimes placed in such pits with their upper side between the rails hewed to a narrow peak. Surface cattle guards, however, are generally considered better practice than the pit cattle guard, and such guards are made generally either of wood or of metal slats placed between the rails, as is shown in the accompanying illustration. Wooden cattle guards cost in the neighborhood of $25 and metal ones somewhat more.

CONCRETE FENCE POSTS.

The railroad company is usually required by law to build and maintain fences along both sides of its right of way. A post-and-wire fence is now the most common design used by railroads, the wire being either barbed or smooth, smooth being considered the better practice. The posts are usually of wood, but there are some forms of metal post in use, and in recent construction a post made of concrete, such as may be seen in the accompanying illustration, is being used.

In many parts of America it is necessary to protect certain stretches of track from heavy snowstorms, especially where the track is in a cut. In some cases a permanent board fence from 5 to 10 feet high is built on the right of way. Where the fence is placed more than 50 feet from the centre of the track, space is provided between the boards, and the snow collects on the under or leeward side of the fence; where the fence is nearer than 50 feet to the centre of the track, the boards are laid solid and the snow collects on the outward or windward side of the fence. Such a fence must be sufficiently strong to resist the pressure of snow and high winds. In the majority of cases where snow fences are necessary in America, portable fences are found more practicable than permanent ones. In certain localities and under certain conditions the use of three or four lines of portable snow fence, set parallel and spaced about 100 feet apart, is required. Snowsheds are necessary in mountainous country to protect the track from snowslides. Wooden snowsheds used to be almost universal. The American Railway Engineering Association recommends that railroads, if possible, should be so located as to make snowsheds unnecessary, that their use should be confined to localities which require protection from mountain snowslides, and that they should be built of permanent material.

PORTABLE SNOW FENCE.



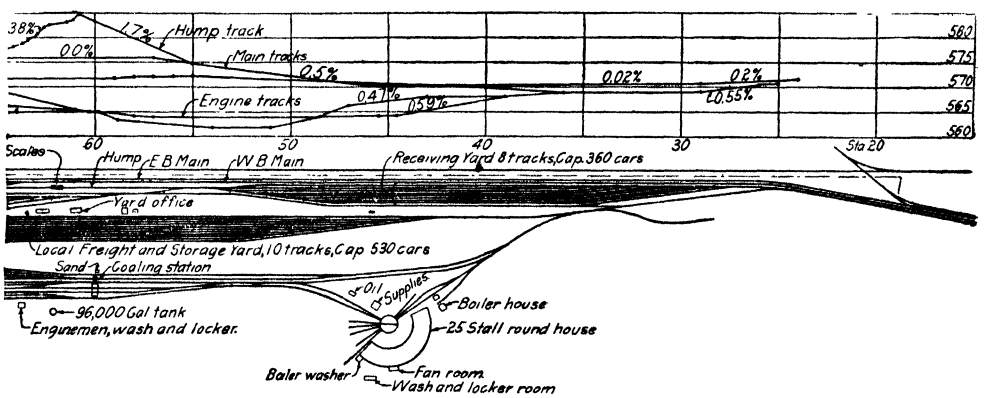
Signals and Interlocking. See special article on BLOCK-SIGNAL SYSTEM.

RAILWAY BUILDINGS

Terminals and Freight Houses. Freight houses are usually classed as inbound-freight houses, outbound-freight houses, and freight-transfer stations. Inbound-freight houses are those which provide for the delivery of freight from the railroad to the consignee; outbound-freight houses for the delivery of freight by the consignor to the railroad; and freight-transfer stations, where the necessity exists for consolidation or separation of shipments. The problem of handling both inbound and outbound freight and freight-transfer stations is one which has received a great deal of attention because the cost of this service is such a large proportion of the total cost of handling the traffic. The most universally used method of handling less than carload (L. C. L.) shipments—package and merchandise freight as it is usually called—is by means of hand trucks. Where the distance from the point of delivery of the freight to its destination is considerable, electric trucks are in use in some freight houses. These electric trucks can of course carry many times the load that a man with a hand truck can move, but, on the other hand, require additional men besides the man managing the truck to load and unload it, and cannot so easily be run into a box car for picking up or laying down packages. Different types of telpherage systems have been experimented with for handling package freight, but none of them has proved entirely satisfactory under general conditions where the variety of packages handled is great. The most extensive installation of a telpherage system for handling package freight at an inbound and outbound freight house was that of the St. Louis freight house of the Missouri, Kansas, and Texas. In this installation the telpher was operated by electricity on an overhead rail and picked up the truck loaded with package freight and moved it to the desired point, each telpher being operated by a man riding on the telpher itself. This system, however, was abandoned and hand trucks substituted.

It is estimated that it costs from 25 cents to 50 cents per ton to handle either inbound or outbound package freight at a freight house, the difference in cost being accounted for in part by differences in the availability and price of labor and in part by the nature of the service required and character of freight handled.

Shops and Roundhouses. Railroad shops for the repair of locomotives and cars are not greatly different from manufacturing plants, and as a matter of fact many railroads not only repair their locomotives and cars but build a portion of their equipment. Roughly speaking one general repair shop is sufficient for a road of less than 800 miles. If the road is a busy one there will also be shops at division terminals for light and running repairs. Roundhouses are used for the storage of engines when not in use and for cleaning out the fire boxes, washing boilers, etc. They consist of an outer circular wall with a roof providing for ventilation, and at the entrance have a turntable by means of which a locomotive can be shunted on to any one of the tracks which end against the circular wall. Each of these tracks is known as a stall, and a roundhouse is generally spoken of as having 10 stalls, 20 stalls, etc., meaning that it has accommodation for 10 or 20 locomotives. Sheds for electric locomotives are provided with pits for the inspection and repair of the running gear and are usually long rather than circular in shape.



PLAN AND PROFILE OF A HUMP YARD.

Fuel Stations. The fuel used on the great majority of roads in the United States and Canada is coal, although in the West and Southwest, especially in Texas and California, there are a large number of oil-burning locomotives in all classes of railway service. The simplest form of fuel station is a trestle, on which a coal car can be shoved, with one or more chutes which project over the track and into which coal can be dumped and so conveyed to the tender of the locomotive. Usually the fuel station has pockets in which coal can be stored, thus releasing the car in which the coal was brought to the trestle. The most modern fuel stations, such as those now in use on the Pennsylvania Railroad, have an elevator arrangement by which the coal is conveyed from the car into pockets, doing away with the necessity for a trestle. These fuel stations extend over two or more tracks, and all the work incident to elevating the coal and to opening and closing the chute, etc., is performed by machinery.

Water Stations. Water for the locomotive-tender tank which supplies the boiler is stored for immediate use either in tanks raised above the level of the top of the tender tank, so that water will flow into the tender by gravity, or in tanks on the ground level or below it, from which water is pumped through a standard to the locomotive-tender tank. Until a few years ago the storage tanks were usually of wood and were in the form of a huge barrel. They are now generally made of metal and have a rounded

bottom, so that there is no floor on which sediment can form and cake. Water for locomotive boilers in many parts of the country needs to be treated with some form of water softener to prevent the chemical action of alkalies, etc., on the locomotive boiler tubes. Much attention has been given within the last few years to providing an adequate supply of good water for locomotive-boiler use. The Pennsylvania Railroad has spent much money in providing reservoirs at places where good water is obtainable and for piping this water to conveniently located water stations along its lines. Many other roads also are establishing reservoirs and making provision for an adequate supply of good water.

A storage tank necessitates the stopping of the locomotive during the time that the tender tank is being filled. For fast passenger express service some roads, of which the Pennsylvania Railroad and the Lake Shore and Michigan Southern are the two largest, have built what are called track tanks, which consist of a pan about 4 to 6 inches deep and ¼ mile long, placed between the rails and filled by pipes leading into the bottom of it. Locomotives are provided with a scoop which is dropped down into this pan, and the speed of the locomotive forces the water up the scoop and into a pipe leading to the tender tank. In this way a locomotive can take water while going at a speed of from 30 to 40 miles an hour. In winter it is necessary to have some system of warming the water so that it will not freeze in these track tanks. The water that is splashed on the ballast freezes and necessitates constant maintenance work. This form of water station is very expensive of operation and is justified only in a few instances where railroads have very fast and very long runs without a station stop.

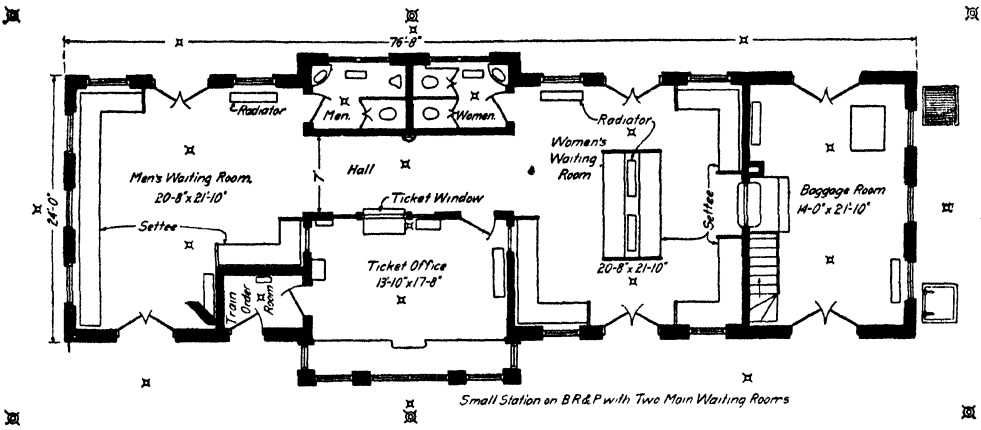
PLAN AND PROFILE OF A HUMP YARD.

Power Plant. See ELECTRIC RAILWAYS.

Yards and Terminals. The American Railway Engineering Association defines a yard as a system of tracks within defined limits provided for making up trains, for storing cars, and for other purposes, over which movements not authorized by time-table or by train order may be made subject to prescribed signals and regulations. A yard unit at a division terminal consists of a receiving, classification, and departure yard. With this unit are usually combined repair tracks and storage tracks for cabooses and engines. A yard system at a large terminal may consist of quite a number of yard units, it having been found more economical to increase the number of units rather than to increase the size of each unit, a yard track longer than the longest train which has to be handled through the yard being of course uneconomical because necessitating unnecessary movement of cars and engines.

When a train enters a receiving yard the road engine and the caboose are cut off and the work of distributing the cars is performed by a switching engine. The cars are then separated according to the needs of the trains. For instance all the cars containing one class of commodity may be sorted out and stored on one track, or the separation may be made according to districts to which the cars are destined. The classification yard is laid out so as to permit of the assembling or switching of cars which have been grouped according to districts in order of delivery at destination. The departure yard is those tracks which are used for the final bringing together of the cars that are to go out in a train and attaching the road engine and the caboose. Connected with this unit there are certain tracks which are used to store cars which for some reason cannot be sent directly through the yard. Connected more or less closely in point of distance with the yard are so-called team tracks and the freight-house tracks. The principle of these team tracks and freight-house tracks is the same, viz., they are tracks on which cars can be placed for either loading or unloading. If the loading or unloading is to be done in the open directly from or to wagons, no shed is provided, but sufficient room is left between the tracks for convenient roadways to be used by teams. If cars are loaded or unloaded through a freight house there are a series of tracks separated by platforms.

There is some difference of opinion as to whether an attempt should be made in the originating yard so to classify a freight train as to eliminate as far as possible switching until the final destination, or whether to reclassify the train at division terminals as necessity demands. The practice depends very largely on the class of commodities handled and the nature of the service. If it is possible to make up trains in the first place so that there will be very little switching at divisional terminals, this is the more economical way. On the other hand, if the nature of the service is such that a good deal of switching is necessary in any case at divisional yards, it is often more economical to



spend less time and switching-engine mileage in the originating yard in an attempt to get a train that will theoretically be liable to the least switching at divisional terminals.

It is standard practice, where there is a very large amount of switching work to be done, to build a yard in such a way as to permit a considerable part of the switching to be done by gravity. Such a yard is generally known as a hump yard (q.v.). Cars are pushed to the top of the hump and from there are drilled or run down on to the classification tracks by means of gravity. In some large modern yards the cars are weighed as they pass over the hump and are released for the glide away from the hump by electricity.

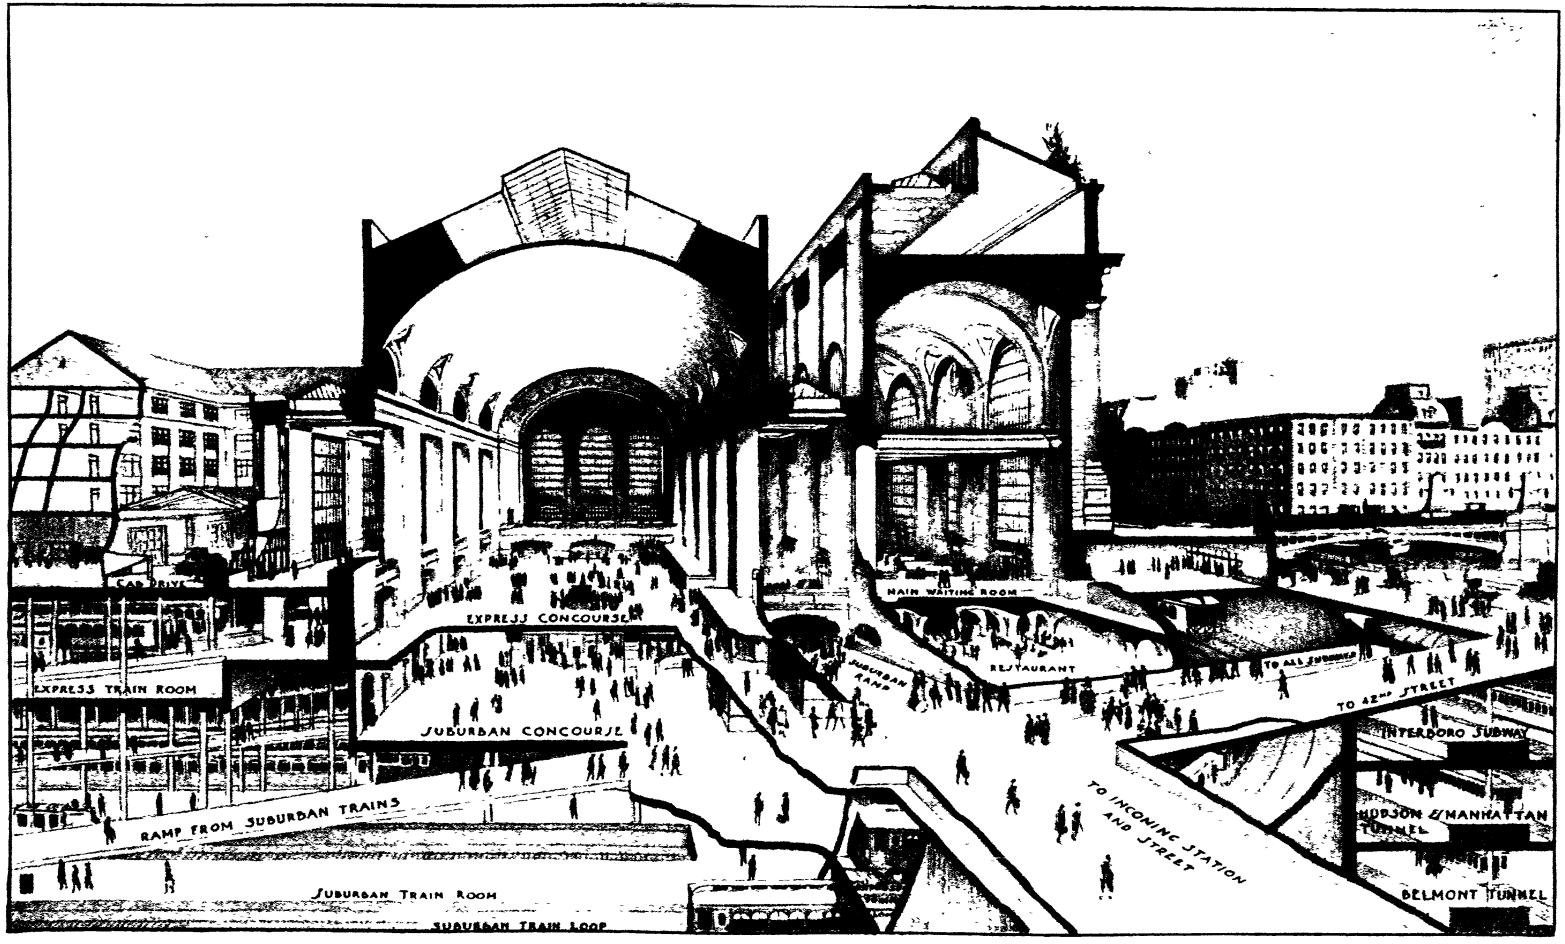
Passenger-car yards are a comparatively simple system of tracks where passenger trains are broken or made up. Because of the cost of land within city limits it is customary for roads entering large cities to build both their freight and passenger yards outside of the city limits. Passenger trains are run out from the passenger station to the yard and are there broken up, and

for luxury in traveling, the progress in passenger-station building has been very great within the last few years. A striking example of the change that has taken place is afforded by the fact that the Grand Central terminal station, which was built in 1871 to take care of the New York Central and the New York, New Haven, and Hartford passenger business in New York City, was rebuilt in 1898 and 1899 and was at that time criticized as being in excess of any probable future needs. Within six years plans were begun for tearing this station down and building one many times as expensive and elaborate. The most notable and costly stations that have been built in the United States within the last 10 years are the Pennsylvania station at New York City, the Grand Central station at New York City, the Chicago and North Western's union station at Chicago (see illustration under CHICAGO), while others of considerable size are contemplated in several American cities.

Passenger stations naturally are very different in character. A combination depot or

A SMALL STANDARD STATION PLAN, BUFFALO, ROCHESTER, AND PITTSBURGH RAILROAD.

made up and brought into the passenger station ready for departure. Freight cars for loading and unloading at team tracks or freight houses are brought in from the yard, sometimes as far as 15 or 20 miles, and spotted at the proper points within the terminal for loading or unloading, and are collected from the terminal without switching and brought out to the classification yard. Some idea of the importance of the cost of freight-switching service may be gained from the estimates of C. L. Bardo as to the cost of switching a 60-car train. By the ordinary method of pushing and pulling cars without the help of gravity the time consumed was two hours, the wage expense $2.44, and the distance traveled by the locomotive 24,750 feet. By the use of a hump gravity yard the time consumed was 30 minutes, the wage expense $1.02, and the number of feet traveled by the locomotive 6000.



STATIONS

Passenger stations vary in size and elaborateness of construction from the station in a small town of 1000 inhabitants, through which possibly 10 to 20 persons pass a day, to the great passenger terminals in the cities.

With the tremendous increase in passenger traffic and the increasing demand of the public

station handles freight and passenger business under one roof. Its chief requirements are a freight room with platforms on both sides, respectively next the tracks and next the yard or roadway, a waiting room, baggage room, and ticket office. Where the volume of traffic is sufficient, however, the freight and passenger buildings are separated, sometimes by a considerable distance. Local passenger stations are those situated at points between the terminals. They are of two types—through stations, in which the tracks pass through a shed having platforms on both sides and waiting rooms, offices, etc., on one or both sides, and side stations, located only on one side of the tracks.

The Pennsylvania station in New York City is a through station; trains run into the station from New Jersey and after discharging passengers continue through the East River tunnels to the Sunnyside yards on Long Island. This avoids reverse movement, i.e., hauling empty trains out in the face of incoming loaded trains, etc., and was practicable because the Pennsylvania built its tremendously expensive tunnels under the Hudson River and under the East River. The New York Central station in New York is a stub station, but reverse movement will be avoided when the station is complete by a series of loops.

A MODERN AMERICAN RAILWAY TERMINAL

MAIN WAITING ROOM

CONCOURSE SHOWING TRAIN GATES AND INDICATORS

PENNSYLVANIA STATION, NEW YORK CITY

In European practice all but the most insignificant local stations are provided with bridges or tunnels for crossing the tracks. This important precaution for safety is too often neglected in the United States. The essentials of a small local station are a waiting room, divided into two parts respectively for men and women, a ticket office and a telegraph office (these two often combined in one), a baggage room, and lavatories (toilets) for men and for women. Such stations are usually long, low, one-story buildings, of frame construction where economy is necessary, but often (and generally in Europe) of brick or stone. The platforms are generally roofed over, wholly or in part. In the larger stations there are also restaurants, smoking rooms for men, rest rooms for women, news stands, telephone booths, and express offices. A union station is one which serves several railways in common. The planning of such a station, when it is a local and not a terminal station, offers many special problems; the same is true of junction stations, especially at intersections of two or more lines.

A terminal station differs from a local station in that, standing at the end of a line, all the general accommodations, or a large part of them, can be grouped in a head house of any desired size, at right angles to the tracks, with a concourse or platform from which the ends of all the track platforms are reached. The tracks, of which there may be many, are grouped in pairs, with a platform between each pair of pairs. The more important terminals are buildings of great magnificence and cost; the waiting rooms are of enormous size, and the provision of restaurants, parlors, offices and booths, and even of shops, is often lavish. Until about the beginning of the twentieth century the great European terminals and important through stations far surpassed those in American cities, e.g., the Gare de l'Est and Gare du Nord, Paris, the terminals at Vienna, the larger Italian stations (Milan, Genoa, etc.), the stations at Frankfort, Dresden, etc., in Germany, and one or two of the London stations. Many of these are now, however, out of date in style and equipment; but magnificent new stations have replaced some of the older ones (Gare de Lyon, Gare d'Orléans, Paris; Antwerp, Frankfort, Dresden, etc.).

It is the United States, however, which has now taken the unquestioned lead in this branch of architecture. There is still much to be done in America in reconstructing hundreds of antiquated local stations, and above all in improving their too often squalid surroundings. But much progress has already been made in this respect (e.g., Pittsburgh, Atlanta, Portland, Me., Worcester, Mass., Dayton, Ohio, and many others). Such terminals as the North Western at Chicago, the New York Central at New York, the Union at Washington, and the colossal Pennsylvania station in New York are in planning, design, and equipment unsurpassed and perhaps unequaled in Europe.

In two respects there is in modern railway architecture an increasing tendency to depart from old-time types, especially in the United States. The first is due to the more frequent elevation or depression of the tracks on approaching and entering or traversing a city. This necessitates dividing the functions and service of the station between two levels, that of the street and that of the tracks (New York; Broad Street, Philadelphia; Cleveland, Ohio; Baltimore, Md.; Antwerp; Gare d'Orléans, Paris; and many others). The other is the abandonment of the vast, metal-and-glass-roofed train shed in favor of separate platform roofs nearly but not quite meeting over the tracks. Such splendid structures as the arched train sheds of the Midland Terminal, London, or the former Grand Central station at New York are not likely to be repeated in the future.

Terminal and other station hotels are a common adjunct of English stations in important cities and are occasionally found on the Continent (Midland, Charing Cross in London; St. Lazare, Paris, etc.), but have never found favor in the United States.

Maintenance Costs. The cost of maintaining the right-of-way tracks and structures of an American railroad generally consumes from 12 to 15 per cent of total operating revenues. The cost of upkeep of a mile of single main track over which there is a traffic density (ton miles per year) of 1,000,000 and a passenger density (passengers one mile) of 200,000, where the track is rock-ballasted, laid with 90-pound rail, and the conditions of drainage, etc., not unusually bad, is in the neighborhood of $1300. The average cost per mile of track for the larger railroads in the United States varies from $900 to $1800. This includes the maintenance of structures, stations, etc., appertaining to the plant, but does not include any expenditures for maintenance of equipment. Track is maintained by section gangs which consist of a foreman and from four to seven men. A section of single track varies in length from 5 to 8 miles, 7 miles being the most common unit. When there are two or more tracks the length of section is correspondingly shortened, so that on a four-track road the section which a gang of seven men maintain will be about 2 miles of road.

Locomotives. See LOCOMOTIVE.

Freight Cars. The types of freight cars most generally used are the box car, gondola car, hopper car, flat car, tank car, stock car, and refrigerator car. The accompanying table shows the dimensions, weight, etc., of typical examples of each of these classes.

STANDARD AMERICAN FREIGHT CARS

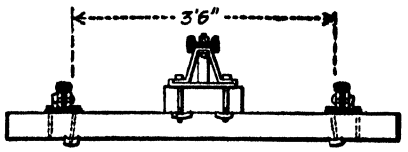
	Capacity	Weight	Length	Width	Height
Box car	30 tons	35,700 lbs.	36 ft.	8 ft. 6 in.	8 ft.
Gondola car	50 "	43,200 "	40 "	9 " 4 "	4 " 6 in.
Hopper "	50 "	43,600 "	31 " 6 in.	9 " 4 "	
Flat "	50 "	37,900 "	34 " 2 "	8 " 10 "	
Tank "	12,000 gals. (50 tons)	45,400 "	33 " 6 "		
Stock "	40 tons	40,000 "	40 "	8 "	8 "
Refrigerator car	30 "	49,800 "	32 " 10 "	8 " 4 "	7 " 6 "

Wooden freight cars are being rapidly replaced by steel cars or steel-underframe cars. The great majority of coal cars, either gondola or hopper, are now being made of all steel; box cars are now generally made with steel underframes and some box cars are being made of all steel or with the wooden sides reënforced with steel ribs; tank cars are of all steel; refrigerator cars of steel underframe; and stock cars usually of steel underframe. Until recently iron wheels were in general use for freight cars, but with the adoption of the 50-ton (capacity) car steel wheels are in a great many instances being specified instead of iron wheels. The cost of maintenance of steel freight cars is not yet known with any degree of accuracy. The average yearly cost of repairs, exclusive of renewals or any allowance for depreciation, for all classes of cars in freight service varies from about $36, the average on the Chicago and Northwestern, to about $100, the average on the Pennsylvania and the Southern Pacific. The caboose is the car, generally weighing from 25,000 to 36,000 pounds, in which the freight-train crew rides. It usually has two or more bunks, a stove for heating and for cooking meals, lockers, etc.

Passenger Cars. The principal types of passenger cars in America are the coach, the sleeping car, the parlor car, and the observation or club car. In passenger-train service there are also the dining car, mail car, caboose, and express car. A coach has a seating capacity of from 60 to 80 passengers, is about 65 feet long, and has an inside width of from 8 to 9 feet. The standard sleeping car is about 70 feet long and has a compartment at either end and 16 sections, each section consisting of a lower and an upper berth, the lower berth being formed by the seats and the upper berth by a hanging platform which is pushed back during the daytime. The average annual cost of repairs of passenger-train cars varies on different roads from $500 to $1000. Passenger cars either with steel underframes or of all steel are being built for all the larger roads, the advantage of the all-steel car being in the resistance which it offers to destruction in accidents, the steel-underframe car also being far less likely to telescope in an accident than an all-wooden passenger car.

Elevated Railways may be divided into two classes according to use. One class is used for urban passenger traffic, affording a rapid-transit service auxiliary to street surface railways. A discussion of the economics of these railways will be found under STREET RAILWAY and URBAN TRANSPORTATION. The first elevated railway was a short line built in New York City in 1867, but the successful operation of such lines was begun in 1872 when the New York Elevated Railroad Company began running trains on Ninth Avenue from Battery Park to 30th Street, about 4 miles.

The engineering features usually involve some form of continuous-girder construction carried by suitable columns or pillars, and the design and erection present no serious difficulties. In the third-tracking of some of the elevated lines in New York City for express service in 1915, the raising of the added track above the level of the others required special construction which was adapted to individual requirements and where the erection was undertaken without interference with traffic.



The other elevated railways are those which are used by steam railways or electrified steam railways to avoid grade crossings in cities. The development of this type of railway has been rapid in recent years. In general the cost of elevating steam-railway tracks in cities has been borne by the railway company, although in some instances the cities have contributed a part of the cost of elevating tracks or of depressing transverse streets to avoid grade crossings. A great deal of track-elevation work has been done in Chicago, and the forms of construction used are varied in accordance with the nature of the particular problem, such as necessary clearances, width of right of way, etc., involved. In general some form of reënforced-concrete construction has been used. Usually supports are provided at the curbs and in the centres of the streets. Where spans are short a reënforced-concrete deck is used, and where concrete slab deck construction is not feasible I-beam decks incased in concrete are placed transversely and supported on through girders Reënforced-concrete columns and cross girders are also used.

In the early history of railway building in the United States towns and cities were so eager to get railway facilities that they gladly gave rights of way through sections of business streets. In recent years, however, elimination of grade crossings by track elevation or otherwise has been demanded from railways in a great number of cities and towns. New Jersey and other States have passed laws compelling the railway to elevate their tracks through towns of more than a certain number of inhabitants, and while it has been possible to prove confiscation in many of these laws, the force of public opinion is causing heavy expenditures for track elevation.

Mountain Railways. The term "mountain railway" is applied to lines whose grades are too steep to be operated by locomotives, depending upon adhesion only for their drawing power, and which, therefore, necessitate the use of some special system of securing greater traction power. Several such systems are employed. The two principal ones are the Fell system, with a central, elevated, double-headed rail laid sideways, which is gripped by horizontal wheels on each side, which greatly augment the adhesion, and the system with central racks in which vertical cogwheels work, whereby the adhesion of the ordinary driving wheels is greatly assisted in drawing a train up the incline and the descent of the train is kept under control. This latter system embraces the Riggenbach, Abt, and other systems. In tourist lines ascending the steep sides of mountains for the sake of the views, a cogwheel working in a central track is generally used as the sole means of propulsion up the inclines. Lastly, where the ascent is steep, straight, and fairly short, a cable is employed for hauling up the vehicles, a system which has also occasionally been adopted for the steep inclines on ordinary railways.

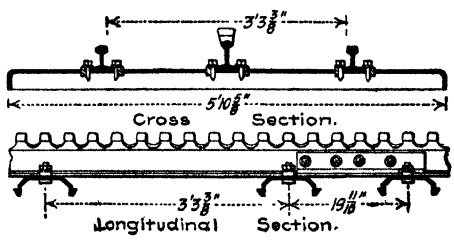
The central-rail system was first adopted for crossing the Mont Cenis Pass by a railway laid mainly along the road between Saint-Michel and Susa, a distance of 48 miles, having a gauge of 3 feet, 7⅞ inches and surmounting a difference of level of 5300 feet between Susa and the summit, with a total variation in level between its termini of about 9900 feet. The ruling gradient was 1 in 12, the average gradient about 1 in 17, and the central rail, raised 7½ inches above the ordinary rail level, was laid along all gradients exceeding 1 in 25; while the minimum radius

for the curves was 2 chains. The greatest train load carried over the Mont Cenis Fell Railway was 36 tons, and the heaviest locomotives employed on it weighed 26 tons. In this system the grip of the horizontal wheel on the central rail not merely secures sufficient adhesion to mount steep inclines, but also serves as a very

CENTRAL-RAIL SYSTEM FOR MOUNTAIN RAILWAYS.

effective brake in the descent and keeps the locomotive firmly on the line in going around sharp curves.

The Rimutaka incline, on the Wellington and Featherstone Railway in New Zealand, with a gradient of 1 in 15 for 2½ miles and a total rise of 869 feet, opened about 1879, having a gauge, like the rest of the railway, of 3 feet, 6 inches and curves of 5 chains' radius, was laid with a central rail, and the traffic on the incline has been worked continuously by a locomotive with horizontal wheels gripping the central rail. Each engine, weighing about 36 tons, can draw a maximum train load of 70 tons up the incline; and in order to avoid an undue strain on the drawbars the three engines employed for taking up a heavy train are so distributed between the carriages as to enable each to draw its own load. The system has proved safe and satisfactory and well adapted for running around sharp curves; while the saving in cost of construction by adopting the incline on this particular railway, instead of a more circuitous course, to obtain flatter gradients, readily surmounted by ordinary locomotives, was estimated at £100,000.



A solid central rack was introduced for the first time in 1847 on an incline of the Madison and Indianapolis Railway near Madison, Ind. It was 1⅛ miles long, with gradients of 1 in 16½ to 1 in 17. The rack railway, however, which was the precursor of the numerous Swiss mountain railways for tourists, was the line, 3 miles in length, constructed up to the top of Mount Washington in New Hampshire in 1866–69, rising altogether to a height of 3600 feet, with ruling gradient of 1 in 3. The rack in this case was formed in lengths of 10 feet, with two parallel angle irons, 4 inches apart, connected by a series of round wrought-iron bars constituting the teeth of the rack, which resembles a ladder laid on the ground. The locomotives, provided with a central cogwheel working in the ladder rack, push the vehicles up the mountain at a rate of about 3 miles an hour. The first rack railway carried out in Europe up a mountain slope was the Vitznau-Rigi Railway, constructed from Vitznau, on the Lake of Lucerne, to the summit of the Rigi in 1869–73, rising 4472 feet in its course of 4⅛ miles, with a ruling gradient of 1 in 4 for about a third of its length and never less than 1 in 6 except at the stations. The locomotive on these mountain lines is always placed below the carriages, so as to push them up the inclines and control their descent as well, the speed of the trains on the Rigi line being limited to between 3 and 4 miles an hour.

The driving cogwheel and the other cogwheels fitted to the locomotive and carriages are furnished with powerful brakes, which, when applied, keep the cogs firmly engaged in the rack, so as to arrest the descent of the train; and an air brake acting on the piston of the locomotive serves to regulate the downward speed. Strong hooks attached under the locomotive and carriages encircle the top flange of each sidepiece of the rack and thus secure the train from leaving the rails or being blown over by the wind.

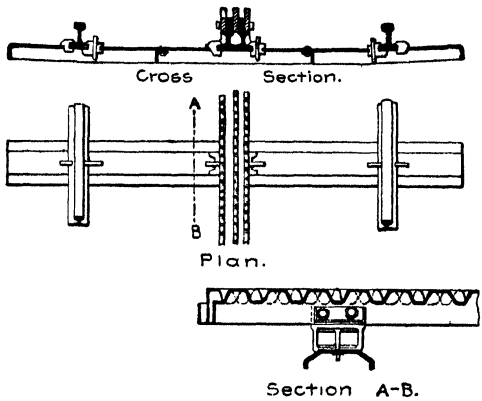
A steel rack rail with teeth on each side, in which horizontal cogwheels work, was adopted for surmounting the exceptionally steep inclines of the Pilatus Railway, averaging 1 in 2.8, and attaining 1 in 2.08 in some places, preliminary trials having proved that the ladder rack was unsuitable for such gradients. This railway, opened in 1889, starts from Alpnach, on the Lake of Lucerne, and rises 5363 feet in its length of 2¾ miles. The driving cogwheels are actuated by spur gearing, and the two pairs of cogwheels are controlled by hand brakes, which suffice to regulate the descent of the train or to stop it if necessary. An air brake acting on the pistons of the locomotive furnishes additional control of the train on its descending journey; and if at any time the speed in descending becomes more than 3 miles an hour, a reserve automatic brake comes into action.

Another form of rack consists in cutting the edge of a flat steel bar so as to provide a uniform row of teeth on its upper side, and the strength of the rack can be increased for steeper gradients by increasing the thickness or the number of the bars. The rack is thus formed by a series of solid bars, with teeth shaped to the most convenient form for the working of the cogwheel in them. This simple form of rack, consisting of successive lengths of single bars joined at their ends and laid in the centre of the track, has been employed on the flatter gradients of several rack railways.

The Sant' Ellero-Saltino Railway, the first purely rack railway built in Italy, was constructed in 1892. This railway rises 2765 feet in a length of 5 miles, and it is laid to meter gauge, with a ruling gradient of 1 to 4.55. The rack on gradients not exceeding 1 in 8⅛ consists of two steel angle bars riveted together, 4 to 6 feet long, with teeth formed in them; but for steeper gradients up to the maximum of 1 in 4.55, two flat steel bars are introduced between the angle bars, increasing the thickness of the teeth and the rigidity of the rack, which

TRACK CONSTRUCTION OF STRUB RACK RAILWAY.

latter can be still further augmented by introducing a distance piece between the angle bars, so as to form two or three parallel racks with a small interval between them, in which the cogwheel works with a widened bearing. This Telfener rack is simpler in construction and cheaper



than the Riggenbach and Abt racks, but it does not possess the special advantage of the Abt rack, of thoroughly engaging two or three successive teeth of the cogwheel at the same time. The speed of the trains ranges from 5½ to 4⅓ miles an hour, according to the gradients, and averages 5 miles an hour.

A more complicated form of single rack, resembling a flat-bottomed rail in its low portion and widened out considerably for the teeth at the top, called the Strub system, after its designer, is used on the Jungfrau Railway, which is laid to the meter gauge and was opened in 1809, the motive power being electricity generated by waterfalls on the mountain. This line rises 6657 feet in a length of 7⅝ miles, with gradients ranging from 1 in 14⅓ up to 1 in 5; and the upper 6⅛ miles are in tunnel, completed in 1912, while the final ascent to the summit is to be effected by an elevator with a lift of 241 feet. The central rack rails, 11½ feet long, are joined together at their ends by fish-plates, like ordinary flat-bottomed rails. A brake is provided, which encircles and grips the widened-out head of the rack.

The Abt system consists essentially of two or three steel rack bars, from $\frac{11}{16}$ inch to $1\frac{9}{16}$ inches thick and 2 to 4⅓ inches deep, placed nearly 2 inches apart and so arranged that the teeth are not opposite each other, but as it were break joints, causing the cogwheels to engage in a tooth in front on one rack before leaving the tooth behind on the adjacent rack, which renders the motion smoother and increases the security of the trains in descending, besides proportioning the strength of the rack to the steepness of the gradient by the addition of one or two bars. The Generoso Railway in Italy and the Rothorn Railway in Switzerland, 5⅔ miles and 4⅘ miles long, rising 4326 feet and 5515 feet, with ruling gradients of 1 in 4.55 and 1 in 5, and constructed in 1889–90 and 1891, respectively, are laid to a gauge of 2 feet, 7½ inches, with cast-steel sleepers, and provided with a double Abt rack in which cogwheels on the driving axles work. The system has also been extended to mountain lines in several other countries, as, e.g., the Manitou and Pikes Peak Railway in Colorado, of standard gauge, rising 7552 feet in a length of 8¾ miles, with a maximum gradient of 1 in 4.

On the state railways of Chile there is a 36-mile section of rack railway near the station of Palquico, on 6 per cent grades, and at Illapel, at an elevation of 4800 feet above sea level, there is another section of rack about 10 miles in length, which includes the Espino Tunnel, nearly 1 mile long, with a grade through it of 6 per cent. The Transandine Railway, connecting Argentina with Chile, passes over the Andes by means of a tunnel at 10,500 feet elevation. On the easterly slope of the mountains there are 8 miles of rack railway, and about 13 miles on the west or Chilean side. The steepness of this part of the line is between 7 and 8 per cent, and the rack is built on the Abt system, with three bars instead of the two usually employed. On the line of the Arica-La Paz Railway, connecting the former place in Chile with the latter in Bolivia, out of a total length of 274 miles there are 24 miles of rack built on the Abt system, with a grade of nearly 6 per cent. The summit of the line in the Andes reaches an elevation of 13,970 feet. These lines are difficult to operate in winter owing to excessive depths of snow and the formation of ice in the teeth of the racks, thus causing derailments.

Instances of the application of electricity as the motive power on mountain railways laid with the Abt rack, where water power is readily available for generating the electrical current, are furnished by the Mont Salève Railway, near Geneva, and the Gornergrat Railway ascending from Zermatt. These railways, constructed in

TRACK CONSTRUCTION OF ABT RACK RAILWAY.

1891 and 1896–98, respectively, have lengths of 5⅝ miles and 5¼ miles, with rises of 2363 feet and 4600 feet, and are laid to the meter gauge, with gradients of 1 in 4 and 1 in 5 and a double line of rack. In all these rack railways special care is always taken to anchor the track firmly down into the solid ground, so as to prevent its creeping gradually downhill under the pressure of the cogwheels on the rack.

RAILWAY MANAGEMENT

The organization of a railway company, large or small, may be divided into the executive department, the legal and financial departments, the operating department, the traffic (sales) department, and the engineering department. On a small road the president is usually not only the chief executive, but also acts as the head of the other departments. On a large railroad of 2000 or 3000 miles it becomes necessary, of course, to diversify the organization to a considerable extent. A typical organization on a 3000-mile road would be as follows: the chairman of the board of directors is chief executive officer; then comes the president, who is in charge of all departments of operating the road, but whose relations with the legal and financial and accounting departments are advisory rather than superior to these departments, reporting to the chairman of the board. The general counsel is in charge of the legal department, and the secretary or vice president is in charge of the financial department. There is a vice president in charge of the operating department, a vice president in charge of the traffic department, and a vice president or chief engineer in charge of the engineering department.

There are two quite different systems of railway organization. These are known as the divisional form of organization and the departmental form of organization.

The three departments of a railway organization analogous to other large corporations are the executive, legal, and financial. The four de-

partments into which a railway organization as transportation, producing, and selling plant is divided are: *operating*, the department in charge of the movement of trains; *traffic*, the department in charge of the solicitation of freight and passenger business and the fixing of rates; *engineering*, the department in charge of the physical upkeep and betterment of the plant exclusive of the engines and cars; and *mechanical*, the department in charge of the physical upkeep and betterment of engines and cars.

The departmental form of organization is the form in almost universal use in England and in France and Germany. The various New York Central Lines have this form of organization, and it is followed on quite a number of other roads in the United States. Under this scheme the vice president in charge of operation has under him a general manager, who in turn has one or more assistants, and has reporting to him two or more general superintendents, a superintendent of transportation, and a staff of division superintendents. The division superintendent has jurisdiction over only the operation of his division. Under him are the train masters, the chief train dispatcher, and the train dispatchers. The dispatchers are the lowest officers in the operating department. The train master, therefore, has reporting to him the petty officers in actual charge of directing the movement of trains and the employees engaged in this service. The enginemen, firemen, conductors, and brakemen form the train crew, the yardmaster and his assistants and the yard train crews are engaged in getting trains ready for the road train crews, and telegraph operators, station agents, etc., are engaged in carrying out the orders of the chief and assistant train dispatchers. The train master is in charge of discipline of employees under the supervision of the superintendents.

The vice president in charge of engineering or the chief engineer is the head of both the construction and the maintenance-of-way forces. His subordinate officers are the assistant engineers, office engineers, engineers of bridges and buildings, engineers of structures, and district engineers—these latter having a territory corresponding generally with that of the general superintendents—and finally division engineers, who, as the title implies, have jurisdiction over the maintenance-of-way forces on a given division, but who are not subordinate to the division superintendent or at least do not report to him. The chief engineer reports directly to the president and is not subordinate to the general manager.

In the mechanical department the superintendent of motive power has under him one or more assistants, district superintendents of motive power, and, in some cases, district master car builders, whose territory generally corresponds with that of general superintendents, and master mechanics, whose territory corresponds with that of the division engineer. Under the master mechanics are the general foremen and, in a strictly departmental organization, the road foremen of engines. The road foremen of engines instruct enginemen in their duties, and therefore report both to the master mechanic and to the train master. The underlying idea of the departmental organization is that there shall be an expert force for each class of work. The mechanical department, however, is under the direction of an officer, the superintendent of motive power, who does not report directly to the president but reports to the general manager.

The traffic department is entirely separate and is under the jurisdiction of a vice president, who reports to the president, and the traffic officers come in contact or conflict with the operating, mechanical, or engineering officers only to a very limited extent.

Under the departmental form of organization a difference of opinion between the division superintendent and the master mechanic has to be carried up through the operating staff, on the one side, and the mechanical staff, on the other, to the general manager. A difference of opinion between a division engineer and a division superintendent has to be carried up through the engineering department, on the one hand, and the operating department, on the other, to the president's office. On a small road where the president can be in close touch with all departments it is generally considered that the departmental form of organization works satisfactorily. On a large road, however, American experience has been that the divisional form of organization is better.

In this form of organization each division superintendent is really the general manager of his division. He has reporting to him not only the train masters and their petty officers and employees in train service, but also the master mechanics in charge of the division shops and the division engineers or roadmasters in charge of maintenance of way of the division. The division superintendent reports directly to the general manager, who in turn reports to the vice president in charge of operation. The general manager has on his staff a mechanical-department officer, generally with the title of superintendent of motive power, and one or more engineering officers with the title of engineer maintenance of way or something similar, who act as his advisers on technical matters and who may confer directly with master mechanics and with division engineers on matters of standards. It will be seen that this form of organization closely follows the practice in the United States army. A development of this divisional organization is the so-called unit system of organization.

The unit system of organization was worked out by Major Hine on the Union Pacific and Southern Pacific lines. Here, as in the divisional organization, the superintendent is the responsible ruler of his territory. He has under him a certain number of assistant superintendents, one performing the duties that were performed by the train master in the divisional organization, one performing the duties that were performed by the master mechanic, and one the duties that were performed by the division engineer. In addition he has an assistant superintendent, whose chief function is that of an office alter ego for the superintendent. The superintendent reports to the general manager, and the general manager has certain staff officers to advise him on mechanical and engineering matters, with the title, however, of assistant general managers instead of superintendent of motive power, engineer maintenance of way, etc. The radical departure that was made by Major Hine was to permit and encourage a master mechanic to learn something about and take some of the responsibilities of the transportation department or the engineering department, and a division engineer to do the same, and in this

connection separate office files for these officers were done away with and a single divisional file is kept under this form of organization. One important advantage claimed for this system is that it does away with an immense amount of correspondence between the chief clerk of this officer and the chief clerk of that, etc. It has been found, however, in practice that it usually adds one officer to the staff of the division.

A division varies in length from 150 miles on the main line of the Pennsylvania to 650 miles on the single-track line of the Southern Pacific through the Arizona desert. In the one case the limitation of the power of supervision of the superintendent is fixed by the amount of traffic handled and the number of men required to handle it, and in the other case, that of the Southern Pacific, by the amount of territory which he can personally visit at frequent intervals. The problem has two sides, the intensive and the extensive side.

The traffic department has not been discussed under either the divisional or the departmental form of railway organization. This is in all cases a separate and distinct branch of the service. The traffic department originally formulated rates as well as solicited business. Since the Interstate Commerce Commission has absolute authority over rates, the first function of the traffic department has largely been taken from it and the solicitation of business is now its principal work.

In connection with the description of the form of organization of the officers of a road it is proper to make some mention of the mode of discipline. Discipline, of course, has to be strictly enforced, especially in train service, where the safety of life continually depends on the strict enforcement of the rules. On the other hand, the great power which has been obtained by the various labor organizations of trainmen has made the enforcement of strict discipline on railways particularly difficult. Discipline is usually administered by the train master, but sometimes directly by the superintendent. Punishment for infringement of the rules generally used to consist of suspension for a certain number of days for an offense that was not so serious as to require actual dismissal. Under this system the man's family often suffered as much, if not more, than the man himself. Brown's discipline, so called, was devised to remedy this and also to overcome the other objection to suspensions, viz., that the man's services might be badly needed. Under the Brown system of discipline a man is given a certain number of demerits for an offense which would have been punishable by suspension. When the total number of his demerits reaches a certain amount the man is supposed to be dismissed from the service. Good conduct over a certain period is often allowed as an offset to a certain number of demerits, and most roads find it very difficult, if not impossible, to discharge a man simply for an accumulation of demerit marks because of the pressure which the unions can bring to bear.

RAILWAY OPERATION

Transportation of either passengers or freight consists of a terminal service, a line haul, and another terminal service. The terminal service in the case of passengers is comparatively slight and consists in placing cars in the passenger station. In the case of freight, however, it may be quite a considerable part of the total service performed. Yard costs and movements were discussed above under *Yards and Terminals*, and it will only be necessary here to discuss the line movement of trains. The directing of the movement of trains is termed train dispatching. The simplest form of train dispatching and that which was in use quite generally on American railways during their early history was by means of train orders. A line was divided into certain sections and a train dispatcher was given charge of each section. Upon leaving a terminal on this section the train crew would receive a written order instructing them to proceed to this station or that station, to wait at this point or that point for an opposing train, or to wait at this point or that point for a superior train running in the same direction to pass them, and it was the business of the dispatcher to see that he did not issue orders which were conflicting. Stations along the line would report the passing of trains to the dispatcher, who in this way knew where the trains were on his district. He works with what is known as a train sheet, which consists of a large sheet of paper on which the names of stations on his district are printed one below another, with columns on either side of the station names corresponding in number to the number of trains passing over the division. The dispatcher follows the movement of a train by jotting down in the proper column opposite each station the time at which that train passes the station, a train northbound being entered on the right-hand side of the sheet and southbound on the left-hand side. On a road on which the automatic block system has been fully adopted (see BLOCK-SIGNAL SYSTEM), instead of issuing orders to the train crews the dispatcher issues orders to the tower men who are in charge of the operation of the signals. It can readily be understood that the work of the train dispatcher is one requiring quick and accurate thinking and a level head.

All regular passenger trains are moved on schedules and certain freight trains have regular schedules, but on most roads there are in addition to the freight trains that move on schedule a very large number of freight trains moving as extra trains. The combined schedules for all the passenger and freight trains on a division form the time-table for that division. The train dispatcher must work his extra trains in between the regularly scheduled trains. The preparation of a time-table for a busy division is a very important and complicated piece of work. The through fast passenger trains have to be taken care of first, then the local passenger trains, then time freights, and finally local freights and way freights. There are, of course, continually two considerations, which are often at variance, which govern the making of schedules. One is the convenience of the public to be served; the other is the economical arrangement for operating the division. In passenger service the convenience of the public is of course compelling. In freight service economy of operation is generally the first consideration, except for fast freights, and this is modified as need be by considerations of convenience.

The working time-tables which the train crews and railroad officers use contain the name of every station with the miles between, the scheduled speed of the train between those stations, information as to water tanks, passing sidings, etc.

The accompanying table shows some fast regular passenger schedules in the United States and in England and Europe and some slower typical runs.

REGULAR RUNS

From	To	Distance	Time	Average miles per hour	Name of railway	Country
London	Bristol	118 375	2 h.	59 2	Great Western	England
London	Edinburgh	393	7 h. 20 m.	52.8	Great Northern	"

Freight Service. The most economical movement of heavy freight trains is generally at the rate of about 8 to 14 miles an hour. This is called drag freight, and such service, of course, can only be used where there is no competition in the time of delivery. Coal, iron ore, lumber, and like commodities are generally moved in drag-freight service, and the cost of such operation is comparatively low.

To compare the work of one railroad with that of another it is necessary to have some unit on which to measure the work done. In England the wagon (loaded car) and train are often the unit adopted. In America the train mile, the car mile, and the ton mile are all used as units on which to figure costs of service and to make comparisons between different classes of the service and the same service on different roads. Ton-mile cost, which means the cost of moving one ton one mile, is usually considered the most scientific basis on which to figure freight train service costs. In passenger service the cost of moving one passenger one mile is the commonly adopted unit in the United States, as it is also in England. In Germany, however, they estimate the weight of their passengers and reduce the cost of both freight and passengers to a weight multiplied by distance unit, and this method has been tried for certain purposes by some accounting officers of American railways. The argument for a train-mile cost basis of measuring service is that the train is the unit of the measure of expenditure, although it is not the unit of the measure of receipts. Train-mile costs vary widely as between different classes of service, different fuel costs, different wage scales, and many other factors, including size and power of locomotives, grades, etc. In making a study of such costs it is of great importance that an exact definition is agreed upon as to what shall be included in these costs.

Demurrage. Closely connected with the question of suitable facilities for the rapid handling of freight are the difficulties for both carrier and shipper due to a lack of cars or the neglect of the consignee to remove his freight promptly. It is customary for the railway to allow the consignee a reasonable amount of time to remove his freight from the car and if this is exceeded to charge demurrage according to the time

the car is kept on the track or out of service. Likewise when a shipper calls for a car and delays in loading beyond a reasonable time, the railway usually makes a similar charge. In the United States such claims and the justice of the basis on which they are made are often points of dispute between the carrier and the shipper. Rules for car service have been adopted by the American Railway Association, some of which apply to this question, and various decisions have been made bearing on this question by the Interstate Commerce Commission and by State railway commissions. In 12 States demurrage is regulated by statute and in 23 by orders of a State railway commission. In some States it has been proposed to charge a reciprocal demurrage against the railways, based on delay in furnishing cars promised or ordered.

ACCIDENTS

In the operation of both freight and passenger trains safety should, and generally does, rank ahead of any considerations of economy. There are exceptions to this rule, however, especially in the United States, since it is generally conceded that if all the roads were equipped with the automatic block system, safety from collisions would be very largely increased. Even with automatic block signals there is the human element which enters into the question of accidents, and the American railway man is more prone to disregard his instructions and to take chances than are either English railway employees or European railway employees. The lower table on page 507 gives the railway-accident records in the United States in 1912, 1913, and 1914.

The following table shows the accident record for England and Scotland (the United Kingdom) for the year ended June 30, 1914.

FREIGHT RATES AND TRAFFIC

Although the great majority of people in the United States are at one time or another passengers on railways and comparatively few are shippers of freight, freight service is the chief concern of the railway officer either from the point of view of earnings or from that of the number of men employed in and expenses on this service. To understand the present discussions of freight rates and the development that has taken place in the last few years in regard to rates and the regulation of rates, one must go over the history of railway freight service in the United States. It was early discovered that certain commodities would move by railway even when charged a high rate per 100 pounds per mile, while other commodities could only be induced to move if a low average rate per 100 pounds per mile were granted. The railway company can earn money only by selling the commodity which it manufactures, viz., transportation. There is the same problem facing the traffic man that faces the large retail merchant. There are two classes of people who patronize a department store—those who go there to buy something because they want it and those who go there because something is sold to them through the art of salesmanship.

The railway, to an even greater extent than the department store, has a very large fixed overhead charge. The interest on the cost of the plant must be paid whether or not any transportation is sold, and the roadbed must be kept in good repair whether a large number or but a few trains are moved over it each day. The cost of maintaining the roadbed varies to some extent with the amount of traffic which goes over it, but it costs but a very small percentage more to maintain track over which 100 trains pass a day than to maintain track over which 50 trains pass a day. The American traffic man argued somewhat in this way: if I can get enough from my freight rates on commodities that will come to my railway if I charge anything less than an exorbitant rate to pay the cost of this service and interest charges on the investment and upkeep of the plant, then if I get a rate on other commodities which will yield me anything above the bare additional cost of the service required to move these commodities, there is that much profit. Of course, this is stating the theory in a crude way. The freight-rate structure is fearfully and delicately complicated, but this way of stating the theory brings out clearly what is meant by the often quoted phrase that "rates are based on what the traffic will bear." Railway men have in recent years changed this phrase to "rates are made no higher than what the traffic will bear."

Besides this factor of a desire to induce the movement of commodities which can only move at a very low ton-mile rate, there is also the element of competition. Not only is there competition between two parallel roads serving the same communities, but there is competition between roads which serve the same markets with the same commodity, although that commodity may originate in entirely different parts of the country. Shoes that are sold in Denver are manufactured both in St. Louis and in Boston. Boston had the shoe industry well established before St. Louis began to ship consignments of shoes more than 100 or 200 miles from its own city limits. The railways running from St. Louis to Denver were asked to make such a rate on shoes to Denver as would permit St. Louis manufacturers to compete in Denver with Boston manufacturers. If this rate was made low enough so that the St. Louis manufacturers could get what, to them, seemed a fair share of the Denver business, Boston manufacturers brought pressure to bear on the roads running from Boston to Denver to get them to reduce the rate on shoes, and so on.

It was this competition between markets and the fact that the railway company's interests were so closely identified with the interests of the manufacturers on its lines that led to the extensive practice of rebates. The railway company wanted to make the large shippers on its lines larger. All of this tended to make the element of cost of service as a consideration in rate making of subordinate importance. It also tended to make the element of distance subordinate. Possibly as good an example of the

reasons that led American railway managers to disregard distance in so far as possible is the practice in regard to commuters in passenger service. In passenger service, except in commutation service, distance is the controlling factor in rates; but the commuter business is closely analogous to freight business in the rate structure. A man can afford to pay, we will say, $4 a month car fare between his office and the suburban town where he would like to live. The town is built up by the establishment of a $4 a month commutation rate; land values go up, and the man finds that his rent is beginning to be prohibitive. He wants to move farther out, but he cannot afford to pay a proportionately larger commutation rate. For the next town, however, the railway makes a commutation rate that is only slightly higher. This induces him to move out, and by making a commutation rate lower per mile the farther out the commuter goes, the railway company induces a greater and greater number of families to move out into the suburbs. The commutation rate may even go lower than the actual cost of service, because by settling country that would not be colonized except for the low commutation rate the railway gets freight and express business and passenger business other than commutation business which it would not otherwise get. It was an exactly analogous theory that has been so large a factor in the formation of the freight-rate structures of the United States. Further discussion of this subject is taken up in *Government Regulation* below.

On the great majority of railways in America from 70 to 90 per cent of the total tonnage of freight carried is carried in carload lots. Less than carload lots of freight and certain kinds of commodities move on what are called class rates, the highest rate being charged to small package freight and the other commodities being grouped in classes.

PASSENGER TRAFFIC

On the majority of railways in the United States the total receipts from passenger fares are less than one-third of the total revenues from operation. There are a few exceptions to this general rule. The Long Island Railway derives more than half of its revenue from passenger fares. The New York, New Haven, and Hartford derives just about half of its revenues from passenger fares. It is, however, significant that the Long Island has operated at a deficit in every year from 1902 to 1914. The New York, New Haven, and Hartford in 1914 was on the verge of bankruptcy and had failed to earn its interest charges in the previous year and its dividends for a number of years previous to that. Although on most roads only a third, or less than a third, of the total revenue comes from the transportation of passengers, passenger train miles form fully half of the total train mileage. Train miles, as has previously been mentioned, is a commonly used unit for the comparison of operating costs. The revenue derived from the operation of a passenger train mile, including both the receipts from passenger fares and the receipts from mail and express carried on passenger trains, varies in different classes of service in the United States from about $1 to as high as $3. The receipts per freight train mile vary from $1.50 to $4.

Passenger rates per passenger mile have not decreased in the United States so rapidly or to the same extent as did freight rates previous to about 1906. On the other hand the cost of passenger service has been steadily increasing during the last 30 years, and especially has this been true during the last 10 years. The lowest to which passenger rates fell was two cents a mile, which was a rate put in by the New York, New Haven, and Hartford for all of its passenger service for a short time in 1912. The New York Central passenger rates between Albany, N. Y., and Buffalo are fixed by its charter at two cents per mile. The prevailing passenger rate, however, in the eastern section of the United States has been two and one-half cents per mile and in the West three cents per mile.

In addition to the regular rates charged for a local or through trip, there are special rates, such as excursion rates, mileage-book rates, and commutation-book rates. For instance, the one-way fare between New York and Washington was for a long time $5.50; the round trip fare for a ticket good for 10 days was $10. Special excursions, however, are sometimes run, where the round-trip fare is but $3. The basis on which the passenger traffic manager justifies such a great difference as that between the one-way regular fare and the special excursion fare is that regular fares pay overhead charges, maintenance-of-way costs, and all those expenses which form so large a part of the railway company's total and which do not vary directly with the amount of business handled. It is only necessary, therefore, to clear something more than the actual out-of-pocket cost of moving excursion business to show a profit on this business. Since at least 99 per cent of the excursion business would not move at all between New York and Washington unless the rate were a great deal lower than the regular rate, the running of the excursion would not take away anything from the regular business, and the profit over and above out-of-pocket cost is a profit which otherwise would not have been earned. Whereas the average number of passengers per train in through passenger service between New York and Washington is about 70, an excursion train will carry in the neighborhood of 300 passengers. The total receipts per train mile, therefore, for the excursion trains are as high as or higher than the average receipts per train mile for regular service.

The principal factors which have tended to increase the costs of passenger service have been faster service, more frequent service, more space per passenger, more dead weight per passenger, and more luxurious accommodations. There is constant pressure brought to bear by local authorities on railways to compel them to give more frequent passenger service. After a train has once been put in service it is almost impossible to take it off, even if the railway finds that it does not average over 10 passengers per mile. The very proper demands for greater safety in railway service and especially, of course, in passenger service has added a great deal to the cost that should properly be charged against passenger service as distinguished from freight service. Automatic block signals are justified by the increased safety which they afford to passenger train service, but few roads would probably install them if there were no passenger service with its fast schedules. The adoption of steel passenger coaches, steel parlor and sleeping cars, and steel mail and baggage cars is costing the railways of the United States a sum which

has been variously estimated at from $10,000,000 to $100,000,000 over and above what it would have cost to continue the use of wooden passenger equipment, replacing it when necessary with other wooden passenger equipment.

Sleeping Cars. The coach is the car usually used in local service and in through service at the regular fare. A sleeping car was put into service on the Cumberland Valley Railroad of Pennsylvania (now part of the Pennsylvania Railroad system) in 1836–37 but was abandoned in 1848. Various companies began the building of sleeping and parlor cars, and in 1870 to 1890 there were two large car companies which built and operated sleeping cars. These were the Pullman Company and the Wagner Palace Car Company. The Pullman Company, however, through the control of better patents and in the ordinary course of competition, became the only important sleeping-car company in the United States. This company not only builds sleeping cars and operates them, but also builds other types of cars and sells freight cars and express cars to Europe, South America, and England. There are some railway companies in the United States that operate their own sleeping cars. The Chicago, Milwaukee, and St. Paul is the largest railway company which in 1914 operated its own sleeping cars. The arrangement between the railway company and the Pullman Company for operation of sleeping cars when this service is performed for the railway company by the Pullman Company varies widely as between different railways. Where the potential Pullman passenger traffic per car mile is very light the railway company pays a substantial rental to the Pullman Company for its cars. This rental, of course, is in addition to the charge made the passenger by the Pullman Company. On the other hand, where the average number of passengers traveling in Pullman cars per car mile is very high, as it is on the New York Central, the Pullman Company pays the railway company something for carrying the car on its trains.

In 1910 the Interstate Commerce Commission made an exhaustive investigation into Pullman rates, and in an unusually comprehensive report signed by the chairman of the commission, Martin Knapp, it was held that Pullman rates were in general entirely reasonable, although it was suggested that a difference should be made between the charges for upper and for lower berths. This suggestion the Pullman Company almost immediately put into effect, but as an illustration of the fact that a majority of the public who travel in Pullman cars prefer additional comfort to decreased cost, lower berths at 25 to 33 per cent higher rates are almost invariably sold out before any considerable proportion of the upper berths are sold.

The new accounting rules of the Interstate Commerce Commission, which went into effect July 1, 1914, prescribe a form of accounts which shows the cost of sleeping-car, dining-car, and parlor-car service and the receipts from this service separately. The profit on sleeping and parlor car service which is operated by the railway company is in general very small; dining-car service is almost invariably performed at a loss. The exception to this is the dining-car service of the New York, New Haven, and Hartford, where the density of passenger traffic is so great as to permit the operation of this service on a scale which reduces the unit cost per meal served below the average receipts per meal.

The Canadian Pacific, which operates the only transcontinental, properly so called, line in America, operates its own sleeping-car service, parlor-car service, express service, and also many of the restaurants and hotels along its lines. It is the opinion of the directors of the Canadian Pacific Company, who are most closely in touch with the company's operations, that these outside services, especially the sleeping-car and parlor-car service, make a handsome profit for the company. The service, however, is not in general of so high a standard as that given by the Pullman Company on roads in the United States.

Railway Mail Traffic. Although some mail service and a considerable proportion of express service are performed by trains carrying no passengers, most passenger trains in through service also carry a mail or an express car or both. The United States government has paid the railways for the carriage of mail on the basis of the average weight carried. The basis is determined once in four years. This has given rise to a very bitter complaint on the part of railway managers generally, because, of course, the amount of mail carried is increasing steadily year by year, but there is no compensation for the additional weight carried each year over the weight carried in the year in which the government weighing tests were made.

The Bourne Bill, introduced into Congress in 1914, provided for annual weighing of the mails and for an increased rate of compensation, but failed to pass. The bill was the result of an investigation made by a congressional committee and was generally considered by railway managers as being much fairer than the system which was then in force. The introduction of the parcel post added much to the weight of the mail matter which railways were called on to carry and detracted from their receipts from express business.

Express Traffic. The transportation of express matter is paid for by the express companies on the basis of actual, not estimated, weight, so that any falling off in express business is at once reflected in decreased payments made by the express companies to the railways. The express companies' charges for the transportation of goods in the United States include the collection of the goods from the consignor and the delivery of the goods to the consignee. It differs from the freight service performed by railways both in the manner of handling at terminals and in the manner of handling in transit. Even where express or mail matter moves in solid trains these trains run at high scheduled speeds.

GOVERNMENT REGULATION

The basis on which the Federal government regulates railway rates, service, and operation is contained in Section 8 of the Constitution of the United States and is as follows: "The Congress shall have power . . . to regulate commerce with foreign nations and among the several states and with the Indian tribes."

The English common law gives the courts the right to regulate fares of common carriers, and American law has followed the English common law in this respect. The States, either through specific provisions in their constitutions or following the English common law, regulate the rates and operation of railways within their borders, but the Supreme Court of the United

States has held that this State power of regulation is limited by Federal power of regulation of interstate commerce. Railway companies are also subject to State regulation from another angle, that of their charters. All railways in the United States hold charters under the laws of some one or more States, and this has given rise to various conflicts in authorities between different States and between States and the Federal government or courts. The commission appointed by President Taft in 1909 to investigate and make a report on the question of the regulation of the issuance of securities by railway companies, and of which President Arthur T. Hadley of Yale University was chairman, recommended that railway companies be permitted to incorporate under the Federal statute, which would thus do away with the conflicting State laws in regard to incorporation. Up to 1914, however, no steps had been taken to carry out this recommendation.

The original Act to regulate commerce was passed by Congress in 1887. It was supplemented by the Elkins Act, passed in 1903 and amended in 1906, and the original Act was amended in a quite drastic way in 1910. This amendment, which left the Elkins Act in force, was known as the Mann-Elkins amendment to the Act to Regulate Commerce. The Act as amended in 1910 contains 24 sections, which are very briefly summarized below.

1. Railways, express companies, and sleeping-car companies are made subject to the Act. Charges by all these companies must be reasonable. Free transportation is prohibited, with certain exceptions, and a penalty of fine and imprisonment is provided for the violation of the free-transportation provisions. The railway company is forbidden to transport any article or commodity other than timber and the manufactured products thereof, manufactured, mined, or produced by it or under its authority, or which it may own in whole or in part, or in which it may have any interest, direct or indirect, except such articles or commodities as may be necessary and intended for its use in the conduct of its business as a common carrier. It must make switch connections with the shippers or branch railways on reasonable terms.

2. Discrimination and rebates are made unlawful.

3. Unreasonable preference for any particular firm, person, or corporation is made unlawful, and the railway company is required to afford all reasonable facilities for the interchange of traffic, but is not required to give the use of its tracks or terminal facilities to any other carrier engaged in like business.

4. It is unlawful to charge more for the transportation of passengers or like kinds of property for a shorter than for a longer distance over the same line in the same direction, the shorter distance being included within the longer, or to charge any greater compensation as a through route than the aggregate of the intermediate rates subject to the provisions of the Act. On application to the Interstate Commerce Commission a carrier may be authorized by the commission to charge less for longer than for shorter distances.

5. Pooling of freight and divisions of earnings are forbidden.

6. Each common carrier subject to the Act must publish tariffs showing all rates, fares, and other charges, and in the absence of joint rates as between different carriers separate rates must be shown by each one. The tariffs must be posted at certain places on the lines of each carrier, at which places they must be open for inspection by the public. No change in rates or tariffs is permitted without 30 days' notice to the commission, but the commission may at its discretion modify this time required for notice. All joint tariffs between different carriers and copies of all agreements or contracts between carriers must be filed with the Interstate Commerce Commission and the commission may prescribe the form of the tariffs, and no carrier is permitted to transport passengers or property where the rate has not been filed with the commission and published. The tariff rates must be charged and no deviation therefrom is permitted. Failure or refusal to comply with the terms of any regulation adopted by the commission in accordance with the provisions of this section makes a carrier liable to a penalty of $500 for each offense and $25 for every day during the continuance of the offense. This penalty is recoverable by a civil suit brought by the United States. The carrier must upon written request quote in writing the charges applicable on a described shipment between stated places under tariffs to which the carrier is a party. A damage or loss to a shipper resulting from the refusal of a carrier to furnish the information requested makes the carrier liable to a fine of $250.

7. It is unlawful for a common carrier to enter into a combination to prevent the carriage of freights from being continuous from the place of shipment to the place of destination.

8. The carrier is made liable for any damage or loss resulting to any person from failure to comply with the provisions of the Act to Regulate Commerce.

9. Persons claiming to be damaged may elect whether to complain to the commission or to bring suit in the Federal courts.

10. Any carrier, or officer or director of a carrier company, who shall do anything declared by the Act to be unlawful, or fail to do anything required to be done by the Act, shall be liable to a fine not exceeding $5000 for each offense, and if the offense shall be an unlawful discrimination in rates, the offender shall also be liable to imprisonment for two years. Any carrier or officer of a carrier who makes a false billing is subject to a fine of $5000 or imprisonment for two years. Any shipper or agent of a shipper who gives a false description of goods offered for transportation, in an attempt to obtain a refund or payment for damage, or a rate less than the published tariff, shall be liable to a fine of $5000 or imprisonment for two years.

11. The Interstate Commerce Commission, consisting of five commissioners (now seven, see Section 24), is to be appointed by the President with the advice and consent of the Senate; the commissioners' terms to be six years. A commissioner may be removed by the President for inefficiency, neglect of duty, or malfeasance in office. Not more than three of the commissioners shall be appointed from the same political party.

12. The commission is given the power and duty to inquire into the business of carriers, to require attendance and the testimony of witnesses, and to invoke the courts to compel witnesses to attend.

13. Any person, firm, corporation, or associa-

tion may make a complaint to the commission and it shall be the commission's duty to make an investigation, and the commission shall also have the power to make an investigation on its own motion in regard to any matter which could be the subject of a complaint.

14. The commission must make a full report of its investigations.

15. The commission may prescribe rates for the transportation of persons or property and the transmission of messages, and its orders in this respect shall be valid for two years. The commission may prescribe the proportions of through rates. Whenever any schedule involving a change in rates is filed with the commission, the commission has the power to suspend it either on the complaint of some one affected by the new schedule or on its own motion for 120 days, and for a further period of six months if necessary. The justification of any new rate after Jan. 1, 1910, which may be suspended by the commission, rests as a burden on the railway. The commission shall give precedence over other business to the hearing of suspension cases. The commission may establish through routes and rates, but the commission has not the power to prescribe a through rate between street and electric passenger railways. The shipper shall have the right to choose his own route. It shall be unlawful for a railway company or its employees to give out any information as to the kind, quantity, destination, consignee, or routing of any freight, and the penalty for the violation of this provision is a fine of $1000.

16. The Interstate Commerce Commission may award damages for violation of provisions of the Act, which damages may be collected through the Federal courts.

16a. After a decision or order has been made by the commission, any party thereto may at any time make an application for a rehearing of the same or any matter determined thereunder, and it shall be lawful for the commission in its discretion to grant such a rehearing.

17. The commission may prescribe its own form of procedure for hearings.

18. The salary of the commissioners is fixed at $7500 each (see Section 24).

19. The general offices of the commission are to be in Washington, but the hearings may be held anywhere in the United States.

20. The commission is authorized to require annual reports from carrier companies and to prescribe the contents of these reports and the manner in which accounts shall be kept. The annual reports are to be for the fiscal year ending June 30, unless the commission changes this to the calendar year ending December 31. The commission also has authority to require carriers to file monthly reports. The commission may prescribe the form of all accounts and of access to all accounts, and it shall be unlawful for the carrier company to keep accounts other than those prescribed or approved by the commission. An examiner of the carrier who divulges any information which comes to his knowledge in the course of examining the carrier's accounts except as directed by the commission or a court is subject to a fine of $5000 or imprisonment for two years. The District Court on request of the Attorney-General or of the commission may issue a writ of mandamus commanding common carriers to comply with the provisions of this section. Carriers must issue bills of lading, and lawful holders of bills of lading can recover full liability from the carrier for loss or damage to the property covered by the bill of lading.

21. The commission shall make an annual report to Congress on December 1 of each year.

22. Carriers may perform services at reduced rates or free for the United States, State or municipal governments, or for charitable purposes, or to or from fairs and expositions, and may issue mileage, excursion, or commutation passenger tickets, give reduced rates to ministers of religion, or for the transportation of inmates of national homes or State homes for disabled volunteer soldiers, etc.

23. District courts of the United States have jurisdiction to issue writs of mandamus commanding the movement of interstate traffic or the furnishing of cars; provided, however, that the carrier shall be compensated for such service, but the amount of the compensation need not be determined until after the provisions of the writ have been carried out.

24. The commission is enlarged to seven members with a term of seven years each and salary of $10,000 each, and not more than four of the commissioners may be appointed from the same political party.

In addition to the Act to Regulate Commerce the principal Acts which have been passed by Congress affecting railways are as follows:

The Act creating the Commerce Court in 1910, which provided that three Circuit Court judges should act as a special court to hear appeals from decisions of the Interstate Commerce Commission, in other words to act as an intermediary between the Interstate Commerce Commission and the Supreme Court. In 1912 no provision was made for the expenses of this court, so that its functions, with the exception, of course, of the salaries of the judges, ceased to be performed.

The Elkins Act, passed in 1903 and amended in 1906, making it a criminal offense to give rebates.

The Act relating to testimony, passed in 1893 and amended in 1906, making it compulsory for persons subpœnaed to testify before the Interstate Commerce Commission.

The Expediting Act, passed in 1903 and amended in 1910, to give precedence to appeals from the Interstate Commerce Commission's rulings and providing that an appeal from a District Court shall lie directly to the Supreme Court of the United States.

The Safety Appliance Acts, passed in 1893 and amended in 1910, which prescribe certain forms of equipment, such as automatic couplers, grab irons, etc., for use on railways engaging in interstate commerce.

The Employers' Liability Act, passed in 1908 and amended in 1910, making common carriers liable to their employees or employees' dependents for injuries or death resulting from the negligence of officers, agents, or employees of the carriers, or defects or insufficiency due to its negligence in its cars, engines, appliances, track, etc.

The Hours of Service Law, passed in 1907, providing severe penalties for requiring or permitting employees in train service or telegraphers to remain on duty for more than 16 consecutive hours or to return to duty after 16 consecutive hours without 10 hours or more off duty, and no employee in its service may be permitted to remain on duty in any 24-hour period without at least 8 consecutive hours off duty.

Train dispatchers are not to be permitted to remain on duty for a period longer than 9 hours in every 24, in towers or stations operated night and day, and are not to be permitted to remain on duty longer than 13 hours in towers or stations occupied only during the daytime. Exceptions are permitted in cases of emergency.

The Accident Law, passed in 1910, requiring reports of all accidents to the Interstate Commerce Commission on a form prescribed by the commission.

The Ash-Pan Law, passed in 1908, requiring a certain type of ash pan and the inspection of locomotive boilers by employees of the Interstate Commerce Commission, further amended in 1914, which amendment made the entire locomotive subject to inspection by employees of the commission.

The Arbitration Act, passed in 1898 and amended in 1913 by the Newlands Act, providing that a board of mediation and conciliation shall at the request of either party to a dispute between railway companies and their employees try to bring about an agreement between the parties and that, failing to do so, the parties may ask for arbitration by a board of either three or five men, of whom one each or two each, as the case may be, shall be chosen by the parties to the controversy and the three or four or five members be chosen by the other members or in case of the failure of agreement by the Board of Mediation and Conciliation.

The Transportation of Explosives Act, passed in 1909, regulating the manner of the transportation of explosives and the marking of the same.

Regulation both by the States and by the Federal government was the sequel of very extensive aid, both local and national, to railway construction. This aid took the form of land grants, surveys, remission of duties on iron, and guarantee of railway securities by the government. Aid through land grants may be divided into gifts of the right of way and gifts of alternate sections of land along the right of way. This aid is important because of the fact that it led to the government regulation of railways. The Granger movement, which was a form of State regulation of railways, was in part the extreme reaction from the almost prodigal liberality of government aid and local aid to railways of the two previous decades.

From 1850 to 1860 aid of railways was predominant, although the Federal government took steps to regulate the mail service. From 1860 to 1870 aid was still being freely given, but there was also considerable regulation, largely of a negative character. From 1870 to 1880 the volume of railway bills in Congress increased tremendously. The revulsion against the Pacific railways policy began in 1869, and in 1876 there was a law passed which permitted land-grant roads to receive but 80 per cent of regular rates. The first comprehensive regulation of railway practice was the passage of laws regulating live-stock shipments.

The so-called Granger legislation followed the panic of 1873. The Farmer's Antimonopoly Convention was held at Des Moines, Iowa, on Aug. 13, 1873. Iowa passed a law in 1874 fixing maximum rates, and this was followed by similar laws in Wisconsin and Minnesota. The Granger movement had for its aim the improvement and construction of inland waterways, the construction of national freight railways, and the regulation of existing lines, but the regulation of existing lines consisted chiefly in an attempt to pass laws which would secure cheap transportation. The railways turned to the courts for protection, and the basis on which they asked for relief from State and Federal laws was that their property was being taken without due process of law. The courts finally upheld them in this contention in Smythe *v.* Ames, in which the Supreme Court of the United States held that a State Legislature could not fix railway rates which were so low as to fail to yield a fair return on the value of the property employed in the public service.

This decision of the Supreme Court has been the keynote of public policy in regard to the regulation of railways ever since. From the time of the passage of the Act to Regulate Commerce in 1887 down to the time of the passage of the Elkins Act in 1903 Federal regulation failed to obtain its primary object—the elimination of discrimination as between different shippers and the practice of giving rebates. The course of freight rates during that period was steadily downward, but only in small part can this be attributed to government regulation. Competition both between parallel railways and between railways serving the same markets or railways serving the same producing areas was largely responsible for the steadily decreasing average ton-mile rate. Of course the larger proportion of low-grade traffic, such as coal and lumber, is also responsible for the lower average rate. The feeling of the public against discrimination and rebates was far stronger than any general feeling that the level of rates as a whole was too high. Although it has been customary to attribute to government regulation the credit of having stopped rebating and discrimination, it was the decision of A. J. Cassatt and his associates on the Pennsylvania Railroad which made possible the passage of the Elkins Act, which made regulation in regard to discrimination and rebates effective. The amendment to the Elkins Act made it a criminal offense punishable by imprisonment for a railway officer to give rebates or to make a discrimination in rates as between different shippers. The passage of this Act followed the announcement by President Cassatt that the Pennsylvania Railroad was in favor of putting an end to rebating and would do all in its power to bring this about. Since 1906 the Interstate Commerce Commission work, in so far as the commission has been an organ for enforcing the prohibition of rebating, has been largely to decide cases where discrimination was not obvious and where there might be difference of opinion as to whether or not certain practices constituted discrimination.

Previous to the amendment of 1906 to the Act to Regulate Commerce the Interstate Commerce Commission did not have the power to fix a rate, although it might order a railway company to charge a lower rate than one then in effect. After Congress had granted it the power to fix maximum rates in 1906 and to award reparation where rates had been charged that were upon investigation held to have been unduly high, a vast number of complaints were filed with the commission, and in a great majority of the cases heard by the commission the decisions were unfavorable to the railway companies. The commission apparently took the point of view that its primary duty was to protect the shipper and the public against the railways.

By a process of attrition the Interstate Commerce Commission and the State commissions wore down both freight and passenger rates to a point which railway men began to believe in 1909 would injure the credit of United States railways. On the other hand the Interstate Commerce Commission had been asking Congress to grant it the power to suspend advances in rates until an investigation could be made, and in 1910 Congress passed the Mann-Elkins amendment, which gave the Interstate Commerce Commission this power and moreover placed the burden of proof of the reasonableness of the proposed advance rates upon the railways. Just before the passage of this amendment the railway companies by a concerted action horizontally increased their freight rates by about 10 per cent. The movement was so strongly opposed by public opinion that the Attorney-General of the United States at once filed a suit under the Sherman Antitrust Law charging the railways with conspiracy in restraint of trade. An agreement was reached by which the railway companies abandoned their rate advance and the Attorney-General abandoned the suit. There is no doubt in the mind of any one who studies the practices of the railways in regard to rates that the companies are technically violating the Sherman Antitrust Law all the time. Rates of different railways between the same points must of necessity be the same, otherwise all the traffic would move over the road having the lowest rate. Uniformity of rates has been obtained only through conference and agreement between the different roads.

After abandoning the increases in rates which they had made before the passage of the Mann-Elkins amendment, the railways made an application to the Interstate Commerce Commission under the provisions of the amendment asking for permission to increase their rates by about 10 per cent. The application of the roads east of the Mississippi and that of the roads west of the Mississippi River were treated by the commission as two cases and a long series of hearings were held in which the railways made an attempt to justify the advanced rates. The year 1910 was a particularly prosperous one for railways. It marked a reaction from the panic of 1907 and the depression of 1908, although men like President McCrea of the Pennsylvania and Julius Kruttschnitt of the Southern Pacific testified under oath that in their opinion, although superficially conditions indicated prosperity of the railways, the majority of the railway companies absolutely needed an increase in freight rates. This expert testimony was disregarded by the Interstate Commerce Commission, and in two long opinions, one by Commissioner Prouty in the Eastern case and the other by Commissioner Lane in the Western case, the commission refused to permit any of the advanced rates to go into effect. Both opinions were filled with expressions of friendship for the railways and all confidence in the credit of the companies and in their ability to raise new capital, and there were also many assurances of the commission's readiness to grant increases in rates whenever it should appear that these increases were actually needed.

Although not recognized by the commission in 1910, certain economic laws were at work which were destined to prove the commission wrong in its 1910 decision. These economic laws can best be understood from the description of a hypothetical case. A 500-mile railway is built, all of it being single track, with sidings 2000 feet long spaced about 20 miles apart. The passenger density on this road in 1900 was, we will say, 150,000 passenger miles per mile of road and the freight density 500,000 ton miles per mile of road. In the next five years the passenger density had increased by 30 per cent and the freight density by 50 per cent. During these years certain capital expenditures had been made for heavier locomotives, additional sidetracks, larger yards, etc., but the interest requirements on this new capital were more than offset by the increased net earnings per unit of business handled due to decreased cost per unit. At the end of another five years, however, the passenger density had reached 300,000 passenger miles per mile of road and the freight density 1,500,000 ton miles per mile of road and congestion had now become so great that to handle the business promptly and economically it became absolutely essential to double-track considerable portions of the road. Almost at one stroke overhead charges were added to by 80 to 90 per cent, maintenance charges were increased at least 50 per cent, while there was no corresponding increase in traffic, and whereas the single-track road had been worked up to 105 per cent of its economical capacity, the new double-track road was being worked only to about 40 per cent of its capacity. The unit cost of handling business had been, therefore, very greatly increased by the additional investment. This is what might be called the law of diminishing returns on the expansion of railway traffic. On the eastern roads especially this law has been at work ever since 1906. The railway presidents who testified in the 1910 rate advance case before the Interstate Commerce Commission recognized this fact, but the commission did not.

In 1913 an application was made to the Interstate Commerce Commission by the railways in what is known as official classification territory, i.e., the territory lying east of the Mississippi and north of the Potomac and Ohio rivers, for permission to increase rates by 5 per cent. The commission refused this permission to the majority of the railways involved, although granting permission to the railways lying between the line drawn from Buffalo south through Pittsburgh and the Ohio River to the Mississippi to increase some of their rates by 5 per cent.

The outbreak of the European War in August, 1914, accentuated the depression in business in the United States and railway earnings at once reflected the business depression. Application was made to the commission for a rehearing of the Eastern rate advance case and a vigorous campaign of publicity was undertaken by the railways to support their contentions. A delegation of railway executives headed by Frank Trumbull, chairman of the board of directors of the Chesapeake and Ohio Railway Company and of the Missouri, Kansas, and Texas, went to President Wilson and laid their case before him, asking him to do what he could to restore confidence in railway securities. In an open letter addressed to Mr. Trumbull President Wilson expressed his confidence in the railway situation, but at the same time expressed the opinion that all branches of the government should coöperate to support the credit of the railways of the United States. The commission reversed its former opinion and granted the roads permission to increase their rates by 5 per cent, mak-

ing an exception, however, in regard to rates on coal. Shortly after this decision the Western roads made an application to the Interstate Commerce Commission to increase their rates, but most of these requests were refused.

Vitally connected with the course of regulation of railway rates and operation by Legislatures and by the State commissions and the Interstate Commerce Commission has been the attitude of the Federal and State courts. The first relief which the railways received from unlimited regulation was the court's decision that property could not be taken without due process of law. This was the only restriction which the courts would place on regulation, and in a long series of decisions the Supreme Court recognized more and more fully the authority of the Interstate Commerce Commission to prescribe rates and to regulate railway operation free from court review except where a confiscation could be proved. The check which came to regulation in 1914 was imposed not by the courts but by public opinion and the pressure which public opinion brought to bear on the Interstate Commerce Commission. Besides the series of decisions which have established beyond question apparently the Interstate Commerce Commission's right to determine finally and as a court of last appeal what is a reasonable rate so long as confiscation is not involved, there has been a series of decisions which have established the principle that wherever the Interstate Commerce Commission has taken jurisdiction in matters involving even indirectly interstate commerce, State legislatures and State commissions cannot interfere. Lastly in a decision handed down early in 1915 the United States Supreme Court held that each class of service rendered by a railway company has a legal right to earn a fair return on the value of the property used in that service and that, while railway managements may charge lower rates for certain services than would yield a fair return on the value of the property used in that service, it is not within the power of State Legislatures, and presumably of the Interstate Commerce Commission, to compel railways to adopt this policy. The result of these court decisions has been that the Interstate Commerce Commission in attempting to fix reasonable rates has deemed it essential to make a physical valuation of the railways, and after considerable agitation Congress passed a law providing for the valuation of the railways of the United States, and this work was begun in 1914. It is estimated that it will take a number of years to complete the work, and in this connection the Interstate Commerce Commission's rules for accounting by railway companies are of the utmost importance.

ENGLISH REGULATION OF RAILWAYS

English regulation of railways began in 1848. Before this there had been various bills presented to Parliament providing for specific acts of regulation, the first being that presented by James Morrison in 1836, which provided for limiting dividends and revising tolls. There were committees of investigation appointed in 1839, and at the instigation of Sir Robert Peel in 1846 Parliament passed laws restricting the flotation of fraudulent railway projects. In 1848 the Railway Commissioners, who were constituted by the Act of Parliament passed in 1846, drew up a scheme of supervision of railway policy. This board of commissioners was abolished by an Act passed in 1851. In 1854 a Tariff Act, so called, was passed which established a General Committee on Railway and Canal Bills in the House of Commons. In 1873 the Regulation Act was passed appointing three commissioners, who formed a tribunal which, in the first place, was judicially not administrative and the commissioners were appointed for five years.

Later an Act was passed forbidding railways to raise their rates, and after the passage of this Act it became necessary to obtain an Act of Parliament each time a rate advance was needed. This has tended to make English railway rates absolutely rigid, the companies, of course, seldom, if ever, reducing a rate to meet special circumstances because of the difficulty that would be encountered in getting Parliament to raise it again. The Railway Commission consists of the president of the Board of Trade, a secretary, and one member. The president of the Board of Trade, being a member of the British cabinet, is of course a political officer, holding his office only during the time his party is in government. The secretary and the other member are permanent nonpolitical appointees, holding office for indefinite periods. The principal work of these commissioners is the investigation of railway accidents, on which a report is made by an expert employed by the commission.

RAILWAY CAPITALIZATION AND FINANCE

A railway company in the United States is a corporation created under the laws of one of the States. Its charter provides the powers under which it builds its road and engages in the business of transportation or in other businesses which it may be expedient for it to engage in. With the exception of the so-called land-grant railroads mentioned in connection with the government regulation, the capital for American railways has all been provided through private subscriptions. In the days of the greatest activity in railway building the common method of procedure for the financing of the new project was somewhat as follows: a group of promoters secured options on a right of way between the points which were to be connected by the railway. A company was then formed and a charter obtained, and the right of way, or rather the options for the right of way, the promoters' services, etc., were sold to the new company, the new company paying in its own securities. This nominal cost was the first item, therefore, on the asset side of the balance sheet of the new company. The promoters then undertook to sell the securities of the new company, bonds being offered at a certain price, generally with a bonus of stock. From the proceeds of the sale of the bonds the grading and construction of the road were paid for, often equipment trust notes were issued to pay for the engines and cars necessary to equip the line, and the road began operation.

Gradually, if the project was successful, earnings over and above the interest charges on the bonds were put back into the property in the form of improvements, and if the company continued to be successful, in time it was built up out of earnings until its credit was sufficient to permit the sale of securities to pay for additions and betterments and to permit the payment of surplus earnings as dividends on the stock. If

the company was not successful, as a very great number of railways built in the United States were not, it failed to earn interest charges on its bonds, would go into the hands of a receiver, and be reorganized. Often during the time of the receivership earnings would be used to make additions and betterments to the property instead of for the payment of bond interest, and so build up the physical plant and make it capable of earning a return on the securities of the new company which was formed at the time of the reorganization.

The stock of a railway company represents participation in the ownership of the property. Stock certificates are usually issued in denominations of $100 and multiples of that sum. As a matter of fact, however, the dollar sign on stock certificates means very little. Legally it is supposed to mean that $100 cash or the equivalent of cash has been paid into the company for every one-hundred-dollar certificate issued. Under English common law and under the Federal and most State laws of the United States, bondholders or other creditors of a railway company could compel stockholders to pay in to the company's treasury the full par value of the stock which they held, in case of a default of interest or principal on bonds or other indebtedness. The English courts early held, however, and the American courts followed them, that a stockholder who had innocently bought stock from other individuals believing that originally the full par value of the stock had been paid in to the company's treasury could not be held liable for the amount that was not so paid in. Since the fact that a stockholder was not the original purchaser from the company was prima facie evidence that he was an innocent stockholder, the theoretical remedy which the bondholder or creditor had was of practically no value.

Some corporations have been formed with stock having no nominal value but simply participating in the ownership of the assets and right to a distribution of profits, each share being equal to a certain fraction of the total. The Hadley Securities Commission recommended very strongly that if Federal incorporation were to be permitted to railway companies, stock should be issued without par value, i.e., simply participating certificates. As a matter of fact the present stock issues of all railway companies are really nothing but certificates of participation in the ownership of assets and the right to the distribution of profits.

Bonds of a railway company are of various classes, but may be divided into two general classes, one in which the bonds are secured by a mortgage on specific property, the other in which they are secured only by an indenture which is a promise to pay interest and principal made by the railway company. A bondholder is a creditor of the railway company. His claim may be secured either by a mortgage or simply by a promise to pay, but in either case theoretically he has no voice in the management of the property so long as interest payments are made when due and his principal is paid at maturity. Bondholders can of course obtain the protection of the courts if it can be proved that the owners of the property, the stockholders, are dissipating assets improperly.

With few exceptions new railway construction in the United States since 1895 has been carried on by existing railway companies through extensions and branch line building.

Railway Systems. A short account of the upbuilding of the various railway systems in the United States, such as the Harriman, Gould, Huntington, etc., will be found under the article UNITED STATES.

The need for new railway capital has been estimated variously at from $100,000,000 to $400,000,000 a year for the United States. The greater part of this new capital which has been raised since the beginning of the present century has been through the sale of bonds. With very few exceptions these bonds have been sold by the railway company to a group of bankers or to an individual banking house and by the bankers have been resold to investors. The railway company may sell its bonds or notes outright to the bankers at a fixed price, and the banker sells them to his customers at the best price which he can obtain, with the hope, of course, that he will make a profit on the transaction.

Underwriting of Securities. Another common method of railway financing is for the railway company to make an offering of either stock or bonds to its own stockholders at a certain price. The sale of these securities, however, is underwritten by a banking house or group of banking houses, which agree to take any of the securities which are not taken by the stockholders at a fixed price, usually lower by a certain amount than the price at which the securities were offered to stockholders. This is called the underwriting of securities, and the bankers are usually paid a certain commission which varies from 1 to 3 per cent. Thus, if the entire issue of securities was taken by the stockholders, the bankers would get their commission in payment for their willingness to have taken the issue, despite the fact that they were not called upon to advance any money whatsoever. On the other hand, if none of the issue, or only a small part of it, is taken by the stockholders, the railway company gets its money from the underwriters, despite the fact that eventually the underwriters may have to sell the securities to the public at a lower price than that which they paid the railway company.

Generally the banking house which underwrites the issue of securities or buys it outright from the railway company does not sell any great part of a large issue directly to the individual investors, but acts as a wholesaler, who in turn sells to jobbers, the so-called secondary private banking houses, who in turn sell, on the one hand, to the very large individual investor and, on the other, to retailers, the small bond houses, which eventually distribute the securities to their customers, the individual investors. The three large banking houses of original issue in the United States in 1916 were J. P. Morgan & Co., Kuhn, Loeb & Co., and Speyer & Co. There were in addition a large number of other banking houses, which were affiliated in interest more or less closely with one or more of these three banking houses, and also a number of independent banking houses which might buy directly from the railway companies or other corporations comparatively small issues of securities. The railway companies which have been financed very largely through the banking house of J. P. Morgan & Co. are the New York Central and its subsidiaries, the Great Northern, the Northern Pacific, the Southern Railway, the Chicago, Burlington, and Quincy, and the Chicago and Northwestern. The railways which have been financed principally by Kuhn, Loeb

& Co. are the Pennsylvania Railroad, the Union Pacific, the Southern Pacific, and the Illinois Central. The companies which have been financed principally through Speyer & Co. are the St. Louis and San Francisco, the Chicago, Rock Island, and Pacific, and the Gould lines.

The cost of building and equipping a mile of railway varies widely in different parts of the country and with the character of the country through which the road is built, as well as with the different standards which may be adopted. A road built over a comparatively level country, dirt ballasted, as were so many of the roads in the Southwest in the early days, with 60 or 70 pound rail, with light engines and a comparatively small number of cars, might be built for $15,000 a mile or even somewhat less. A double-track road built through mountainous country, with the present standards of concrete structures, heavy rail and heavy engines, with steel cars, will cost from $100,000 to $300,000 a mile. First-mortgage bonds of a railway company which has had a long record of prosperous operation, with the required dividend payments to its stockholders forming a margin of safety behind its interest charges, could be sold in 1913 to 1914 at a price which would cost the railway company about 4 per cent to 4½ per cent. On the other hand even first-mortgage bonds of a new company, secured on a road which is just being put in operation, could not have been sold during those years at a price which would have cost the railway company less than 5½ per cent to 6½ per cent, if they could have been sold at all.

The average capitalization, i.e., total par value of stock and face value of bonds outstanding against the 249,803 miles of railways of the United States in 1913 was $19,796,125,712. Of this more than one-half was represented by funded indebtedness. The bonded indebtedness had increased in the previous 15 years in very much greater proportion than had the stock. This has been one of the tendencies of railway financing in which bankers and students of railway economies have in general seen a danger to the continued high credit of railway securities as an investment. An investor in bonds of a standard railway company should expect absolute security of principal, barring, of course, some great national calamity, and security of interest except under some unforeseeable exceptional circumstance. This can only be assured if the railway property can earn a very substantial margin over its interest charges, even in a year of business depression. This margin over interest charges is, of course, the profit which belongs to the stockholders. The stockholders have the choice either of taking their profit through the declaration of dividends, which will be equivalent substantially to all the surplus earned after the payment of interest charges, or of taking only part of this profit through declaration of smaller dividends and of investing in the property the remaining surplus. The Pennsylvania Railroad, which is the most conservatively managed road in the United States, paid out in dividends just about half of the profits belonging to stockholders in each year, investing the remaining half as a margin of safety for future earning power of the property.

The Interstate Commerce Commission's system of accounts, under which system all railways of the United States doing an interstate business must be kept, defines expenses, as distinguished from additions and betterments, as the expenditures necessary for repairs and renewals of the plant necessary to keep it up to the standard in which it was at the beginning of the period for which accounts are kept. This leaves no provision for expenditures which are necessary to keep the property abreast of the continually progressing art of transportation. Such expenditures the commission holds to be paid for through the investment of new capital, either by the owners in the form of surplus not paid out in dividends or by the owners or others through the sale of new securities. Experience has shown that with the rapid progress which has been made in the development of heavier engines, larger cars, permanent structures, etc., the credit of a railway company can be maintained only through the investment of part of the surplus above interest charges of the property as an offset to this course of progress. Since investors will not become participants in the ownership of railways unless they will receive in profits a rate of return on the investment commensurate with what they could get from becoming part owners in some other business in which the risk was comparable, it follows that a railway company must, if it is to be able to secure capital needed for additions and betterments, earn not only its interest charges and a fair return on its stock, but also a substantial surplus as a margin of safety behind its dividends.

The tendency in the years 1906 to 1915 was to reduce this margin of safety materially, even for the strongest railway companies, to wipe it out entirely for the less strong companies, and to reduce net earnings even below the amount required to pay interest charges alone on many of the weaker railway companies. It was on the basis of these facts that the railway companies appealed to the Interstate Commerce Commission for permission to increase their freight rates in 1910 and again in 1913 and 1914. Various other expedients besides increasing railway rates have been suggested to meet this situation. One has been that the government shall guarantee a certain per cent on railway securities and in exchange receive representation on the board of directors of the company. Another is that the government take over the operation and the ownership of the railways of the United States, paying the present holders of railway securities a sum to be fixed by the court. This is generally called in the United States government ownership and is spoken of in England usually as the nationalization of the railways.

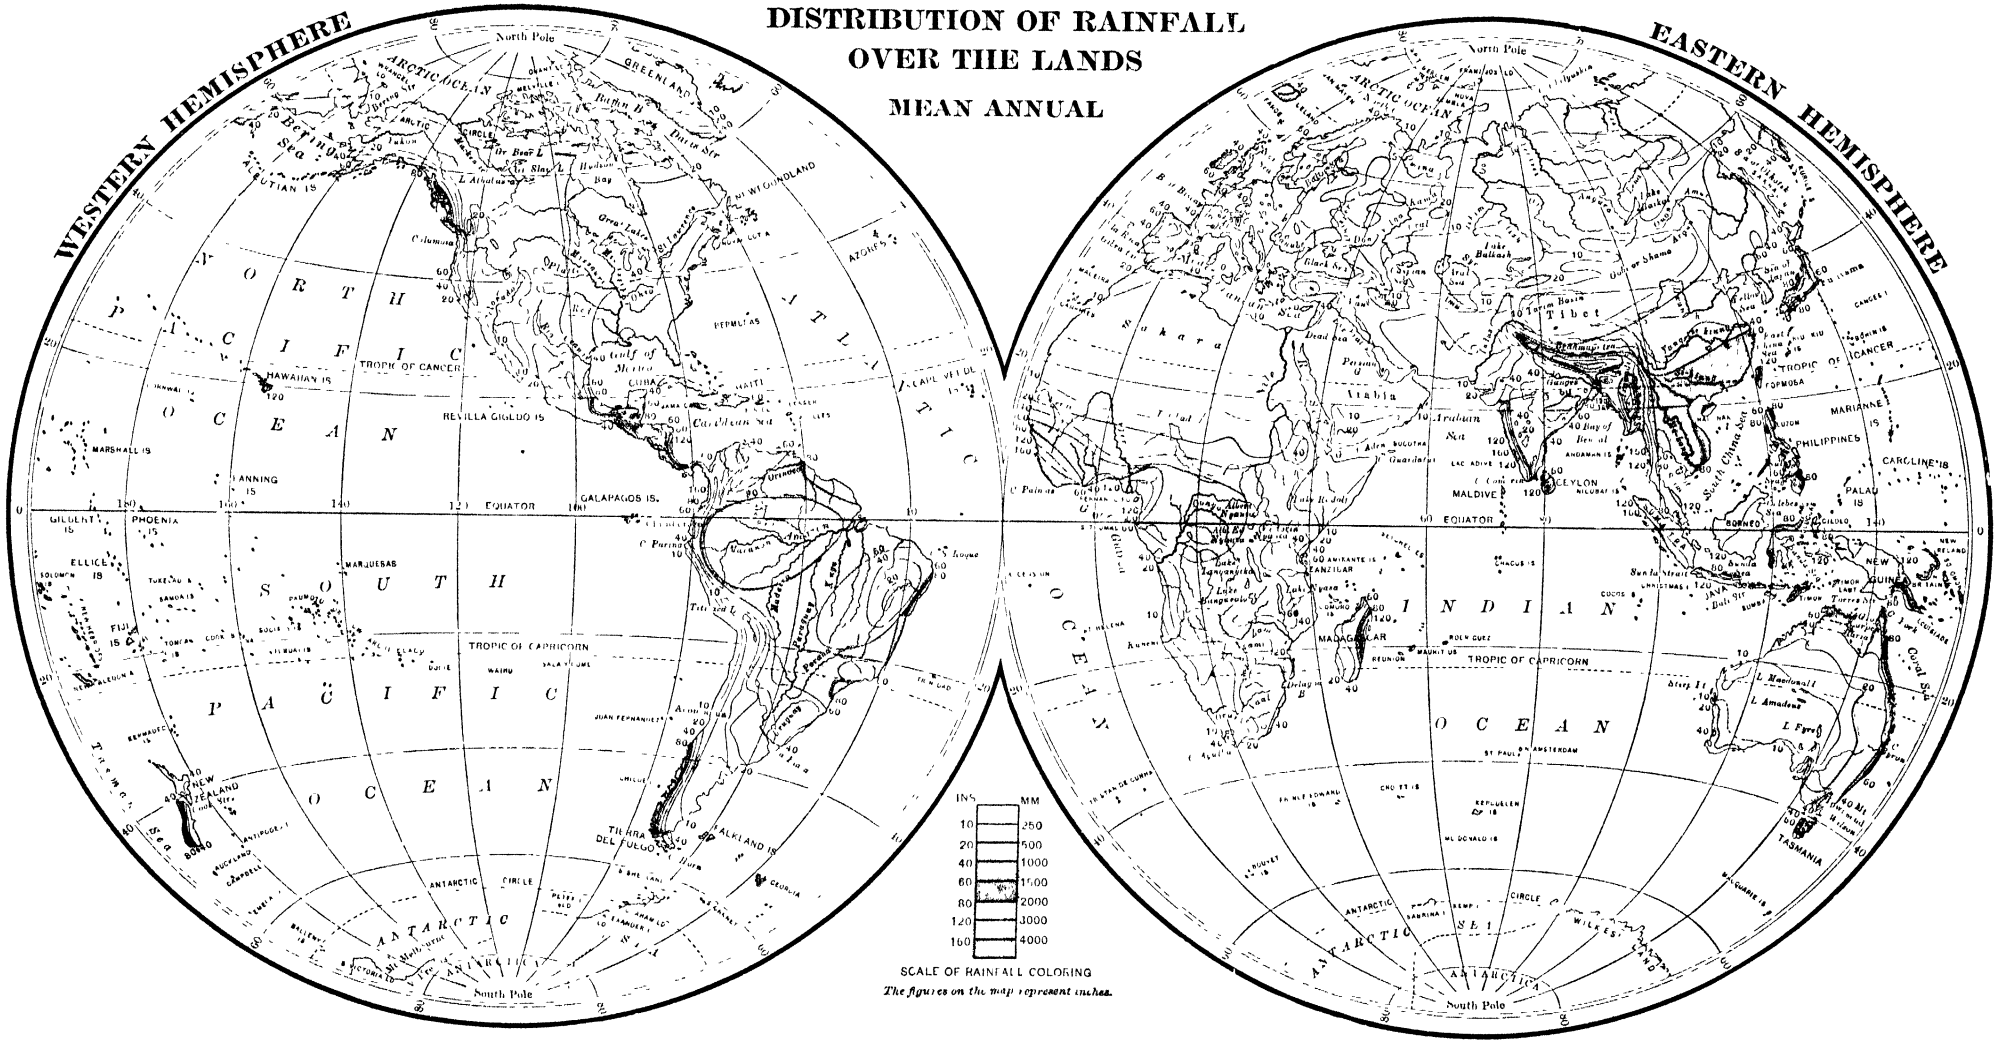
RAILWAY TRAINMEN, BROTHERHOOD OF. See RAILWAY BROTHERHOODS.

RAIMONDI, rī-mōn'dē, ANTONIO (1825–90). An Italian geographer and naturalist, born in Milan. In 1850 he went to Peru and was professor of botany in the University of Lima from 1862 to 1871. During this time he explored the country and gathered material for his proposed exhaustive work on the geography, botany, zoölogy, and ethnology of Peru. Four volumes had been published before his death under the title *El Perú*, but a part of the work, which is of the highest importance, was destroyed when Lima was captured in the Chilean War. His manuscripts became the property of the Lima Geographical Society. An edition of *El Perú* was published at Lima in 1890–1902 (3 vols.).

RAIMONDI, MARCANTONIO (c.1480–c.1534). The chief Italian line engraver of the Renaissance. The details of his life are uncertain, but it is thought he was born about 1480 in Bologna, where he studied engraving under Francia, devoting himself at first to niello, then to line engravings after the paintings of his master and after his own designs. The influence of the German engravers, like Schongauer, is evident, particularly in the landscape backgrounds. Greatly impressed by Dürer's engravings, he copied about 70 of his woodcuts and copperplates in line engraving, even counterfeiting the signature and pirating without acknowledgment the entire *Life of the Virgin* and the *Little Passion*. But Vasari's statement that Dürer obtained redress from the Venetian government is improbable, since the first series was not published until after Dürer's visit to Venice in 1506.

Until 1510 Raimondi resided at Bologna, with occasional visits to Venice, but in that year he seems to have been at Florence, since it was the date of his celebrated engraving, "Les Grimpeurs" (The Climbers), after Michelangelo's cartoon, the "Battle of Anghiari," the background of which was taken from Lucas van Leyden. He was then probably on the road to Rome, where he thenceforth devoted himself to the reproduction of the works of Raphael, conducting a flourishing school and printing establishment in conjunction with Raphael's color grinder, Baviera. Most of his plates are free interpretations of Raphael, probably executed after the latter's designs or studies, not after the finished paintings. Marcantonio carried out these designs with great vigor and charm, rendering, as no other has done, the forms of Raphael, not only in line, but in spirit. His early plates in particular are distinguished by perfection of line and mellowness of tone; his later are more summarily executed. Among the best after Raphael are: "Poetry"; "The Massacre of the Innocents"; "Quos Ego" (Neptune riding on a shell); "Lucretia"; "The Judgment of Paris"; "The Death of Dido"; etc. After Raphael's death he engraved after Giulio Romano, notably a "Hercules and Antæus," and after the antique, which he was largely instrumental in popularizing. His engraving of Giulio's illustrations of Aretino's *Sonnetti lussuriosi* caused his imprisonment by Clement VII, and he was ruined by the sack of Rome in 1527, when he was held for ransom by the Spaniards at an exorbitant sum. Afterward he seems to have returned to Bologna, where he died not later than 1534. His chief pupils at Rome were Agostino Veneziano and Marco Dente of Ravenna, whose work is often confounded with their masters. Consult Delaborde, *Marc-Antoine Raimondi* (Paris, 1887), and *Marc Antonio*, in "Great Engravers Series" (London, 1912).



RAIMUND, rī'mụnt, FERDINAND (1790–1836). An Austrian actor and playwright, born in Vienna. After playing on provincial stages in Hungary, he secured an engagement in Vienna at the Josephstädter Theatre, in 1813 and in 1817 at the Leopoldstädter Theatre, where he soon became the most popular exponent of local comedy and which he managed as director in 1828–30. In the meanwhile he had come before the public as a popular dramatist with *Der Barometermacher auf der Zauberinsel* (1823), after the fashion of the old Viennese extravaganza; *Der Diamant des Geisterkönigs* (1824); *Das Madchen aus der Feenwelt, oder Der Bauer als Millionär* (1826); *Der Alpenkönig und der Menschenfeind* (1828); and others which, after severing his connection with the Leopoldstädter Theatre, he presented on the stages of Munich, Hamburg, and Berlin, appearing himself in them in a starring capacity. His last and best play was *Der Verschwender* (1833), which is still popular on the German stage. Raimund, despondent, attempted suicide and died within a week. He was a genuine poet of the old Viennese folk play, who dwelt with affectionate sympathy upon the life of the people and wove its joys and sorrows into the fabric of fantastic dramas of peculiar charm. Their pathos and humor are alike telling. His life was made the subject of a novel by Otto Horn (Bäuerle) and of several dramatic productions. By the Raimund Dramatic Club, founded in Vienna in 1890, the Raimund Theatre was established there in 1893. His complete works were edited by Vogl (Vienna, 1837) in four volumes; by Glossy and Sauer (Vienna, 1881; 2d ed., 1891) in three volumes; and with biography by Castle (Leipzig, 1903) in three volumes. Consult: Frankl, *Zur Biographie Raimunds* (Vienna, 1884); article by Erich Schmidt in *Charakteristiken*, I (2d ed., Berlin, 1902); Aug. Sauer, in *Reden und Aufsätze* (Vienna, 1903).

RAIMUND, GOLO. See FREDERICH, BERTHA.

RAIN (AS. *regn, rēn*, Goth. *rign*, OHG. *regan*, Ger. *Regen*, rain; connected with Lat. *rigare*, Gk. *βρέχειν, brechein*, to wet). Drops of water formed in the atmosphere by the condensation of its aqueous vapor and falling rapidly by virtue of their weight. The very small drops that fall slowly are spoken of as mist, cloud, or fog. The largest drops of rain that have been measured are as much as 0.25 to

DISTRIBUTION OF RAINFALL OVER THE LANDS

MEAN ANNUAL

SCALE OF RAINFALL COLORING

The figures on the map represent inches.

0.30 inch in diameter and fall at the rate of from 15 to 25 feet per second. The smallest drops that are likely to be spoken of as rain are about $\frac{1}{20}$ inch in diameter and fall at the rate of about 5 feet per second. As rain water is condensed vapor that had previously been evaporated from distant water surfaces, therefore, in accordance with the laws of evaporation, it would be chemically pure water were it not for a small percentage of foreign substance which it gathers to itself from the atmosphere. Rain water washes down out of the air dust, soot, pollen, spores of fungi, and many other solid substances. Ordinary rain water contains an appreciable percentage of dissolved oxygen, nitrogen, ammonia, and carbonic-acid gas, and in special cases it is found to contain nitric acid, sulphuric acid, and other components of the impure air of cities. The acid and alkaline impurities generally increase the power of the rain water to dissolve the mineral constituents of the earth's crust; the gases make it possible for plants and animals to live in rivers and ponds, which would be impossible if the water were chemically pure. Rain water becomes wholesome potable water for man's use only after it has been thoroughly filtered through the earth, whence it issues as springs.

Up to the middle of the nineteenth century rain was supposed to be naturally formed by the mixture of cold and warm masses of moist air, but the publication of Espy's *Philosophy of Storms* (Boston, 1842) and his lifelong contention that cloud and rain are not due to cooling by mixture or by radiation, but are a consequence of the cooling of the atmosphere by virtue of the work done in expansion, supported as he was by Prof. Joseph Henry, Sir William Thomson (Lord Kelvin), and other physicists, finally led meteorologists to study the great thermodynamic problems of the atmosphere. When air is forcibly compressed, the work done by compression is represented by the increase in temperature of the confined air; vice versa when the air expands by diminution of pressure, the work done in expansion is represented by the heat abstracted from the expanding air, which therefore experiences a corresponding cooling. The laws of convective equilibrium governing the temperature and the volume of a unit mass of rising air were first expressed in the exact language of mathematical physics by Sir William Thomson in 1861. Graphic methods of treating the complex meteorological problems were devised by Hertz in 1884 and improved by Von Bezold in 1888 and Neuhoff in 1900. The analytical treatment of the subject is given by F. H. Bigelow with convenient tables in his report of 1900 *On the International Observations of Clouds.* When warm moist air ascends from near the earth's surface it cools by expansion; if no heat is added or subtracted it is said to cool adiabatically, and does so at the rate of about 1 degree Centigrade per 100 meters of ascent, or 1 degree Fahrenheit for 182 feet, until it reaches an altitude at which its temperature is the same as the temperature of the dew point of the original air. At and above this elevation cloud is formed as the air ascends. If the rise continues until the air has cooled to the temperature of freezing point of water, then the watery cloud particles begin to change to ice, giving out their latent heat as they do so without further lowering of temperature until in the course of its further ascent all the cloud particles have become ice; then any additional rise will be accompanied by further lowering of temperature and by the formation of snow crystals. This latter condition would continue to exist throughout the further ascent of the air were it not that in these higher regions the formation of snow is very slight. If the sun is shining upon the clouds the process ceases to be adiabatic, and the particles of water or ice may be immediately evaporated back into vapor. Owing to the resistance of the air the cloud particles fall very slowly to the ground, or may, in fact, be upheld indefinitely by a gentle ascending current. But if numerous small particles combine together into drops of water, the latter may fall rapidly to the ground as rain. The above paragraph correctly explains the formation of cloud by cooling due to expansion, but nothing is as yet known satisfactorily as to the process by which large raindrops are formed from the minute cloud particles.

Among the several plausible hypotheses are the following: (*a*) That the cloud particles are jostled together by currents of air or that the larger ones fall fast enough to overtake the smaller ones, so that in either case larger particles are formed which, as they descend, grow by the accretion of small particles that lie in their path. (*b*) That some of the smaller particles are positively and others negatively electrified and consequently by attraction are made to coalesce. (*c*) That some particles, being larger than others, have different surface tensions and that the larger ones are thereby enabled to grow at the expense of the smaller ones. (*d*) That the original cloud particles consist of vapor that has condensed upon particles of dust or foreign substances in the air and that this condensation takes place more readily upon some nuclei than others, as is known to be the case from the observations of Wilson, Aitken, Barus, and others. (*e*) That the atmosphere within a cloud, being saturated, has no remaining nuclei upon which condensation can take place, and as the air continues to rise and cool it comes to a state of supersaturation and intense molecular strain, which is finally relieved by a violent condensation upon groups of cloud particles already existing; this violent condensation takes place in such a way as to sweep many of the smaller cloud particles together into one large drop. C. T. R. Wilson has shown that these larger drops can be formed only when the air in the dustless cloud has been expanded and cooled at least one-third more than is required for ordinary dusty air. (*f*) Wilson has shown the plausibility of a slight modification of the preceding method; he finds that dustless air virtually acquires new nuclei on which condensation takes place when a beam of ultra-violet light or of the Röntgen rays, the radiation from uranium, or even ordinary sunlight, passes through the moist air, that in fact such nuclei are being formed in it all the time.

Prof. J. J. Thomson's observations on the formations of ions—viz., the breaking away from a molecule of some one of its integral components which he calls corpuscles—suggest that the atmospheric ions thus formed are active in producing cloudy condensation and that the negative ions attract moisture to them-

selves more readily than the positive, therefore they grow to be larger drops and, descending to the earth with their negative charges, give it negative electricity, while the atmosphere is left essentially positive.

Geographical Distribution of Rain. From the preceding section it is readily seen that the distribution of rain over the earth's surface must depend upon the influences that force air to ascend rapidly. Thus, on warm clear days, when the surface of the ground or water is highly heated, the lower stratum of air acquires a decided upward motion by reason of its buoyancy. Masses of hot air are rising while the cooler air near by is descending. Thunderstorms are usually formed in this way, and nearly every station in the torrid and temperate zones has a preponderance of local rains in the afternoon. Whenever an ocean breeze or a monsoon wind rises high enough on a mountain side it gives rise to cloud and rain, so that the ocean winds bring more rain than the land breezes. The finest illustrations of this principle are seen in the rains of the southwest monsoon in India, in the rains that fall with southwest winds on the coast of Europe, or in the southerly winds with rain on the Gulf coasts of the United States. Again, when a moist warm wind meets a cold dry wind, the latter generally flows under and lifts up the former, because of the greater density of the cold air compared with the warm. Therefore above the cold air is formed a layer of cloud and oftentimes of rain, owing to the rapid elevation of the warm air. Illustrations of this are to be found on the southeast and southwest sides of the areas of low pressure that pass eastward over the United States throughout the year and especially in the winter season. From the preceding it follows (1) that every rising slope, whether of mountain ranges or interior plains, should, other things being equal, show a greater rainfall as we proceed up the slope, and this distribution of rainfall with altitude has been found to agree with observations in Great Britain, Germany, India, the East Indies, and the United States; (2) considering the world at large, the heavier rainfalls should occur in regions where warm moist winds steadily impinge upon the mountain slopes. The above principles are exemplified in the rainfall charts contained in Bartholomew's *Physical Atlas* (London, 1899), and especially in the 26 maps showing the monthly and annual distribution of the rainfall on the land surface throughout the globe compiled by A. J. Herbertson and published by the Royal Geographical Society of London in 1900. Herbertson's charts of annual rainfall on the land surfaces are reproduced herewith.

Seasonal Distribution of Rain. This is in many respects more important than the total annual quantity. It is the combination of rainfall, temperature, and sunshine that determines the character of the vegetation in each part of the globe. In the Northern Hemisphere some stations have a large rainfall in June and July, when the sun is nearly overhead; but other stations have the minimum rainfall at this season. In the tropics most stations have two minima and two maxima of rainfall during the year. In the Southern Hemisphere, where the sun has its maximum power in December or January, even greater diversities appear. The growth of the perennial vegetation, and especially the annual plants and the important crops, are entirely controlled by these relations of sunshine and rain. In regions where the rainfall is insufficient to perfect the important grain crops, recourse must be had to irrigation, the success of which again depends upon the annual distribution of snow and rain.

Various types of rain prevail over the ocean as well as over the land, although, unfortunately, we have but very few measurements of the actual rainfall at sea and must, therefore, speak only of the frequency of the rain. Thus, on the Atlantic and Pacific oceans, under or near the equator, is a rainy belt where the pressure is always low, the winds exceedingly light, variable or calm; here the sun almost invariably rises in a clear sky, but about midday clouds begin to gather, and in a short time the whole face of the sky is covered with dark clouds which pour down prodigious quantities of rain. Towards evening the clouds disappear, the sun sets in a clear sky, and the nights are serene and fine. In lat. 25° N. to 35° N. on both Atlantic and Pacific there is a region of northeast trade winds in which the rainfall is comparatively light and occurs equally in all parts of the earth.

The details of the distribution of rainfall in the United States are given by Prof. A. J Henry in his "Rainfall of the United States," *Weather Bureau Bulletin D* (Washington, 1897); in the article "Rainfall and Charts of Rainfall," in the *Monthly Weather Review* (ib., April, 1902); and particularly by B. C. Wallis in the *Monthly Weather Review* (ib., January, April, and June, 1915).

RAIN BIRD. Any bird popularly believed to foretell rain. Many of these birds are cuckoos. Both the North American species have this reputation, as have also the black anis of Mexico and southward, which are frequently called rain crows. In the middle western portion of the United States the bird commonly called rain crow is the yellow-billed cuckoo. The East Indian cuckoos, called koels (see KOEL), have the same reputation and are commonly known in India and the Malay countries as rain birds and foretellers. To what extent this repute is justified is a question admitting of discussion. Birds, as well as other animals, are no doubt sensitive to changes in the temperature and humidity of the air, and some may be quick to recognize that certain of these changes portend disagreeable weather. The immediate effect or their anticipations may lead them to make outcries indicative of discomfort or alarm. A great variety of information and folk sayings on this subject is given in Dunwoody's "Weather Proverbs," *Signal Service Notes*, No ix, published by the War Department (Washington, 1883). For Oriental superstitions, see *Ibis* (London, 1879).

RAIN'BOW (AS. *regnboga, rēnboga;* OHG. *regan-bogo;* Ger. *Regenbogen*). The name of the arc of prismatic colors which at times is seen when the sun or the moon is shining while it is raining. It always is seen in the part of the heavens opposite to the sun, and is high when the sun is low, and low, near the horizon, when the sun is high. It is a short arc, or a complete one resting on the earth at each end, according to the extent of the rain. Sometimes a second concentric bow is seen with the colors reversed. Both are due to

the reflection and refraction of the rays of the sun in the drops of rain.

If the parallel lines *S*, Fig. 1, represent rays coming from the sun and falling upon the drop

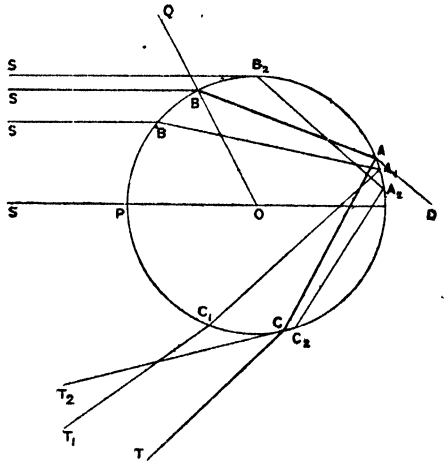


Fig. 1.

of water, the centre of which is *O*, it is possible to determine the path of each ray by applying the simple law of refraction. For example: the ray *SB* will be refracted to *A*, reflected to *C*, and finally refracted out to *T*. The parts of the ray which are reflected out at *B*, refracted out at *A*, or reflected in at *C*, need not be considered, as they do not contribute to the phenomenon. It may be shown that when the arc *B A* and *AC* are equal, then the angle between *SB* and *CT* is greater than for any other case. In other words, when the ray passes through the drop symmetrically, the final direction of the ray is at the greatest angle with the original direction, and also that a greater proportion of the total light falling on the drop is sent out in this direction than in any other. The light which falls farther

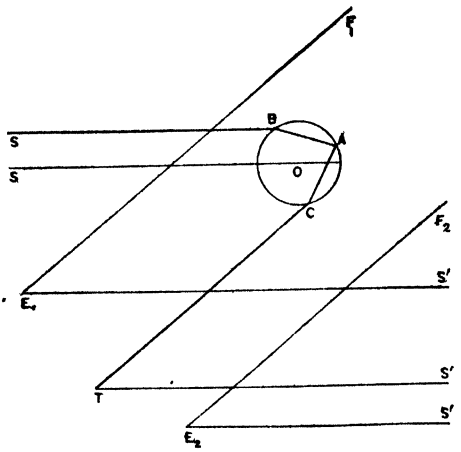

Fig. 2.

out on the drop than *B* is mostly reflected off the drop, and that which falls nearer than *B* enters the drop, but mostly passes out at the back at *A*. Inasmuch as the index of refraction is different for the different-colored lights, it follows that the angle between *SB* and *CT* must be different for the different colors, less for violet than for red. An eye at *T*, Fig. 2, looking towards the drop, would see considerable of the light coming in the direction *CT*, but an eye at E_1 would see only a little light corresponding to the ray $SB_2A_2C_2T_2$, and an eye at E_2 would see no light from that drop. If we imagine the whole of Fig. 2 revolved upon the line *TS'* as an axis, then the ray *SB* becomes a cylindrical shell of rays, the drop becomes a circular arc of drops, and the ray *CT* becomes a conical shell of rays, which, seen by the eye at *T*, appears as a ring of light against the clouds as a background, having an angular radius equal to *CTS'*. If the red rays are considered this radius would be about 42° 22′, for the violet rays 40° 35′, and for the intervening colors it would have corresponding values. Thus, the ring of violet would appear the smallest and the red the largest, with the other colors ranged between. Of course, a particular drop is in the right position to contribute to this ring of light for only a small fraction of a second, but others take its place. Moreover, the apparent diameter of the sun causes a widening of the line of light to a band, and these bands of different colors overlap and blend. The bow formed as above described is called the primary bow and is much brighter than the secondary bow, which is formed as follows:

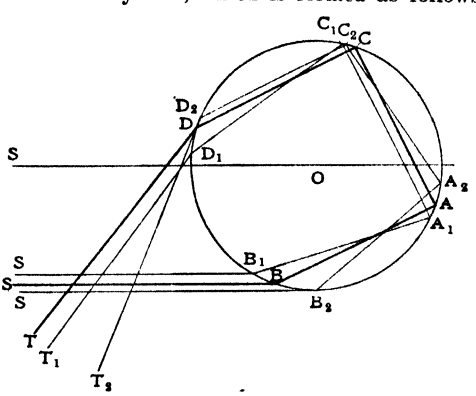

Fig. 3.

by a line of reasoning entirely analogous to that given above it may be shown that light falling upon the opposite half of the drop, as shown in Fig. 3, may undergo two reflections in the drop and emerge in the direction *DT*. Again, when the path is symmetrical in the drop, the angle between *SB* and *DT* is now smaller than for any other case, but larger for violet than for red, and in all cases larger than the angle between *SB* and *CT* in the primary bow. Applying a similar consideration to Fig. 4 and considering it revolved upon the line *TS'* as an axis, it will be seen that colored bands of light will be seen by the eye at *T* of an angular diameter greater than any in the primary bow, and with the violet having the largest and the red the smallest diameter. The angular radius of the red is about 50° 24′ and of the violet 53° 22′. The values of the diameters were calculated by Airy and experimentally verified by Miller. When the conditions are very favorable other fainter bows may be seen inside the primary and outside the secondary bow. These correspond to a still

more complex combination of reflections and refractions of the rays in the drops. A lunar rainbow differs from a solar bow only in the

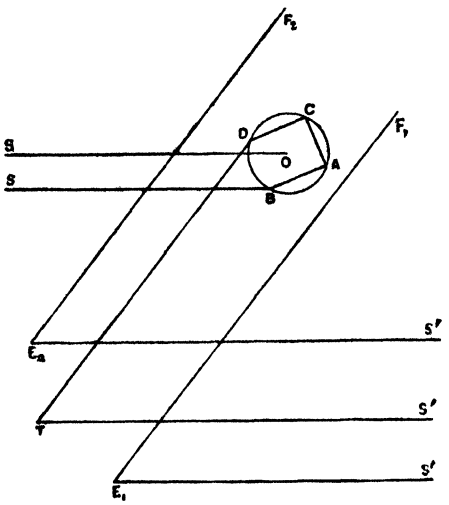

FIG. 4.

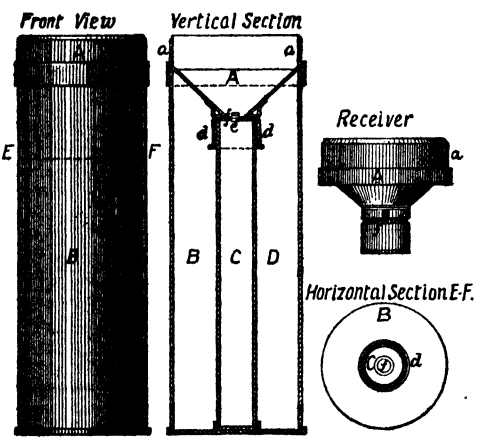
intensity of the light and consequent paleness of the colors.

RAINBOW BIBLE. See POLYCHROME BIBLE.

RAINBOW FALLS. A cataract in the State of Washington. See CHELAN, LAKE.

RAINBOW TROUT. The trout of the coast ranges of the Pacific coast, from central California northward to Puget Sound, which takes its name (*Salmo irideus*) from the large, brilliant spots scattered over its bluish-silvery body. See TROUT; and Plate of TROUT AND GRAYLING.



RAIN CROW. See ANI; and Plate of CUCKOOS.

RAINES, JOHN (1840–1909). An American politician, born at Geneva, N. Y. Graduating (1861) from the Albany Law School, he practiced at Geneva from 1863 to 1867 and thereafter at Canandaigua, N. Y. He served as a member of the State Assembly in 1881–82 and in 1885 and as State Senator in 1886–89, and after serving in the Fifty-first and Fifty-second Congresses (1889–93) was again a member of the State Senate from 1895 until his death, serving as its President pro tempore in 1902–09. Though a Republican in politics he formed an alliance with Democratic Senators in order to defeat Governor Hughes's reform measures. He is chiefly remembered as the author of the Raines Law. See RAINES LAW HOTELS.

RAINES LAW HOTELS. In 1896 a law, the author of which was John Raines (q.v.), was passed by the Legislature of New York State, providing that no liquor should be sold anywhere in the State on Sunday except in a licensed hotel having not fewer than 10 bedrooms. Many saloon keepers attached bedrooms in order to sell liquor on Sunday; their places became known as Raines Law Hotels, and in many cases gained the reputation of being disorderly houses. This condition was investigated in 1905 by a committee of fourteen, and the result was that such hotels were reduced in number from 1400 to 750. The law was amended, forcing those seeking a license to conform to the municipal requirements for hotel buildings.

RAINEY, PAUL J. (?–). An American explorer and hunter. The possessor of a large fortune, Rainey devoted much attention to sport. He hunted grizzly bears in the Rocky Mountains, and after his return from an Arctic expedition (1909), presented to the New York Zoölogical Park two polar bears, a musk ox, seven Eskimo dogs, and a blue fox. During a hunt in Africa, where he covered practically the same route through British East Africa as Colonel Roosevelt, he shot 74 lions in 1910. He took moving-picture films with him on both expeditions, and succeeded in obtaining a complete photographic record of a lion hunt and also films of a rhinoceros fight, and of baboons, cheetahs, giraffes, hyenas, jackals, and ostriches in the natural surroundings. When exhibited in New York, London, and other cities his pictures made a sensation. In 1914 Rainey started on another hunting trip in Africa and India and later exhibited more pictures. He contributed articles on his hunts to the New York *World*, the *Scientific American Supplement*, *Cosmopolitan*, and *Outing*.

RAIN GAUGE. An apparatus to catch the rain and measure its equivalent depth on the ground at any place. The simplest rain gauge consists of a vertical cylinder, into which one may dip a graduated stick and read off the depth of the collected water. Such an instrument, illustrated in the accompanying figure, is furnished by the United States Weather Bureau to its voluntary observers. Other gauges consist essentially of funnels to catch the water, glass bottles to hold it, and slender graduated glass tubes by which to make minute measurements. Self-registering gauges are now made so economically that they are always to be recommended. Those of the simplest pattern employ a tipping bucket, divided into two equal compartments and tipping to the right and left alternately, according as the right or left

SIMPLE RAIN GAUGE, UNITED STATES WEATHER BUREAU PATTERN.

compartment is filled. Each tip corresponds to a definite depth, such as a hundredth of an inch. Another favorite form consists essentially of a weighing machine, and every ounce of rain, or the equivalent depth, is properly recorded on a sheet of paper moved by clockwork. Both forms, as perfected by Prof. C. F. Marvin, are used by the United States Weather Bureau.

The great value of exact data of rainfall and

snowfall in remote unsettled mountain regions in which are often located the headwaters of important waterways or sources of irrigation water has created a demand for a so-called seasonal gauge. Such a gauge must stand all the vicissitudes of exposure in severe weather, the alternations of freezing and thawing, and withal catch and retain for measurement the precipitation in all forms for a month or a season. Satisfactory gauges of this character are not yet available. A gauge devised to keep continuous record for a month is described in the *Monthly Weather Review* (Washington, January, 1915).

It has long been known (since Heberden, 1776) that perfectly reliable gauges collect less rain the greater their height above ground, and it is now satisfactorily demonstrated that this is entirely due to the fact that the gauge causes eddies of wind around and even within its mouth. These eddies carry away the smaller particles of rain or snow to a greater or less extent. On the average of all records that have been made in Europe and America and in all kinds of rain, the deficit of rain recorded by the gauge has been found to increase in proportion to the square root of the altitude above ground. Consequently the correct rainfall can be approximately determined if the observer notes the difference between the catches of two or more similar gauges set at different altitudes above the ground. When a gauge is set up within a shallow saucer-like depression in the ground so that the mouth of the gauge is level with the earth beyond the edges of the pit, or when it is placed on the flat roof of a building and protected on all sides by a high balustrade, good measurements are also obtained. Most elaborate investigations into the peculiarities of rain gauges are published in the annual volumes of Symons, *British Rainfall* (London). For other special studies, see the works of Eastman, United States Naval Observatory; Hellman (Berlin, 1890); Abbe (Washington, 1887, 1892); Boernstein (St. Petersburg, 1890); E. Berg (St. Petersburg, 1870).

RAINIER, rā-nēr′, MOUNT, or MOUNT TACOMA. One of the highest peaks of the United States, exceeded south of Alaska only by Mount Whitney. It is a regular volcanic cone rising from the Cascade Range in the southwestern part of the State of Washington to a height of 10,000 feet above its immediate surroundings and 14,408 feet above the sea (Map: Washington, D 4). Although its crater still emits sulphurous fumes, it is to be regarded as extinct, since the deeply eroded slopes of the mountain show that the last eruption must have occurred at a remote period. The lower slopes are densely forested, but the higher portion carries a series of 14 glaciers, the largest in the United States south of Alaska.

RAINOLDS, rĕn′olz, or **REYNOLDS,** JOHN (1549–1607). An English biblical scholar. He was born at Pinhoe, near Exeter, graduated B.A. at Corpus Christi College, Oxford, in 1568, and became tutor to Richard Hooker. He was afterward (1572–78) reader in Greek at the university. He distinguished himself as a zealous Protestant. In 1593 he was made dean of Lincoln, and from 1598 he was president of Corpus Christi. Rainolds's greatest distinction is the part he took in the Hampton Court Conference (q.v.) and his connection with the translation of the Bible. It was he who urged upon the King the necessity of the latter work, and he occupied a prominent place among the translators; his company was that to which the prophets were assigned.

RAINS, rānz, GEORGE WASHINGTON (1817–98). An American soldier and chemist, born in Craven Co., N. C. He graduated in 1842 at the United States Military Academy and was an instructor there in 1844–46. He served in the Mexican War, was brevetted major for gallant conduct and in 1849–50 fought against the Seminoles. Promoted in 1856 to be captain, he resigned in the same year and in 1861 entered the Confederate army as colonel. He erected the Confederate powder mill at Augusta, Ga., and was promoted to be brigadier general. From 1867 he was professor of chemistry and pharmacy in the University of Georgia and until 1884 was dean of the faculty. He published: *Steam Portable Engines* (1860); *Rudimentary Course of Analytical and Applied Chemistry* (1872); *Chemical Qualitative Analysis* (1879).

RAINSFORD, WILLIAM STEPHEN (1850–). An American Protestant Episcopal clergyman, born in Dublin, Ireland. He took his degree at St. John's College, Cambridge, in 1872, and then was curate of St. Giles's Church, Norwich, until 1876. In this year he came to the United States to take part in gospel-tent meetings in New York. Subsequently he conducted evangelistic services in other cities of the United States, in London, and in Canada, and from 1878 to 1882 was assistant rector of St. James' Cathedral, Toronto. From 1883 till his resignation in 1906 he was rector of St. George's Church, New York, which under his direction developed great institutional activity. After his retirement from the ministry Rainsford became known as an African lion hunter, his experiences being recounted in *The Land of the Lion* (1909). In the field of religious literature he published: *Good Friday Meditations* (1901); *The Reasonableness of Faith, and Other Addresses* (1902); *A Preacher's Story of his Work* (1904); *The Reasonableness of the Religion of Jesus* (1913).

RAINY, rā′nĭ, ROBERT (1826–1906). A Scottish divine and scholar, born in Glasgow. Educated at Glasgow University and at New College, Edinburgh, he became minister of the Free Church at Huntly in Aberdeenshire (1851–54) and of the Free High Church in Edinburgh (1854–62). After serving for 12 years as professor of Church history in Free Church College, Edinburgh, he was elected principal (1874). He was active in the reorganization of the United Free church, made necessary by the decision of the House of Lords, in 1904, depriving the church of its property. Among his publications are: *Three Lectures on the Church of Scotland* (1872; often reprinted); *The Bible and Criticism* (1878); *Presbyterianism, a Form of Church Life and Doctrine* (1894); *The Ancient Catholic Church* (1902). Consult the *Life* by P. Simpson (Edinburgh, 1909).

RAINY LAKE. A lake forming part of the boundary line between Canada and the State of Minnesota and situated 160 miles west of Lake Superior (Map: Ontario, N 13). It is a very picturesque sheet of water, nearly 50 miles long and 5 miles in average breadth. Its surplus waters are drained into the Lake of the Woods (q.v.) by the Rainy River.

RAIS, rā, or **RETZ**, rĕs; *Eng.* rĕts, GILLES DE. See BLUEBEARD.

RAI SANYO, rī sän'yō (1780–1833). A Japanese author and historian, who, in 1827, after sifting 650 native books in 20 years of continuous labor, published in 22 volumes his great work, the *Nihon-Guaishi*. It is written in Chinese and tells the story of the domination of the Empire by the military class from the twelfth century onward, picturing the rise of those military clans, the Taira and Minamoto, that usurped the power of the Mikado, and ending with the establishment of the Tokugawa shogunate in the early part of the seventeenth century. In his other work, the *Nihon Séiki*, also in Chinese, published posthumously, Rai sketches in 16 volumes the history of Japan from 660 B.C. to 1596 A.D., discussing the character and conduct of each sovereign in turn. The effect of these writings was to educate the Japanese Samurai (q.v.) into a bitter hatred of the Shogun and to set forward the revolution of 1868. The name of Rai Sanyo is cut upon the walls of the Boston Public Library as one of the great names in the world's literature. Five books of the *Nihon-Guaishi* were later translated into English in 1872 by Satow (q.v.), British Minister to Japan and afterward Minister to China. Consult B. H. Chamberlain, *Things Japanese* (New York, 1891), and W. G. Aston, *History of Japanese Literature* (ib., 1901).

RAISED BEACHES. See BEACHES, RAISED.

RAISINS (OF. *raisin, reisin*, Fr. *raisin*, It. *racemo*, grape, dried grape, cluster of grapes, from Lat. *racemus*, cluster of grapes; connected with Gk. *ῥάξ, rhax*, berry). The dried fruit of the grape. Raisin grapes are usually the product of warm climates and contain from 28 to 30 per cent of sugar. They are for the most part dried in the sun, and as this requires several weeks of practically rainless weather, the areas of commercial culture are limited to a few countries about the Mediterranean Sea, South Australia, and in the Western Hemisphere to southern California and Chile. The principal and most valuable class of raisins is the muscatel or muscat from Malaga and Valencia in Spain and from California. The seedless raisins of commerce are largely the product of the sultana grapes. The Thompson seedless, which is a promising seedless raisin grape in California, produces raisins a little larger than the sultana. The smallest raisins come from the small currant grape, originally from Corinth. The small black currant of Zante belongs to this class. (See CURRANT.) In the sun curing of standard raisins in California the bunches of grapes are picked by the stems and, all imperfect berries, dirt, etc., having been removed, laid in trays slightly raised so as to incline towards the sun. When about two-thirds dry, which will be at the end of six to eight days, they are turned by placing an empty tray over the filled one and inverting both. The upper or original tray is then removed and the grapes exposed four or five days longer for further drying. At the end of this time the grapes are stored and put through a sweating process of from 15 to 20 days, when they are ready for packing. Sometimes the drying is done entirely in drying houses. In the Mediterranean districts the stems of the ripened bunches are sometimes partially cut and the sun drying begun on the vines. Another method of curing is to dip the bunches into a hot solution of potash lye to which has been added a little salt and olive oil. This method is practiced much more in Europe and Asia Minor than in California. Some of the best raisins of commerce are thus treated. The raisin industry in California has developed rapidly. In 1912 the production amounted to 190,000,000 pounds. Consult Eisen, *The Raisin Industry* (San Francisco, 1890), and G. C. F. Husmann, *Grape, Raisin, and Wine Production in the United States* (Washington, 1902).

RAISULI, rī-sōō'lē (ACHMED BEN MOHAMMED ER RAISUNI, rī-sōō'nē) (c.1875–). A Moroccan bandit, in rank a shereef, or noble descendant of the Prophet. He was born in Tetuan of Berber stock. It was in 1904 that Raisuli became famous for the kidnaping of Ion Perdicaris, a naturalized American. By this act he forced the Sultan to restore his honors and property, of which he had been deprived, and to pay $70,000 ransom, the United States compelling the Sultan to comply with Raisuli's demands. Raisuli had formerly kidnaped Walter Harris, the wealthy London *Times* correspondent in Tangier, and had held him for ransom. In 1907 Kaid Sir Harry Maclean, the Sultan's military instructor, became Raisuli's third captive. For Maclean's release Raisuli demanded and received the governorship of the entire Fassi district, £20,000 cash, large quantities of arms and ammunition, and a promise that his fortress at Zinat should be rebuilt. Later he had to return £15,000 and the Sultan of Morocco £5000. Raisuli was for a time a British subject. Under Raisuli's governorship order was reëstablished in the Fahs, and yet reports persisted of his attempted revolts against higher authority, and at least twice he was reported as certainly dead, the statement being withdrawn each time.

RAJAH, rä'jȧ (Skt. *rājan*, king; akin to Lat. *rex*). Originally a title of those princes of Hindu race who, whether independent or not, governed a territory. It subsequently became a title given by the native governments, and in later times by the British government, to Hindus of rank, and it is now not uncommonly assumed by zemindars or landholders. Other forms are *ras, rana*, and *rawal*, and in Hindustani *rai*. The native princes now frequently assume the title of Maharajah, or great King. According to the ancient social system of India, the rajah belonged to the Kshatriya, or military caste (see CASTE), although the title is now also given to or assumed by members of inferior castes. Consult Foy, *Die königliche Gewalt nach den altindischen Rechtsbüchern* (Leipzig, 1895), and Jolly, *Recht und Sitte* (Strassburg, 1896).

RĀJAŚEKHARA, rä'jȧ-shā'k'hȧ-rȧ (c.900 A.D.). A Sanskrit dramatist. He seems to have been born in the Deccan, doubtless in the region about Vidarbha and Kuntala, whence he came to the court of Mahendrapala, King of Kanauj. He was a Brahman, and his wife, Avantisundari, was a Rajput princess. Four plays are ascribed to Rājaśekhara. The first is a drama in four acts, entirely in Prakrit (q.v.), entitled *Karpūramañjarī* (Cluster of Camphor Blossoms). It was edited by Vamanacarya (Benares, 1872) and, together with the *Bālabhārata*, by Durgaprasad and Parab (Bombay, 1887), and with an admirable English

translation, glossary, and account of the author by Konow and Lanman (Cambridge, Mass., 1901). The second drama is the *Viddhaśālabhañjikā* (Pierced Statue), also in four acts, which much resembles in plot the *Karpūramañjarī*. It has been edited by Vamanacarya (Benares, 1871), by Vidyasagara (Calcutta, 1873; 2d ed., ib., 1883), and by Arte (Bombay, 1886). The remaining plays are based on the two great epics of India, the *Rāmāyana* (q.v.) and the *Mahābhārata* (q.v.). Of these dramas the *Bālarāmāyaṇā* (Exploits of Balarana), in 10 acts, is the more important. It was edited by Sastri (Benares, 1869) and by Vidyasagara (Calcutta, 1884). The last play, the *Bālabhārata* or *Prachandapāndava* (the Wrathful Sons of Pandu), in only two acts, seems to be incomplete. It has been edited by Cappeller (Strassburg, 1885). Consult Apte, *Rājaśekhara: His Life and Writings* (Bombay, 1886).

RĀJATARAÑGINĪ, rä'jä-tä-rän'gē-nē (Skt., river of kings). A work of the Kashmirian poet and historian Kalhana. In eight cantos with a total of about 8000 verses, or slokas, it tells the histories of the various dynasties which ruled Kashmir from the earliest (mythic) period down to the time of the author. Kalhana describes himself as the son of Campaka, the minister of the famous King Harsha, who ruled from 1089 to 1101. The history was written between 1148 and 1150 under the reign of Sinhadeva. Kalhana's chronicle is practically the sole extant work of a truly historical character in the entire range of Indian literature. He reports that he studied 11 historical works, but not content with that, he examined old documents, grants, proclamations, laws, and sacred books. He is especially well acquainted with the great epic, the *Mahābhārata* (q.v.), which he cites frequently. Above all he has the gift of character portrayal. The historians whom Kalhana mentions as his predecessors are all lost, so that the *Rājataraṅgiṇī* is the chief and direct source of information on the ancient history of Kashmir. The first three cantos, which deal with the first two dynasties, are almost wholly legendary. Stein published a critical edition of the text at Bombay in 1892 and a translation in two volumes, with an introduction, commentary, and appendices, at Westminster in 1900. There is also a translation by Y. C. Datta (Calcutta, 1898).

RAJENDRALALA MITRA, rä-jĕn'drä-lä'lä mē'trä, Rajah (1824–91). An Indian Orientalist, born near Calcutta. He early devoted himself to historical and philological research, became librarian of the Bengal Asiatic Society in 1846, its vice president (1861–85), and its president in 1885. In 1878 he was granted the Order of Companion of the Indian Empire. To the *Journal* of the society he contributed many valuable papers. But he was better known for his *Notices of Sanskrit MSS.* (10 vols., 1871); *Antiquities of Orissa* (2 vols., 1875–80); *Buddha Gayá* (1878); *Indo-Aryans* (1881); and the *Sanskrit Buddhist Literature of Nepal* (1882), in which he showed special skill in deducing history from artistic and architectural remains. He was also engaged in the translation of Cākya-Sinha's *Lalita-Vistara* (q.v.) from 1881 to 1896, edited the *Twelve Principal Upanishads* (1891), and contributed more than 80 articles to the *Bibliotheca Indica*.

RAJKOT, räj'kōt'. A town and railway station, capital of a Gujarat native state of the same name, on the Kathiawar peninsula, Bombay, India, 110 miles west of Cambay (Map: India, B 4). It has several educational institutions, including a Rajkumar college for native princes, and there is a bridge of some merit spanning the Aji River. Pop., with cantonment, 1901, 27,159; 1911, 26,412.

RAJNA, rī'nä, Pio (1847–). An Italian philologist, born at Sondrio and educated at Pisa. He taught in *licei* at Modena and Milan and in 1883 became professor of Romance philology at the Florence School for Higher Studies. His works include: *Ricerche intorno ai reali di Francia* (1872); *Le fonti dell' Orlando Furioso* (1876); *Le origini dell' epopea francese* (1884, winning the Diez prize); an edition of Dante's *De Vulgari Eloquentia* (1896, 1897). Consult for complete bibliography, *Studi letterari e linguistici dedicati a Pio Rajna* (Florence, 1911).

RAJON, rà'zhôN', Paul Adolphe (1844–88). A French etcher. He was born in Dijon and studied painting with Pils and etching with Bracquemond. His own style is distinguished by great freedom, delicacy, and precision. In 1873 he went to England, where he afterward passed part of each year, and shortly before his death he visited New York, where he received numerous commissions. His best plates are small and elaborate. They include the portraits of Mrs. Susan Rose, after Watts, and Darwin, after Ouless, his two masterpieces; "The Duel after the Masquerade," after Gérôme; "Man Reading," after Meissonier; "Salome," after Regnault; and "The Blue Boy," after Gainsborough. Rajon contributed powerfully to the great revival of etching in France. See Plate of Tennyson. Consult Stephens, *Twelve Etchings by P. A. Rajon*, with a memoir (1889).

RAJPUTANA, räj'pōō-tä'nä (the country of the Rajputs). A territorial division of north-central India, officially called Rajputana Agency, consisting of 18 native states and two chiefships (Map: India, B 3). Rajputana entirely surrounds the small British province of Ajmer-Merwara. The area of Rajputana is 128,987 square miles. The country comprises two distinct physical divisions, formed by the Aravalli Hills, which intersect it in a northeast and southwest direction. The northwest portion contains about three-fifths of the area and is largely unproductive and sparsely populated; it includes much of the Thar, or Indian desert. Near the southwest end of the Aravallis is Mount Abu, whose principal peak, 5650 feet high, is the highest point between the Himalayas and the Nilgiris. The southeast division of Rajputana is more elevated than the northwest part and more fertile. It nevertheless contains much jungle and rugged rocky country. It is traversed by numerous streams, most of which reach the Jumna; the largest and most important is the Chambal, which flows through the country for about one-third of its course and forms the boundary for another third. The climate, in the main, is dry and very hot; the diurnal range of temperature is considerable, especially in the north, where in the winter frosts often occur at night. At Jaipur the mean temperature in January is 60.9° and in May 91.8°. The rainfall is very unequally distributed. In Jaisalmer and parts of Bikaner and Jodhpur the annual precipitation averages only about 6 or 7 inches. The country is

subject to famine, due to the occasional failure of the southwest monsoon. The worst famines of which there is record were those of 1661–62, 1812–13, 1868–69, and 1899–1900.

The principal occupation of the people is agriculture and the raising of camels, cattle, and sheep. In most of the northwest portion the soil is too light and the rainfall too scanty for successful farming, and irrigation is not practicable, but live stock is raised in considerable numbers. In the southeast portion much better conditions obtain; here the principal crops are bajra (spiked millet) and jowar (great millet); other important crops are wheat, grain, barley, sesame, corn, and the poppy. There are also produced kidney beans, a coarse kind of rice, cotton, hemp, tobacco, indigo, etc. Some commerce is carried on with the surrounding regions. The length of railway in Rajputana (including that in Ajmer-Merwara) was 1576 miles in 1906. Several lines with branches traverse the country.

The population increased from 10,268,000 in 1881 to 12,401,000 in 1891. In the following decade were successive years of drought, with fever epidemics in 1892, 1899, and 1900 and the great famine in the latter year. The 1901 census returned a population of 9,853,366. The 1911 census showed 10,530,432 inhabitants (5,515,275 males, 5,015,157 females). Population by important religions in 1911: Hindu, 8,753,919; Mohammedan, 985,825; Jain, 332,397; animistic, 444,702. The Christians comprised 2548 Indians, 529 Eurasians, and 1179 Europeans. Population by language in 1911: Rajasthani (of which there are at least 16 real dialects), 8,297,636; Hindi, 1,190,083; Gujarati, 503,399; Western Hindi (which includes Hindustani, or Urdu), 434,852; others, 104,462. The principal towns, with 1911 population, are: Jaipur, 137,098; Jodhpur, 59,262; Bikaner, 55,826.

The 18 states and two chiefships comprising Rajputana are governed by their native rulers, most of whom are Rajputs, although only about 6 or 7 per cent of the population is Rajput. The government of India is represented by an officer styled the agent to the Governor-General, who is also the chief commissioner of the British Province of Ajmer-Merwara. The states and chiefships constitute eight political charges —three residencies and five agencies—under the superintendence of the Governor-General's agent. These charges are: Mewar Residency (comprising Udaipur, Banswara, Partabgarh, and Dungarpur), Western Rajputana States Agency (Jodhpur, Sirohi, and Jaisalmer), Jaipur Residency (Jaipur, Kishangarh, and the chiefship of Lawa), Haraoti and Tonk Agency (Tonk, Bundi, and the chiefship of Shahpura), Eastern Rajputana States Agency (Dholpur, Karauli, and Bharatpur), Kotah-Jhalawar Agency, Bikaner Agency, and Alwar Agency.

The several native tribes which occupied Rajputana were captured by the Mohammedans in the eleventh century. In the latter half of the sixteenth and during almost all of the seventeenth centuries they were under the sway of the Moguls. Then came a period of Mahratta rule, which lasted until the early part of the nineteenth century, when Rajputana came under the protection of the British Empire.

RAJPUTS, räj-pōōts′ (Hind. *Rājpūt*, from Skt. *rājaputra*, prince, from *rājan*, king + *putra*, son). The Rajputs, from whom Rajputana, in north-central India, has received its name, number some 11,000,000. The name is an honorary one applied to a congeries of tribes and castes of diverse origin and customs. The Rajputs were originally the feudal conquerors of Western Hindustan. Despite their claim to be descendants of the ancient Hindu Kshatriya caste (see CASTE), it is doubtful whether their Brahmanism is not, like other of their mental and physical qualities, a transferred character. The chief seat of the Rajputs is Rajputana, but they are also numerous in Gujarat, and were formerly powerful in Lower Sind. Consult Crooke, *Tribes and Castes of the Northwest Provinces and Oudh* (Calcutta, 1896); the *India Census Report*, vol. xxii (ib., 1911); J. Seesodia, *The Rajputs* (London, 1915).

RAJSHAHI, räj-shä′hē. A division of Bengal, British India, having an area of 17,356 square miles. It is divided into seven districts: Rajshahi, Dinajpur, Jalpaiguri, Darjeeling, Rangpur, Bogra, Pabna. Pop., 1911, 1,480,587.

RAKE'S PROGRESS, THE. A series of eight paintings by Hogarth (1735), now in the Soane Museum and widely known through the engravings after them. They depict the career of a dissolute man of fashion of that day and are entitled: (1) "The Heir and his Property"; (2) "Surrounded by Artists"; (3) "Tavern Scene"; (4) "Arrest for Debt"; (5) "Marriage"; (6) "Gaming"; (7) "Prison"; (8) "Madhouse."

RAKI, rä′kē′ *or* räk′ē. See ARRACK.

RÁKÓCZY, rä′kō-tsĭ. A Transylvanian family which played an important part in the affairs of Hungary during the seventeenth and eighteenth centuries. GEORGE I RÁKÓCZY (1591–1648) became Prince of Transylvania in 1631. He married the heiress of the Báthory family, thereby acquiring immense riches. In alliance with the Swedes and the French he invaded Hungary in 1644 and succeeded in extorting new guarantees for Hungarian liberties in the Peace of Linz (1645).—A great grandson of George I was FRANCIS II (1676–1735), Prince of Transylvania. His father, FRANCIS I, was elected Prince of Transylvania, but never assumed the office, and died soon after his son's birth. Francis II was a Protestant, married a princess of Hesse, and in 1701 was imprisoned on an accusation of conspiracy to incite rebellion, but he escaped to Poland and headed an insurrection in Hungary against Leopold I (1703) at the time when that prince was engaged in the War of the Spanish Succession. He soon gained possession of Hungary and Transylvania, his operations being facilitated by subsidies obtained by Louis XIV. In 1705 the insurgent parts of Hungary united themselves in a confederation and placed Rákóczy at the head. He had previously been chosen Prince of Transylvania. In 1708 he was defeated by the Austrians; dissensions sprang up in the confederation, and during his absence in Poland (1711) a treaty of peace was negotiated between Austria and the confederation at Szatmár; but to this treaty Francis Rákóczy was never willing to accede. He lived in exile in France and Turkey and died at Rodosto, on the Sea of Marmora, April 8, 1735. Consult his *Mémoires sur les révolutions de Hongrie* (The Hague, 1739).

RÁKÓCZY MARCH. A military air by an unknown composer popularized by the army of

Francis Rákóczy II of Transylvania. The Hungarians adopted it as their national march, and, like the "Marseillaise" in France, it has been placed under the ban of the Austrian government at various periods of political excitement. The air most generally known in Germany and elsewhere out of Hungary as the Rákóczy March, which is introduced by Berlioz in his *Damnation de Faust*, is a weak paraphrase of the original version of Rucziska.

RÁKOSI, rä'kô-sē, JENÖ (1842–). An Hungarian author, born at Acsád, Eisenburg County, and largely self-educated. At 21 he went to Budapest, became a contributor to the *Napló* when that journal was under the charge of Kemény, and in 1866 scored a great success with his comedy, *Æsop*. From 1875 to 1881 he was manager of the Hungarian popular theatre in Budapest and then founded the *Budapesti Hirlap*, a radical paper. His success with *Æsop* made him a leader of the younger literary circle. Among his later works are the tragedy *Andrew and Joanna*, dealing with the murder of Andrew of Anjou by Joanna I of Naples (1885); a study of the nature of tragedy (1886); a very realistic and Zolaesque drama entitled *Magdalene;* a novel, *The Greatest Fool;* and some dramas, comedies, and farces. His collected works in 20 volumes appeared in 1905.—His brother VICTOR (SIPULUSZ) (1860–) became popular as a humorist.

RAKSHASA, rŭk'sha-sà (Skt. *raksas, raksasa*, demon, probably from *raks*, to injure). In Hindu mythology, the name of the principal class of demons or goblins that were supposed to infest the earth. The Rakshasas play an important part in the religion of India from the Vedic period to the present time. They may assume various shapes at will, as of dogs, vultures, owls, and other ill-omened creatures, or of human beings. When they assume human form they are occasionally beautiful, especially as women, but more often they are hideously malformed, with three heads, five feet, monstrous bellies, projecting teeth, crooked thighs, or with feet turned backward. Their special object of maleficence next to children is sacrificial worship, although they ever lurk to destroy the pious, especially by entering his body together with his food. The post-Vedic texts abound in tales of these demons, who there assume the vampire type. They are essentially nocturnal fiends, devourers of corpses and haunters of graveyards. Among themselves the Rakshasas have kingdoms and enormous wealth which they bestow generously on those who win their favor. They are therefore regarded as the attendants of Kubēra. They are constantly at war with the gods, but are routed by Vishnu (q.v.). The origin of these demons is uncertain. Some texts say they were either created by Brahma to guard the waters or were born from his foot, while other accounts call them the children of Pulastya or of Rakshas, son of Kasyapa. Consult: John Muir, *Original Sanskrit Texts*, vol. v (3d ed., London, 1884); Crooke, *Popular Religion and Folk-Lore of Northern India* (2d ed., ib., 1896); A. A. Macdonell, *Vedic Mythology* (Strassburg, 1897); W. J. Wilkins, *Hindu Mythology, Vedic and Purānic* (London, 1900).

RÂLE, räl. See RESPIRATORY SOUNDS.

RÂLE, or **RASLE**, räl, SÉBASTIEN (1657–1724). A Jesuit missionary in North America. He was born in Franche-Comté Jan. 4, 1657, became a Jesuit novice at Dôle in 1675, taught at Carpentras and Nîmes, and in 1689 went to Canada as a missionary. He was stationed for two years at the Abnaki mission of St. Francis, near the mouth of the Chaudière, spent two years among the Illinois Indians, and from 1694 until his death was stationed among the Norridgewocks, near the present Norridgewock, Me. He learned the Abnaki language, acquired great influence over the Indians, and was believed by the English, apparently with good reason, to have been the instigator of the Indian attacks upon the English in this region which resulted in Dummer's War (q.v.). Retaliation by the English culminated (August, 1724) in the murder of Râle. Among Râle's papers carried off by the English was his dictionary of the Abnaki language, upon which he had been engaged for 30 years. The manuscript is preserved in the library of Harvard University. A number of Râle's letters are given in Thwaites (ed.), *Jesuit Relations* (Cleveland, 1903). Consult: Francis Parkman, *A Half Century of Conflict* (Boston, 1892); J. P. Baxter, *The Pioneers of New France in New England* (1894); J. F. Sprague, *Sebastian Rale: A Maine Tragedy of the Eighteenth Century* (Boston, 1906); N. E. Dionne, *Le Père Sébastien Rasle* (Quebec, 1911).

RALEGH, SIR WALTER. See RALEIGH.

RALEIGH, rą'lī. A city, the county seat of Wake County, and the capital of North Carolina, 203 miles northeast of Columbia, S. C., on the Southern, the Seaboard Air Line, and the Norfolk Southern railroads (Map: North Carolina, D 2). It is situated at an elevation of 363 feet and is regularly laid out. The many fine buildings include the State capitol, occupying a prominent site in a square near the city, Administration building, Governor's mansion, Museum and Hall of History, Agricultural and Mechanical College, Department of Agriculture building, State and Supreme Court libraries, Hospital for the Insane and Epileptics, the prison, poultry farm, Confederate Soldiers Home, School for White Blind, School for Negro Deaf Mutes and Blind, and buildings on the fair grounds and the Experiment Farm. Other prominent structures are the Rex, St. Agnes and Leonard hospitals, the municipal building, Federal building, Raney Library, Methodist and Roman Catholic orphanages, and the Country Club. Raleigh is noted for its educational institutions, which include, in addition to 14 public schools, the State College of Agriculture and Mechanic Arts, St. Mary's Peace and Meredith colleges for women, Shaw University (Baptist), and St. Augustine's Normal School and Collegiate Institute, both for negroes, and two business colleges. Of interest also are Pullen and Bloomsbury parks and the Confederate and National cemeteries.

Raleigh is a large cotton and tobacco market and is industrially important, its manufactures in 1909 having an invested capital of $2,027,000 and products valued at $2,376,000. The principal manufactures are cotton goods, yarns, hosiery, underwear, boilers, structural iron, agricultural implements, vehicles, cotton oil, fertilizers, house-building material, furniture, stationery, woodenware, and candy. The city has adopted the commission form of government. It is unique in that its public property and highways are owned by the State and not by

the city. Pop., 1900, 13,643; 1910, 19,218; 1915 (U. S. est.), 19,980. The site of Raleigh was selected for the capital of the State in 1792 and in the same year the city was laid out and named in honor of Sir Walter Raleigh. In 1794 the Legislature met here for the first time, and by Acts of 1795 and 1803 Raleigh was incorporated. General Sherman occupied the city during a part of 1865. Consult Battle, *The Early History of Raleigh* (Raleigh, 1893).

RALEIGH, rą'lĭ, or **RALEGH**, SIR WALTER (c.1552–1618). An English courtier, navigator, and explorer. He was the son of Walter Raleigh of Fardell, was born at East Budleigh, and studied for a year or two at Oriel College, Oxford. In 1569 he was in the Huguenot army at the battle of Jarnac, and he seems to have spent some five years in France. In 1577 he was among the hangers-on at court, and in 1578 he sailed with a small fleet belonging to his half brother, Sir Humphrey Gilbert, upon an alleged voyage of discovery, though the capture of Spanish galleons was probably the real object in view. During 1580–81 Raleigh was a captain in the Irish service and was a member of a commission for governing Munster. Upon his arrival at court with Irish dispatches in December, 1581, his handsome presence and address attracted the attention of Queen Elizabeth. Within a few years he had received appointments and grants which placed him among the most wealthy courtiers. As vice admiral of the western counties of England he was in constant touch with the buccaneering expeditions against Spain, which sailed under pretended commissions from the Prince of Condé or William of Orange. He invested heavily in Sir Humphrey Gilbert's unfortunate expedition to Newfoundland in 1583, and after the latter's death applied to the Queen for a continuation of his patent. The privileges obtained entitled him to fit out expeditions for a period of six years and to take possession of unknown lands in the name of the Queen. In 1584 Raleigh sent Amadas and Barlow to find a place for a settlement. As the Queen refused to allow Raleigh to leave England, he fitted out an expedition consisting of seven ships, which sailed in 1585 under the escort of his cousin, Sir Richard Grenville, and planted a settlement on Roanoke Island, on the Carolina coast, with Ralph Lane (q.v.) as Governor. In June, 1586, however, the settlement was abandoned. Grenville left a new party of colonists, which was reënforced by settlers from England in the year following under John White, but ships sent out by Raleigh failed to reach the colony, and when, in 1590, a relief expedition finally arrived at Roanoke, all trace of the settlement had disappeared. Although the colony was a failure, the enterprise resulted in the introduction of the potato and of tobacco into England.

During 1587 and 1588, when Spanish invasion was threatened, Raleigh was one of a commission to draw up a plan for the defense of the country, and performed important services in levying and forming the militia in the west of England. It is not probable that he took any part in the actions against the Armada. Raleigh was not, as is frequently stated, with Drake in the Portugal expedition in 1589, but at that time was in Ireland, where his friendship with the poet Spenser was formed. In 1591 he was made second in command of an expedition under Lord Thomas Howard to intercept the Spanish plate fleet. Again the Queen refused to let him leave England and his place was taken by Sir Richard Grenville. In 1592 another expedition was equipped. Raleigh had obtained permission to command in person, but at the last moment was recalled and imprisoned in the Tower because of an intrigue with a maid of honor, Elizabeth Throgmorton, which had become known to the Queen. There he remained from July to September, when the expedition returned. Raleigh was permitted to marry, although forbidden to come to court. In 1593 he sat in Parliament as member for Cornwall. In 1594 he sent out an expedition in search of El Dorado (q.v.), which he conceived to be situated in the interior of South America, upon the Orinoco, in the country then designated as Guayana, or Guiana. The effort was unsuccessful, and Raleigh determined to go himself. He fitted out five ships, chiefly at his own expense, and obtained a commission from the Queen to wage war against the Spaniards. He penetrated into the interior, going up the Orinoco a distance of more than 400 miles, but was obliged to return for supplies. Upon reaching England he published his *Discoverie of Guiana* (1596). He brought back quartz containing gold, and the first mahogany seen in England. An expedition was sent against Cadiz in 1596, in which Raleigh distinguished himself by gallantry in action. In 1597 he was one of the commanders of a fleet sent to the Azores to intercept the Spanish treasure ships. Many valuable prizes were secured. The next few years were passed in administrative duties, as member of Parliament, and as Governor of Jersey.

For many years Raleigh had active and powerful enemies at court, and although even Essex, Howard, and Cecil could not permanently discredit him in the eyes of Queen Elizabeth, he met with nothing but ill treatment at the hands of James I. His posts and grants of monopoly were withdrawn, and a few months after the King's accession (1603) he was sent to the Tower on the charge of being privy to the plots contrived against the King's person by Lord Cobham and the Spanish agent, Count Aremberg. He was condemned under the harsh procedure of *læsa majestas* trials for failing to produce conspicuous proofs of innocence. A reprieve was granted and his personal property restored, but he still remained a prisoner in the Tower until his petition to be allowed to lead another expedition to the Orinoco was granted in 1616. The Spanish Ambassador protested, and Raleigh was ordered not to engage in any hostilities against the Spaniards on penalty of his life. He sailed on June 17, 1617, and encountered an unbroken series of misfortunes. During the voyage the Spanish settlement of San Tomás was attacked and destroyed. Upon his return to England he was at once arrested, and after some deliberation was executed, by virtue of the former sentence, on Oct. 29, 1618. During his long imprisonment in the Tower he wrote the *History of the World*, one of the monuments of Elizabethan literature. He also wrote treatises on religious and philosophical subjects and several poems of merit.

Bibliography. His collected works, including a life by Oldys and Birch, were published in London in 1829, and his correspondence is included in Edward Edwards, *Sir Walter Raleigh* (2 vols., ib., 1868). Consult also: E. W.

Gosse, *Raleigh*, in "English Worthies Series" (ib., 1886); Martin Hume, *Sir Walter Raleigh* (ib., 1897); William Stebbing, *Sir Walter Raleigh* (ib., 1899); I. A. Taylor, *Sir Walter Raleigh* (New York, 1903); Sir Sidney Lee, in *Great Englishmen of the Sixteenth Century* (ib., 1904); Hugh De Sélincourt, *Great Raleigh* (ib., 1908); F. A. Ober, *Sir Walter Raleigh* (ib., 1909); Beatrice Marshall, *Sir Walter Raleigh* (ib., 1914). His poems have appeared in several editions, a recent one edited by John Hannah (ib., 1892).

RALEIGH, SIR WALTER (?–). An English literary historian and critic, educated at University College, London, and at King's College, Cambridge. For a time he held the chair of modern literature at University College, Liverpool, and that of English literature at Glasgow University. Subsequently (1904) he was made professor of literature at Oxford, where he was fellow of Merton College in 1914. Raleigh was knighted in 1911. In 1915 he delivered the Vanuxem lectures at Princeton on "The Origins of Romance" and "The Beginnings of the Romantic Revival," and lectured on Chaucer at Brown, which gave him the degree of Litt.D. His principal writings are: *The English Novel* (1894), an excellent brief history of its subject; *Robert Louis Stevenson: An Essay* (1895); *Style* (1897); *Milton* (1900); *Wordsworth* (1903); *The English Voyagers* (1904); *Shakespeare* (1907); *Six Essays on Johnson* (1910).

RAL'LENTAN'DO (It., slackening). A musical term, abbreviated *rallent.* or *rall.*, indicating a gradual relaxing or diminution of time.

RALPH, JAMES (c.1695–1762). An American poet and pamphleteer, born in Philadelphia. He became an intimate friend of Benjamin Franklin, whom he accompanied to London in 1725. There he tried to support himself by writing, but with little success. Pope satirized his poem *Night* (1728) in the *Dunciad*. Afterward Ralph attached himself to the Prince of Wales and used his pen to assist his friends the Whigs in every possible way. When George III ascended the throne he was given a pension. His works include: *Zeuma* (1729), a poem; *The Groans of Germany* (1734), a political pamphlet; *The Use and Abuse of Parliaments* (1744); *History of England during the Reigns of King William, Queen Anne, and George I* (1744); poems, essays, and plays.

RALPH, JULIAN (1853–1903). An American author and journalist, born in New York City. He joined the staff of the New York *Daily Graphic* in 1875, but within a year he left it and was on the staff of the New York *Sun* until 1895, gaining a world-wide reputation as a correspondent. In 1896 he became London correspondent for the New York *Journal*, was with the Turkish armies during the Græco-Turkish War in 1897, and in 1899 went to South Africa as war correspondent for the London *Daily Mail*. Besides numerous magazine articles his publications include: *Cuba* (1882); *The Sun's German Barber* (1883); *Dutchman or German* (1889); *Along the Bowstring* (1891); *On Canada's Frontier* (1892); *Chicago and the World's Fair* (1893); *Our Great West* (1893); *People we Pass* (1896); *Dixie* (1896); *Alone in China* (1897); *A Prince in Georgia* (1899); *Towards Pretoria* (1900); *An American with Lord Roberts* (1901); *War's Brighter Side* (1901); *The Millionairess* (1902), a novel; *The Making of a Journalist* (1903).

RALPH ROISTER DOISTER. A comedy by Nicholas Udall (q.v.).

RAM (AS. *ram*, *ramm*, Ger. *Ramme*, battering ram, OHG. *ram*, *rammo*, Ger. *Ramm*, male sheep), MARINE. It was evident to the ancients that a ship, if given a sufficient rate of speed, could deal the enemy's vessel a more disastrous blow than could any weapon then known, so that the use of the ram is as ancient as maritime war. The oar-propelled galley furnished requisite speed and control for ramming, and to further the efficacy of craft of this sort they were furnished with beaks. The short ranges at which ancient weapons were dangerous were favorable to the use of the ram, and most of the celebrated actions of the galley period were decided by it. But the advent of gunpowder rapidly effected a change. With the introduction of sail propulsion ramming was nearly given over, but when steam came to the front it reappeared in a form which soon reached its highest development. The ram, however, has never accomplished much except under special conditions. W. Laird Clowes, in 1894, tabulated all cases of ramming or attempted ramming which had taken place in modern naval warfare up to that time and he found that: (*a*) when both vessels have had plenty of sea room and were able to steer, not one of the 32 attempts to ram were wholly successful—indeed, the ships attempting to ram received slightly the graver injuries; (*b*) where the ramming took place in waters which were too contracted to admit of free manœuvring, 28 per cent of the vessels attacked by ramming were sunk, as were 3 per cent of the attacking ships, while the percentages of the attacked vessels which were seriously injured was double that of the ships attempting to ram. The torpedo and the enhanced gun power of recently built ships both serve to weaken the influence of the ram upon naval operations, leaving its probable effective use confined to unusual and special conditions. One of these is the attack of submarine boats. During the Great European War many submarines were known to have been destroyed, some of which were sunk by ramming.

It is difficult to determine who first suggested ramming by steam vessels. One of the earliest designs is that of Capt. Samuel Barron of the United States navy, which was made in 1827 and a model of which is preserved at the Naval Academy, Annapolis. At this time, however, there was but one steam man-of-war in existence, and it was not until the Civil War broke out that attention was seriously attracted to the importance of ramming. The *Merrimac* was fitted with a ram with which she sank the *Cumberland*, and the *Monitor* was designed to use her sharp bow for ramming if opportunity offered. After the sinking of the *Cumberland* many war vessels were supplied with rams, and ramming became a favorite method of attack during the latter part of the Civil War. The battle of Lissa (1866) was won by a determined use of the ram, but the success attained was partly due to accident and partly to the bad handling of the Italian ships. Since the perfection of the automobile torpedo and the development of the submerged torpedo tube, most naval officers have regarded ram attack as a last, desperate resort; and the teachings of the Russo-Japanese War (q.v.) are so particularly

unfavorable to the employment of the ram that in the design of nearly all the latest ships it has been omitted, though the ram-shaped bow is still preserved in recent American battleships, and the size and amount of the projection beyond the stem is increased, because this form gives the least wave-making resistance.

The marine ram as a special vessel designed to use its beak as its principal weapon of offense appears to have had few advocates after the time of Captain Barron's ram in 1827 until (as already mentioned) late in the Civil War. Admiral Ammen of the United States navy was a strong advocate of the purely ram type of vessel, and one of his designs was embodied in the U.S.S. *Katahdin*. About 1880 the British built the torpedo ram *Polyphemus*, which was like the *Katahdin* in many respects. No other large ram vessels have been built which were not also well armed with guns.

Bibliography. *Journal of the Royal United Service Institution*, particularly 1875, but also various later volumes (London); Elliot, *The Ram* (ib., 1884); Noel, *The Gun, Ram, and Torpedo* (Portsmouth, England, 1888); W. L. Clowes, "The Ram in Action and Accident," in *Proceedings of the United States Naval Institute*, No. 69 (Annapolis, 1894); Bennitt, *The Monitor and the Navy under Steam* (Boston, 1900); also *Proceedings of the United States Naval Institute* (Annapolis, bi-monthly).

RAMA, rä'mȧ, or **MELCHORA**, mĕl-chō'rȧ. An interesting tribe formerly upon the Rama River on the Caribbean coast of southern Nicaragua and now gathered upon a small island in Bluefield lagoon. They are related linguistically to the wilder Guatuso of northern Costa Rica. They are now on the verge of extinction, having numbered only about 250 persons in 1891, all Christianized by Moravian missionaries and described as being of fine physique and great strength.

RAMADAN, rä'mȧ-dän' (Ar. *Ramaḍān*, from *ramiḍa*, to be burning hot). The ninth month in the Mohammedan year. Mohammed is said to have had his first revelation in Ramadan, and every Moslem is therefore enjoined to keep a strict fast during this month from dawn to sunset of every day and to abstain from eating, drinking, smoking, bathing, smelling perfumes, and other bodily enjoyments. During the night, however, the most necessary wants may be satisfied, and this permission leads to nightly indulgences in all sorts of enjoyments. As the Mohammedan year is a lunar one, the months rotate through the different seasons, and the fast of Ramadan becomes a severe affliction upon the faithful when the month happens to fall in the hot days of the summer. The sick, travelers, and soldiers in time of war are temporarily released from this duty, though it must subsequently be performed during an equal number of days. Nursing and pregnant women and those to whom it might prove really injurious are exempted from fasting. During this month 20 additional prayers are said after the night prayer. Very pious believers seclude themselves and devote their time to the reading of the Koran. The fast is followed by the feast of Beiram (q.v.). In establishing this fast Mohammed seems to have been guided by the Christian institution of Lent, which in the early Church varied in length from four to six weeks. The principal passages treating of the fast of Ramadan are found in the Koran, sura ii, 179–184. Consult: D'Herbelot, *Bibliothèque orientale* (Paris, 1781); Julius Wellhausen, *Reste arabischen Heidentums* (2d ed., Berlin, 1897); C. I. Huart, *Histoire des Arabes*, vol. i (Paris, 1912).

RAMAKA, rȧ-mä'kȧ. See HATASU.

RAMAKRISHNA, rä'mȧ-krĭsh'nȧ (1833–86). A Hindu yogi or ascetic. He was born at Kamarpukar, near Jahanabad, in Bengal, and was the youngest son of a poor Brahmanic family. At 16 years of age he attended the school of his eldest brother, Ramkumar Chattopadhyaya, at Calcutta, and followed him when he was appointed priest to the temple of the goddess Kali, founded in 1853 at Dakshinesvara. He became a devotee of Kali and began a course of 12 years of asceticism. The fame of his humility and wonderful teachings spread, and people of all classes, including Keshub Chunder Sen, fell under his spell. Consult Max Müller, *Ramakrishna: His Life and Sayings* (New York, 1899), and Abhedānanda, *The Sayings of Sri Ramakrishna* (ib., 1903).

RAMALEY, răm'ȧ-lĭ, FRANCIS (1870–). An American botanist and hygienist. He was born at St. Paul, Minn., and was educated at the university of that State (S.B., 1895; Ph.D., 1899), where he was an instructor in botany in 1894–98. He served as assistant professor of biology in 1898–99, and thereafter as professor, at the University of Colorado. In 1909 he became director of the Mountain Laboratory at Tolland, Colo., and in 1911–12 was president of the board of education of Boulder. Ramaley is author of *Wild Flowers and Trees of Colorado* (1909) and *Prevention and Control of Disease* (1913).

RAMAYANA, rȧ-mä'yȧ-nȧ (Skt., *Rāmāyaṇa*, story of Rama). The second of the two great epic poems of mediæval India. It is in the main the work of a single author, Valmiki. Herein lies the important distinction between it and the *Mahabharata* (q.v.). Though all its parts are not from the same hand, and though it is not entirely free from digressions or episodes, the poem tells a connected story of great interest in epic diction of the highest order; it ranks with the great epics of the world, and is even to this day the favorite poem of the Hindus.

The central figures in the epic are Rama and his devoted wife, Sita; the main event, the conquest of Lanka (probably Ceylon).

The *Ramayana* consists of seven books in about 24,000 verses or slokas. Notwithstanding the essential unity of the entire epic, the first and last books are in a certain sense secondary. The first deals with Rama's youth up to his marriage with Sita; the last with Rama's life from his restoration to his death. In these Rama is apotheosized and identified with the god Vishnu (q.v.) as one of his incarnations. The main body of the epic (books ii–vi) deals with Rama as a national hero, the embodiment especially of the ethical ideals of the people. But the Rama-Sita story itself, notwithstanding that it presents itself outwardly as an heroic legend, is justly under the suspicion of containing one or more mythic roots, though the exact formulation and explanation of them are perplexing. In the Veda Sita (q.v.) is the personified furrow of the plowed field, the beautiful wife of Indra or Parjanya. Hence Rama has been identified with Indra (q.v.), the slayer of demons, especially of the demon Vritra. In the epos Ravana is supposed to have taken

the place of Vritra. According to another interpretation the legend is a mixture of culture and nature myth, typifying the spread southward towards Ceylon of Brahmanical civilization. The demons who disturb the ascetics in their holy practices are the barbarous tribes who oppose Aryan culture. In any case these mythical and other motives cannot have served as more than mere suggestions for the story.

The *Ramayana* exists in three recensions which differ from one another in their reading, in the order of their verses, and in having each more or less lengthy passages that are wanting in the others. The best known and most popular of these is also the most original version of the poem. Its home is in the northwest and south of India. It has been edited a number of times in India, and is most accessible in the second Bombay edition of 1888. It has been edited by the Italian scholar Gaspare Gorressio, who added to his edition a somewhat free Italian translation in poetical prose (10 vols., Paris, 1843–67). The second recension arose in Bengal. The third recension, apparently originating in the west of India, is as yet unpublished, but is accessible in manuscripts at Berlin and Bonn. The poetic translation of the Anglo-Indian scholar Griffith in five volumes (Benares, 1895; into Eng. prose by M. N. Dutt, 3 vols., Calcutta, 1894) is based upon the second recension.

Dutt, *The Epic of Rāma, Prince of India*, condensed into English verse (London, 1899); E. W. Hopkins, *The Great Epic of India* (New York, 1901); Roussel, *Le Rāmāyana* (Fr. trans., 3 vols., Paris, 1903–09); "Les anomalies du Rāmāyana," in the *Journal asiatique* (ib., 1910); A. A. Macdonell, *History of Sanskrit Literature* (London, 1913).

RAMBAUD, răn'bō', ALFRED NICOLAS (1842–1905). A French historian, born at Besançon. He was a pupil of the Ecole Normale, and after receiving his degree in 1870 traveled in Russia and taught history at Caen and Nancy (1871–79). He was chief of a department in the Ministry of Public Instruction in Ferry's cabinet in 1879–81 and held the portfolio of Public Instruction in the Méline cabinet in 1896–98. He became professor of contemporary history at the Sorbonne in 1883 and was elected to the Academy of Moral Sciences in 1897. His works include: *La Russie épique* (1876); *Histoire de la Russie* (1878), translated by Lang as *A History of Russia* (1879); *Histoire de la civilisation française* (1887); *Histoire de la civilisation contemporaine en France* and *Histoire de la révolution française, 1789–99* (1895); *Expansion of Russia: Problems of the East and Problems of the Far East* (1904). With Lavisse he directed the publication of the *Histoire générale du IVme siècle à nos jours* (1893–1901).

RAMBAUT, răm'bŏ, ARTHUR ALCOCK (1859–). An English astronomer, born at Waterford and educated at Trinity College, Dublin, where he was assistant in astronomy from 1882 to 1892. He was then Andrews professor of astronomy at the University of Dublin and royal astronomer of Ireland until 1897, when he was appointed Radcliffe observer at Oxford. His valuable astronomical papers are to be found in *Transactions* and *Proceedings* of the Royal Dublin Society, of the Royal Irish Academy, and of the Royal Astronomical Society, and in the publications of Radcliffe Observatory.

RAMBERG, răm'bĕrk, ARTHUR, BARON (1819–75). A German genre painter and illustrator, born in Vienna. He studied at the School of Art in Prague under Franz Kadlik and others, then in Dresden (1844) under Julius Hübner, and was influenced by Schwind. His great coloristic talent is most successfully displayed in "Women of Dachau on Sunday" (1853); "Morning Devotion in the Mountains" (1855); "Hide and Seek," "After the Masked Ball" (1858); "Meeting on the Lake" (Metropolitan Museum, New York); and "Invitation to Boating." In 1860 Ramberg was appointed professor at the School of Art in Weimar, where he executed the historical painting "Court of Emperor Frederick II at Palermo" (1866, Maximilianeum, Munich) and where he also painted the "Fairy Tale of the Frog King" (Weimar Museum). He earned fame as an illustrator, notably with the drawings for Cotta's jubilee edition of Schiller's poems and with the cycles of grisailles to Goethe's *Hermann und Dorothea* and to Voss's *Luise*. In 1866 Ramberg became professor at the Munich Academy. Consult Rosenberg, *Geschichte der modernen Kunst*, vol. iii (Leipzig, 1889), and Richard Muther, *History of Modern Painting* (New York, 1907).

RAMBLER, THE. A periodical published twice a week from 1750 to 1752 by Dr. Samuel Johnson, who wrote all the numbers but five.

RAMBOUILLET, răN'bōō'yā', HÔTEL DE. The house which, towards the middle of the seventeenth century, was the most famous meeting place of the cultivated society of Paris. The house itself had previously been known as the Hotel Pisini, the residence of the Marquis of that name, whose daughter, Catherine de Vivonne, received it as a part of her dowry on her marriage in 1600 with the future Marquis de Rambouillet. Dissatisfied with the style of the house, she had it entirely remodeled between 1610 and 1617. After its completion the young beauty, weary of the crowded assemblies of the Louvre, decided to remain at home and make her own house supply all the society she desired. Here, for a generation, assembled the most brilliant coterie in Paris, known, from their insistence on refinement in speech and manners, as *précieux*. Among early frequenters were Richelieu, Malherbe, Balzac, Corneille, Racan, Voiture, and, somewhat later, Bossuet, Ménage, Chapelain, Scarron, Saint-Evremond, Benserade, and La Rochefoucauld. There too were trained the ladies who were to found literary salons in their turn—Madame de la Fayette, Madeleine de Scudéry, the Duchess of Longueville, and Madame de Sévigné. Its influence was altogether refining, but it led in some to an exaggeration which resulted in a most ludicrous affectation. It must be borne in mind that Molière, in his *Précieuses ridicules*, was satirizing not this accomplished group, but the exaggerations of their pedantic imitators. From a little before 1620 the society which assembled here represented all that was best and brightest in the social life of the time. Its lustre began to decline after the marriage (in 1645) of the daughter of the house to the Duc de Montausier, and the troubles of the Fronde, the death of M. de Rambouillet in 1652, and his wife's increasing age and infirmities put an end to it.

RAMBOV, råm-bôf'. A town in Russia. See ORANIENBAUM.

RAMEAU, rà'mô', JEAN (1858–). A French poet and novelist, whose real name was Laurent Lebaïgt. He was born at Gaas (Landes). He began with a volume of fantastic verse, *Poèmes fantasques* (1883), which was followed by *La vie et la mort* (1886), *La chanson des étoiles* (1888), *Les féeries* (1897), etc. Of his 40 novels the following are probably the best known: *L'Amant honoraire* (1895); *Ame fleurie* (1896); *La vierge dorée* (1901); *La route bleue* (1912); *Le fuseau d'or* (1914).

RAMEAU, JEAN PHILIPPE (1683–1764). A French composer and organist, who is to be credited with the foundation of the modern science of harmony. He was born of a musical family at Dijon. He studied the organ under Marchand in Paris and became organist at Lille and at Clermont. His theories of the relationship of sounds he published in 1722 under the title of *Traité de l'harmonie,* and in 1726 he published *Nouveau système de musique théorique.* The main points of his new harmonic theory were the reduction of all possible chords to a limited number of fundamental chords resting upon an imaginary fundamental bass, which was not the same as thorough or general bass, but a series of root tones which underlie the various chord progressions. These theories received the formal approval of the Academy in 1737, and had much to do with the development of the theory of music. Rameau's dramatic composition *Samson,* with a libretto by Voltaire, was rejected at the Opéra on account of its biblical subject. His second attempt, *Hippolyte et Aricie,* obtained a hearing in 1733, but was not immediately successful, and he was tempted to abandon dramatic composition. His next effort, the opera ballet *Les Indes galantes* (1735), won public favor. *Castor et Pollux* (1737) is usually considered his best work. Other operas followed in quick succession and held the French stage for a generation, besides winning for him from Louis XV the position of court composer, especially created for him. His other compositions include: *Les talents lyriques* (1739); *Dardanus* (1739); *La princesse de Navarre* (1745); *Zaïs* (1748); *Pygmalion* (1748); *Platée* (1749); *Daphné et Eglé* (1753); *Zéphire* (1757); *Les surprises de l'amour* (1759); *Les Paladins* (1760). He wrote several books of compositions for the clavier which are of the greatest importance in the history of piano music. As developments of his operatic works for the stage he produced *Génération harmonique* (1737) and *Démonstration du principe de l'harmonie.* His services to music were acknowledged by the erection of a statue to him in his native town in 1880. Under the editorship of Saint-Saëns and Malherbe a complete edition of Rameau's works was in course of publication (1915) by Durand et Fils in Paris. Consult: A. Pougin, *Rameau: sa vie et ses œuvres* (Paris, 1876); L. Laloy, *Rameau* (ib., 1908); L. de la Laurencie, *Rameau* (ib., 1908); Ch. Malherbe, *Biographie* (in vol. i of the complete works).

RAMÉE, rà-mā', LOUISE DE LA (generally known by her pen name, OUIDA) (1839–1908). An English novelist, whose father was French and whose mother English. She expanded her surname Ramé into de la Ramée, and her pseudonym Ouida was her own childish pronunciation of Louisa. Born at Bury St. Edmunds, Jan. 1, 1839, she moved to London in 1859 and in that year made her literary début in Harrison Ainsworth's *New Monthly Magazine* with a short story entitled "Dashwood's Drag." Her first novel, *Held in Bondage* (1863), first appeared in the same magazine. A parody in *Punch* of her novel *Strathmore,* that followed in 1865, together with Lord Strangford's denunciation of her novels in the *Pall Mall Gazette,* assisted greatly in establishing her vogue. Ouida was a born story-teller, picturesque and at times strikingly dramatic. Her romances are often false in their interpretation of the significance of conduct, and in sentiment they are sham and tawdry. Ouida herself had little more than a bowing acquaintance with the glittering military and fashionable life she delighted to depict. The Italian peasant, however, she knew at first hand and presented with faithfulness and sympathy. She loved dogs, and in certain of her stories has presented memorable pictures of them. After 1860 Ouida lived much in Italy, settling there permanently in 1874. Unable to handle money with care, and after 1890 steadily less popular, Ouida died in poverty at Viareggio, Jan. 25, 1908. In later life she wrote considerably for the magazines and reviews on English, French, and Italian literature. An ardent antisuffragist and antivivisectionist, she put her convictions on these subjects into *Views and Opinions* (1895) and *Critical Studies* (1900). Many of Ouida's novels had an immense vogue in English, and several of them also in French, Italian, and Hungarian. The most popular, in addition to those already named, were: *Idalia* (1867); *Under Two Flags* (1867); *Tricotrin* (1869); *Puck* (1870); *A Dog of Flanders, and Other Stories* (1872); *Two Little Wooden Shoes* (1874); *Moths* (1880); *Bimbi* (1882), children's stories, one of which, *The Nurnberg Stove,* is a classic of its kind and is to be had separately. Consult: Edmund Yates, *Celebrities at Home* (1st series, London, 1877); S. M. Ellis, *W. H. Ainsworth and his Friends* (ib., 1911); Elizabeth Lee, *Ouida* (New York, 1914).

RAMENGHI, rà-měn'gē. See BAGNACAVALLO.

RAM'ESES, or **RAM'SES** (Gk. Ῥαμέσσης, *Rhamessēs,* Ῥάμσης, *Rhamsēs,* Ῥάμψης, *Rhampsēs*). The name of 12 kings of Egypt of dynasties XIX and XX.

RAMESES I, the first King of dynasty XIX, ruled for a brief period about 1355 B.C. Beyond the fact that he waged war in Nubia, where he left an inscription, and constructed some of the buildings at Karnak, little is known of his reign. His mummy was found, in 1881, at Deir el Bahri. His son, Seti I (q.v.), built the Memnonium at Kurnah (q.v.) in honor of his father's memory.

RAMESES II (c.1340–1273 B.C.), the son of

Seti I and the grandson of Rameses I, figures in history as the *grand monarque* of Egypt. The earlier portion of his reign was spent in war with the Cheta or Hittites, who occupied the former Asiatic possessions of Egypt as far south as the northern border of Palestine. In his second year he reconquered Phœnicia as far as Berytus, and left a memorial inscription on the banks of the Nahr el Kelb. In his sixth year he moved against the important city of Kadesh on the Orontes, but, though he was successful in an engagement with the enemy's chariot force, no decisive result was obtained and the city did not surrender. In the fighting around Kadesh Rameses with a detachment of his troops was cut off from the main body and was for a time in personal danger. His exploits on this occasion form the theme of the so-called poem of Pentaur (q.v.), in which they are celebrated with gross exaggeration. The war continued with varying success for a number of years, but finally a peace was arranged by the terms of which Egypt retained Phœnicia as far as Byblus and a strip of territory to the north of Palestine. In his twenty-first year Rameses concluded an offensive and defensive alliance with the King of the Hittites and cemented it by marrying his daughter. Of the treaty two copies have been discovered on the temple walls at Thebes, and a Hittite copy was discovered in 1906 in Babylonia cuneiform on a tablet found at Boghaz-kieui. The remainder of Rameses's long reign was peaceful and is chiefly remarkable for the large number of important edifices constructed by the King, who, as a builder, surpassed all other Pharaohs. By his many wives and concubines he had many children, 162 being mentioned by name on the monuments. He died after a reign of 67 years and his mummy, at first buried at Bîbân el Mulûk, was subsequently concealed from grave robbers in the shaft at Deir el Bahri, where it was found in 1881. Rameses II was formerly regarded as the Pharaoh of the oppression, and his son, Mer-en-Ptah, as the Pharaoh of the Exodus; see, however, the section on ancient history under EGYPT. See Plate with EGYPTIAN ART.

RAMESES III, son of Setuakht, the second Pharaoh of dynasty XX, reigned for 33 years from about 1230 B.C. or perhaps a little later. In the fifth year of his reign he expelled the Libyans, who had taken advantage of the weakness of Egypt at the end of dynasty XIX to establish themselves in the western part of the delta. In the eighth year of his reign he attacked and made tributary the piratical Pulastæ or Philistines and other "peoples of the sea," who had recently effected a settlement in Palestine and were making incursions into the delta. Three years later he repelled a Libyan invasion, and in his twelfth year he raided the Amorite district north of Palestine. From this campaign he brought back rich booty which he lavished upon the temples of Egypt and especially upon the national sanctuary of Ammon of Thebes. He made, however, no permanent conquests in Asia, and Egyptian influence in that quarter soon sank to a very low ebb.

Rameses III, like Rameses II, was a great builder. The great temple of Medinet Habu (q.v.) is his work, and he restored, or made additions to, temples in many parts of Egypt. The King's mummy was among those found at Deir el Bahri in 1881. He was followed by nine kings of little importance, all bearing the name of Rameses (RAMESES IV–XII), whose reigns mark a steady decline in the affairs of Egypt. Through the enormous wealth lavished upon the temples by many successive Pharaohs, the ecclesiastical interest had by this time attained a preponderating influence in the state, and the feeble successors of Rameses III were mere puppets in the hands of the powerful priesthood of Ammon. Finally, about 1100 B.C. Her Hor (q.v.), the high priest of Ammon of Thebes, dethroned Rameses XII and made himself King in name as well as in fact.

Bibliography. E. Meyer, *Geschichte des alten Aegyptens* (Berlin, 1887); E. A. T. Wallis Budge, *A History of Egypt* (New York, 1902); Müller, *Die alten Aegypter als Krieger und Eroberer in Asien* (Leipzig, 1903); W. M. Flinders Petrie, *A History of Egypt* (New York, 1905); J. H. Breasted, *Ancient Records of Egypt* (Chicago, 1906); id., *A History of the Ancient Egyptians* (New York, 1908).

RAM'ESSE'UM (Neo-Lat., from *Ramcses*). A temple built by Rameses II on the west bank of the Nile at Thebes and dedicated to the god Ammon. The temple is now in a ruined condition. The entrance is formed by a great pylon of which the inner face is well preserved and is covered with sculptures representing scenes from Rameses's Syrian campaigns. Near the entrance to the inner court lie the broken fragments of a colossal statue of Rameses II. Consult: K. R. Lepsius, *Denkmaler aus Aegypten und Aethiopen* (Berlin, 1850–59); A. F. F. Mariette, *Monuments of Upper Egypt* (London, 1877); Johannes Dümichen, *Geschichte des alten Aegyptens* (Berlin, 1878); Quibell, *The Ramesseum* (London, 1898); W. M. Flinders Petrie, *A History of Egypt* (New York, 1905).

RAMESWARAM, rä-mēs'wŭ-rŭm', **RAMISSERAM,** or PAMBAM. A small island in the Gulf of Manar, forming the west end of the line of black rocks stretching from the Indian peninsula to Ceylon and known as Adam's Bridge. It is low and sandy and covers an area of 53 square miles. At the town of the same name the temple, with a magnificent gopura 105 feet high, is believed to have been founded by Rama and has been visited for centuries by pilgrims from all over India. The chief town is Pambam, at the west end. Pop. (island), 1911, 23,605, chiefly Brahmins.

RA'MIE (Malay name), *Bœhmeria nivea;* sometimes called in trade CHINA GRASS. A

RAMIE.

nettle-like but nonstinging East Indian shrub of the family Urticaceæ. The upright stems

produced by the perennial rootstock furnish one of the most durable of vegetable fibres. It is stronger than hemp and almost equals silk in fineness and lustre. The fibre is highly valued for making cordage, nets, various fabrics, and paper which is especially esteemed for banknote making. The plant requires a hot, moist, equable climate and a rich damp soil. It is propagated by seeds, cuttings, layers, and division. When the leaves can be readily stripped off the stems are harvested and the fibres removed by machinery or, either before or after boiling in chemicals, by hand—either process being costly or otherwise unsatisfactory. The crop can be raised in the southern United States, but the cost of obtaining the fibre is against the establishment of the industry and foreign fields are relied upon to supply American needs. Rhea, *Bœhmeria tenacissima*, is a very similar fibre plant. Consult: S. H. Slaught, *Promotion of Ramie Industry* (Washington, 1908); H. A. Carter, *Ramie (Rhea) China Grass: The New Textile Fibre* (New York, 1910). See BŒHMERIA; and Colored Plate of FIBRE PLANTS, accompanying article HEMP.

RAMILLIES, rȧ'mē'yē'. A village of Brabant, Belgium, 13 miles north of Namur and 28 miles southeast of Brussels (Map: Belgium, C 4). It is memorable as the place near which, on May 23, 1706, one of the most important battles of the War of the Spanish Succession was fought. The French forces were under the command of Marshal Villeroi and the Elector of Bavaria, while Marlborough led the troops of the allies. Villeroi, after a battle of three hours and a half, was defeated, with the loss of almost all his cannon, the whole of his baggage, and 13,000 men in killed and wounded, the loss of the allies being only about 3500.

RAMISSERAM. See RAMESWARAM.

RAMLER, räm'lĕr, KARL WILHELM (1725–98). A German poet, of the rationalistic school, born at Kolberg. He studied theology at the University of Halle and afterward devoted himself to literature. In 1748 he was made professor at the Military Academy of Berlin, where he lectured on logic and literature. He was considered a master of poetical diction. King Frederick William II nominated him member of the Berlin Academy of Sciences, granted him a pension of 800 thaler per annum, and appointed him assistant director of the National Theatre in 1790, the sole director of which he was from 1793 to 1796. His fame as a lyric poet Ramler established by his edition of *Lieder der Deutschen* (1766), which he remodeled to a certain extent and afterward increased and reedited as *Lyrische Blumenlese* (1774–78). He wrote the cantata *Der Tod Jesu*, made famous by Graun's music. Together with Lessing he published a selection of Logau's epigrams (1759). He was a rigid adherent to the so-called classical models, and was called the German Horace because of his imitations of that poet. By his correct translations and elegant style Ramler exerted great influence on the development and refinement of the German language, and he is regarded as the creator of the art of translating into German. His other writings include *Sammlung der besten Sinngedichte der deutschen Poeten* (1766) and *Kurzgefasste Mythologie* (1790). His poetical works were edited with biographical notes by Göckingk (Berlin, 1800–01); selected poems with excellent biographical introduction by Muncker in Joseph Kürschner, *Deutsche National-Litteratur*, vol. xlv (Stuttgart, 1894). Consult Schüddekopf, *Ramler bis zu seiner Verbindung mit Lessing* (Leipzig, 1886), and the *Allgemeine deutsche Biographie*, vol. xxvii (ib., 1888).

RAMMAN, räm'mȧn. An epithet of the Ammonitish and Aramæan deity Adad or Hadad (q.v.). Ramman means the roarer. The name occurs occasionally in Akkadian texts. A Chaldæan inscription published by Belck-Lehmann in 1899 has shown that the Assyrians pronounced the divine name as Adad, and not Ramman, in Adadnirari. But it is found several times in the Old Testament under the form *Rimmon*. According to 2 Kings v. 18 he was the chief deity of Damascus; the name also appears in the proper name Tabrimmon (1 Kings xv. 18), and probably in several Palestinian place names. He probably came through the Amorites to the Akkadians, the Lulubæans, the Assyrians, and probably also to the Sumerians, among whom his name seems to have been Ishkur. As the storm god Adad-Ramman is the deity presiding over the rainy season and floods, is the genius of the battle onslaught, and is even a god of oracles. He carries the thunderbolts and the battle-axe and is symbolized by the bull. In the Syrian sphere Adad appears under various names, Hadad, Addu, Daddu, the name being preserved in the biblical names Hadad and Ben Hadad and in Bar Hadad of the Zakir inscription. Hadad is likewise a storm god and was the chief in the Syrian pantheon, his cult extending from Sengirli and Aleppo to the south of Damascus. He was identified by the Hittites and Mitannians with Teshub. In Zech. xii. 11 there is a reference to the wailing for Hadad Rimmon, who probably was identified with Tammuz (q.v.).

Bibliography. F. Baethgen, *Beitrage zur semitischen Religionsgeschichte* (Berlin, 1888); Morris Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898); Zimmern and Winckler, in Schrader, *Keilinschriften und das alte Testament* (Berlin, 1902); Morris Jastrow, *Die Religion Babyloniens und Assyriens* (Giessen, 1902–12); A. K. Jeremias, *Das alte Testament im Lichte des alten Orients* (Leipzig, 1906); Eduard Meyer, *Geschichte des Alterlums* (3d ed., Stuttgart, 1913).

RAMMELSBERG, räm'mĕls-bĕrk, KARL FRIEDRICH (1813–99). A German chemist and mineralogist, born in Berlin. He studied in the University of Berlin, became a professor there in 1845, and taught also in the Royal Industrial Institute and the Academy of Mines. He resigned in 1891. His specialty was mineralogical chemistry and he also made a number of valuable contributions to chemical analysis. His chief works include: *Handwörterbuch des chemischen Teils der Mineralogie* (1841–53); *Lehrbuch der Stöchiometrie* (1842); *Lehrbuch der chemischen Metallurgie* (1850; 2d ed., 1865); *Handbuch der kristallographischen Chemie* (1855–57); *Elemente der Kristallographie* (1883); *Chemische Abhandlungen* (1888).

RAMMOHUN ROY, rȧ-mō'hōōn roi (1772–1833). A Hindu rajah, scholar, and theist, the founder of the Brahmo-Somaj (q.v.). He was born at Bardwan, Bengal, of a high-caste Brahman family. He received a good native education, acquired some knowledge of Persian, and at Patna and Benares studied Sanskrit works on Hindu law, literature, and religion. In a treatise antagonistic to Hindu idolatry, written

when he was 18 years of age, he laid the foundation of a prose literature in the Bengali vernacular. His religious views aroused the antagonism of his family, and in his two or three years' residence in Tibet he also gave offense by his denial that the Lama was the creator and preserver of the world. For five years he held the office of revenue collector in the District of Rangpur. He published various works in Persian, Arabic, and Sanskrit, their object being the uprooting of idolatry, and he was instrumental in procuring the abolition of suttee (q.v.). Becoming convinced of the excellence of the moral theories of Christianity, he published *The Precepts of Jesus, the Guide to Peace and Happiness* (1820), a work of Unitarian tendencies. In 1830 was opened the first building in the Brahmo-Somaj, or Theistic church of India, which he had inaugurated and endowed. Shortly afterward (1831), as representative of the titular King of Delhi, who had created him a rajah, he visited England. He was deluged with invitations, and in his anxiety to see everything overtaxed his strength and died at Bristol, where he is buried. Consult Carpenter, *The Last Days of Raja Rammohun Roy in England, with Biographical Sketch* (London, 1866).

RAMNES, răm'nēz, or **RAMNENSES,** răm-nĕn'sēz. One of the three patrician tribes—Ramnes, Tities, and Luceres—which in the oldest times constituted the *populus Romanus.*

RAMÓN Y CAJAL, rä-mōn' ē kä-häl', SANTIAGO (1852–). A Spanish histologist. He was born at Petilla, Aragon, and received his medical education at the University at Saragossa, graduating in 1873. In 1881 he became professor of anatomy at the University at Valencia, in 1886 professor of histology at Barcelona, and in 1892 professor of histology at Madrid. In 1906 he received one-half the Nobel prize for medicine for his work on the histology of the brain and nerves, Golgi (q.v.) being the other recipient. Ramón y Cajal also found a new staining method for histological researches of the nervous system. Among his writings are: *Manual de histología normal y técnica micrográfica* (1889; 4th ed., 1905); *Les nouvelles idées sur la structure du système nerveux chez l'homme et chez les vertébrés* (1894); *Elementos de histología normal* (1895); *Manual de anatomía patológica general* (1896); *Textura del sistema nervioso de hombre y de los vertebrados* (2 vols., 1899–1905); *El aparato endocelular de Golgi de la célula de Schwann* (1912).

RAMOTH-GILEAD, rā'mŏth-gĭl'ē-ăd. A chief city of Gad, east of the Jordan (Map: Palestine, D 3). It is called Ramoth in Gilead and in 2 Kings viii. 29 Ramah; the Gilead of Hos. vi. 8 and Judg. x. 17 may mean the same. It is mentioned as a city of refuge and a Levitical city (Deut. iv. 43; Josh. xx. 8, xxi. 38) and as the headquarters of one of Solomon's commissarial officers (1 Kings iv. 13). It was a strong fortress and the key to an important district. Ahab, King of Israel, was killed there in the wars with the Syrians (1 Kings xxii), and his son Joram was wounded there some years later (2 Kings viii. 28). Reimun in the hills of Gilead, Es-Salt, and Jerash have been suggested as possible identifications of Ramoth-Gilead; the weight of the evidence seems to be in favor of the last named. Consult Selah Merrill, *East of the Jordan* (New York, 1881), and G. A. Smith, *Historical Geography of the Holy Land* (New York, 1904).

RAM'PANT (Fr., raging). In heraldry (q.v.), a term applied to a lion or other beast of prey when erect on its two hind legs, with only one of the forelegs elevated, the head being seen in profile. Sometimes also termed counter-rampant.

RAMPART. See FORTIFICATION.

RAMPOLLA, räm-pôl'lä, MARIANO, MARQUIS DEL TINDARO, CARDINAL (1843–1913). An Italian prelate, born Aug. 17, 1843, at Polizzi, Sicily. He was educated at the Collegio Capranica, the Jesuit College, and the Accademia dei Nobili Ecclesiastici, all in Rome. Afterward he entered the service of Pope Pius IX and in 1875 was appointed councilor to the papal nunciature at Madrid. But it was with the long incumbency of Leo XIII that he was mainly identified. Upon his return to Rome he became Secretary of the Propaganda for Eastern Affairs and in 1880 Secretary of Ecclesiastical Affairs. In 1882 Rampolla was made Papal Nuncio at Madrid, and it was he who suggested the Pope as arbitrator between Spain and Germany in the dispute over the Caroline Islands in 1885. Created titular Archbishop of Heracles in 1882, five years later he was made Cardinal and appointed Papal Secretary of State. This difficult position brought him into contact with the Italian government (especially during Crispi's premiership) in the matter of penal laws directed against the clergy. In endeavoring to strengthen French sympathies for the holy see Rampolla antagonized Germany and Austria. This is said to have been the cause of Austria's veto when upon the death of Leo XIII (1903) Rampolla led in the balloting for his successor. After the election of Cardinal Sarto (Pius X) Rampolla resigned as Secretary of State and lived in retirement near the Vatican, devoting himself to the study of archæology and sacred literature, until his death, Dec. 16, 1913. He had been a strong defender of the temporal power of the Pope against the restrictive measures of the Italian government. Benedict XV, successor of Pius X, early saw service as an assistant to Rampolla, and it was expected that as Pope he would revive the policy of active participation in the diplomatic affairs of Europe, persistently followed by Leo XIII and his Secretary of State.

RAMPUR, räm-pōōr'. A native state, feudatory to the United Provinces of Agra and Oudh (q.v.), British India, having an area of 899 square miles. Pop., 1901, 533,212; 1911, 531,217.

RAMPUR. The capital of the native state of the same name, British India, on the Kosila River, 38 miles northwest of Bareli, with which it is connected by rail (Map: India, D 3). Manufactures of pottery and damask are important industries. Pop., with cantonment, 1901, 78,758; 1911, 74,316.

RAMSAY, răm'zĭ, ALLAN (1686–1758). A Scottish poet, born at Leadhills in the Parish of Crawford, Lanarkshire, Oct. 15, 1686. His father was manager of Lord Hopetoun's mines at Leadhills, and his mother, Alice Bower, was the daughter of a Derbyshire instructor of miners. He received the ordinary education of a parish school. In his sixteenth year he was apprenticed to a wigmaker in Edinburgh, and soon married (1712) and set up for himself. In 1716 or a little later he gave up wig making and began business as bookseller, first in High Street, under the sign of the Mercury, and afterward in the Luckenbooths, under the heads of

Drummond and Ben Jonson. Here he added to his business a circulating library, the first in Scotland. In 1736 he built a theatre in Carrubbers Close. In the following year the licensing act, prohibiting all dramatic exhibitions without a special license, compelled him to close his theatre. In 1755 he built a quaint and picturesque house on the north side of Castle Hill, where he died, Jan. 7, 1758.

Ramsay's earliest poems were written for the entertainment of the Easy Club (1712–15). After setting up as a bookseller he issued many short humorous pieces, printed as broadsides and sold for a penny each. In 1716 he published the old Scottish poem *Christ's Kirk on the Green*, adding a canto of his own, and two years later still another canto. This was followed by a volume of *Scots Songs* (1719). By this time he was writing in the Horatian manner verse epistles to his friends. His first important publication was a collected edition of his poems in 1721, on which he realized 400 guineas. There followed *Fables and Tales* (1722); *The Fair Assembly* (1723); *Health* (1724); *The Tea-Table Miscellany*, an anthology of Scottish and English songs (vol. i, 1724; vol. ii, 1725; vol. iii, 1727; vol. iv, 1740); *The Evergreen*, a Scottish anthology, containing what is probably his own "Vision" (1724–27); a pastoral drama entitled *The Gentle Shepherd* (1725), to which songs were added (1728); a second collection of poems (1728); *Thirty Fables* (1730). Ramsay's tales and fables are amusing, but coarse. His verse epistles are neat and graceful. His many songs, as "The Yellow-Hair'd Laddie," are the best before Burns. His finest longer lyric is "The Vision." *The Gentle Shepherd*, which reached its tenth edition by 1750, was long held to be the best pastoral comedy ever written. Consult: *Poems*, edited, with a *Life*, by Chalmers (Edinburgh, 1800; reissued and revised, Paisley, 1877); *Poems*, selected, by J. L. Robertson (London, 1887); Oliphant Smeaton, *Life* (Edinburgh, 1890); also *Cambridge History of English Literature*, vol. xi (New York, 1914).

RAMSAY, Allan (1713–84). A Scottish portrait painter, the son of Allan Ramsay, the poet. He was born in Edinburgh and studied there and in London at St. Martin's Lane Academy and later in Rome. On his return he lived for 18 years in Scotland, where he did much of his best work, including the full-length portrait of the Duke of Argyle (Glasgow Gallery). He then removed to London and in 1767 was made court painter to George III. Besides the King and the Queen, whom he painted repeatedly, some of his famous sitters were Lord Bute, Gibbon (National Portrait Gallery), Chesterfield, and Hume. The two last-named canvases, together with the beautiful portraits of his wife and Mrs. Bruce, are in the Edinburgh National Gallery. Ramsay's art lacks spontaneity and power, but it is expressive, graceful, and elegant, and agreeable in color. His peculiar charm is still more visible in his chalk sketches and studies, good collections of which are owned by the Board of Trustees, Edinburgh, and the Scottish National Gallery. One of his portraits of George III is in Independence Hall, Philadelphia.

RAMSAY, Sir Andrew Crombie (1814–91). A Scottish geologist, born in Glasgow. His education at the grammar school in that city being interrupted in 1827 by the death of his father, Andrew entered a counting house and in 1837 attempted business as a dealer in calico and linen. By 1840 this project had proved a failure, but in the following year, at ninepence a day, he was appointed assistant to the Geological Survey. With this he was connected until 1881, becoming local director for Great Britain in 1845, senior director for England and Wales in 1862, and director general in 1871. Upon retiring from active service in 1881 he was knighted. In 1848 he had been appointed to the chair of geology in University College, London, and in 1851 received a like position in the Royal School of Mines. He was president of the Geological Society in 1862–64, became a fellow of the Royal Society in 1862, received the Neill prize from the Edinburgh Royal Society in 1866, the Wollaston medal of the Geological Society in 1870, and in 1880 a Royal Society medal. As a geologist he was a stratigrapher at the expense of paleontology or petrography. His most valuable work on glacial formations, *Old Glaciers of Switzerland and North Wales* (1860), was followed by a series of popular lectures, *Physical Geology and Geography of Great Britain* (1864; 6th ed., 1894). The theory with which he was most closely identified, but which has not received general assent, is that many lake basins have been formed as the result of glacial excavations. Consult Sir Archibald Geikie, *Memoir* (London, 1895).

RAMSAY, Andrew Michael (1686–1743). A writer of Scottish birth who resided in France, where he was known as the Chevalier de Ramsay. He was born at Ayr, studied at the University of Edinburgh, and served with the English auxiliaries in the Netherlands. The mystic Poiret and Fénelon, with whom he became intimate, induced him to adopt Romanism. In 1724 he went to Rome as tutor to the two sons of the Stuart Pretender, Prince James. In 1730 he visited England and was made a member of the Royal Society. Among his works are: *Discours de la poésie épique*, originally printed as preface of *Télémaque* (1717); *Essai philosophique sur le gouvernement civil* (1721); *Vie de Fénelon* (1723), translated into English by N. Hooke; *Les voyages de Cyrus* (1727); *Poems* (1728); etc.

RAMSAY, David (1749–1815). An American physician and author. He was born in Lancaster Co., Pa., and having studied medicine at the University of Pennsylvania, he settled in practice in Charleston, S. C., in 1773. He served as field surgeon in the Continental army during the Revolution. From 1776 to 1783 he was a member of the State Legislature; he was a member of the Council of Safety at Charleston and was a prisoner of the British at St. Augustine, Fla. (1780–81). From 1782 to 1786 Ramsay was a member of the Continental Congress and for the years 1785–86 its president. He was again a member of the South Carolina Legislature (1801–15) and also president of the State Senate. He was shot by a lunatic. Among his works are: *History of the Revolution of South Carolina* (1785); *History of the American Revolution* (1789); *Life of George Washington* (1807); *History of South Carolina* (1809); *History of the United States, 1607–1808* (1816–17).

RAMSAY, James Andrew Broun. See Dalhousie, tenth Earl and first Marquis of.

RAMSAY, Nathaniel (1751–1817). An American soldier. He was born in Lancaster Co., Pa., graduated at Princeton in 1767, was

admitted to the Maryland bar in 1771, and in December, 1776, became lieutenant colonel in the Continental army. At Monmouth (q.v.), June 28, 1778, he, together with Colonel Stewart, checked the advance of the English until Washington could rally the main army, but was badly wounded and was taken prisoner. He was exchanged in December, 1780, but retired on Jan. 1, 1781. He was a member of Congress in 1786–87. In 1794 he received the appointment of naval officer for the district of Baltimore, a position he held during five administrations.

RAMSAY, Sir William (1852–1916). A British chemist, nephew of the geologist Andrew Crombie Ramsay. He was born in Glasgow, studied there and at Tübingen, where he received his doctor's degree at the age of 20, was professor of chemistry at University College, Bristol (1880–87), and thereafter was professor in University College, London, until 1913, when he became professor emeritus. With Lord Rayleigh (q.v.) he discovered argon, a new constituent of the atmosphere. Ramsay also discovered other gaseous elements of the air, including neon, xenon, and krypton. He was knighted in 1902 and was awarded the Nobel prize for chemistry in 1904. He translated Beilstein's *Qualitative Analysis* and published: *The Gases of the Atmosphere: The History of their Discovery* (1896; 3d ed., 1905); *Introduction to the Study of Physical Chemistry* (1904); *Essays Biographical and Chemical* (1908); *Elements and Electrons* (1912).

RAMSAY, Sir William Mitchell (1851–). A Scottish classical scholar and Church historian, born in Glasgow. He was educated at Aberdeen, Oxford, and Göttingen, and was elected fellow of Exeter College, Oxford, in 1882, and of Lincoln College in 1885. From 1886 to 1911 he was professor of humanity (Latin) at Aberdeen. Ramsay became widely known for his researches in the history of the Church, in the course of which he traveled extensively in Asiatic Turkey. In 1885 he held the chair of classical art at Oxford and in 1894 was Levering lecturer at Johns Hopkins. He received gold medals from Pope Leo XIII, the University of Pennsylvania, the Royal Geographical and Royal Scottish Geographical Societies, and honorary degrees from many universities. In 1906 he was knighted. His writings include: *The Historical Geography of Asia Minor* (1890); *The Church in the Roman Empire* (2 vols., 4th ed., 1895); *The Cities and Bishoprics of Phrygia* (1895–97); *Historical Commentary on Galatians* (1899); *The Education of Christ* (1902; new ed., 1911); *Letters to the Seven Churches of Asia and their Place in the Plan of the Apocalypse* (1905); *Pauline and Other Studies in Early Christian History* (1906); *The Cities of St. Paul* (1907); *The First Christian Century* (1911); *The Teaching of Paul in Terms of the Present Day* (1913); *The Bearing of Recent Research on the Trustworthiness of the New Testament* (1914).

RAMS'BOTTOM. A town in Lancashire, England, on the Irwell, 4 miles northwest of Bury. Its industries comprise cotton mills, bleaching fields, calico-printing establishments, iron foundries, and stone quarries. Its growth dates from the installation of calico printing by Sir Robert Peel. Pop., 1901, 15,920; 1911, 15,146.

RAMS'DEN, Jesse (1735–1800). An English optician and mechanician, born at Salterhebble, near Halifax, in Yorkshire. He received a good education and, after having first been engaged as a clothworker, became in 1758 an apprentice in the workshop of an instrument maker. In 1762 he started business on his own account and became famous for the excellence of his instruments. He was a skillful engraver and was frequently employed by the best artists. In 1766 he married Dollond's (q.v.) daughter and received as her dowry a share of his father-in-law's patent for achromatic telescopes. The sextants of his time were very imperfect, being untrustworthy within 5′ of a degree, and Ramsden succeeded in reducing the possible error to within 30″. He also invented a dividing machine, which could graduate instruments much more rapidly and accurately than could be done by hand. For this invention he received a reward from the Board of Longitude. He constructed astronomical instruments for many of the great observatories. Ramsden wrote: *Description of an Engine for Dividing Mathematical Instruments* (London, 1777); also the following memoirs read before the Royal Society: "Description of Two New Micrometers" (1777); "A New Construction of Eye-Glasses" (1782).

RAMSES. See Rameses.

RAM'SEUR, Stephen Dodson (1837–64). An American soldier, born at Lincolnton, N. C. He graduated at West Point in 1860 and was assigned to artillery duty at Fortress Monroe. The next year, while serving in Washington, he resigned from the army, April 6, entered the Confederate service, and was made major of North Carolina State troops. He commanded a battery of artillery at the siege of Yorktown, was engaged in the Seven Days' battles and was severely wounded at Malvern Hill, July 1, 1862. As brigadier general he took the field again soon after Fredericksburg. At Chancellorsville he led the advance of Rodes's division and won special commendation from both Lee and Jackson. On July 1, 1863, at Gettysburg, he helped to take possession of the town. He was engaged in the battles around Spottsylvania Courthouse, and was again severely wounded when driving Hancock from the Confederate works. With rank of major general he took part in Early's raid and was engaged at Harper's Ferry and at the Monocacy. At Winchester his division was the first to be attacked, but retreated in good order. While covering the retreat at Cedar Creek, October 19, he was mortally wounded and captured.

RAMSEY, răm'zĭ, Alexander (1815–1903). An American administrator, war Governor of Minnesota, born near Harrisburg, Pa., and educated at Lafayette College. He took a prominent part in politics as a member of the Whig party, and in 1849 was appointed Territorial Governor of Minnesota. In that capacity he made treaties with the Sioux and Chippewas by which much valuable land was opened to settlers. From 1859 to 1863 he was Governor of the State of Minnesota. He became United States Senator in 1863, was reëlected in 1869, was Secretary of War under President Hayes, and from 1882 to 1886 was chairman of the Utah commission on polygamy appointed under the Antipolygamy Act of 1882, whose passage was procured by Senator George F. Edmunds (q.v.).

RAMS'GATE. A seaport and favorite watering place on the Isle of Thanet, County of Kent,

England, 65 miles southeast of London (Map: England, II 5). The town consists of well-arranged streets, crescents, and terraces; the older part, situated in a natural depression or cutting in the chalk coast, opens out towards the sea. The principal buildings are a Benedictine monastery and college and a small but beautiful Roman Catholic abbey church. The harbors, 47 acres in extent with 3300 feet of quayage, serve as harbors of refuge for the Downs. Ramsgate has shipbuilding and fishing industries and a small coasting trade. Anciently a fishing village, it increased in importance about the beginning of the eighteenth century, when a successful trade with Russia and the east country was opened up. The chief imports are timber, ice, and stone. The municipality, incorporated in 1884, provided an iron promenade pier, public parks, and esplanades. On Ossengal Hill, 1 mile west of the town, are the remains of a Saxon cemetery. Pegwell Bay, to the west, is the traditional landing place of Hengist and Horsa, and a monolithic cross at Cliff's End (Ebbsfleet) marks the landing place of St. Augustine in 596. Pop., 1901, 27,693; 1911, 29,603. Consult Simson, *Historic Thanet* (London, 1891), and "Ramsgate Reviewed," in *Municipal Journal* (ib., 1900).

RAM'SONS. A weed. See ALLIUM.

RA'MUS, PETRUS (Latinized form of *Pierre de la Ramée*) (1515–72) A French humanist, philosopher, and mathematician, born at Cuth, Vermandois, the son of a charcoal burner of noble descent. In his twelfth year he became servant to a rich student at the Collège de Navarre, and by devoting the day to his master obtained the night for study and made rapid progress. He was profoundly dissatisfied with the scholasticism and authoritarianism of the day, and showed his contempt for the idol of the times by maintaining as his thesis for his master's degree in 1536 that all that Aristotle had said was false. Ramus, with two learned friends, opened a special class for reading the Greek and Latin authors, designed to combine the study of eloquence with that of philosophy. His attempts to reform the science of logic excited much hostility among the Aristotelians, and when his treatise on the subject (*Animadversiones in Dialecticam Aristotelis*) appeared in 1543, it was fiercely assailed by the doctors of the Sorbonne, who managed to get it suppressed by an edict of Francis I. But Ramus had powerful friends, through whose influence he was, in 1545, appointed principal of the Collège de Presles, which he raised from a condition of decay to the most splendid prosperity. In 1551, under Henry II, the Cardinal of Lorraine succeeded in instituting for him a chair of eloquence and philosophy at the Collège de France. He had long been suspected of a leaning towards Protestantism, and he ventured formally to abjure the old faith. The outbreak of the religious wars drove him from France to Germany and Switzerland, where he continued his academic activity. Unfortunately he returned to Paris in 1571 and was one of the victims of the Massacre of St. Bartholomew. His followers, known as Ramists, were a widespread and for a long time a powerful body of thinkers and teachers. Consult: Charles Waddington, *Ramus: sa vie, ses écrits et ses opinions* (Paris, 1855); Charles Desmaze, *Ramus* (ib., 1864); P. Lobstein, *P. Ramus als Theolog* (Strassburg, 1878); Voigt, *Ueber den Ramismus der Universität Leipzig* (Leipzig, 1888); F. P. Graves, *Peter Ramus and the Educational Reformation of the Sixteenth Century* (New York, 1912).

RAMUSIO, rä-mōō'zē-ō, GIAMBATTISTA (1485–1557). An Italian compiler, born at Treviso. He was Ambassador of Venice to France, Switzerland, and Rome, and subsequently held the post of secretary to the Council of Ten. He published *Delle navigationi e viaggi, etc.*, a remarkable collection of travels and voyages (1550, 1559, 1566), containing much material important for the history of early America. The best edition was published in Venice in 1606.

RANC, ränk, ARTHUR (1831–1908). A French politician and author, born at Poitiers. He studied law in Paris and took such a violent part in the Republican activities under the Empire that he was deported to Lambessa, accused of an attempt upon the life of the Empress. But he escaped and went to Switzerland. After the amnesty of 1859 he returned to Paris and contributed to the *Opinion Nationale*, the *Nain Jaune*, and other journals. Because of the tone of some of these articles he was imprisoned for four months. In 1870 he was elected maire of the ninth arrondissement of Paris, and joined Gambetta, who gave him the directorship of police, a post in which he highly distinguished himself. The following year he was elected to the National Assembly, but he voted against the arrangements for peace with Germany and resigned to become a member of the Commune. The violence of that body was contrary to his own views and he resigned from it also. Afterward the Monarchist press attacked him and his organ, the *République Française*, for the part he had taken during the Commune, and after he had been elected from the Department of Rhône to the National Assembly of 1873 he was condemned to death *in contumaciam*. He had escaped to Belgium, where he remained until the amnesty of 1879. Ranc had continued his connection with the *République Française* and became director of the *Petite République* in 1880. In 1881 he was elected deputy from the Seine and in 1891 Senator. In 1900 he declined reëlection and became editor of the *Radical*. But three years later he was reëlected to the Senate from Corsica. In 1905 he replaced Clemenceau as editor of *Aurore*. He was consistently Republican throughout the Boulanger difficulties, and he took a leading part in the revision of the Dreyfus case. His works include: *Le roman d'un conspiration* (1868); *Sous l'empire* (1872); *De Bordeaux à Versailles* (1877).

RANCAGUA, rän-kä'gwä. The capital of the Province of O'Higgins, Chile. It is situated in a rich agricultural district on the railroad 40 miles south of Santiago. In 1814 it was the scene of an important battle in which the patriot forces were defeated by the Spaniards. Pop., 1907, 10,380.

RANCÉ, rän'sā', ARMAND JEAN LE BOUTHILLIER DE (1626–1700). The founder of the reformed order of La Trappe. (See TRAPPISTS.) He was born in Paris. After taking his degree at the Sorbonne he became distinguished as a preacher, and through the favor of his godfather, Cardinal Richelieu, obtained valuable benefices. He succeeded while yet a young man to his father's large fortune and lived a careless

and irregular life. In 1662, however, having forfeited the favor of Cardinal Mazarin, and deeply moved by the sudden death of the Duchess de Montbazon, to whom he was much attached, he retired to the abbey of La Trappe, in Normandy, with the intention of restoring the strict discipline of the order. He was abbot from 1664 to 1695, when ill health compelled his retirement. The only remarkable event of his literary life was a controversy with Mabillon, in which he opposed study as a part of the monastic life. He also wrote *De la sainteté et des devoirs de la vie monastique* (1683; Eng. trans., *A Treatise on the Sanctity and on the Duties of the Monastic State*, Dublin, 1830). Consult Du Bois, *Histoire de l'abbé de Rancé et de sa réforme* (2d ed., 2 vols., Paris, 1869), and M. L. Serrant, *L'Abbé de Rancé et Bossuet, ou le grand moine et le grand évêque du grand siècle* (ib., 1904).

RAND. A popular designation for the gold-bearing Witwatersrand (q.v.) reef in the Transvaal Province, South Africa.

RAND, EDWARD KENNARD (1871–). An American classical scholar, born in Boston. He graduated from Harvard in 1894 and subsequently studied at Harvard Divinity School, at the Episcopal Theological School, Cambridge, and at Munich, where he took his Ph.D. in 1900. He taught Latin at the University of Chicago (1895–98) and at Harvard after 1901, becoming professor in 1909. In 1912–13 he was professor at the American School of Classical Studies in Rome. Besides numerous articles in the periodicals he published *Dante Alighieri Operum Latinorum Concordantiæ* (1912) with E. H. Wilkins.

RANDA, rän'dȧ, ANTON, KNIGHT VON (1834–1914). An Austrian jurist, born at Bristritz, Bohemia. He studied law at Prague, where he afterward (1868) became professor of Austrian civil law. In 1881 he was appointed life member of the Austrian House of Peers, and soon afterward he was made a member of the Imperial Court of Justice. He is considered one of the highest authorities on Austrian civil law. His publications include *Der Besitz nach österreichischem und römischem Rechte* (1865; 4th ed., 1895), his chief work; *Der Erwerb der Erbschaft* (1867); *Oesterreichisches Handelsrecht* (1904; 2d ed., 1911); *Schadenersatzpflicht* (1907).

RAN'DALL, JAMES RYDER (1839–1908). An American poet and journalist, born in Baltimore. After studying at Georgetown College, where, on account of ill health, he did not graduate, he traveled in South America, but he returned to the United States and began newspaper work in Louisiana before the beginning of the Civil War. The news of the fighting in Baltimore when the Massachusetts troops passed through the city inspired him to write "Maryland, my Maryland," which was at once set to music and with "Dixie" became the most popular of Confederate songs. Randall wrote other war lyrics, some good, but none of the calibre of his first. For many years after the war he was editor of the *Constitutionalist* of Augusta, Ga., and in 1905 he became editor of the New Orleans *Morning Star*. Consult his *Poems*, edited by M. P. Andrews (New York, 1910).

RANDALL, SAMUEL JACKSON (1828–90). An American political leader and legislator, Speaker of the National House of Representatives from 1876 to 1881. He was born at Philadelphia and was educated there at the University Academy. He was early a prominent Whig and then a member of the Democratic party. In 1858 he was elected to the State Senate. At the outbreak of the Civil War he went to the front as a private in the First Philadelphia City Troop. At the time of Lee's invasion of Pennsylvania in 1863 he recruited a company of which he became captain, and served also as a provost marshal. For 14 consecutive terms he was a member of Congress. He served on the Committee on Rules (1873–75) with Blaine, Banks, Garfield, and Cox, and by directing the Democratic opposition to the Force Bill won general recognition as the leader of his party in the House, discipline and party harmony being established among the Democrats for the first time since the Civil War. In the Forty-fourth Congress he was appointed chairman of the Committee on Appropriations. In December, 1876, he was elected to succeed Speaker Kerr, who had died during the recess of Congress, and thus was called upon to preside during the exciting and critical period of the disputed Hayes-Tilden election. He was reëlected Speaker of the Forty-fifth and Forty-sixth Congresses (1877–81). After about 1883 Randall became the leader of a small group of Democrat protectionists who consistently opposed all attempts at tariff reform.

RANDAZZO, rän-dät'sô. A town in the Province of Catania, Sicily, situated on the north slope of Mount Etna, 26 miles by rail north-northwest of Catania (Map: Italy, E 6). The town is built of lava from Mount Etna and is remarkable for never having been destroyed by the volcano. There is trade in wine, oil, and cheese. Pop. (commune), 1901, 11,798; 1911, 13,656.

RANDEGGER, rän'dĕg-gĕr, ALBERTO (1832–1911). An Austrian-English composer, born at Triest. He was a pupil of Lafont in piano and of Luigi Ricci in composition and, with two other young composers, produced two ballets and an opera, *Il Lazzarone*, in 1852. In 1854 he produced his opera *Bianca Capello* at Brescia. As teacher of singing in London, where he settled about 1855, he became well known, and in 1868 was appointed professor of singing at the Royal Academy of Music. In 1857 he conducted Italian opera at the St. James's Theatre and was musical director of the Carl Rosa Opera Company from 1879 to 1885, and, upon the resignation of Benedict in 1881, became conductor of the Norwich Musical Festival, which he directed until 1905. He wrote a comic opera, *The Rival Beauties* (1864); a dramatic cantata, *Fridolin* (1873); two scenas for soprano and orchestra, *Medea* (1869) and *Sappho* (1875); the *150th Psalm* for soprano solo, choir, orchestra, and organ; *Funeral Anthem*, in memory of the Prince Consort; numerous other vocal pieces; and a well-known *Primer of Singing*.

RANDERS, rän'ĕrs. A town of Jutland, Denmark, situated at the entrance of the Gudenaa into the Randers Fiord, 22 miles northwest of Aarhus (Map: Denmark, D 2). The chief manufactures are railroad cars, gloves, oleomargarine, and the chief exports grain, butter, eggs, fish, and wool. Pop., 1901, 20,057; 1911, 22,970.

RAN'DOLPH. A town in Norfolk Co., Mass., 15 miles south of Boston, on the New York,

New Haven, and Hartford Railroad (Map: Massachusetts, E 4). It contains the Boston School for the Deaf and the Turner Library. The chief manufactures are shoes, boxes, and poultry houses. Pop., 1900, 3993; 1910, 4301.

RANDOLPH. A town, including several villages, in Orange Co., Vt., 25 miles south by west of Montpelier, on the Central Vermont Railroad (Map: Vermont, D 5). It is the seat of the State Agricultural School, and has a public library. The surrounding district is chiefly engaged in farming and lumbering. Furniture, wood finishings, and plows are manufactured here. Pop., 1900, 3141; 1910, 3191.

RANDOLPH, EDMUND JENNINGS (1753–1813). An American statesman, the nephew of Peyton Randolph (q.v.). He was born in Williamsburg, Va., graduated at William and Mary College, studied law with his father, early became prominent as an opponent of the measures of the British ministry, and in consequence was disinherited by his father, John Randolph, a stanch Loyalist. In August, 1775, he became one of Washington's aids and in 1776 sat in the Virginia Constitutional Convention. He was chosen first Attorney-General under the new State Constitution (1776), sat in the Continental Congress from 1780 to 1782, and was Governor of Virginia from 1786 to 1788. In 1787 he headed the Virginia delegation to the Constitutional Convention and took a prominent part in the debates, proposing the celebrated Virginia plan and opposing among other things the single executive, the vice presidential office, and equality of the States in the Senate. He refused to sign the instrument as finally drafted, but in the Virginia Convention strongly advocated its ratification. He helped to codify the Virginia laws and in September, 1789, was appointed by Washington Attorney-General of the United States. On Jan. 2, 1794, he succeeded Jefferson as Secretary of State, but resigned in August, 1795, primarily on account of an intercepted dispatch of the French Minister Fauchet by a British man-of-war and sent to the British Minister to the United States, which led to charges being brought against him reflecting on his honor. Most of these charges have in recent years been effectually disproved. Returning to his home, he became the leader of the Virginia bar, and in 1807 helped defend Aaron Burr against the charge of treason. He wrote a *History of Virginia*, which, though never published, has been much used in manuscript by other historians. He also wrote (and published) *A Vindication of Mr. Randolph's Resignation* (1795) and pamphlets entitled *Democratic Societies* (1795) and *Political Truth* (1796). Consult Conway, *Omitted Chapters of History Disclosed in the Life and Papers of Edmund Randolph* (2d ed., New York, 1889).

RANDOLPH, EDWARD (c.1620–c.1694). A British colonial agent. He was sent to the New England Colonies in 1675 to investigate their condition and impose on them certain royal demands; but Governor Leverett of Massachusetts having refused to recognize Randolph's commission, after six weeks he returned to England. Hoping to evoke oppressive taxation from Parliament and to keep himself occupied, he presented an exaggerated report of the wealth and population of the Colonies. During the next nine years he made eight voyages to New England, and each time brought back a false report. As a collector of customs in Massachusetts after 1679 he urged upon the home government the adoption of punitive measures, the outcome being the forfeiture of the Massachusetts charter in 1684. Randolph was a member of the council of the new Governor, Sir Edmund Andros (q.v.), from 1686 until 1689, when the Andros régime came to its sudden end. Then he left for the West Indies, where he died.

RANDOLPH, JOHN, OF ROANOKE (1773–1833). An American statesman, born at Cawsons in Chesterfield Co., Va., June 2, 1773; died in Philadelphia, June 24, 1833. He was descended from an old and wealthy Virginia family and boasted Pocahontas as one of his ancestors. Educated at Princeton and Columbia colleges, he began the practice of law, but in 1799 he was elected to Congress, where he became distinguished for his eloquence, wit, sarcasm, invective, and eccentricity. At a very early stage in his career he was the Democratic-Republican leader of the House of Representatives. He denounced the settlement of the Yazoo land dispute effected by Madison and Gallatin. In 1804 he introduced a resolution impeaching Justice Samuel Chase (q.v.) and was the foremost prosecutor in the famous trial in the following year. He ultimately broke with Jefferson and lost his influence, although as a free lance and hurler of invectives he never ceased to be feared. He opposed the War of 1812 and the Missouri Compromise and stigmatized the Northern members who voted for the latter as "doughfaces." In 1822 and 1824 he visited England, where his eccentricities attracted much notice. In 1825 he began his two years' service as Senator from Virginia and fought his famous duel with Henry Clay. In 1830 he was appointed Minister to Russia, and gave much occasion for scandal by his short stay and heavy demands on the Treasury. By his will he manumitted his 318 slaves and provided for their maintenance in a free state. In some respects full justice has never been done to Randolph's intellect. He was not merely a well-read man and possessed of a good style, as appears from his *Letters to a Young Relative* (1834) and many of his speeches in Congress, nor was he simply an unparalleled master of invective; he was also a far-sighted statesman, who foresaw the direction American politics would take with regard to the question of slavery and outlined the policy of Southern defense afterward taken up by Calhoun and his followers. He was considered a Virginian of Virginians, upon whom young Southern extremists modeled themselves. Consult: H. A. Garland, *Life of John Randolph of Roanoke* (2 vols., New York, 1857); W. P. Trent, *Southern Statesmen of the Old Régime* (ib., 1896); Henry Adams, *John Randolph*, in the "American Statesmen Series" (ib., 1899).

RANDOLPH, PEYTON (1723–75). An American patriot of the Revolutionary period. He was born at Williamsburg, Va., graduated at William and Mary College, studied law at the Inner Temple in London, and in 1748 became the Royal Attorney-General for the Colony of Virginia. In the same year he became a member of the Virginia House of Burgesses and served as chairman of a committee to revise the laws of Virginia. In 1764 he framed the remonstrance of the Burgesses against the threatened Stamp Act. The following year, however, he opposed Patrick Henry's radical

Stamp Act Resolutions. In 1766 he resigned the office of Attorney-General and devoted himself to furthering the cause of the Patriot or Whig party, serving as chairman of the Committee of Correspondence and as president of the Virginia Convention of 1774. In the latter year he was chosen a delegate to the Continental Congress at Philadelphia, and was unanimously elected president of that body upon its assembling at Carpenter's Hall, September 5. In 1775 he was again elected to the Continental Congress and again chosen president. In the same year he presided over the second Virginia Convention and served as Speaker of the House of Burgesses. Shortly after his return to Congress he died suddenly of apoplexy.

RANDOLPH, THOMAS (1523–90). An English courtier and diplomat. He was educated at Oxford and remained there until the Protestant persecutions in Mary's reign. Elizabeth sent him on missions to Germany and Scotland, where he mingled in all the complex political dealings between England and Scotland from 1559 until 1586. Mary, Queen of Scots, banished him from her court in 1566 on the charge of being concerned in Murray's rebellion. (See MURRAY, or MORAY, JAMES STUART, EARL OF.) He was afterward sent on embassies to Russia (1568) and Paris (1573, 1576).

RANDOLPH, THOMAS (1605-35). An English playwright, educated at Westminster School and at Trinity College, Cambridge, of which he was elected a fellow in 1632. Except for visits to London, where he met Ben Jonson and other wits at the Devil Tavern, he passed his time at the university. He gained a reputation for graceful Latin and English verse and for dramatic performances arranged for the students. *Aristippus, or the Jovial Philosopher* (1630), a drama in verse and prose, is a satire on university education. With it was published the *Conceited Pedler*, a monologue of a rogue much like Shakespeare's Autolycus. There appeared posthumously a volume entitled *Poems, with the Muses' Looking-Glasse and Amyntas* (1638). *The Muses' Looking-Glasse* is a witty comedy and *Amyntas* is a pastoral drama adapted from the Italian. To Randolph have been ascribed a pleasant comedy, *Hey for Honesty* (published 1651), and a Latin comedy, *Cornelianum Dolium* (1638). Consult his *Poetical and Dramatic Works*, edited by W. C. Hazlitt (2 vols., London, 1875).

RANDOLPH, THOMAS JEFFERSON (1792–1875). An American statesman, born at Monticello, Va. He was the oldest grandson of Thomas Jefferson and paid the debts that Jefferson left at his death. He also acted as Jefferson's literary executor, and in 1829 published *Life and Correspondence of Thomas Jefferson* (4 vols.). As a member of the Virginia Legislature he in 1829 introduced a postnatal plan for the gradual abolition of slavery, but the bill was defeated in the following year. In 1851–52 he was a member of the State Constitutional Convention, and for seven years was rector of the University of Virginia. In 1872 he presided over the Democratic National Convention that nominated Horace Greeley for the presidency.

RANDOLPH-MACON SYSTEM OF COLLEGES AND ACADEMIES. A system of five collegiate and preparatory institutions in Virginia, under Methodist auspices, managed by one board of trustees and comprising a college for men, with two academies, and a college for women, with one institute. The organization is designed to secure close correlation between the preparatory school and the college, with economy of time and expense to both. *Randolph-Macon College*, for men, the parent institution of the system, was chartered in 1830 and opened in 1832 at Boydton, Va. The college was closed during the Civil War and was reopened in 1866. In 1868 it was removed to its present situation, at Ashland, Va. It has no professional schools. The course is partially elective and leads to the degrees of bachelor of arts, and master of arts, and bachelor of science. Students for any ministry are exempt from tuition fees. The college had in 1914–15 a faculty of 15 instructors and 190 students of collegiate grade. The productive fund amounted to about $335,000 and the income to about $40,000. Grounds and buildings were valued at $149,129, the total value of the college property being estimated at more than $500,000. The library contains 16,000 volumes. The feeding schools of the college are the *Randolph-Macon Academy*, at Bedford City, Va., established in 1890, and the *Randolph-Macon Academy*, at Front Royal, Va., established in 1892.

Randolph-Macon Women's College was founded at College Park, Lynchburg, Va., in 1893. The foundation was due largely to the subscriptions secured from the citizens of Lynchburg and by Dr. W. W. Smith, the founder and first president of the college. The institution was placed under the care of the Randolph-Macon board of trustees and rapidly rose to a leading position among the women's colleges in the United States. In 1906 the college was admitted to the benefit of the Carnegie Fund, but voluntarily withdrew in 1909. In 1914–15 there were enrolled 610 students, of whom 511 were candidates for the A.B. degree. In the same year there were 45 instructors. The endowment in 1915 amounted to about $385,000 and the income from all sources to about $185,000. The buildings and grounds were valued at $462,240. The library contains about 13,000 volumes. The president in 1915 was Dr. William Alexander Webb. Its preparatory school, the *Randolph-Macon Institute*, at Danville, Va., was admitted in 1897.

RANELAGH, răn'e-lâ. A fashionable resort in Chelsea, London, during the eighteenth century. The plot of ground, occupied from 1742 to 1803 by gardens and a building called the rotunda, was acquired by the Earl of Ranelagh about 1690, and here Ranelagh lived until 1712, but in 1741 the rotunda was erected and the following year the place was opened to the public. The rotunda was built in imitation of the Pantheon at Rome, and could accommodate more than 6000 guests. In 1803 the rotunda was closed, and subsequently all the buildings were removed and the grounds were made part of those of Chelsea Hospital. Consult Warwick Wroth, *The London Pleasure Grounds of the Eighteenth Century* (New York, 1896).

RANENBURG, rä'nyen-bo͝org. A town in the Government of Riazan, Russia, about 230 miles southeast of Moscow (Map: Russia, F 4). The place was granted in 1702 by Peter I to Menshikov. It subsequently served as a place of exile for Menshikov himself and for Anna Karlovna. Pop., 1910, 5834.

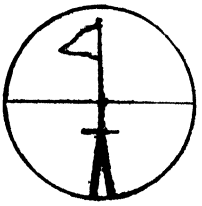
RANGABÉ, räŋ'gä-vē', or RHANGABE, RHANKAVES, RHANGAWIS, ALEXANDROS RIZOS (1810–92). A Greek author and statesman, born in Constantinople and educated at Odessa and in the Military School at Munich, whence he entered the Bavarian artillery. In 1831 he returned to Greece and entered governmental employ, serving for several years in the department of the Ministry of Education. There he founded a new school system, primary and secondary, and established the Greek Archæological Society. In 1844, after two years in the Department of the Interior, he was expelled because of his foreign birth. He was called in 1845 to the chair of archæology in the University of Athens, was Minister of Foreign Affairs (1856–59), became Minister at Washington (1867), at Paris (1868), and at Berlin (1874–86), where he supported Delyannis (q.v.) before the Congress of Berlin. He was a leader of the classicists who urged a return to ancient Greek, in which he wrote versions of Dante, Goethe, and Lessing, lyric, epic, and dramatic poetry, and a valuable volume on Greek archæology. In French he wrote *Antiquités helléniques* (1842–55) and *Histoire de la littérature néo-hellénique* (1877; in German, 1884; in Greek, 1888). His archæological dictionary (1888 et seq.) was not completed. A collection of his works in 13 volumes appeared in 1874.

RANGE (from OF., Fr. *ranger*, to align, from *rang*, line, from AS., OHG. *hring*, *hrinc*, Ger. *ring*, Eng. *ring;* connected with OChurch Slav. *krangu*, circle, with Lat. *circus*, Gk. *κρίκος*, *krikos*, ring, or with Skt. *srnkhala*, chain). In gunnery, the extreme distance a projectile can cover after leaving the muzzle of the piece from which it was discharged. The maximum range of a gun is the greatest distance to which it will throw its projectile under ordinary conditions of loading. This occurs for any given conditions when the gun is at an elevation of approximately 40°. The range, in addition to the elevation at which the gun is fired, depends on the initial velocity given the projectile and the weight and diameter of it. It will therefore be seen that for any gun the range and the effect of the projectile at this range must first be decided upon, after which the gun and the projectile are designed to meet these requirements. The maximum range for the United States 16-inch breech-loading rifle mounted in the Panama fortifications is about 21 miles. By increasing the velocity this range would be still greater. Increasing the velocity, however, produces such a wear on the gun that it would be unserviceable after a comparatively small number of rounds.

The effective range, or the range at which the projectile may be counted upon to perform the work for which it is intended, is usually much smaller than the maximum range, and of course is of more importance than the maximum possible range. The limit of the effective range has been the subject of endless and heated argument for several years. It is evident that this limit must to a large extent depend on personal opinion. The points to be considered are many. The main consideration is the difficulty of supplying ammunition. The supply of ammunition to the firing line of infantry troops is especially difficult, and though the ranges for using rifle fire have lately been greatly increased, it is probable that as compared with larger guns this increase in range is very little. The reason assigned is that the chance of hitting intrenched or deployed infantry soldiers at long ranges is so small that were the soldier allowed to fire he would do little damage to the enemy, and by the time the enemy was so near as to make it possible to "aim at the white of the enemy's eyes" the ammunition would be expended.

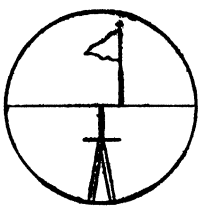
The same condition is true as regards artillery fire. For this the question of the life of the gun together with the expense of and facility for replacing or relining it must also be considered. As a consequence the almost general standard adopted by all countries until very recently was to construct the carriages or mounts so that the guns could be given a maximum elevation of approximately 15°. This corresponds to maximum ranges from about 6500 yards for guns of 3-inch calibre to about 19,000 yards for the 16-inch gun. This does not apply to howitzers or mortars, where higher elevations are used in order to give the projectile a steeper fall.

Recently some of the conditions which previously limited firings to ranges corresponding to 15° elevation have changed, observing instruments and range finders (q.v.) have been greatly improved, and it is now possible to see at much greater distances. Motor trucks lessened the difficulties incident to supply of ammunition. Aëroplanes offered a means of obtaining exact information concerning the location of hostile troops. By the use of these modern appliances longer range findings have been made possible. These changed conditions, however, found every country well supplied with guns of shorter ranges, with the result that only the nations pursuing an energetic military policy started to increase the permissible ranges. Germany provided herself with larger guns in which elevations up to 40° could be used, but other countries did not immediately follow her lead. She provided herself with a large number of these, and the tremendous advantage attained during the European War because of this policy is well known. The old idea was blasted, and where in previous wars mid-range firings of 3000 or 4000 yards was the rule, in this war firings at ranges from this range up to 15,000 yards became the practice.



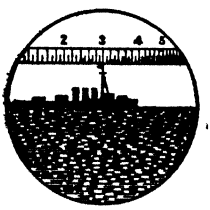
The same general condition is true of naval and seacoast guns. The demands for long ranges are so great that guns constructed in the future will have to be more powerful than ever thought of before, and it is safe to assume that the artillery of the various nations will have to be replaced with long-range guns of high power and mounted so as to get the maximum effective elevation. With more powerful guns the expense will be much greater, since the guns will become unserviceable much sooner. See BALLISTICS; FIELD ARTILLERY; GUNNERY; ORDNANCE; SMALL ARMS.

RANGE FINDER. An instrument used in naval and military operations to determine the distance of the object to be hit from the gun which is firing. (See RANGE.) Several types have been tried, but the only ones now in general use are autobase instruments. The best-known examples are the Barr and Stroud, the Bausch and Lomb, and the Lewis. The first two are used in the navy and have a horizontal base. The Lewis has a vertical base and is used in the army. Vertical-base instruments are not well suited for shipboard observations on



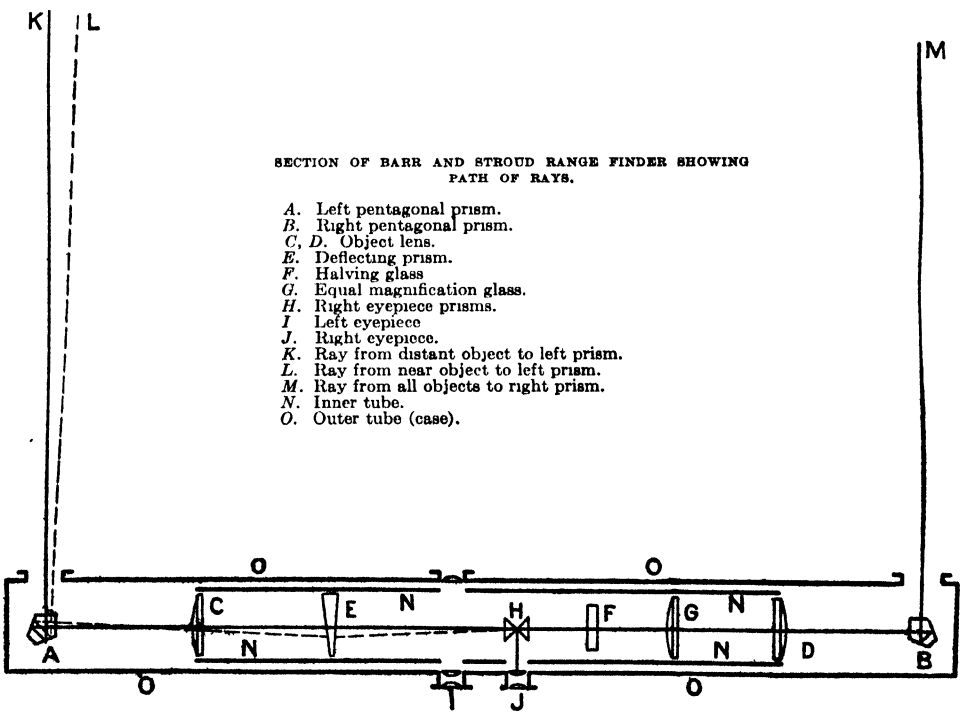
account of the difficulty of taking observations when the vessel is rolling.

The Barr and Stroud and the Bausch and Lomb range finders are of the same general construction, but differ in optical details. Each consists of a long horizontal tube, supported on a vertical pivot, with a reflecting prism at each end. These prisms bring the images of the object to the centre of the tube, where the eyepieces (like those of binocular glasses) are located. The instrument (like those of a vertical type) is designed to solve a right triangle of which the base is the distance between the reflecting prisms and the altitude is the distance of the object. The angle between the axis of the tube and the line of sight to the object is 90° at one end of the tube and somewhat less than 90°—depending upon the distance—at the other. The difference between the two angles is equal to the angle subtended by the instrument at the object observed, and it is this angle which is measured. In measuring it the distance is automatically determined.



The accompanying sketch shows the arrangement of the Barr and Stroud range finder. At the ends of the outer tube are the pentagonal prisms *A* and *B*, the reflecting surfaces of which are silvered. If the object (such as a star) is at a great distance, the rays of light from it are represented by *KA* and *MB*. If the object is comparatively near, the rays from it are enters the prism on the left side of the right eyepiece in such a manner as to be deflected to the line of sight. The distance the prism *E* has to be moved determines the range, the

FIELD OF RIGHT EYEPIECE. Images in coincidence.



FIELD OF RIGHT EYEPIECE. Images not in coincidence.

FIELD OF LEFT EYEPIECE.

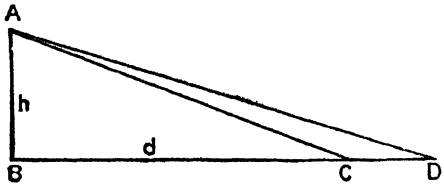
scale of yards moving above the image in the finder, which is seen in the field of the left eyepiece. To assist in bringing the rays *LAH* and *MBH* into exact coincidence in the field

SECTION OF BARR AND STROUD RANGE FINDER SHOWING PATH OF RAYS.

A. Left pentagonal prism.
B. Right pentagonal prism.
C, D. Object lens.
E. Deflecting prism.
F. Halving glass
G. Equal magnification glass.
H. Right eyepiece prisms.
I Left eyepiece
J. Right eyepiece.
K. Ray from distant object to left prism.
L. Ray from near object to left prism.
M. Ray from all objects to right prism.
N. Inner tube.
O. Outer tube (case).

LA and *MB*. The optical arrangement is such that *MB* is kept perpendicular to the axis of the tube. *LA* is inclined to the axis at an angle whose magnitude depends upon the distance. The operation of measuring the angle is effected by the deflecting prism *E*, which is moved to the right as the range increases. By this means the path of the ray *LA* (after passing through the prism *A*) is bent until it of the right eyepiece, the object is divided horizontally, the upper part coming from one side and the lower part from the other. When the two parts join exactly the adjustment of *E* is correct. If necessary the object may be lengthened vertically by means of an astigmatizer. It is then easy to determine exact coincidence.

To facilitate the operation of the instru-



ment a finder is fitted. This is in effect an ordinary telescope with a field sufficiently large for the operator to pick up quickly the object which is to be observed and direct the instrument to it. Such an arrangement is necessary because the high magnification of the contacting eyepiece causes its field to be very small

The error of a range-finder determination depends upon the proficiency of the observer, the length of the instrument, the degree of magnification, the condition of the atmosphere, the character of the object, and its direction with reference to the sun. Objects near the sun are poorly defined and the sunlight dazzles the observer. If the object has well-defined points or vertical lines (e.g., masts or smoke pipes), the determination is easy. Points or lights may be astigmatized before attempting to measure the distance. The condition of the atmosphere affects visibility and clear definition of the object The average error is (other things being equal) exactly proportional to the length of the instrument. Thus, an error of 10 seconds of arc in measuring the angle with an 18-foot instrument would give half the range error of a similar angular error in a 9-foot instrument. Since the human eye cannot distinguish an error of less than 10 seconds of arc, it is important that great distances be determined by long range finders and that the magnification be as great as the optical conditions will permit.

Although range finders are of the utmost importance in ascertaining the distance of objects at which guns are aimed, the distance as given by them does not wholly control the setting of the gun sight. On account of the variation in muzzle velocity, due to the effect of atmospheric conditions on the powder and to other causes, the range-finder reading is modified in setting the sights, the correction being made from observations of the fall of the projectiles. If they strike the water surface before reaching the target or the enemy, the sight-bar range is increased, no matter what the range finder shows, as it is evident that the sight scale is not quite correct for existing conditions. In fact, the range finder is, in naval warfare, used chiefly (*a*) at the beginning of an action, (*b*) when ranges are changing rapidly, (*c*) when the fall of the projectiles cannot be determined with accuracy, and (*d*) when the object of attack is changed. Long-base range finders, on account of their weight and size, are used chiefly on board ship, with siege-train apparatus, or in fortifications.

The United States coast artillery in the coast defenses uses a horizontal base line established by survey and from 1000 yards to 3000 yards long according to the site. This base line is equipped at one end with an azimuth instrument and with a D P.F. (depression position finder) at the other. These base-end stations are themselves coördinated by an electric bell that rings at fixed and regular intervals of time, so as to obtain synchronous observations. These observations are sent in to a third station, where the graphical plot is made and range corrections applied before the communication of the data to the battery interested. In addition to the horizontal-base system the coast artillery also uses self-contained and vertical-base instruments.

Before the development of accurate autobase range finders and of precision in gunfire, range finding was effected by three other methods. The first was by simultaneous observations from two stations separated by a known distance which formed the base. This method is still used in military operations. The second, called Buckner's method, was used only at sea. An observer at *A*, *h* feet above the water surface (*BCD*), measured the angle (*DAC*) between

the object (*C*) and the horizon (*D*). By means of suitable tables the range or distance (*BC*) was derived. The third method was by observing the time between the flash and the report of the enemy's guns and multiplying this by the velocity of sound in air. This method was abandoned many years ago as no longer practicable.

An important use for a ship's range finders is in navigation, where they are employed to determine the distances of land, lighthouses, buoys, beacons, rocks, etc.

Consult textbook on *Naval Ordnance*, United States Naval Academy (Annapolis, 1915); and "Professional Notes," in the *Proceedings of the United States Naval Institute* (ib., bimonthly); and the publications of the United States Signal Office and the Office of the Coast Artillery. See BALLISTICS; GUNNERY.

RANGELEY (rānj'lī) **LAKES.** A chain of lakes near the west boundary of Maine (Map: Maine, B 4). The principal members are Kennebago, Rangeley, Mooselookmeguntic, Molechunkemunk, Richardson, and Umbagog. All of these are connected by streams in the order named and form the sources of the Androscoggin River They lie in a wild and beautiful region and are a favorite resort of tourists and sportsmen.

RANGER, rān'jẽr, HENRY WARD (1858–1916). An American landscape painter, born in western New York. He was self-taught in art, and by travels in France, England, and Holland assimilated various styles of landscape painting. His early work often lacks truth to nature, but he steadily developed in technical skill, breadth, and feeling until finally he became known as the dean of American landscape painters and as a leader of the Tonal school. His favorite subjects are the woods and hillsides of New England. Among his finest paintings are "High Bridge" and "Spring Woods," Metropolitan Museum, New York; "Sheep Pasture," Pennsylvania Academy; "Top of the Hill," Corcoran Gallery, Washington; "Bradbury's Mill Pond, No. 2," and three other landscapes in the National Gallery, Washington. He is also represented in the Carnegie Institute, Pittsburgh, the Buffalo Academy, and the Brooklyn Museum. He received gold medals at Charleston (1902) and Philadelphia (1907) and was elected National Academician in 1906.

RANGERS, MOUNTED. In 1832 the United States government found it necessary to increase the regular-army establishment, owing to increasing Indian troubles and particularly because of the Black Hawk War of that year. One battalion of mounted rangers was raised

and added to the establishment, but was disbanded the following year and a regiment of dragoons substituted, which afterward was organized into what is now the First Regiment of regular cavalry. The State of Texas maintains a small body of mounted military police, called Rangers, or the Texas Rangers, whose principal duties consist in enforcing the State laws along the Mexican border.

RANGOON, răn-gōōn′, or **RANGUN.** The capital and chief port of Burma, India, on the Rangoon River, the eastern branch of the Irrawaddy, about 25 miles from the sea (Map: Burma, C 3). Rangoon is finely situated for internal as well as foreign commerce, having a continuous water communication with the vast region on the Irrawaddy. The town, well laid out with straight streets crossing at right angles, extends for over a mile along the river front and three-quarters of a mile inland. Rangoon is a stronghold of Buddhism and on every side are seen monuments to Gautama. The most remarkable of these is the Shoay, or Shwe, Dagon Pagoda, a shrine the foundation of which is said to have been laid 588 years B.C. It stands on an artificial elevation 168 feet high within the military cantonment on the north, is 370 feet high, 1355 feet in circumference, entirely covered with gold leaf, and contains personal relics of Buddha; it is annually visited by thousands of pilgrims. The European buildings include the Government House, the courthouses, post and telegraph offices, a cathedral, college, museum, free library, and hospital. Other notable features are the native bazars, Dalhousie and Victoria parks, and the several pretty lakes in the vicinity. Street railways give access to all the principal points. The chief industrial establishments are the lumber, rice, and oil mills; there are also manufactures of silk and cottons, mats, pottery, salts, and fish paste. The river front is lined with wharves, and two-thirds in value of the exports of Burma are shipped and almost all the imports are received at this port, which is the third in importance in British India. The principal exports are teak and rice; the imports include cotton, cutlery, petroleum, hardware, liquors, wines, silks and woolens, and raw silk. The city was rebuilt by Alompra in 1755; the British captured it in 1824, but it was retaken by the Burmese. The British again took possession in 1852, since which time the city has been held by them. Pop., 1901, 234,881; 1911, 293,316.

RANIERI, rä-nyā′rē, Antonio (1809–88). An Italian author, born in Naples. He was the friend and biographer of Leopardi, whom he faithfully nursed until his death. His novel, *Ginevra* (1839), and his history, *I primi cinque secoli della storia d' Italia* (1841), involved him in trouble with the government, but United Italy recognized his abilities, and at the time of his death he was a deputy and a professor at the University of Naples. His collected writings were published at Naples in 1862–64 and *Scritti varii* in 1891.

RANJIT SINGH, rŭn-jēt′ sĭng′h' (1780–1839). Maharajah of the Punjab. He was born at Gujranwala, the son of Maha Singh, Sirdar of Sukur-Chukeah, who died when Ranjit Singh was about 12 years old. When he was about 17 years old his mother died under somewhat suspicious circumstances, and he immediately assumed the reins of government. In 1798, having rendered important service as an ally to Zaman Shah of Afghanistan, who had invaded the Punjab, he received Lahore, which he defended against the neighboring sirdars. To them he next turned his attention and succeeded in subduing some and rendering others tributary. His successes alarmed the Sikh chiefs, allies of the British, situated between the Sutlej and the Jumna, who besought the interference of Lord Minto, the Governor-General. According to a treaty made with Ranjit Singh in 1809 by Charles Metcalfe, the English gave up all interference north of the Sutlej, on condition that that boundary should be respected. Ranjit Singh, thus freed from the only danger he feared, by 1812 had compelled all but three of the Punjab sirdars to resign their authority and proclaimed himself Rajah. In 1813 he obtained possession of Attock, took Multan by storm in 1817, and in 1819 annexed Kashmir, assuming after these exploits the title of Maharajah. In 1822 he took into his service Allard and Ventura, two French officers who had served under Napoleon, and by their aid he finished the reconstruction of his army, with the view of extending his dominion to the west of the Indus. In pursuance of this scheme he wrested the Province of Peshawar from the Afghans in 1829. After several years of desultory war with the Afghans his army was routed by them in 1836, but this reverse does not seem to have affected the stability of his rule, even in the most recently acquired districts, and his reign was not disturbed by a single revolt. He died June 27, 1839. He was totally uneducated, but his administration was energetic and, for an Oriental despotism, equitable. Consult: Griffin, *Ranjit-Singh* (Oxford, 1892); Gen. Sir John Gordon, *The Sikhs* (London, 1904); James Burgess, *The Chronology of Modern India, 1494–1894* (Edinburgh, 1913).

RANK, rank, Joseph (1816–96). An Austrian novelist, born at Friedrichsthal. He studied law and philosophy in Vienna, but devoted himself entirely to literature and won reputation with the popular tales *Aus dem Bohmerwalde* (1843), a new series of which, *Neue Geschichten aus dem Bohmerwalde*, was published in 1847. These and his other village stories rank among the best of their kind in German literature. Elected a member of the Frankfort Parliament in 1848, he sided with the moderate liberals, lived subsequently at Stuttgart, Frankfort, Weimar, and Nuremberg, and in 1861 became secretary of the Imperial Theatre at Vienna, being afterward appointed to a similar position at the Imperial Opera. His numerous novels and tales include: *Florian* (1853; 3d ed., 1861); *Geschichten armer Leute* (1853); *Von Haus zu Haus* (1853); *Achtspännig* (1856); *Aus Dorf und Stadt* (1860); *Ein Dorfbrutus* (1861); *Im Klosterhof* (1875); *Der Seelenfanger* (1885). Posthumously appeared *Erinnerungen aus meinem Leben* (Vienna, 1896). Consult Pröll, *Joseph Rank* (Prague, 1892).

RANK AND COMMAND. Military rank is that character or quality bestowed on military persons which marks their station and confers eligibility to exercise command or authority in the military service within the limits prescribed by law. It is divided into degrees or grades, which mark the relative positions and powers of the different classes of persons pos-

sessing it. In the United States army rank is generally held by virtue of office in an arm of the service, corps, or department, but may be conferred independently of office, as in the case of retired officers and of those holding it by brevet (q.v.). Command is exercised by virtue of office and the special assignment of officers holding military rank who are eligible by law to exercise command. Without orders from competent authority an officer cannot put himself on duty by virtue of his commission alone, except as contemplated in the twenty-fourth and one hundred and twenty-second articles of war. An officer of engineers not on duty with engineer troops, or of ordnance, or of the Adjutant General's, Inspector General's, Judge-Advocate-General's Department, Quartermaster or signal corps, or of the line, detailed to fill a vacancy in these staff departments or corps, though eligible to command according to his rank, shall not assume command of troops unless put on duty under orders which specially so direct, by authority of the President. An officer of the Medical Department cannot exercise command except in his own department.

The rank is relative to the grade or command, and an officer may be of the same grade yet be inferior in rank to another. Officers of the same grade are senior or junior to each other according to the priority of their commission. In the United States the regular-army commission takes precedence of either organized militia or volunteer commissions of the same grade. Where the grade and date of commission of two or more officers are the same, seniority is according to length of previous service; and should their period of service be equal, precedence will be determined (1) by rank in service when appointed, (2) by former rank in the army or marine corps, (3) by lot. Brevet rank applies only to the army.

As responsibility and subordination are the basis of organization, rank and command are the necessary correlatives. Every rank should have its proper command, and conversely every command should be accompanied by a proper rank. The only safe guide is the custom of nations, according to which all the forces of the land, comprising usually several armies, are commanded by a general in chief, who is often the sovereign or head of the nation himself, if he should be by education and training a soldier capable of taking the field in that capacity; each separate army is commanded by a general or field marshal, each army corps by a lieutenant general, each division by a major general, and each brigade by a brigadier general. The regiment is commanded by a colonel, assisted by a lieutenant colonel, each battalion by a major, and each company by a captain, assisted by first and second lieutenants. The relative rank between officers of the United States army and navy is as follows, lineal rank only being considered: general with admiral; lieutenant general with vice admiral; major general with rear admiral; brigadier general with commodore; colonel with captain; lieutenant colonel with commander; major with lieutenant commander; captain with lieutenant; first lieutenant with lieutenant (junior grade); second lieutenant with ensign.

There are some slight differences in the various armies of the world. For example, in France the highest rank is that of marshal of France, and there is no grade corresponding to the United States major general; in Germany the generals are classified as marshal generals, colonel generals, generals of infantry, cavalry, or artillery (commanding army corps), lieutenant generals (commanding divisions), and major generals (commanding brigades); there are no brigadier generals, and there are two grades of captains, first and second class. In Great Britain the battalions are commanded by lieutenant colonels and the field batteries by majors. The grades of noncommissioned officers, other than sergeant and corporal, are also quite different in the different armies.

In the United States by the Constitution the President is the commander in chief of the army and navy, but from time to time the rank of general and lieutenant general has been created or reëstablished by special act of Congress, to be conferred on the commanding general of the army, or latterly the chief of staff, as the position of commanding general was abolished in 1903.

The rank of general has been granted only as a signal honor in recognition of extraordinary services, and those holding it have been as follows:

George Washington	June 15, 1775,	to Dec.	23, 1783
U. S. Grant	July 25, 1866,	to March	4, 1869
W. T. Sherman	March 4, 1869,	to Feb	8, 1884
P. H. Sheridan	June 1, 1888,	to Aug.	5, 1888

Likewise the rank of lieutenant general has been considered in much the same light, having been held by the following:

George Washington	July 3, 1798,	to Dec.	14, 1799
U. S Grant	March 2, 1864,	to July	25, 1866
W. T Sherman	July 25, 1866,	to March	4, 1869
P. H Sheridan	March 4, 1869,	to June	1, 1888
J. M. Schofield	Feb. 8, 1895,	to Sept.	29, 1895
N. A. Miles	June 6, 1900,	to Aug.	8, 1903
S. B. M. Young	Aug. 8, 1903,	to Jan.	9, 1904
A R. Chaffee	Jan. 9, 1904,	to Feb.	1, 1906
John C. Bates	Feb. 1, 1906,	to April	14, 1906
H C Corbin	April 15, 1906,	to Sept.	15, 1906
Arthur McArthur	Sept. 15, 1906,	to June	2, 1909

In addition Gen. Winfield Scott held the rank of brevet lieutenant general from March 29, 1847, to Nov. 1, 1861.

Promotion is an important factor in rank and command, since its rate determines the age at which any particular rank or command is reached, and the latter is a very important element in the organization of an army, because rapid promotion insures to the higher commands young and therefore energetic officers. Germany under peace conditions may be taken as the type of the continental armies, and there promotion from second to first lieutenant normally takes place in the arm of the service, from first lieutenant to captain by corps, from captain to major in the arm again, and above that in the entire army; transfers are often made in order to equalize promotion, and incapable officers are retired; in the general staff promotion is more rapid, because there are more majors than captains, and the former are continually passing out for service in the line. Promotion in the German army previous to the Great War was as follows: to first lieutenant after 7 years of service, to captain after 12, to major after 23, to lieutenant colonel after 30, to colonel after 33, and to major general after 36; in the general staff, however, captaincies are attained in two or three years less than in the line and majorities three or four years earlier than in the line. See ARMIES; ARMY ORGANIZATION.

RANK, MARKS OF. See MILITARY INSIGNIA.

RANKE, räŋ'ke, HERMANN (1878–). A German Assyriologist and Egyptologist. He was born at Balgheim, near Nördlingen, was educated at Göttingen, Greifswald, Munich, and Berlin, and from 1902 to 1905 was at the University of Pennsylvania as research fellow in Assyriology and reader in Egyptian. Then, after five years (1905–10) in the Egyptian Museum in Berlin, he became professor of Egyptology at Heidelberg. He brought out the German edition of Breasted's *History of Egypt* (1909) and wrote: *Early Babylonian Personal Names* (1893 et seq.); *Babylonian Legal and Business Documents* (1906); *Aegyptische Texte zum alten Testament* (1909); *Keilschriftliches Material zur altagyptischen Vokalisation* (1910), an important study of cuneiform renderings of Egyptian words and sounds.

RANKE, JOHANNES (1836–). A German physiologist and anthropologist, born at Thurnau, Bavaria. He was educated in Munich, Berlin, and Paris, became a lecturer in physiology at Munich in 1861, in 1869 professor extraordinary, and in 1886 full professor of anthropology, his being the first chair of that science in Germany. In 1889 he became curator and director of the collection of prehistoric objects of Bavaria presented by him to the State. Ranke edited the *Beitrage zur Anthropologie und Urgeschichte Bayerns*, the *Archiv für Anthropologie*, and the *Korrespondenzblatt* of the German Anthropological Society, of which organization he was chosen honorary president. His published works include *Tetanus* (1865); *Grundzüge der Physiologie* (1867–81); *Beitrage zur physischen Anthropologie der Bayern* (vols. i and ii, 1883–92); *Der Mensch* (1887–1902), a very elaborate work on anthropology; *Schadelgrund* (1892); etc.

RANKE, LEOPOLD VON (1795–1886). A celebrated German historian, who, with Niebuhr, was the founder of the modern historical school. He was born at Wiehe in Thuringia. At the age of 18 he went to the University of Leipzig, where he studied theology and the classics. In 1818 he became an instructor in the Gymnasium at Frankfort-on-the-Oder. He first published the *Geschichte der romanischen und germanischen Völker von 1494–1535* (1824). In 1825 he was appointed professor extraordinary at the University of Berlin and entered upon a study of the Venetian Relations. The result of these studies was his *Fürsten und Volker von Südeuropa im 16. und 17. Jahrhundert* (1827). He next received a commission from the Prussian government to go to Venice and investigate the archives there, and in 1834–37 he published *Die römischen Päpste, ihre Kirche und ihr Staat im 16. und 17. Jahrhundert* (10th ed., 1900, under the title *Die römischen Päpste in den letzten vier Jahrhunderten*), a work which attracted the attention of the entire civilized world. In 1834 he was made a full professor at Berlin. Ranke's great studies of the Reformation period in Germany, France, England, and Italy all form parts of one related whole. These works are the most notable and important of Ranke's voluminous contributions to historical literature and form a unique study of the period. Ranke became historiographer of Prussia in 1841. He retired from his chair in Berlin in 1871, but in 1880 began the publication of a universal history. The volumes of the *Weltgeschichte* published before his death carry the account to the eleventh century. Two additional volumes were edited by his assistants after his death. The whole was published in nine volumes (1881–88). Ranke's interests were cosmopolitan, not German, as he lived before the days of intense German nationalism. As a writer he is clear but dry and uninteresting. His fame rests mainly on his scientific method of studying history from original sources and not from legend and tradition. Among his works are: *Die serbische Revolution* (1829), republished as *Serbien und die Türkei im 19. Jahrhundert* (1879); *Die Verschwörung gegen Venedig 1618* (1831); *Deutsche Geschichte im Zeitalter der Reformation* (1839–47); *Französische Geschichte vornehmlich im 16. und 17. Jahrhundert* (1852–61); *Englische Geschichte im 16. und 17. Jahrhundert* (1859–67); *Zur deutschen Geschichte vom Religionsfrieden bis zum dreissigjährigen Kriege* (1868); *Geschichte Wallensteins* (1869); *Zur Geschichte Deutschlands und Frankreichs im 19. Jahrhundert* (1887). His works are published in 54 volumes, covering the range of modern European history. Some of them have been translated into English.

Bibliography. His autobiography, *Zur eigenen Lebensgeschichte*, edited by Alfred Dove (Leipzig, 1890), also published as vols. liii–liv of the collected works; H. B. Adams and others, in American Historical Association, *Papers*, vol. iii (Washington, 1888); E. G. Bourne, in American Historical Association, *Annual Report* (ib., 1896); Alfred Dove, *Ausgewählte schriftchen vornehmlich historischen Inhalts* (Leipzig, 1898); Antoine Guilland, *L'Allemagne nouvelle et ses historiens, Niebuhr, Ranke, Mommsen, Sybel, Treitschke* (Paris, 1899); Wahan Malbandian, *Leopold von Ranke: Bildungsjahre und Geschichtsauffassung* (Leipzig, 1901); H. F. Helmolt, *Ranke Bibliographie* (ib., 1910).

RANKIN, räŋ'kĭn. A borough in Allegheny Co., Pa., 8 miles from Pittsburgh, on the Baltimore and Ohio, the Pittsburgh and Lake Erie, the Union, and the Bessemer and Lake Erie railroads and on the Monongahela River. It has extensive manufactories of steel and wire goods. Pop., 1900, 3775; 1910, 6042.

RANKIN, (ARTHUR) MCKEE (1841–1914). An American actor, born in Canada. He first played at Rochester, N. Y., under the stage name of George Henley, but after the early sixties appeared under his own name in London, New York, and Boston. Joining A. M. Palmer's stock company, he became one of the best-known American actors, and was especially successful in *The Two Orphans* and in his dramatization of Joaquin Miller's novel, *The First Families of the Sierras*, as *The Danites*. In 1883 he built Rankin's Theatre in New York City.

RANKINE, räŋ'kĭn, WILLIAM JOHN MACQUORN (1820–72). A Scottish engineer and physicist. He was born at Edinburgh and studied at the university of that city. He afterwards studied civil engineering and was employed on various railways in Scotland as a civil engineer. In 1849 he was elected a fellow of the Royal Society of Edinburgh and in this year read his celebrated paper *On a Formula for Circulating the Expansion of Liquids by Heat*. He published in the *Philosophical Magazine* (1851) a paper on the *Centrifugal Theory of Elasticity as Applied to Gases and Vapors*, in which this theory was elaborated. In 1853 he was elected fellow of the Royal Society

and submitted to that body a paper on thermodynamics, *On the Geometrical Representation of the Expansive Action of Heat.* After delivering lectures in the university at Glasgow, he was elected regius professor of civil engineering in that institution in 1855, succeeding Prof. Lewis Gordon. Rankine may be considered one of the founders of the science of thermodynamics (q.v.). In applied science his work as an engineer was of a high order, and he was the first president of the Institute of Engineers in Scotland. He was also consulting engineer to the government and corporations and was a contributor to the *Engineer.* He was the author of the following books: *Manual of Applied Mechanics* (1858); *Manuals of the Steam Engine and Other Prime Movers* (1859); *Manual of Civil Engineering* (1862); *Manual of Machinery and Mill Work* (1869); *Cyclopædia of Machine and Hand Tools* (1869). Rankine was also the corresponding and general editor of *Shipbuilding Theoretical and Practical* (1866). His *Miscellaneous and Scientific Papers* were published in 1880 and contain a biographical memoir by Prof. P. G. Tait.

RANN OF CUTCH, or **KATCH.** See CUTCH, GULF OF; INDUS.

RANS'DELL, JOSEPH EUGENE (1858–). An American legislator, born at Alexandria, La. Graduating from Union College (later University), Schenectady, N. Y., in 1882, he practiced law at Lake Providence, La., until 1899, serving also as district attorney of the eighth judicial district (1884–96) and as a member of the levee board of the fifth Louisiana levee district (1896–99). A Democrat in politics, he served in the national House of Representatives from 1899 to 1913 and in 1912 was elected Senator. In the Senate, in 1913, Ransdell bitterly opposed the sugar schedule of the Underwood-Simmons Tariff Bill. President of the National Rivers and Harbor Congress after 1907, he actively promoted legislation for waterways. He became honorary chancellor of Union University.

RAN'SOM (OF., Fr. *rançon,* from Lat. *redemptio,* redemption, ransom, from *redimere,* to buy back, redeem, from *red-, re-,* back again, anew + *emere,* to buy). A price paid by a prisoner of war, or paid on his behalf, in consideration of his being granted liberty to return to his own country. In early times, when armies received little or no regular pay, the soldier looked for his reward in the booty he might capture, and this booty included the bodies as well as the chattels of the vanquished. The conqueror had the option of slaying his prisoner; but for his profit he might make him his slave or sell him into slavery. The transition to accepting compensation from the prisoner himself and setting him at liberty would be natural. In the feudal period in western Europe, when the practice of holding captured kings and other great men to ransom was common, an assessment of freehold tenants for the purpose of ransoming the lord's body from captivity was one of the usual aids or incidents of feudal tenure. See AID; FEUDALISM.

In international law the term "ransom" is also sometimes employed to describe a sum paid to redeem captured property, such as ships and the like. For example, a ship captured by a privateer may be redeemed by her owners at an agreed price, and is then entitled to a ransom bill from her captors, i.e., an instrument which is supposed to assure her safe-conduct to her native ports provided she follows a prescribed course.

RANSOM, MATTHEW WHITAKER (1826–1904). An American Confederate soldier and legislator. A brother of Robert Ransom, he was born in Warren Co., N. C. He graduated at the University of North Carolina in 1847 and was admitted to the bar in the same year. He was a Whig in politics and served as Attorney-General of the State (1852–55), and as a member of the Legislature (1858–60), and in 1861 was a peace commissioner to the Confederate Congress at Montgomery, Ala. After his State seceded he soon became colonel of the Thirty-fifth Regiment, was in the Seven Days' battles, and was twice wounded at Malvern Hill. At Antietam he was in command of the brigade during part of the engagement. After Fredericksburg he served in North Carolina, was promoted brigadier general, and during the Gettysburg campaign was in command of the Suffolk line and checked the advance towards Weldon in July. Afterward he served before Petersburg and on the Crater line, was particularly complimented by General Lee for the assault on Hare's Hill (March 25, 1865), and was engaged at Five Forks. From 1872 to 1895 he was a prominent Democratic member of the United States Senate.

RANSOM, ROBERT (1828–93). An American Confederate soldier, born in Warren Co., N. C., brother of Matthew W. Ransom. He graduated in 1850 at West Point, where he was assistant instructor in cavalry tactics in 1854–55. Later he served in Kansas and on recruiting or frontier duty (1855–61), and was made a cavalry captain in 1861. The same year he resigned his commission to enter the Confederate service. He was then commissioned captain of cavalry, organized the First North Carolina Cavalry, and was chosen colonel. In November he commanded at Vienna, Va., in the first cavalry encounter of the war. On March 6, 1862, he was made brigadier general to reorganize the cavalry in the West and Southwest, but after the fall of Newbern was sent to oppose the Federal forces in eastern North Carolina. During the Seven Days' battles in June–July, 1862, he was attached to Huger's division. In the Maryland campaign, in Walker's division, Longstreet's corps, he took part in the reduction of Harper's Ferry, and was especially commended for judgment and skill at Antietam. At Fredericksburg he commanded the division and had immediate charge of the defense of Marye's Heights. Until May, 1863, he was in charge of the defense of the Weldon Railroad, but on his promotion to be major general was assigned to the district including Appomattox and Blackwater. In October, 1863, he was in command in east Tennessee and southwest Virginia and remained until April, 1864, when he was recalled for the defense of Richmond. He surrendered to General Howard at Warrenton (May 2, 1865). For a time he served as express agent and city marshal at Wilmington, N. C., and then engaged in farming until 1878. In that year he was appointed superintendent of the United States harbor and river improvements about Newbern.

RANSOM, THOMAS EDWARD GREENFIELD (1834–64). An American soldier. He was born in Norwich, Vt., studied at Norwich University, and at the outbreak of the Civil War entered the

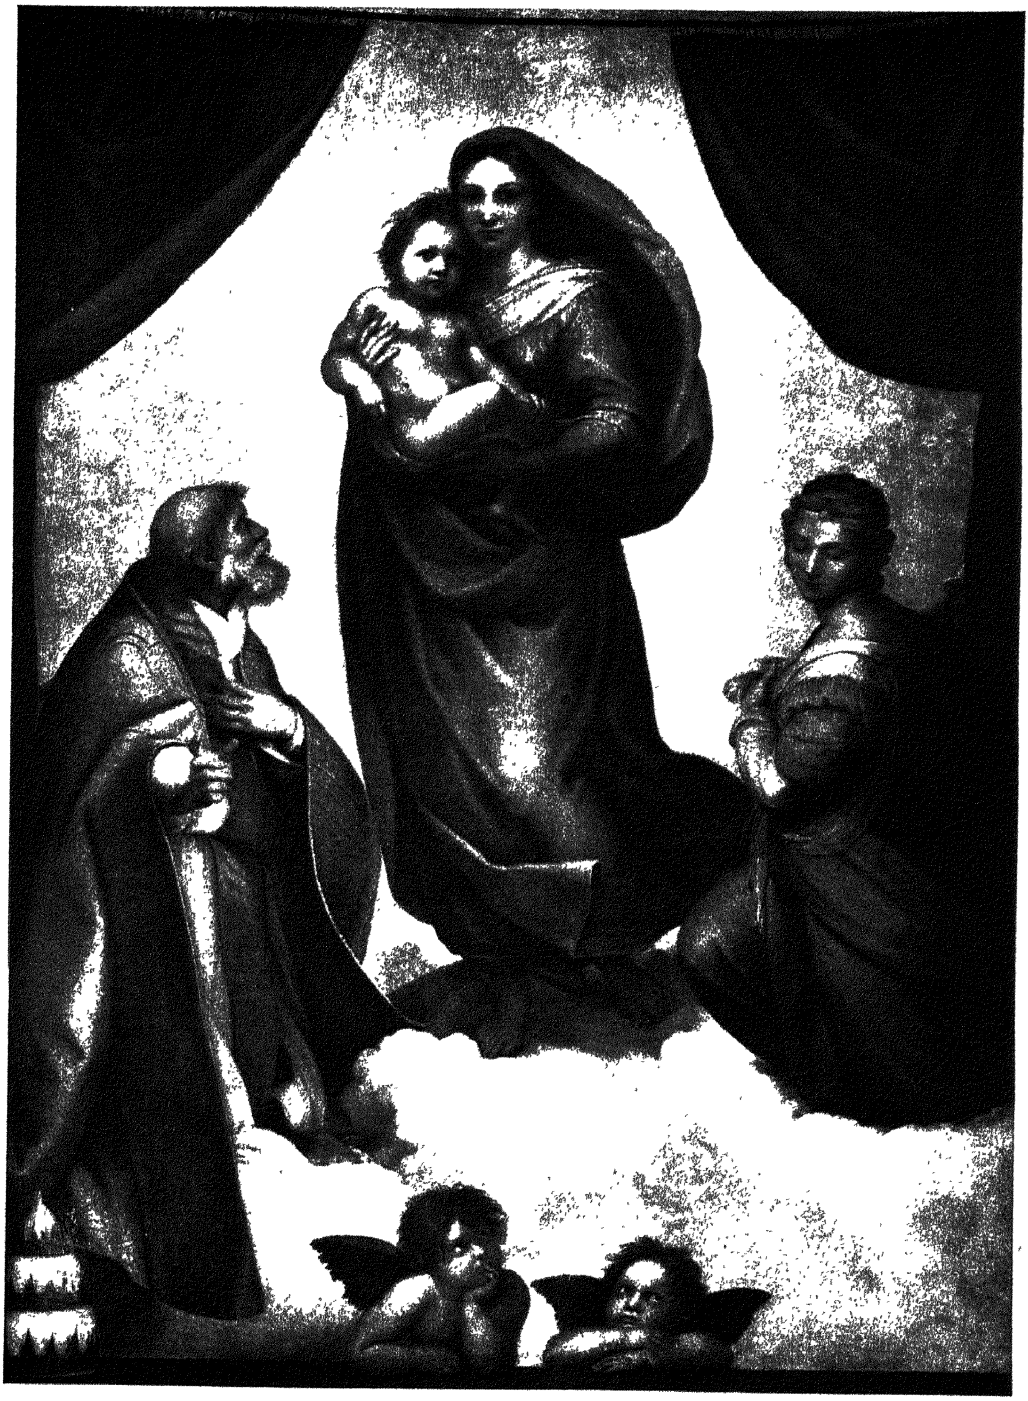
Federal service and was elected major of the Eleventh Illinois Volunteers. Promoted to be lieutenant colonel, he took part in the attacks on Forts Henry and Donelson and distinguished himself at Shiloh. He served on the staff of General Grant, was promoted brigadier general, fought at Vicksburg, and commanded a division in the Red River campaign. He subsequently commanded the Seventeenth Corps in the operations about Atlanta, and was promoted major general. Consult J. G. Wilson, *Sketches of Illinois Officers* (New York, 1862).

RANSOME, FREDERICK LESLIE (1868–). An American geologist, born at Greenwich, England. He was educated at the University of California (S.B., 1893; Ph.D., 1896) and was an assistant in mineralogy and petrography at Harvard in 1896–97. Assistant geologist (1897–1900) and thereafter geologist on the United States Geological Survey, he had charge of the sections of western areal geology and of metalliferous deposits after 1912. At the University of Chicago he lectured on ore deposits in 1907. Ransome became associate editor of *Economic Geology* and of the *Journal* of the Washington Academy of Sciences. His many official reports and bulletins deal mainly with phases of economic geology.

RANT'ERS. An alleged English sect of the Commonwealth period of Antinomian views. They were charged with immoral practices and were speedily suppressed. Thomas Fuller, in his *Church History,* associates them with the Familists. Probably many of the stories about them were idle gossip. The Primitive Methodists were also called Ranters because of the violent physical phenomena which attended their worship.

RANTOUL, răn'tōōl, ROBERT, JR. (1805–52). An American lawyer and political leader. He was born in Beverly, Mass., graduated at Harvard in 1826, and early practiced law at Gloucester. He became a leading supporter of Andrew Jackson, and from 1834 to 1838 was a member of the State Legislature. He was a member of the first commission to revise the laws of Massachusetts and in 1837 was appointed by Gov. Edward Everett a member of the first State Board of Education. In 1839 he removed to Boston, where his connection with several legal cases of great importance added to his growing reputation In 1843 he was appointed collector of the port of Boston and from 1845 to 1849 was United States district attorney. In 1852 he defended Thomas Sims, the first slave reclaimed under the Fugitive Slave Act from New England. In 1851 he was elected to the United States Senate to fill out the term of Daniel Webster and in November of the same year was elected to Congress as the candidate of Democrats and Free Soilers. His strong opposition to the Fugitive Slave Law and to the general proslavery policy of the Democratic party led to his exclusion from the Convention of 1852 that nominated Franklin Pierce for the presidency.

RAN'ULA (Lat., little frog; so called from a fancied resemblance to a frog in the form of the swelling). A cystic tumor on the floor of the mouth caused by obstruction and dilatation of one of the several ducts of the salivary glands or mucous follicles, opening under the tongue. The tumor contains a glairy fluid, resembling mucus or saliva, which, as it increases in size, pushes the tongue to the opposite side. Ranula is not painful, and these tumors sometimes reach a considerable size before relief is sought. The usual method of treatment is by free incision or by removing a portion of the sac wall; if this is not effective and the sac refills, the interior is touched with a caustic such as nitrate of silver or pure carbolic acid, to produce an adhesive inflammation of its walls.



RANUN'CULA'CEÆ (Neo-Lat. nom. pl., from Lat. *ranunculus,* sort of medicinal plant, dim. of *rana,* frog), CROWFOOT FAMILY. A family of about 35 genera and 11,000 species of dicotyledonous herbs (rarely climbing shrubs), distributed throughout the world, but not abundant in the tropics. The family is quite variable in its features, but is characterized in general by hypogynous flowers, with five sepals and petals, and numerous stamens and carpels. It is regarded as the genetic family characterizing the order Ranales and giving rise to the higher dicotyledons, as well as to the monocotyledons. It includes many very familiar forms, such as buttercup, larkspur, anemone, columbine (*Aquilegia*), clematis, marsh marigold, peony, etc.

RANUN'CULUS. A genus of about 275 species of mostly perennial herbs of the family Ranunculaceæ (q.v.), some of them (crowfoots, buttercups, pilewort or lesser celandine) common in pastures and gardens, many (spearworts) in moist places, others wholly aquatic. See Plate of DICOTYLEDONS.

RANZ DES VACHES, räns dā vāsh (Swiss Fr., lowing of the cows, or line of the cows). A name applied to certain simple native melodies of the Swiss Alps, which are usually sung by the herdsmen and played by them, when driving their herds to and from the pasture, on the alpenhorn (q.v.). It is a peculiarity of this music that it is seldom in tune, owing to the presence of the eleventh overtone (a tone between f^2 and $f^2\sharp$) on the alpenhorn. Its principal characteristics are rising and falling broken chords, repetitions, and (when sung) the use of the jodler. A collection of ranz des vaches, along with other Swiss melodies (*Sammlung von Schweizer Kuhreigen und Volksliedern*), was published at Berne in 1818, and these airs are also to be found in the *Allgemeines Schweizer Liederbuch* (1851). The ranz des vaches of Switzerland are ruder in their character than the mountain melodies of the Tirol, with which they are sometimes confounded. See KUHREIGEN.

RAOULT, rä'ōōl', FRANÇOIS MARIE (1830–1901). A French chemist, born at Fournes-en-Veppes, Nord, and educated in Paris, where he became doctor of physical science in 1862. He became professor of chemistry (1870) and then (1889) dean of the faculty of science in the University of Grenoble. His earlier studies were in electrochemistry, but he is better known for his work on the freezing point and boiling point of solutions. About 1884 he discovered the general law of the freezing of solutions, demonstrating that the depression of the freezing point of a liquid, caused by dissolving in it equal quantities of substances, is inversely proportional to the molecular weights of the latter. In 1886 he produced experimental evidence showing that a similar law holds good for the vapor pressure (and hence the boiling point) of solutions. The immediate practical value of Raoult's laws lies in the fact that they permit of determining the molecular weight of innumerable substances that are nonvolatile, but that are soluble in some liquid. See BOILING POINT; DISSOCIATION; FREEZING POINT; MOLECULES—MOLECULAR WEIGHTS.

RAPACES, rā-pā'sēz. See BIRD OF PREY.

RAPHAEL

"SISTINE MADONNA," FROM THE PAINTING IN THE ROYAL GALLERY, DRESDEN

All the works of Raphael up to the time of his removal to Florence in 1504 belong to his Umbrian period. The earliest, according to Morelli, is a small but consummate "St. Michael" in the Louvre, which also possesses "Apollo and Marsyas" and "St. George and the Dragon" of the same period. Best known of all is the charming "The Knight's Dream" (National Gallery, London), an allegory, resembling the mythical vision of Hercules. These works closely resemble those of Timoteo Viti, in form and miniature-like execution, as well as in a delightful poetic sentiment. The finest Madonna of this period is the delightful little Connestabile panel at St. Petersburg. For other Madonnas of the Umbrian period, see MADONNA.

Raphael's more ambitious works resemble Perugino's, except that with him everything is more refined and harmonious, the composition is better, the execution more careful and powerful. Although Perugino departed from Perugia in 1502, his influence is seen in the design of the "Coronation of the Virgin" (c.1503), now in the Vatican Gallery. He executed three important altarpieces in the neighboring Città di Castello, two of which survive—one, a "Crucifixion," being in the Mond collection, London; the other, the famous "Sposalizio" (Marriage of the Virgin), in the Brera, Milan. The latter was formerly supposed to be a copy of the same subject by Perugino at Caen, but Berenson has lately pronounced the Caen picture a copy of Raphael's picture by Lo Spagna. The most ambitious Madonna of the Umbrian period is the fine example in the Morgan collection (Metropolitan Museum, New York). Morelli has justly assigned to Raphael the realistic portrait of Perugino in the Borghese Gallery, Rome, formerly attributed to Holbein.

Equipped with a letter of introduction from the Duke of Urbino's sister to Soderini, gonfalonier of Florence, Raphael removed to that city in 1504. The opportunities for the development of a young artist were at that time most favorable. Florence was in an artistic ferment over the battle of the giants, Michelangelo and Leonardo, in their rival cartoons for the Palazzo Vecchio (see MICHELANGELO; VINCI, LEONARDO DA), and Fra Bartolommeo had just returned to the brush with new designs and ambitions in art. The youthful Raphael studied, in the Brancacci Chapel, the frescoes of Masaccio, whose "Adam and Eve" are recognized in Raphael's Vatican frescoes. He also studied the sculpture of Donatello, as may be seen in his admirable "St. George" (in the Louvre, 1506; replica in the Hermitage, St. Petersburg). From Leonardo he learned modeling and chiaroscuro; from Michelangelo anatomy and dramatic action; from Fra Bartolommeo composition and the art of enlivening statuesque groups by contrasts. His intense diligence is proved by his surviving sketches of Michelangelo's and Leonardo's cartoons and by the innumerable studies for his pictures. Though usually begun with his adoption of a figure or an idea of some other master, his studies end in something quite individual.

Raphael's development during the Florentine period can best be followed in his Madonnas, in which the influence of the various masters is most apparent. Though, like the Florentine, he portrays the simple relation of mother and child, his works are essentially original in pose, in the elimination of the accidental, and in the absolute harmony of all parts both in color and line. The first early example is the "Madonna del Gran Duca" (Pitti Palace), still Umbrian in the draperies and rather resembling Timoteo Viti than Perugino. The transition from fifteenth-century Umbrian to Raphael's own style is seen in the four delightful examples at Berlin, Vienna, Florence, and Paris, in which the Virgin is represented with the infants Christ and John in the midst of a beautiful landscape. All show the influence of Leonardo in sentiment and composition, and the last named, "La Belle Gardinière," in which figures and landscape are perfectly balanced, is one of Raphael's great creations. The last of Raphael's Madonnas executed at Florence, the "Madonna del Baldachino" (Pitti), a monumental altarpiece, shows his close association with Fra Bartolommeo, who completed it. Similar in character with the Madonnas are his less numerous "Holy Families," at Madrid, Munich, and especially the one with the beardless Joseph at St. Petersburg.

Raphael's most important commissions during his stay in Florence came from Umbria. In 1505 he executed for the convent and chapel of San Severo in Perugia the fresco the "Adoration of the Trinity," a well-balanced composition, reminding one somewhat of Bartolommeo's "Last Judgment." For Lady Atalanta Baglione of the ruling family of Perugia he executed the well-known "Entombment" (1507, Borghese Gallery, Rome), an altarpiece in memory of her murdered son. The picture is eclectic in style, showing especially the influence of Michelangelo. To the early part of the Florentine period, still showing Perugino's influence, belongs the beautiful three-quarter figure of "St. Catharine" in the National Gallery, London. Of his portraits the chief are those of Angelo Doni and his wife (1505), the latter recalling Leonardo's "Gioconda"—all in the Pitti Palace—and Raphael's own youthful likeness in the Uffizi. All of these date from the early part of his Florentine period.

From a letter of Raphael dated April 21, 1508, we know that he was then still in Florence, but from another of September 5 that he was at Rome in the service of the Pope. His fellow citizen of Urbino, the architect Bramante, induced Julius II to call him thither. With his accustomed tact in making the best use of artists, the Pope commissioned him to fresco four chambers of the Vatican. They were small, irregularly built, and poorly lighted, but Raphael, aided by the advice and assistance of Bramante, transformed them into spacious halls, with far vistas and beautiful architectural effects. In these decorations the development of his art during the Roman period may best be traced. The first room was the Camera della Segnatura (1509–11), so called from the papal signatures written there. It is by far the best, because executed almost entirely by his own hand. The general plan of the decoration was to represent the four spiritual powers, "Theology," "Philosophy," "Poetry," and "Justice," typified by beautiful female figures occupying medallions in the ceiling of the room. On one of the large walls, under "Theology," is the celebrated "Disputa," in two divisions. Grouped about an altar on the earth below, grave theologians and laymen are discussing the mystery of the Trinity. One of them points upward, where, in the hierarchy of the heavens, the mystery is revealed. While this work is still Florentine in character, the wall under "Philosophy," the "School of Athens," shows a more independent and classic art. The

scene is laid in a beautiful architectural hall, in which all the philosophers and wise men of antiquity, grouped about Plato and Aristotle, are discussing the problem of life. Among the philosophers to the right Raphael has introduced his own portrait and that of Sodoma. Upon the irregular wall under "Justice" are three representations typifying civil and canon law. Under "Poetry," esteemed by many the most beautiful female figure which Raphael ever painted, is the celebrated "Parnassus." Surrounded by the Muses, Apollo sits on a mountain which is so painted as not to be disturbed by an intervening window, and in the spaces on either side are the great poets of Greece, Rome, and Italy. From the point of view of architectural decoration this superb room is considered by many to represent the highest possible attainment in the perfect harmonious blending of architectural form and detail with decorative painting.

The second chamber, the Stanza d' Eliodoro (1512–14), represents the triumph of the Church over its temporal foes and over false doctrine. The medallions and the beautiful decorations of the ceiling are after Raphael's designs, but the wall paintings were executed, at least in part, by himself. The composition is somewhat disturbed by the introduction of papal portraits into three of the frescoes, but this is atoned for by the resulting magnificent group of portraits. The "Expulsion of Heliodorus from the Temple," a painting of mighty dramatic power, symbolizes the expulsion of Charles VIII of France from Italy. "Attila and Leo the Great" is a remarkable composition, designed almost entirely of horsemen. The "Mass of Bolsena" shows how the Host was changed into blood under the eyes of an unbelieving priest, and over the other window "Peter's Release from Prison" is remarkable for its portrayal of the gloom of the night, under the triple illumination of the moon, torches, and the apparition of the angel. The paintings of this room, particularly the one last mentioned, are Raphael's most remarkable colouristic production and show the influence of the Venetian Sebastiano del Piombo, who was at that time in Rome. They also show, in the fine dramatic action, a further influence of Michelangelo, probably derived from frescoes in the Sistine Chapel. This is still more evident in the fresco of "Isaiah" (1512; San Agostino) and in those of the "Sibyls" (1514; Santa Maria della Pace), in which Raphael enters the list as a rival of Michelangelo. A third important influence upon Raphael's art was that of the classic monuments of Rome, but he harmonized all of these factors into an individual art of his own.

The third chamber of the Vatican, the Stanza del Incendio (1514–17), is decorated with historical scenes from the lives of Leo III and Leo IV, the best of which, the "Incendio del Borgo," after which the room is named, represents Leo IV miraculously extinguishing a fire at Rome. It contains wonderfully strong figures and fine nudes. Of the fourth chamber, the Sala Constantina, only the designs were furnished by Raphael, and of these only two were used, the principal of which, the "Victory of Constantine over Maxentius," was executed by Giulio Romano. Near by are the decorations, in stucco relief and color, of the Loggie of the Vatican, which, of all his works, show the highest influence of the antique. The adornment is mainly of grotesques, copied after the Roman models lately discovered in the substructions of the baths of Titus, and on the ceiling is the so-called Raphael's Bible, 52 pictures of biblical subjects executed by Giulio Romano.

Before the death of Julius II, in 1513, Raphael assumed an important position at the papal court, and under Leo X his influence increased. Upon the death of Bramante, in 1514, he was made chief architect of St. Peter's, at his dying predecessor's request, and in 1515 he was appointed conservator of all the excavations of antiquities in and near Rome. The greatest statesmen and humanists of the day sought his friendship, and kings requested, as an especial favor, a work by his hand. He attended court with a following of 50 painters and lived like a prince. Under such circumstances it was impossible for him to execute the remaining decorations of the Vatican with his own hand. He was compelled to intrust them and the execution of his architectural and other designs to his numerous pupils. His compositions became grander than ever, but the execution suffered. The celebrated engraver Marcantonio Raimondi (q.v.) was entirely occupied in carrying out his designs for prints.

Perhaps the most powerful decorative work of Raphael's later life is the 10 delicately colored cartoons for the tapestries which hung upon the walls of the Sistine Chapel. The original tapestries are still in the Vatican, and there are copies at Berlin, Dresden, and Madrid, but only seven of the cartoons survive, in South Kensington Museum, all of them showing wonderful technique and power. The best are the "Miraculous Draught of Fishes," "Christ's Charge to Peter," and "Peter and Paul Preaching." For his friend Agostino Chigi he also designed the architecture and decorations of the Chigi Chapel in Santa Maria del Popolo and the beautiful decorations of the Villa Farnesina Of these the fresco "Galatea" (1514) is perhaps the most perfect of all modern mythological pictures. In it the antique lives again, executed, however, with the more naturalistic technique of the sixteenth century. Raphael's talent as a narrator was never more perfectly exhibited than in the Farnesina with his story of "Cupid and Psyche" (1518–20), which, though executed by his pupils, contains some of the best modern versions of antique mythology. Especially beautiful is the fresco of "Jupiter Kissing Cupid," in which the majesty of old age and the beauty of youth are charmingly contrasted Unfortunately these decorations have suffered considerably from restorations and partial repaintings.

Along with these greater undertakings Raphael executed numerous easel paintings. His portraits are admirable realistic productions with a strong and unaffected conception of character, belonging, indeed, to the greatest portraiture that has ever been produced. Among the principal examples, besides those wonderful likenesses in his frescoes, is that of "Julius II," surviving in a number of examples, of which the original is probably in the Pitti Palace. The old man is represented as seated in an armchair, engaged in deep meditation. Other celebrated specimens are the portraits of Leo X (1518) with two cardinals, a splendid piece of realism; of Cardinal Bibbiena, of which the original is at Madrid; of Tommaso Inghcrami at Volterra; of Baldassare Castiglione, a marvelous piece of color, and Joanna of Aragon, in the Louvre; and the beautiful "Donna Velata," the prototype of the Sistine Madonna, in the Pitti

Palace. The celebrated "Fornarina," formerly supposed to be a portrait of Raphael's beloved, is now attributed to Sebastiano del Piombo (q.v.).

Among his religious pictures the greater number were Madonnas, most of them executed by his pupils. (For an enumeration and description, see MADONNA.) The best example of his early Roman period is the "Madonna della Sedia," or "Seggiola" (Pitti Palace), so called from the chair upon which she is seated. The Virgin is represented as a beautiful Italian woman in picturesque Roman folk costume. The expression of sublime maternal love in this picture has never been excelled. The last and grandest of all of his Madonnas, the consummation and perfection of all such efforts, perfect alike in form, color, and composition, is the "Sistine Madonna" (Dresden Gallery). Painted as an altarpiece for the church of San Sisto at Piacenza, it was finished just before Raphael's death. The Virgin is not represented primarily as a mother, but as the Queen of Heaven descending from the clouds, which are themselves composed of the heads of thousands of cherubs. The Christ-child looks with thoughtful eyes, as if conscious of his destiny as a Saviour of the world, while on either side St. Sixtus and St. Barbara kneel in adoration. At the base of the picture are the two celebrated cherubs.

Raphael's other religious pictures typify the waking religious consciousness of Italy in reply to the Reformation of the North: "Lo Spasimo di Sicilia" (Christ Sinking beneath the Cross) (Madrid); "The Vision of Ezekiel" (Pitti Palace), minute in execution and beautiful in color; the celebrated "St. Cecilia" (1515; Bologna), surrounded by four saints, listening with varied expressions of ecstasy to the heavenly chords; "St. Michel Crushing Satan" (1518; Louvre); "The Transfiguration" (Vatican), left unfinished at Raphael's death and completed by Giulio Romano.

As an architect Raphael was not of the same importance as a painter. He was a disciple of Bramante, whose plan of St. Peter's he continued, though he also had one of his own. (See SAINT PETER'S CHURCH.) The Farnesina is usually ascribed to Peruzzi, and of his other palaces the Palazzo Pandolfini at Florence is the only one carried out in accordance with his plans. His chief work, the Villa Madama, built about 1516 for Cardinal Giulio de' Medici, displays forms of simple majesty. Unfortunately the design was never carried out in its entirety. As a sculptor he is reputed to have carved the "Boy Astride a Dolphin" (St. Petersburg), but the attribution is doubtful. He also tried his hand at poetry, but his few sonnets are amateurish.

Raphael died on Good Friday (April 6), 1520, at the age of 37, as a result of a fever contracted during the excavations in Rome. All Rome mourned over his loss, and he was interred with great honor in the Pantheon. His character, like his art, was a perfect harmony of the elements which go to make life beautiful, and his contemporaries valued the one as highly as the other.

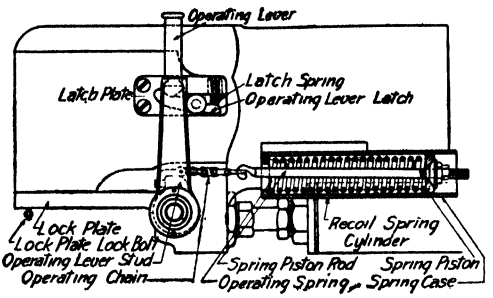
The opinion of Raphael's contemporaries, that his work was the highest perfection of pictorial art, has met with dissent among certain modern artists and critics, who find him lacking in this or that technical quality. But while he did not attain the very highest in all technical qualities, perhaps no other man possessed in such a high degree so many qualities which go to make up the perfect artist. His work embodies the best of all the Central Italian schools, and it is, in this sense, the culmination of Italian painting. To whatever he adopted he added a harmony and grace distinctly his own, attaining more nearly to the universal than any other artist since the Greeks. And in one purely technical quality Raphael has never been surpassed by any artist. In his small pictures as well as in his great frescoes, in arrangement as well as in the treatment of space, his composition is faultless.

The chief cause of Raphael's great popularity with the general public is that he was what Berenson calls "a lovable illustrator." With an imagination that has never been surpassed, he has, better than any other one, embodied our conception of antiquity, translating it into forms surpassing our fairest dreams. He has Hellenized the Hebraic universe, creating, in place of the stern personages of the Old and New Testament, those beautiful ideal types which will last as long as art lasts. In his Madonnas and ideal figures he has created the types of womanhood which "embody for the great number of cultivated men their ideals and spiritual aspirations."

Bibliography. The chief original source of information remains the biography of Vasari (ed. Milanesi, Florence, 1878; best Eng. trans., with notes, by Blashfield and Hopkins, 4 vols., New York, 1896). The biographies of the eighteenth and early nineteenth centuries are antiquated, except those of Rumohr (Berlin, 1831) and J. D. Passavant (Leipzig, 1839; Eng. trans., London, 1872), which contains a valuable catalogue of Raphael's works. The numerous volumes of F. A. Gruyer (Paris, 1859 et seq.) are full of copious information. Other biographies and general criticism: K. A. A. von Wolzogen, *Raphael Santi: His Life and Works*, Eng. trans. by F. E. Bunnett (London, 1866); E. J. Förster, *Raphael* (2 vols., Leipzig, 1867); Hermann, Grimm, *Das Leben Raphaels* (ib., 1872; Eng. trans. by S. H. Adams, Boston, 1888; 3d Ger. ed., Berlin, 1896); R. Dohme, in *Kunst und Kunstler des Mittelalters*, vol. ii (Leipzig, 1878); C. C. Perkins, *Raphael and Michelangelo* (Boston, 1878); Charles Clément, *Michelange, Lionardo da Vinci, et Raphaël* (5th ed., Paris, 1881); Marco Minghetti, *Masters of Raffaello*, Eng. trans. by L. Fagan (London, 1882); Eugène Müntz, *Les historiens et les critiques de Raphael* (Paris, 1883), containing a bibliography; F. P. Stearns, *The Midsummer of Italian Art* (New York, 1895); *Masters in Art*, vols. i, iv (Boston, 1900–03), containing an exhaustive bibliography; S. K. Bolton, *Famous Artists* (New York, 1902); Henry Strachey, *Raphael*, in "Great Masters in Painting and Sculpture" (London, 1902); Edgcumbe Staley, *Raphael*, in "Newnes' Art Library" (ib., 1904); J. C. Ady, *Raphael* (New York, 1905); id., *Early Works of Raphael in Rome* (ib., 1906); id., *Raphael in Rome* (ib., 1907); G. B. Rose, *Renaissance Masters* (ib., 1908); John La Farge, *Great Masters* (3d ed., ib., 1909); A. P. Oppé, *Raphael* (ib., 1910). Consult also: Anton Springer, *Raffael und Michelangelo* (Leipzig, 1878), a scientific, appreciative, and impartial production; Crowe and Cavalcaselle, *Raphael: His Life and Works* (2 vols., London, 1882–85), erudite and careful; Eugène Müntz, *Raphaël: Sa vie, son œuvre, et son temps* (new ed., Paris, 1900), remarkable for its illustrations. For his early period consult:

Seidlitz, *Raphaels Jugendwerke* (Munich, 1891); Giovanni Morelli, *Italian Painters* (2 vols., London, 1892–93); Georg Gronau, *Aus Raphaels Florentiner Tagen*, in "Künstler-Monographien," No. 50 (Berlin, 1902). For a good characterization and list of Raphael's art consult Bernhard Berenson, *Central Italian Painters of the Renaissance* (New York, 1897). For his architectural works consult: Heinrich von Geymüller, *Raffaello Sanzio studiato come architetto* (Milan, 1884); Theobald Hoffmann, *Raffael in seiner Bedeutung als Architekt* (4 vols., Zittau, 1900–11); Max Ermers, *Die Architekturen Raffaels in seinen Fresken* (Stuttgart, 1909). For his drawings consult the studies of W. Koopmann, *Raffaels Handzeichnungen in der Auffassig* (Marburg, 1897), and Oskar Fischell, *Raphaels Zeichnungen* (Strassburg, 1898).

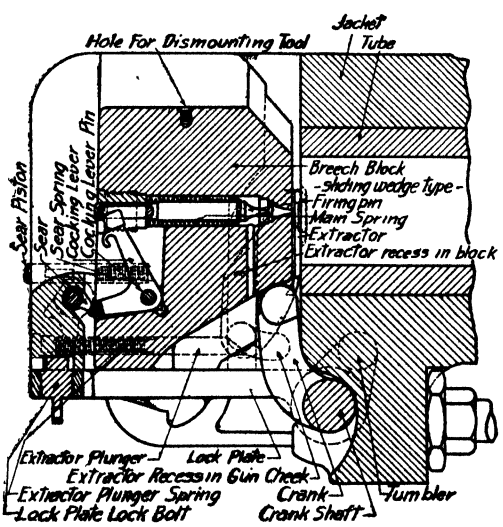
RAPHAEL, răf'ā-el, WILLIAM (1839–). A Canadian landscape and figure painter. Born and educated in Berlin he studied there in the Royal Academy under Wolf and Begas. He went to Canada in 1860 and settled in Montreal. His best work includes "Bonsecours Market, Montreal, in Summer and Winter" and "Habitants Attacked by Wolves." Raphael was one of the founders and original members of the Royal Canadian Academy of Art (1880). In 1904 he was appointed a member of the Provincial Council of Arts and Manufactures.



RAPHELENGH, rā'fā-lĕng', or **RAPHELING,** FRANCIS (1539–97). A Flemish scholar and printer, born at Lannoy in French Flanders. He studied classical and Oriental languages in Paris and afterward taught Greek at Cambridge. Upon his return to the Netherlands in 1565 he entered the Antwerp printing office of Christopher Plantin, whose daughter he married. Here he did valuable editorial work and supplied original matter for books in the form of notes and prefaces. He also worked on the Polyglot Bible, printed at Antwerp in 1569–72, by order of Philip II of Spain. Afterward he moved to Leyden, where he opened a printing office and accepted the chair of Hebrew and Arabic at the University. He published a Hebrew grammar and Chaldee and Arabic dictionaries, which later had 13 editions. See PLANTIN, CHRISTOPHE; POLYGLOT.

RAPHIDES, răf'ī-dēz (Neo-Lat. nom. pl., from Gk. *ῥαφίς, rhaphis*, needle, pin, from *ῥάπτειν, rhaptein*, to sew). Elongated, needle-shaped parallel crystals of calcium oxalate occurring in plants. It has been claimed that they protect plants against herbivorous animals, but investigation shows that no injuries follow the eating of plants containing them. Raphid-bearing cells are found in great quantities in the parenchyma of monocotyledons, such as *Amaryllis, Crinum, Narcissus*, and *Hyacinthus*.

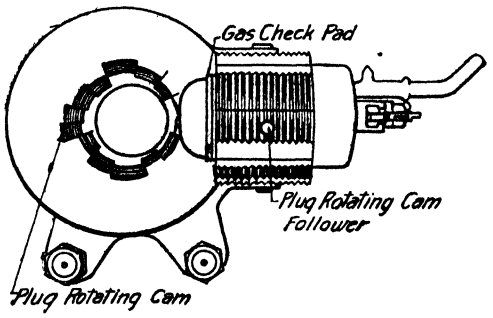
RAPIDAN RIVER. A small river of Virginia, tributary of the Rappahannock (q.v.), which it joins 10 miles above Fredericksburg (Map: Virginia, G 3).



RAPID CITY. A city and the county seat of Pennington Co., S. Dak., 65 miles southeast of Lead, on the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, and the Rapid City, Black Hills, and Western railroads (Map: South Dakota, A 3). It contains the State School of Mines, a government Indian school and land office, and a fine Federal building. Rapid City is the gateway to the Black Hills. In the vicinity are extensive deposits of gold, tin, mica, stone, granite, and gypsum, and the city has lumbering and cattle interests, a creamery, cigar and saddle factories, flour and saw mills, etc. The commission form of government was adopted in 1913. Pop., 1900, 1342; 1910, 3854.

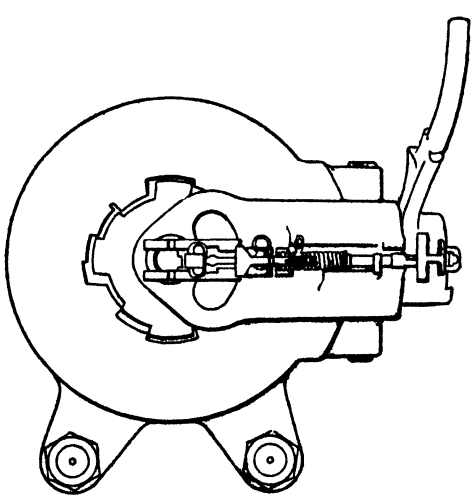
RAPID-FIRE GUN. A cannon designed to have a very rapid rate of firing. The term is losing much of its significance owing to the great rapidity with which all guns are now loaded and discharged. It nevertheless continues to be applied to guns of 8 inches or less in calibre in which the loading is effected chiefly by hand.

3-INCH SEMIAUTOMATIC GUN, UNITED STATES NAVY.
Side view of breech showing some parts in section.



After the limit of size for machine-gun action had been reached, the advantages of rapid fire to guns of calibres large enough to be effective against torpedo boats was appreciated, and 3-pounders and then 6-pounders were made by Hotchkiss and Nordenfeldt, with one barrel and worked by hand, but with quick-opening mechanism and fixed ammunition. This movement progressed to a remarkable extent between 1890 and 1900, heavier and heavier guns being required as torpedo boats increased in size and protection to their boilers by heavier plating, coal, etc., making the penetration of missiles more difficult.

3-INCH SEMIAUTOMATIC GUN, UNITED STATES NAVY.
Section (breech closed).



The development of rapid-fire guns may be said to date from towards the end of the year 1881, when the British Admiralty advertised for designs of a gun that should fulfill the following requirements, viz.: the weight of the gun

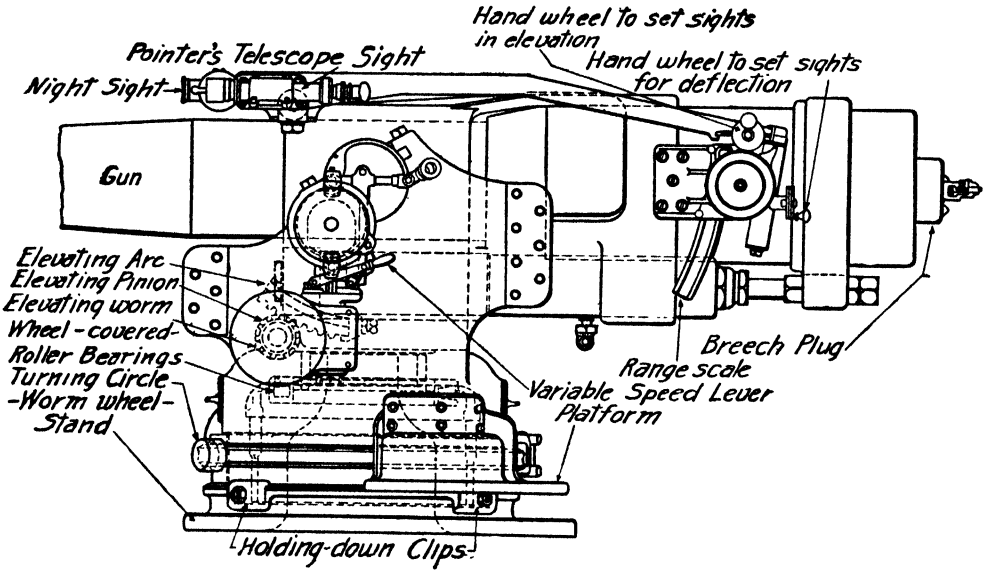
and mount not to exceed 10 hundredweight (1120 pounds); the projectile to weigh 6 pounds and have a muzzle velocity of not less than 1800 feet per second; the projectile and powder to be made up in one cartridge; the service of the gun

UNITED STATES NAVY 5-INCH BREECH MECHANISM, MARK VII.
Breech open (from rear).

to require not more than three men; under the above-mentioned conditions the gun to be capable of firing at least 12 aimed shots per minute. About the same time the French Department of Marine invited designs for a three-pounder to fulfill relatively the same conditions. These two advertisements resulted in the production of the rapid-fire gun. Mr. Hotchkiss, an American who had established works in France, brought out a series of guns, one, three, and six pounders, and it is perhaps interesting to learn that the first order placed with him was from the United States Navy Department. Mr. Nordenfeldt brought out similar guns in England. The three-pounder and six-pounder rapid-fire guns advertised for by France and Great Britain were intended for use against torpedo boats, and

UNITED STATES NAVY 5-INCH BREECH MECHANISM, MARK VII.
Breech closed, ready to revolve plug and lock it.

it was considered that the calibres selected were amply large. Later experience has modified this view, but it must be remembered that the torpedo boats of 1881 were small, slow, and weak. Rapid-firing guns soon began to increase in size. In a short time the calibre of 6 inches was reached, but the fixed ammunition was found to be unwieldy and easily sprung out of shape. The next step was the separation of the projectile and powder in the larger guns, retaining the brass case for inclosing the powder charge. The speed of fire in these guns was not reduced by the change, as the separate parts of the ammunition were more easily and rapidly handled.



In 1897 the British firm of Vicker's Sons and Maxim brought out a new type of gun in which no powder case was used, the powder being in a bag as in old slow-firing pieces. The breech mechanism (see GUNS, NAVAL) was of a very rapid-working type, and the obturation (i.e., the sealing of the breech against the escape of gas to the rear) was effected by a modified form of the De Bange gas check. (See GUNS, NAVAL.) The empty primer case was automatically ejected when the breech was opened and a small loading tray brought up into position as soon as the plug was clear of the breech. A slightly modified form of the Vickers' mechanism was at once adopted for use in the United States navy for guns of 5 and 6 inch calibre. The guns of the new type were officially designated quick-fire to distinguish them from rapid-fire pieces using fixed ammunition. The actual rate of fire was about the same in the two classes.

The increase in speed of fire of the smaller calibres naturally led to improvements in the larger ones. Ambitious manufacturers announced 8, 9, and 10 inch rapid-fire guns, but they were not much faster working than the latest contemporary guns of equal size in nearly all navies. The terminology of naval guns remained thus confused and misleading for some time. Then the semiautomatic gun appeared. In pieces of this type the cartridge is loaded by hand, while the energy of recoil and counter-recoil is utilized to open the breech automatically, eject the empty case, cock the piece, and store energy in a breech-closing spring which closes the breech when its detent is struck by the rim of the cartridge as it goes home in the operation of loading. The gain in speed of operation effected by the semiautomatic mechanism is about 50 per cent. Fully automatic guns are not used, because the semiautomatic fittings give as great a speed of fire as will permit of accurate aim. In the United States navy all new guns of 3-inch calibre or less are of the semiautomatic type. Guns of 4-inch calibre are the only ones in which the simple rapid-fire features (hand loading, quick hand operating, and fixed ammunition) are retained.

Much continues to be done to increase the speed of fire of heavy naval guns. The plug has been decreased in weight through improvement in design, and is better supported in its carrier ring; instead of one-third of a revolution one-sixth suffices to unlock it. By suitable shaping of the screw box the plug can be at once swung out as soon as its threads are disengaged instead of requiring a movement directly to the rear before swinging to one side. In the new 12 and 14 inch guns the plug turns downward, and a spring effects its return with very slight hand assistance. The locks of all recent heavy guns for the United States navy are fitted to eject automatically the old primer case and insert a new primer when the plug is withdrawn. These improvements, assisted by speedier rammers and loading appliances, permit a rate of fire in 14-inch guns of three shots per minute. The best sustained speed of fire of naval guns is about as follows: 16-inch, 2 shots per minute;

15-inch, 2.5 shots; 14-inch, 12-inch, 11-inch, 10-inch, 3 shots; 9.2-inch, 5 shots; 8-inch, 7 shots; 7-inch, 10 shots; 6-inch, 15 shots; 5-inch, 17 shots; 4-inch, 20 shots; 3-inch semiautomatic, 30 shots; 6-pounder and 3-pounder semiautomatic, slightly faster. These rates do not include the time required to perfect the aim, which, under unfavorable circumstances, may be several seconds per shot.

With the appearance of the dreadnought type of battleship the decline of the rapid-fire gun as a battleship weapon began. Most dreadnoughts carry from 15 to 25 of them of a calibre between 5 and 6 inches, but these pieces are installed solely for protection against torpedo craft and will take no part in future battleship actions, which will be decided by the big guns. Under any but the most unusual circumstances no pieces except the big guns of the main battery would be manned in battle; to use the smaller

UNITED STATES NAVY 5-INCH MOUNT, MARK XIII, MODEL II, LEFT SIDE.

guns would be to sacrifice their crews uselessly, as the decisive part of the engagement would probably take place beyond their range. Even if within range the damage they could inflict on a dreadnought would be trivial.

Rapid-fire guns of some sort are now carried by all large submarines. Recent boats of the United States navy are fitted with 3-inch semiautomatic guns and the large fleet submarines under construction are designed to carry 4-inch. Many late-type guns for submarines are fitted for vertical fire against air craft.

RAPID TRANSIT. See ELECTRIC RAILWAYS; URBAN TRANSPORTATION.

RAPIN DE THOYRAS, rȧ'păn' de twȧ'rȧ', PAUL DE (1661–1725). A French historian, born at Castres, Languedoc. He was educated at the Protestant College of Saumur and became an advocate in 1679, but the Revocation of the Edict of Nantes (1685) forced him to leave France and he sought employment in England and afterward in Holland. In 1693 he was appointed tutor to the Earl of Portland's son, with whom he traveled in Holland, Germany, and Italy, after which he took up his residence at The Hague, but in 1707 withdrew to Wesel in the Duchy of Cleves, where he devoted the remaining years of his life to the *Histoire d'Angleterre*, which was published at The Hague in eight volumes the year before the author's death. It was translated into English by Nicholas Tindal (15 vols., London, 1725–31).

RAPP, GEORGE (1770–1847). The founder of the religious society of Harmonists (q.v.). He was born at Iptingen in Württemberg, Germany. Desiring to organize a religious community in accordance with his ideas, he gathered a number of followers. Persecuted in Germany, in 1803 he emigrated to the United States and in 1804 he founded in Butler Co., Pa., a community in which all things were held in common and where both sexes practiced celibacy. In 1815 the society removed to the banks of the Wabash in Posey Co., Ind., and founded New Harmony (q.v.). Nine years later, however, they sold out their rights to the reformer Robert Owen (q.v.) and returned to Pennsylvania, where they built the village of Economy. Of these communities Rapp was both spiritual and temporal head.

RAPP, ràp, JEAN, COUNT (1771–1821). A French general, born at Kolmar, Alsace. He entered the army in 1788. As aid-de-camp to Desaix he distinguished himself by his gallantry in Egypt. On the death of his chief at Marengo he became aid-de-camp to Napoleon, and soon rose to be brigadier general. His brilliant charge

at Austerlitz, which put to rout the Russian Imperial Guard, was rewarded with the grade of general of division. For his services in the battle of Aspern (q.v.) he was made a count of the Empire. Though opposed to the Russian expedition of 1812, he accompanied the Emperor throughout the whole of it, adding, on many occasions, to his military reputation. His defense of Danzig for nearly a year against a powerful Russian army added to his fame. The Russians, contrary to the articles of capitulation, sent Rapp and his garrison prisoners to Russia, and he was not able to return to France till July, 1814. On reaching Paris he was well received by Louis XVIII, and in March, 1815, was one of those sent to oppose the return of Napoleon, but deserted with his troops and was appointed by Napoleon commander in chief of the Army of the Rhine and peer of France. In 1818 Rapp was reinstated in the army by Louis XVIII. He left *Mémoires* (Paris, 1823). Consult Spach, *Le général Rapp* (Colmar, 1856).

RAP'PAHAN'NOCK RIVER. A river of Virginia, formed by several head streams in the Blue Ridge. It flows southeastward and enters Chesapeake Bay by a broad and long estuary running parallel with that of the Potomac and about 20 miles south of it (Map: Virginia, G 3). Its length is 250 miles. At Fredericksburg there is a fall supplying good water power, and below that point the river is a fine, navigable tidal stream for about 90 miles. Its chief tributary is the Rapidan.

RAPPERSWYL, räp'ĕrs-vêl, or RAPPERSWIL. A town in the Canton of Saint-Gall, Switzerland, 22 miles southeast of Zurich, on Lake Zurich (Map: Switzerland, C 1). In the old Hapsburg castle is the Polish National Museum, containing a collection of antiquities, sculptures, and paintings The parish church, the town hall, and the viaduct connecting Rapperswyl with Hurden and Pfäffihon are also of interest. Rapperswyl dates from the twelfth century. Pop., 1900, 3412; 1910, 1954.

RAPPORT, răp-pōrt'; *Fr. pron.* rà'pôr'. See HYPNOTISM.

RAPTORES, răp-tō'rēz. See BIRD OF PREY.

RAR'ITAN. A town in Somerset Co., N. J., about 13 miles (direct) northwest of New Brunswick, on the Central Railroad of New Jersey (Map: New Jersey, C 2). It has woolen mills, stove and machinery foundries, and a grain mill. Water power is derived from the Raritan River. Pop., 1900, 3244; 1910, 3672.

RARITAN RIVER. A river of New Jersey. It is formed by two branches in the highlands in the northern part of the State and flows eastward into Raritan Bay, an inlet of Lower New York Bay (Map: New Jersey, D 2). It is 75 miles long and navigable to the fall line near New Brunswick.

RAROTONGA, rä'rō-tōŋ'gà. The largest of the Cook Islands (q.v.), in the Pacific Ocean.

RASCAL LEAF CRUMPLER. The larva of a phycitid moth (*Mineola indiginella*), which makes irregular crumpled cases on the apple leaves upon which it feeds. It works most extensively during May and June, when it is hidden by the foliage of the tree which it helps eventually to denude. The larval cases are plainly seen in the winter time attached in clusters to the twigs by means of strong silken threads, and in these cases the larvæ pass the winter about one-third grown. In the spring, when the leaves first begin to bud out, the larvæ begin to feed, and reach full growth in June. The pupa is formed within the larval cases, and the moth emerges in July, laying its eggs a little later. It feeds upon the apple and cherry, both wild and cultivated, upon the plum, quince, and crab apple, and to a lesser extent upon the peach. The best remedy consists in collecting and destroying in winter the plainly visible larval cases.

RASCHDORFF, räsh'dôrf, JULIUS (1832–). A German architect, born at Pless, Silesia, and educated at the Academy of Architecture in Berlin. In 1853 he became city architect at Cologne, where he restored the Rathaus and built the Stadt-Theater (1872), and with Felten the Municipal (Wallraf-Richartz) Museum (1855–61). The House of the Rhenish Estates (1879) at Düsseldorf, in the style of the Italian Renaissance, is also noteworthy. Appointed professor at the Academy in Berlin in 1878, he built the Technical Academy at Charlottenburg (with Hitzig, completed 1884), the Mausoleum of Frederick III (1894) at Potsdam, and was associated with his son, Otto, in the erection, from his designs, of the new cathedral (1894–1902). Of his publications the following are the most important: *Entwurfe und Bauausführungen im Stile deutscher Renaissance* (1879); *Baukunst der Renaissance* (1880–90); *Palastarchitektur von Oberitalien und Toscana* (2 vols., 1883–96; vol. iii, "Venedig," by his son Otto, 1894–1900); *Rheinische Holz- und Fachwerkbauten des 16. und 17. Jahrhunderts* (1895).

RASH (OF. *rasche, rasque*, Fr. *rache*, Prov. *rasca*, rash, scurf, itch, from Prov., Sp., Portug. *rascar*, to scrape, from Lat. *radere*, to scrape, shave). The common name of a skin eruption showing redness with but little elevation. It occurs typically in the exanthemata, such as scarlet fever, measles, etc. See ERYSIPELAS; ERYTHEMA; HIVES; URTICARIA.

RASHBAM. See RASHI.

RASH'DALL, HASTINGS (1858–). An English historian and clergyman, son of the vicar of Dawlish. Educated at Harrow and at New College, Oxford, he was ordained in 1884 and was tutor at Durham until 1888. He was fellow and lecturer of Hertford College, Oxford (1888–95), then fellow of New College and, after 1910, also lecturer. He was select preacher at Oxford (1895–97) and preacher at Lincoln's Inn (1898–1903), and in 1915 delivered the Bampton lectures. His life of Wiclif in the *Dictionary of National Biography* (1900) and his *Universities of Europe in the Middle Ages* (1895) are good examples of his fine scholarship. He also wrote: *Doctrine and Development* (1889), a volume of sermons; *New College* (1901), with R. S. Rait; *Christus in Ecclesia: Sermons on the Church* (1905); *The Theory of Good and Evil* (1907); *Philosophy and Religion* (1909); *Ethics* (1913); *Is Conscience an Emotion?* (1914), three lectures.

RASH'ER, or **RASCIERA,** rä'sē-ā'rà (perhaps from Sp. *rascacio*, sort of fish). One of the Californian rockfish (*Sebastodes miniatus*), peculiar in its deep vermilion color, mottled with yellowish pink and speckled on the back and sides with clusters of black dots, so that the whole body has a dusky shade. It comes about 2 feet in length and is a common market fish. See ROCKFISH.

RASHI, rä'shē (Rabbi Shĕlōmōh Yiṣḥākī, or Solomon ben Isaac, often erroneously called Yarchi) (1040–1105). A great Jewish commen-

tator and exegete. He was born in Troyes, France. He began his studies under his father and continued them at Worms, at Mainz, and at Speyer under distinguished Jewish scholars. Returning to Troyes, he established a school for the study of the Bible and Rabbinic literature, and his fame drew scholars from far and wide. Rashi's reputation is greatest as a commentator. His Bible commentary is complete except from Job xl. 21 to the end of Chronicles. It was the first Hebrew book printed with date (1475), and is still generally included in good editions of the Bible for Jews. It has been translated into Latin by Breithaupt (Gotha, 1710–14). The renderings are generally the traditional ones and Midrashic authorities are followed, but simple literal explanations are also given. Through Nicolas de Lyra, who copied him extensively, his influence was felt on Luther's version, and through Ibn Ezra and David Kimbi on the English version. Rashi also wrote a few liturgical poems of little value, and a famous commentary to 23 treatises of the Talmud, which was supplemented by his grandson, Rabbi Samuel ben Meir (Rashbam). This always accompanies editions of the Talmud. His commentaries contain 3157 *la 'azim*, or French vocables, forming a vocabulary of 2000 distinct words, which have a great value as providing material for the reconstruction of Old French. Consult: Zunz, in *Zeitschrift fur die Wissenschaft des Judenthums* (Berlin, 1822); Kronberg, *Raschi als Exeget* (Halle, 1882); Darmesteter, *Reliques scientifiques* (Paris, 1890); H. H. Graetz, *History of the Jews* (Eng. trans., Philadelphia, 1891–98); Morris Liber, in *The Jewish Encyclopædia* (New York, 1905).

RASK, räsk, RASMUS KRISTIAN (1787–1832). A Danish philologist. He was born at Brændekilde, near Odense, in the island of Fünen, studied at Copenhagen, and in 1808 published his first work, an introduction to the Icelandic language. In 1811 he published in Danish an *Introduction to the Grammar of Icelandic and Other Ancient Northern Languages* and in 1814 he edited the *Icelandic Lexicon* of Björn Halldórsson. In 1813 he went to Iceland, where he lived for two years, perfecting his knowledge of the language and history of the inhabitants. On his return to Copenhagen he was appointed assistant librarian to the university, and in 1818 published his researches on Icelandic, which led Grimm to his discovery of the sound shifting in the Germanic languages. (See GRIMM'S LAW.) He left Denmark in 1816 on a literary expedition, and after spending two years in Stockholm, where he published his *Anglo-Saxon Grammar* (1817; new ed. in English by Vernon, London, 1865) and the first critical and complete edition of the *Snorri Edda* and the *Edda Sæmundar* (1818), he went to Finland, next to St. Petersburg (1819), where for two years he studied Sanskrit, Persian, Arabic, Russian, and Finnish. He then went to Astrakhan, where he studied the languages of the Tatars, and then began a journey through the country of the Turkomans, the Caucasus, Persia, Hindustan, and finally Ceylon, where he wrote his *Singalesisk Skriftlære* (1822). In 1823 Rask returned to Copenhagen; in 1825 he was appointed professor of literary history and in 1828 of Oriental languages. In the following year he was made chief custodian of the university library and in 1831 professor of the Oriental languages. But his immense labors had exhausted his energies and he died at the early age of 45. Besides the productions already mentioned Rask wrote a Frisian grammar, *Frisisk Sproglære* (1825); *Den gamle Aegyptiske Tidsregning* (1827); *Den ældste Hebraiske Tidsregning* (1828); *Om Zendsprogets og Zendavestas Ælde og Ægthed* (1826); also grammars of several modern languages and a great number of miscellaneous articles which were collected after his death and published (3 vols., 1834–38). Besides anticipating Grimm in the discovery of the famous law of consonantal shifting, Rask was the first to recognize the kinship of the Germanic languages with Greek, Latin, and Balto-Slavic. Consult, for his bibliography: P. E. Müller, *Biographiske Efterretninger* (Copenhagen, 1833); N. M. Petersen in the complete edition of Rask's works (ib., 1838); Henrichsen, *Rask's Skoleliv* (Odense, 1861); Rönning, *Rask* (Copenhagen, 1887); Wimmer's memorial address (ib., 1887); B. M. Olsen, *Rask* (Reykjavík, 1888). For his correspondence, see Grimm brothers, *Briefwechsel mit nordischen Gelehrten* (Berlin, 1885).

RASKOLNIKI, rås-kôl'nyĭ-kĭ, or **RASKOLNIKS,** rås-kôl'nyĭks (Russ., schismatics). The generic name applied to all those of the Greek faith who dissent from the established church in Russia. The name used by the Raskolniki themselves is Staroobryadtsy (old ritualists) or Starovyertsy (old believers). They represent the extreme conservatism which refused to lay aside forms of worship to which it was accustomed. The immediate occasion of schism was the correction of the old ecclesiastical books. In the first quarter of the sixteenth century Maximus, a Greek monk from Athos, was engaged by the Czar to correct the errors which had crept in, but the revision was rejected and he himself imprisoned. The Hundred Chapter Council of 1551 undertook a correction by collating current translations and not by comparing them with the Greek originals, and still more errors crept in. In the middle of the seventeenth century the Patriarch Nikon (q.v.) undertook a new revision on the basis of old Greek and Slavonic texts. Nikon's opponents—and he had many, owing to his domineering spirit—now made the revision a point of issue in their controversy with the Patriarch. Prominent among them were the popes (priests) Lazar and Nikita, the deacon Fyodor, and especially the protopope Avvakum, a man uncommonly well read and a forceful speaker. Ecclesiastical councils in 1654, 1656, 1666, and 1667 approved the corrections in the service books and anathematized those who refused to accept them. The latter were now officially called Raskolniki, and from this time dates the rise of the *raskol*. Most of the dissenters were banished to remote monasteries, like that at Solofki on the White Sea. The Raskolniki kept up their objectionable propaganda from their places of confinement, and after a seven years' siege the monastery at Solofki was taken in 1676, the rebellious monastics were punished without quarter, and in 1681 Avvakum was executed. The antigovernmental spirit moved the Raskolniki to take a prominent part in the insurrections of the Streltsy (q.v.), and the Regent, Sofia, executed many of them in 1684.

About 1685 there came a split in the ranks of the Raskolniki. Since they had no bishop to ordain priests there was danger that, upon the

death of the priests who had separated with them, the true church itself would disappear and all connection with Christ vanish from the earth. The more moderate among them held that orders in the Orthodox church were still valid, and depended upon converted priests or those deposed from the Orthodox church. They are called *Popovtsy* (having priests). In 1832 they were forbidden to receive priests from the Russian church, but in 1846 induced a deposed Bishop of Bosnia, Ambrosius, to become their head, with a residence in Belo-Krinitza in Bukovina. He was succeeded by a Russian, Cyril. The more extreme regarded the Orthodox church as having, by anathematizing the true believers, lost its validity. These are called the *Bezpopovtsy* (priestless), and are the more irreconcilable of the Raskolniki. With no priests and no sacraments excepting baptism, which a layman may administer, they can have no church. Their leaders are elders whom they elect. They rigidly observe the fasts of the church and whatever ceremonies can be performed without priests. A great number of sects, some very extreme, have risen among them, often rapidly spreading and disappearing. The question of marriage, which in Russia was only legal if performed by a priest, presented peculiar difficulties, and some held that celibacy was the only Christian method of life left to them. In 1874 the government allowed special registers to be kept for the Raskolniki and their marriages to be recorded without the Orthodox ceremony. The former centre of the *Popovtsy* was the island of Vielka, in a tributary of the Dnieper, in Poland. This was destroyed in 1735 and again in 1764 and many were exiled to Siberia. In 1771 they were allowed a centre in Moscow. They are found especially in Great Russia, among the Cossacks of the Don, and along the banks of the lower Volga. The *Bezpopovtsy* flourished in the north, between the great lakes and the White Sea, whence they were called *Pomoryane* (sea dwellers), and spread through the northern Urals and Siberia. A convent on the Vyg was their centre, but in 1771 they also were allowed a centre in Moscow, whence they spread widely.

The government dealt severely with the Raskolniki from the outset, the law of April 17, 1685, prescribing death, almost without exception, to those persevering in the schism or assisting its adherents. In 1716 they were permitted to settle in cities on the payment of a double tax, but were not permitted to appear as witnesses against orthodox persons. The successors of Peter I increased the severity of the enactments against them. In 1752 labels were required on their dress as a distinguishing mark. In 1768 and 1778 ukases forbade the building of churches and chapels and the use of bells. From 1769 on they could again appear as witnesses in court, the double tax was removed in 1782, and the following year the name Raskolniki was discontinued in official documents. Under Paul I (1796–1801) their lot grew worse, and under Alexander I, in 1803, the word Raskolniki reappears in state papers. They were officially subdivided into three classes: I. Most obnoxious: (1) the Judaizers; (2) the Molokani (q.v.), who recognize no authority and object to taking oaths; (3) Dukhobortsy (q.v.), a variety of the preceding; (4) the Khlystovtsy, who introduce anthropolatry; (5) the Skoptsy (q.v.), enemies of society, and blasphemous as deriving their sect from Christ (none of whom are, properly speaking, Raskolniki or Old Believers); (6) those Bezpopovtsy who oppose marriage and praying for the Czar. II. Obnoxious: the Bezpopovtsy who recognize marriage and pray for the Czar; these are harmful as being against priests and the Eucharist and also on account of their democratic teachings. III. Least obnoxious: the Popovtsy, rather schismatics than heretics, as they keep most of the church requirements and give most promise of reforming. The law of May 3, 1883, brought considerable relief to the schismatics. In April, 1905, an Imperial decree effected a radical improvement in the condition of the Raskolniki. They were divided into three groups, Old Believers, Sectarians, and adherents of erroneous doctrines, amenable to judicial punishment. Old Believers are those Raskolniki who acknowledge the fundamental doctrines of the Orthodox church while deviating in certain rites and forms. Old Believers and Sectarians are accorded the rights of public worship, of possessing real and personal property, and of establishing hermitages, monasteries, and schools. Closed meeting houses were to be reopened. Secession from the Orthodox church was permitted.

In general the Raskolniki are counted among the most industrious, sober, and intelligent elements of the Russian population. As to their numbers a serious divergence of statistical data seems to be the rule; many Raskolniki conceal their faith before the magistrates, and even of those registered the governmental reports give only a small fraction, for fear of increasing their popularity with the masses. Thus, e.g., when the official returns in 1870 gave their number as 1,171,000, the foreign newspapers, on the basis of the secret governmental documents, gave a figure almost ten times as high. On this basis, says the Russian Encyclopædia, one can approximately guess their total number, when the report of the Holy Synod for 1893 places them a little below 2,000,000.

RASLE, SÉBASTIEN. See RALE, SÉBASTIEN.

RASMUSSEN, räs'mus'sen, KNUD (JOHAN VICTOR) (1879–). A Danish Arctic explorer, born and bred in Greenland, where his father was a missionary. He graduated at the University of Copenhagen. Rasmussen journeyed to Lapland (1901) and participated in the Danish Literary Greenland expedition under Mylius-Erichsen (1902–04), which spent 10 months in a study of the heathen Eskimo of Cape York, Greenland. He made ethnological expeditions to Greenland in 1905–08, 1909, and 1910. His ethnological researches have been translated from the Danish originals and published as *The People of the Polar North* (1908). Later plans to study the home life of the Eskimo of continental America failed of support. He made (1912) a remarkable crossing of Greenland for the recovery of the Mylius-Erichsen

(q.v.) records, which were found by Mikkelsen (q.v.). Rasmussen's outward journey, 764 miles across the inland ice, was made from Inglefield Gulf to the Danmark Fiords, thence to Independence Bay, and a return (1914), 621 miles, to Wolstenholme Sound. He found Peary Channel to be nonexistent, and discovered a large area of ice-free land, with ample game in that region. He also wrote *Lapland* (1907) and *Avangarnisalerssârutit* (Eskimo). Consult *Geographical Journal* (London, December, 1913).

RASORES, rȧ-sō'rēz. See GALLINÆ.

RASP. See FILE.

RASPAIL, rȧs'pā'y', FRANÇOIS VINCENT (1794–1878). A French revolutionary leader, also a naturalist. He was born at Carpentras, Vaucluse, and went in 1815 to Paris. There he became the editor of radical papers and fought at the barricades in the revolution of 1830. He opposed the government of Louis Philippe and was prosecuted for his newspaper articles and for his connection with illegal societies. As leader of a mob (Feb. 24, 1848) he forced the provisional government to proclaim the Republic, and with Barbès and Blanqui headed the insurrectionists who invaded the hall of the National Assembly on May 15. He was sentenced to five years' imprisonment. He was a member of the Corps Législatif in 1869 and of the Chamber of Deputies in 1876–77. As a naturalist. he became known through his enthusiastic advocacy of camphor as an antiseptic. He wrote on chemistry and plant physiology.

RASPBERRY, răz'bĕr-ĭ *or* rȧz'bĕr-ĭ (from *rasp*, OF. *rasper*, Fr. *râper*, from ML. *raspare*, to scrape, from OHG. *raspōn*, to scrape together (connected with Ger. *rappen*, to seize, Eng. *rap*) + *berry;* so called from the rough surface). Several species of the genus *Rubus*, of the family Rosaceæ. The blackcap or black raspberry (*Rubus occidentalis*) is an American species with white flowers and purplish-black fruits consisting of numerous drupes joined together. Yellow or amber fruited forms also occur within this species. Since its introduction in 1832 the black raspberry has become one of the most important of bush fruits and is extensively raised for dessert, canning, and evaporating. In nature the tips of recurved stems of the present season's growth take root during midsummer and late autumn and give rise to a new plant—a habit utilized in cultivation. In commercial plantations the plants are set in rows 3 by 8 feet apart and are given clean culture until time to put down the stem tips, when cultivation ceases. The first return, then, from a new raspberry patch is a crop of plants. The new shoots which spring up from the roots are cut back to 18 or 20 inches, when about that height, to induce the formation of fruit-bearing wood. As soon as the crop is gathered the canes which have borne are cut away to increase the strength of the new wood which is to bear the following season's crop. The crop is usually picked by hand; many growers, however, use a simple device consisting of an apron with a shallow box attached, into which the ripe fruit is jarred. After the fruit is dried it is run through a fanning mill to separate any leaves or twigs which fell with the fruits into the picking box.

Two species of red raspberries are cultivated, the native American red raspberry (*Rubus strigosus*) and the European (*Rubus idæus*). These two plants are closely related botanically, but differ under cultivation, a marked distinction being the habit of the European species to continue fruiting throughout the season after ripening begins. This is a disadvantage to the commercial grower, but an advantage to the amateur. The European sorts are less hardy than the natives, and cannot be relied upon in the Northern States except in sheltered positions. The number of foreign varieties cultivated in the United States is comparatively small. Out of a total of 100 or more introductions not more than 6 or 8 have stood the test. Both forms of red raspberry propagate readily from sprouts and root cuttings. As a result of the habit of sprouting the patches soon present the character of a matted row, although they are usually planted 3 by 6 feet apart in original plantations. Thorough cultivation is necessary, not only for the purpose of stimulating growth, but in order to hold the plants within bounds. The fruit of these species cannot be successfully gathered by machinery and is never evaporated. Its chief use is for dessert purposes, although the fruit is also prized in wine making, for jam, and for canning.

The thirteenth census states the value of the raspberries produced in the United States in 1909 at $5,132,277.

Another important group of purplish-red raspberries seems to have resulted from the crossing of *Rubus occidentalis* and *Rubus strigosus*. In habit of growth the plant resembles the black raspberry more closely than the red, since it propagates by tips, has a firmer fruit than the red, with greater size and much better flavor than the black. For shipping it is much better than the red and for dessert purposes superior to the black. Flowering raspberry (*Rubus odoratus*) is often planted for ornament. See Plate of RUBUS.

RASPBERRY DISEASES. The fungus diseases of the raspberry, blackberry, and dewberry are the same and at times work serious injury. Among the most important are anthracnose and orange rust. The anthracnose (q.v.) (*Gloœosporium venatum*) is first indicated by the appearance of small rapidly growing purple spots upon the young shoots near the ground. As these spots enlarge and extend around the stems the centres become dirty white, the spots coalesce and rupture the epidermis, and the canes die as though girdled by a knife. The fruit may shrivel and remain upon the stems. Rust (*Cœoma nitens* or *Gymnoconia interstitialis*) attacks and dwarfs the young growth. Soon the leaves turn yellow and both they and the young stems become distorted and covered with masses of orange-colored spores, which rapidly spread the disease. The remedy recommended for the former is spraying with a fungicide (q.v.), for the latter digging and burning. In Colorado, injury to red raspberries due to *Sphœrella rubina* is reported. Spraying with Bordeaux mixture, together with cutting out and burning the old canes, has proved an efficient means of control. The raspberry is especially subject to crown gall, a disease caused by *Bacterium tumefaciens*. A disease known as yellows has been reported in Ohio and Canada. Cane blight, due to *Coniothyrium fuckelii*, is also destructive. All diseased canes should be gathered and burned.

RASPBERRY INSECTS. The canes of raspberry bushes are attacked injuriously in the

United States by two species of beetles. The raspberry cane borer (*Oberea bimaculata*) lives in the larval state in the centre of the cane, where it burrows downward, often causing the death of the cane. It is a native insect, feeding in the wild raspberries, but has transferred its attention to the cultivated varieties. The perfect insect is a cerambycid or long-horned beetle, with a long and narrow black body, the top of the thorax being pale yellowish. It appears in June, and the female lays her eggs towards the end of that month, girdling the young growing cane near the tip in two places and inserting the egg between the girdles. This insect feeds in blackberry as well as in raspberry stems. The remedy consists in pruning the girdled tips as soon as observed, and they are very evident from the withering of the terminal leaves. The other cane borer is the red-necked *Agrilus* (*Agrilus ruficollis*). This is a buprestid beetle which lays its eggs in the stems of raspberry and blackberry, and the resultant larva makes a swelling in the cane. Several larvæ will be found under the bark of one of these swellings, and when full-grown they penetrate to the pith and transform to pupæ from which the perfect beetles escape early in the summer.

Raspberry canes are sometimes damaged to some extent by the snowy tree cricket (*Œcanthus nivcus*), which perforates the stems to a distance of an inch or more, inserting its eggs in the perforations. This is the only damage done by this insect, which, after it issues, feeds upon plant lice. The raspberry sawfly (*Selandria rubi*) in the larval condition feeds upon the leaves and transforms to pupa at the surface of the ground or a little below the surface. This insect is destroyed, when abundant, by sprinkling with hellebore and water. Several species of Lepidoptera in the larval state feed upon the leaves of raspberry, and there is a little measuring worm which feeds upon the fruit. This species (*Synchlora ærata*) reaches full growth about the time of the ripening of the raspberry, when it is about ¾ inch long, of a yellowish-gray color, each segment being furnished with several sharp thorns. It has the habit of disguising itself by attaching to these thorns small bits of vegetable matter, such as the anthers of flowers and bits of leaf. The adult moth is of a delicate pale-green color and has a wing expanse of about ½ inch. The flealike negro bug (q.v.) is often found upon raspberries, and its presence may be discovered by the disagreeable odor of the fruit. The insect is so small that it is often taken into the mouth unnoticed until the disgusting flavor reveals its presence. Consult Slingerland and Crosby, *Manual of Fruit Insects* (New York, 1914).

RASPBERRY WORM. See RASPBERRY INSECTS.

RASPE, räs'pe, RUDOLPH ERICH (1737–94). A German-English writer and mineralogist, born in Hanover. He studied in 1756–60 at Göttingen and Leipzig. In 1767 he became a professor in the Collegium Carolinum at Cassell and curator of the landgrave's cabinet of antiquities and coins. During this time he translated (1765) Leibnitz's philosophical works, wrote the poem *Hermin und Gunilde* (1766), and published a critical treatise on Percy's *Reliques* and papers on geology and mineralogy. In 1775 he was charged with purloining coins and other articles of value, and fled to England, where he published *Some German Volcanoes and their Productions* (1776), a translation of Lessing's *Nathan der Weise* (1781), and, with the assistance of Horace Walpole, a treatise on the origin of painting in oil (1781). Later he became assay master at mines in Dolcoath, Cornwall (1782–85), and compiler of the excellent *Descriptive Catalogue* of more than 15,000 casts of gems forming the collection of James Tassie of Edinburgh. In 1791 he was in the north of Scotland, where he obtained from a certain Sir John Sinclair funds for metallurgical experiments. He then decamped with the money to Muckross, County Donegal, Ireland. This incident was introduced by Scott in *The Antiquary*. Raspe published in 1785, in chapbook form, *Baron Münchhausen's Narrative of his Marvelous Travels and Campaigns in Russia.* See MÜNCHHAUSEN.

RASPUTIN, rä'spo͞o-tēn', GREGORY (c.1870–1916). A Russian monk and royal favorite, born at Petrovsky in the Province of Tobolsk, Siberia. He was introduced into society circles in St. Petersburg and, although of peasant origin, eventually he became intimate even with the Emperor Nicholas himself. It was generally understood that because of supposed mystic powers he exercised much influence over both Czar and Czarina. Rasputin had been credited with many scandalous intrigues and with living a generally immoral life, and a crisis came in 1914, when he was stabbed by a woman friend of a girl he had betrayed. He had the services of the Czar's physician and recovered.

RÄSS, rës, ANDREAS (1794–1887). A German theologian, born at Sigolsheim, Alsace, and educated in Mainz. He was ordained priest in 1816. In 1842 he was nominated Bishop of Strassburg. At the Vatican Council he was a stanch supporter of the dogma of infallibility. Räss founded the periodical *Der Katholike* and wrote many theological treatises. His printed works include *Konvertiten seit der Reformation* (1866–80), and together with Weiss, Bishop of Speyer, he published *Leben der Väter und Martyrer* (23 vols., 1821–27), a translation of Butler's *Lives of the Saints.*

RASSAM, räs-säm', HORMUZD (1826–1910). An Assyriologist, born of Nestorian parents at Mosul, Asiatic Turkey. He acted as agent and overseer for Layard (q.v.) during his expedition in 1845–47, studied at Oxford (1847–49), and again assisted Layard in his Assyrian excavations (1849–51). In 1852–54 he was in charge of the excavations at Kalat Sherkat, Nimrud, and Kuyunjik for the British Museum, and discovered the palace of Asurbanipal and the second half of the library at Kuyunjik. (See NINEVEH.) Later he held government appointments at Aden and Muscat. When, in 1864, King Theodore of Abyssinia had imprisoned the English consul and a number of Germans, Rassam succeeded in securing their freedom. But they were soon imprisoned again, and he was himself jailed and kept in chains from 1866 until Sir Robert Napier's victory over the Abyssinians at Magdala in 1868. After the sudden death of George Smith (q.v.) in 1876 Rassam was asked to take charge of excavations in Assyria. He was first sent, however, during the Russo-Turkish War (1877) to inquire into the conditions of the Christian communities in Asia Minor, Armenia, and Kurdistan. From 1878 until July, 1882, he was almost continuously in the field, both in Assyria and Babylonia. He made many important discoveries, such as the bronze gates of Balawat (q.v.), obtained a large number of valuable in-

scriptions, and identified and partially excavated Sippara, the modern Abu Habba. Among his publications are *The British Mission to Theodore, King of Abyssinia* (1869), and *Asshur and the Land of Nimrod* (1897). An obituary in the *Times* (London, Sept. 17, 1910) gives an extended account of his career.

RASSE, rās'*e or* rās (from Jav. *rasa*, from Skt. *rasa*, flavor, taste). A Malacca weasel. A small civet (*Viverricula malaccensis*), which inhabits the Malay Peninsula, eastward to Formosa, and also the island of Madagascar, where it was probably introduced long ago. It differs from the ordinary civets, being of slighter build, enabling it to climb trees, and in lacking a mane. It has along its back and sides seven blackish stripes, more or less broken into spots, some curving bars on the throat, and a long, tapering, dark-ringed tail. Civet (q.v.) is obtained from this animal.

RAS'SELAS. A prose romance by Dr. Samuel Johnson (1759), written during the evenings of one week to defray the expenses of his mother's funeral.

RASTATT, or **RASTADT**, rä'stät. A town in the Grand Duchy of Baden, Germany, on the Murg, 3 miles from its junction with the Rhine and 15 miles by rail southwest of Karlsruhe (Map: Germany, C 4). Its strong fortifications were dismantled in 1890. The town has a large palace (now a barracks), a Gymnasium, and an industrial school. It manufactures iron stoves, beer, tobacco, and lace. Rastatt is memorable for the two congresses held here. At the first, in 1714, a treaty of peace (following that of Utrecht) was signed which brought the War of the Spanish Succession to a close. The second congress was that of 1797–99 between France and the German Empire. It effected nothing, a new coalition having been formed against France. Its dissolution was followed by the assassination of two of the French delegates, a crime which aroused great indignation throughout Europe. The Baden revolution in 1849 began and ended in Rastatt, which finally surrendered to the Prussians. Pop., 1900, 13,940; 1910, 15,196. Consult Hüffer, *Der Rastatter Gesandtenmord* (Bonn, 1896).

RASTENBURG, rās'ten-bụrk. A town in the Province of East Prussia, Prussia, on the Guber River, 64 miles southeast of Königsberg by rail (Map: Germany, J 1). It has a royal Gymnasium. Among the industrial establishments are iron and brass foundries, a sugar factory, flouring mills, etc. Pop., 1900, 11,144.

RASTOPTCHIN. See ROSTOPTCHIN.

RAT (AS. *rætt*, OHG. *ratto*, Ger. *Ratte*, Fr., Prov. *rat*, It. *ratto*, rat; of uncertain etymology). Any of the larger rodents of the genus *Mus*. (See MOUSE.) Two species are very widely distributed over the world—the black rat (*Mus rattus*) and the brown rat (*Mus decumanus*). Both appear to be natives of central Asia. The black rat found its way to Europe about the beginning of the sixteenth century, but the brown rat did not reach England until about 1728. It received the name of Norway rat, from a belief that it was introduced from Norway. The date of introduction into America is very doubtful, but the black or Alexandrine rat seems to have come first, and has been gradually driven westward by its large and more savage cousin. Both infest ships and are thus conveyed to the most distant parts of the world, and both are wharf rats.

The black rat is nearly 7½ inches in length, exclusive of the long tail. The brown rat attains a length of more than 10½ inches. Besides its large size and comparative shortness of tail, it differs from the black rat in its smaller ears and less acute muzzle, as well as in its lighter color and shorter hair. Both species are extremely prolific, breeding at a very early age, several times in a year, and producing from 10 to 14 at a birth.

Rats feed indiscriminately on almost any kind of animal or vegetable food; they make depredations in fields of grain and pulse, from which they often carry off large quantities to be stored in their holes, and thus have become a serious pest in the West Indian sugar plantations. They devour eggs; they kill poultry, partridges, and the like, and become a pest of ill-kept dwellings and storehouses. Their strong rodent teeth enable them to gnaw very hard substances, such as wood and lead pipes, either for food or in order to make their way to food. They are creatures of no little intelligence, and many curious stories are told of the arts which they employ to attain desired objects, of the readiness with which they detect the approach of danger and the skill with which they avoid it. Under certain circumstances they undertake migrations in large companies. Their sense of smell is very acute, and the professional rat catcher is very careful that the smell of his hands shall not be perceived on the trap. They are capable of being tamed, and have in some instances proved interesting pets.

The flesh of rats is seldom eaten. The skin is used for making a fine kind of glove leather. During the prevalence of the bubonic plague in India, Australia, and Cape Colony, in the latter part of the nineteenth century, it was ascertained that there was a direct connection between the prevalence of the disease and the abundance of rats, and it was shown that the rats were themselves liable to the plague and myriads perished from it. Investigation showed that the fleas with which rats are infested are hosts for the plague germ and that thus rats unwittingly served as an important means for spreading the disease.

RAT, PHARAOH'S. See MONGOOSE.

RATÆ, rā'tē, or **RA'TÆ CORITANORUM.** The Roman name of the town of Leicester (q.v.).

RATAFIA, rāt'à-fē'à (Fr. *ratafia*, from Malay, *araq*, from Ar. *'araq*, arrack, from *'araqa*, to sweat + Malay *tāfia*, spirits distilled from molasses, Eng. *taffy*). A cordial flavored with fruits or the kernels of fruits. The name is used generically to include several varieties of fruit liqueurs. Procope, the ancient master distiller of Paris, includes under this term liqueurs, or sirups, of cherries, strawberries, gooseberries, apricots, peaches, and other fruits. Consult Mew and Ashton, *Drinks of the World* (New York, 1892). See LIQUEUR.

RATAN. See RATTAN.

RATCH'FORD, MICHAEL D. (1860–). An American labor leader, born at Clare, Ireland He emigrated to the United States with his parents in 1872 and began work in coal mines when 12 years old. He was president of the miners at Massillon, Ohio, in 1890–92, and served as general organizer (1893–94) and president (1895–96) of the Ohio miners. In 1897–98, while president of the United Mine Workers of America, Ratchford gained a standard eight-hour day throughout the bituminous coal fields

and brought about uniform working conditions in the mines. He served as a member of the National Industrial Commission from 1898 to 1900, as commissioner of labor statistics of Ohio in 1900–08, as commissioner of the Ohio Coal Operators in 1909–12, and as commissioner of the Illinois Coal Operators' Association after 1913.

RATE. The term applied to the taxes assessed and collected by local authorities in England. The objects subject to taxation being assessed, a rate is fixed sufficient to bring in the needed income. The taxes being imposed by various administrative bodies such as the counties, or poor-law districts, we find frequent references to county rates, poor rates, etc. As the entire revenue of local bodies rests upon this basis, the term "rate" is frequently used by English writers as synonymous with direct taxation, other forms of taxation being designated customs, duties, imposts, etc.

RA'TEL (Fr., dim. of *rat*, rat), or HONEY BADGER. A badger-like animal of South Africa. See BADGER.

RATH, rät, GERHARD VOM (1830–88). A German mineralogist, born at Duisburg and educated in Berlin, Bonn, and Geneva. In 1863 he became professor of mineralogy at the University of Bonn and a few years afterward was made director of the Mineralogical Museum there. He made scientific researches in mineralogy, petrology, and especially in the geology of the Rhine, the Alps, and Italy. He also investigated earthquakes and meteorites. Rath traveled much in southern Europe, Palestine, and the United States. His discoveries appeared in various journals and in: *Ein Ausflug nach Kalabrien* (1871); *Naturwissenschaftliche Studien* (1879); *Durch Italien und Griechenland nach dem Heiligen Land* (1882).

RATH'BONE SISTERS, ORDER OF. See PYTHIAS, KNIGHTS OF.

RATH'BUN, RICHARD (1852–). An American zoölogist and administrator, born in Buffalo, N. Y., and educated at Cornell. He was assistant in zoölogy to the Boston Society of Natural History (1874–75), then for three years assistant geologist on the Geological Commission of Brazil, and assistant in zoölogy at Yale (1879–80). Thereafter he was connected with the Smithsonian Institution, of which he was assistant secretary after 1887, and in 1899 he took charge of the United States National Museum. Rathbun represented the United States on the joint commission with Great Britain relative to the preservation of fisheries in waters contiguous to the United States and Canada (1892–96). He published various articles relating to zoölogy and to problems of museum administration.

RATHENOW, rä'te-nō, or **RATHENAU.** A town in the Province of Brandenburg, Prussia, on the Havel, 45 miles west-northwest of Berlin (Map: Germany, E 2). It manufactures glass, optical instruments, furniture, asbestos, bricks, machinery, wagons, and stoves. Pop., 1910, 24,901.

RATHGEN, rät'gen, CARL (FRANZ THEODOR) (1856–). A German economist and writer on Japan. A grandson of the historian B. G. Niebuhr, he was born in Weimar and was educated at Strassburg, Halle, Leipzig, and Berlin. From 1882 to 1890 he was professor in the Imperial University of Tokyo, in 1892 became docent at the University of Berlin, and in 1893 professor at Marburg. Rathgen accepted a chair at Heidelberg in 1900 and in 1907 went to the Hamburg Colonial Institute. In 1913–14 he lectured at Columbia University, New York. He wrote: *Japans Volkwirtschaft und Staatshaushalt* (1891); *Die englische Auswanderung und Auswanderungspolitik im 19. Jahrhundert* (1896); *Die Japaner und ihre wirtschaftliche Entwicklung* (1905; 2d ed., 1911); *Staat und Kultur der Japaner* (1907).

RATHMINES (răth-mīnz') **AND RATHGAR,** -gär'. A municipality of Leinster, Ireland, suburban to Dublin (q.v.). Pop., 1901, 32,602; 1911, 37,840.

RATHSAMHAUSEN, LUDWIG SAMSON, BARON VON TANN-. See TANN-RATHSAMHAUSEN, L. S.

RATIBOR, rä'tē-bōr. A city in the Province of Silesia, Prussia, on the Oder, 44 miles south-southeast of Oppeln (Map: Germany, H 3). It has a handsome courthouse, a theatre, and a Gymnasium. It has iron foundries and machine shops and manufactures snuff, sugar, chocolate, paper, furniture, and chemicals. The town was the capital of the former Dukedom of Ratibor. Pop., 1900, 25,236; 1910, 38,405.

RATICHIUS, rā-tīk'ī-ŭs (Ger. RATKE, or RATICH), WOLFGANG (1571–1635). An educational reformer, born at Wilster in Holstein and educated at the Hamburg Johanneum and the University of Rostock. While sojourning in Holland (1603–11) he devised a new method for teaching languages quickly. He tried to interest the Prince of Orange in his method, but, failing, he betook himself to Germany. At Amsterdam, Basel, Strassburg, Frankfort, Weimar, Augsburg, Köthen, and various other places he put into operation his method of instruction. His executive ability, however, was not commensurate with the scope of his ideas, and consequently he failed in all his undertakings. His fundamental idea of method was that nature should be followed, meaning by that that there is a natural sequence along which the mind moves in the acquisition of knowledge, through particulars to the general, thus for the first time applying the Baconian theory of induction in education. His work was overshadowed by that of the more successful Comenius (q.v.). Consult: Barnard, *German Teachers and Educators* (Hartford, 1878); Quick, *Educational Reformers* (New York, 1890); G. Vogt, *Wolfgang Ratichius, der Vorgänger des Amos Comenius* (Langensalza, 1894). See EDUCATION; PEDAGOGY.

RAT'IFICA'TION (ML. *ratificatio*, from *ratificare*, to ratify, from Lat. *ratus*, fixed, settled + *facere*, to make). In law, acts or words by which a person adopts as his own obligation the legal effect of an unauthorized act done by another on his behalf or for his benefit, or by which a person confirms and assents to be bound by a voidable obligation. The doctrine is of most frequent application in the law of agency and in the ratification by a person of an act creating a contract obligation performed by him during minority. If a person ratifies and accepts the benefits of an act, he must also be responsible for any consequences of the act, such as damage committed by the unauthorized person in doing it. Ratification may be *express*, i.e., by assent expressed in positive terms, or *implied*, from acts from which a reasonable person would infer assent.

In Scots law the term is applied to the sepa-

rate acknowledgment of a married woman that a deed executed by her is voluntary and made with full knowledge of its legal effect. See AGENT; CONTRACT; INFANT; and consult the authorities referred to under CONTRACT.

RATIO. See PROPORTION.

RATIOCINATION, răsh'ĭ-ŏs'ĭ-nā'shŭn, PSYCHOLOGY OF. See THOUGHT. For reasoning as a logical process, see DEDUCTION; INDUCTION; SYLLOGISM.

RATION. See RATIONS.

RATIONALISM, răsh'ŭn-*a*l-ĭz'm (Lat. *rationalis,* from *ratio,* reason). A term employed in philosophy and theology to denote a system in which the reason is supreme. In theology it is contrasted with supernaturalism and is used to describe a movement of thought which had its important representatives in Germany in the last half of the eighteenth century, but was to be found in England and elsewhere in the previous century in the earlier stages of development. According to one of its recent historians, Kahnis, it "makes the educated reason of the times the standard of all religious truth."

In philosophy the term is used to denote the doctrine that reason is an independent source of knowledge, distinct from sense perception and having a higher authority. In this sense it is opposed to sensationalism (q.v.). It is more widely used, however, for the view opposed to empiricism (q.v.) that in philosophy certain elementary self-evident concepts are to be sought and all the remaining content of philosophy deductively derived from them. This view was first explicitly stated by Descartes, developed by Spinoza and Leibnitz, and formulated by Wolff. Kant endeavored to transform rationalism by showing how reason was implicit in experience; and Hegel revived it in a transformed sense with the construction of experience itself as a system of reason.

Bibliography. W. E. H. Lecky, *History of the Rise and Influence of the Spirit of Rationalism in Europe* (London, 1865; new ed., 2 vols., ib., 1904); K. R. Hagenbach, *German Rationalism* (Eng. trans., Edinburgh, 1865); John Tulloch, *Rational Theology and Christian Philosophy in England in the Seventeenth Century* (London, 1872–74); Otto Pfleiderer, *The Evolution of Rationalistic Theology since Kant* (Eng. trans., ib., 1892); A. W. Benn, *History of English Rationalism in the Nineteenth Century* (2 vols., New York, 1906); J. B. Bury, *History of Freedom of Thought* (London, 1913). See also GERMAN THEOLOGY; KNOWLEDGE, THEORY OF.

RATIONS, rā'shŭnz; *in military usage, usually,* răsh'ŭnz (from Lat. *ratio,* reckoning, relation, reasoning). A ration is the allowance for the subsistence of one person for one day. A forage ration is the food allowance of one animal for one day. In the United States army the garrison ration (for persons) is intended for troops in garrison and in time of peace for troops in manœuvre camps; the ration to be issued to troops on the march in time of peace will be prescribed by the commander and will not exceed the allowances prescribed for the garrison ration; the travel ration is for troops traveling otherwise than by marching and separated from cooking facilities; the reserve ration is carried on the person of the men and in the trains and constitutes the reserve for field service; the field ration is the ration prescribed in orders by the commander of the field forces; the Filipino ration is for the use of the Philippine scouts; and the emergency ration is for troops in active campaign for use on occasions of emergency or in the field for purposes of instruction. The components of the principal rations and their net weights are as follows: Garrison ration: beef, 20 ounces; flour, 18; beans, 2.4; potatoes, 20; prunes, 2.8; coffee, 1.12; sugar, 3.2; milk, canned, 0.5; vinegar, salt, and pepper; lard, 0.64; butter, 0.5; net weight, 4.5 pounds; cost about 25 cents. Field ration: bacon, 12 ounces; hard bread, 16; beans, 4; tomatoes (canned), 10; prunes, 1.28; coffee, 1.12; sugar, 2.4; salt, 0.16; net weight, 3 pounds. The reserve ration is the simplest efficient ration and constitutes the reserve carried for field service. The components for this ration are: bacon, 12 ounces; hard bread, 16; coffee, 1.12; sugar, 2.4; salt, 0.16; net weight, about 2 pounds.

The emergency, or, as it is sometimes called, the iron ration, is a prepared food, carried in a sealed can, weight about 1 pound, and composed usually of chocolate, desiccated meat, and grain mixed. It is carried on the person and used only as a last resort, when no other food can be obtained.

The forage ration for the horse is 12 pounds of oats, 14 pounds of hay; for the mule, 9 pounds of oats, 14 pounds of hay. For the grain component may be substituted equal weights of barley or corn. On the march grain is the only forage carried, recourse being had to grazing if it is not possible to procure long forage in the country traversed.

Rations are carried in campaign as follows: 1. On each man, at least two days' reserve ration; for each draft animal, a reserve of one day's grain ration on each vehicle; on each cavalry and field-artillery horse, one feed. 2. In the ration section of the field train: for each man, two days' field, one day's reserve; for each animal, two days' grain rations. 3. In the supply train: two days' field and grain rations. Whenever possible, troops are supplied with fresh beef—preferably frozen beef sent up from the base, otherwise from herds of cattle driven with the supply train. Fresh or field bread is issued as often as possible, being supplied by the bakery companies attached to the line of communications. Army officers are not allowed rations.

In the United States navy the ration is not allowed to officers paid on the army basis, but for all others it is commuted to a cash payment of 30 cents a day. The enlisted force is furnished food in accordance with a fixed allowance table without regard to its cost, which is, however, about 30 cents a day, and this sum is allowed when the ration is commuted (i.e., paid in money). The navy ration as actually issued is a very liberal one. The average cost is 30 to 35 cents per day. While the allowance table is fixed in general terms, it gives the commanding officer and commissary a wide latitude in varying the character of the constituent parts. The supply of fresh meats and fresh vegetables is effected by means of the refrigerator and supply ships which accompany every fleet and detached squadron. All large ships and many small ones are fitted with refrigerator rooms large enough to hold several weeks' supply of refrigerated articles.

British soldiers have only one regular ration, which is the equivalent of the United States army garrison ration. It consists of three-quarters of a pound of meat and one pound of

bread per day. In war time the meat ration is increased to one pound. The official value of the ration is sixpence (12 cents). All other food over this amount, and such articles as tea, coffee, sugar, butter, salt, pepper, etc., are bought by the soldier at his own expense. Fourpence per day is deducted from the soldier's pay, and from the fund thus raised the articles necessary are obtained. In time of war or on transports the government supplies all needed food and the soldier receives his full pay.

In the German army the same skill and refinement of detail that marks the entire army organization is brought to bear on the question of the soldiers' daily food, with a result that, while probably it is the most economical system in Europe, it is also one of the most excellent. The component parts are bread or zwieback, rice, bacon, fresh or canned meat, coffee, and salt. Japanese soldiers in time of peace receive a ration of rice, besides which they are allowed extra pay to cover the expense for meat, vegetables, and so on. The most scientific ration in the world is that of the Italian army; there are two regular rations, the garrison and the campaign. Consult: *Army Regulations of the United States Army* (Washington, 1913); *Field Service Regulation of the United States Army* (ib., 1914); *Organization Tables of the United States Army* (ib., 1914).

RA'TIO STU'DIO'RUM (Lat., scheme of studies). A code of rules which forms the basis for the guidance of Jesuit education, the full name of which is "Ratio atque Institutio Studiorum Societatis Jesu." See JESUITS.

RAT'ISBON. A city of Germany. See REGENSBURG.

RATISBON INTERIM. See INTERIM.

RATISBONNE, rä'tēs'bŏn', LOUIS GUSTAVE FORTUNÉ (1827–1900). A French author and critic, born in Strassburg and educated there and in Paris. He was one of the minor authors belonging to the Parnassian school (see PARNASSIENS). He resigned from the governmental employ on the declaration of the Empire, entered journalism, serving from 1853 to 1876 on the staff of the *Débats*, succeeded Feuillet as librarian at Fontainebleau, and in 1874 was appointed librarian to the Senate. Ratisbonne was the literary executor of Alfred de Vigny. His critical and literary studies included a metrical version of Dante's *Divina Commedia* (1854–59) and the essay *Henri Heine* (1885). But he was better known for his felicity as a poet of childhood, in such works as *Au printemps de la vie* (1857); *La comédie enfantine* (1860); *Les petits hommes* (1868); *Les petites femmes* (1871); various *Albums* under the pseudonym Trim; *Les grandes ombres* (1900).

RATI'TÆ (Neo-Lat. nom. pl., from Lat. *ratitus*, marked with the figure of a raft, from *ratis*, raft). A primary division of modern birds (Neornithes) based on the shape of the sternum, which is flat and without a keel. (See Plate ANATOMY OF BIRDS, accompanying the article BIRD, Fig. 4.) The Ratitæ are a very small group of the most ancient lineage, now confined to the Southern Hemisphere. It includes the extinct groups Dinornithes (moas) and Æpyornithes (rocs), and the modern ostriches, rheas, emus, cassowaries, and kiwis. Except the kiwis, all are of very large size. The body is uniformly feathered (see PTERYLOSIS), and various anatomical features are characteristic. Naturalists are not agreed as to the precise relationships which exist between the Ratitæ and certain other groups, as, e.g., the Stereornithes (q.v.), but it is plain that the group is the most primitive of all those having existing representatives, and it is now generally believed that it represents a degenerate stage of descent from ancestral forms that were birds of flight. Consult: Hans Gadow, in Bronn's *Tierreich Aves* (Berlin, 1893); F. E. Beddard, *Structure and Classification of Birds* (London, 1898); A. H. Evans, "Birds," in *Cambridge Natural History*, vol IX (New York, 1900); and the authorities therein cited. See BIRD, FOSSIL; FLIGHTLESS BIRDS; and the names of various species of Ratitæ, as MOA, OSTRICH, ETC.

RATKE, rät'ke, WOLFGANG. See RATICHIUS.

RATNAGIRI, rŭt'nä-gē'rē. A district in the Territory of Concan (q.v.), British India.

RATON, rä-tōn'. A city and the county seat of Colfax Co., N. Mex., 25 miles by rail south of Trinidad, Colo., on the Atchison, Topeka, and Santa Fe and the Santa Fe, Raton, and Eastern railroads (Map: New Mexico, E 2). It is the centre of a stock-raising and farming region, which is also noted for its extensive coal deposits. There are large railroad repair shops here, the city being a division terminal of the Santa Fe line. Pop., 1900, 3540; 1910, 4539.

RAT PORTAGE. See KENORA.

RATRAM'NUS (sometimes incorrectly called BERTRAM, or BERTRAMUS). An Aquitanian monk and theologian of the early ninth century, connected with the monastery of Corbie, Picardy. He wrote, at the instance of Emperor Charles the Bald, a famous treatise, *De Corpore et Sanguine Domini*, a defense of the purely symbolical theory as to the Eucharist against a work of the same title by Paschasius Radbertus. In 1526 the work was brought into prominence through its being quoted by Bishop Fisher, of Rochester, as an exposition of the Roman Catholic doctrine regarding the Eucharist. Reprinted in 1527 at Cologne, it was much read by Protestants, and was placed on the *Index* by the Council of Trent. Subsequently it was defended within the Roman Catholic church by Sainte-Beuve and Jacques Boileau. Ratramnus also wrote *Contra Græcorum Opposita Romanam Ecclesiam Infamantium*, in defense of the whole system of Western dogma. The collected works may be found in Migne's *Patrologia Latina*, cxxi (Paris, 1844–64).

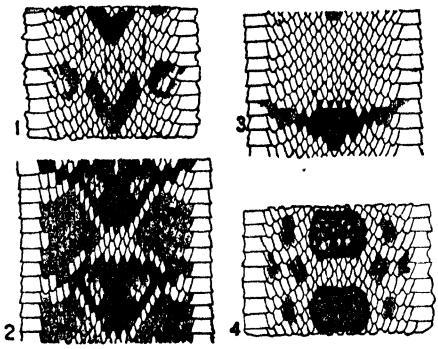
RAT-TAILED VIPER. See FER-DE-LANCE.

RAT-TAIL FISH. See GRENADIER.

RATTAN, rät-tăn', **RATAN,** or **ROTANG** (Fr. *rotin, rotang*, from Malay *rotan*, rattan), *Calamus*. A genus of about 200 species of mostly East Indian and tropical African palms with reedlike, slender, often jointed stems sometimes several hundred feet long. The name "rattan" is extended to other similar palms of the same tribe although placed by botanists in different genera. The stem, which is very smooth, hard, and siliceous externally, is either erect or ascends by means of hooked prickles at the extremities of the midribs of its leaves. It then descends in graceful festoons and may climb neighboring trees. All the species are useful, being much employed in their native countries for making bridges, plaited work, chair bottoms, rope, and so on, and are very largely exported, generally under the name of cane, for similar purposes. *Calamus rotang* and *Calamus rudentium*, occurring in India, Burma, Ceylon, and Malaysia, are among the most useful species. The

walking sticks called Malacca canes are believed to be the produce of *Calamus scipionum;* the plant, however, does not grow in Malacca, but in Sumatra. The fruit of some species of rattan is used as food, and the young shoots, variously prepared, are used as vegetables. A very fine kind of dragon's blood (q.v.) is obtained from a species of rattan (*Calamus draco* or *Dæmonorops draco*), and particularly from the fruit, on the surface of which it appears as a resinous exudation. *Calamus acanthospathus* is one of the hardiest species, occurring as it does at elevations of 6000 feet in the Himalaya.

RAT'TANY. See RHATANY.

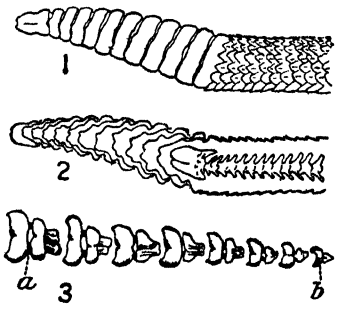


RATTAZZI, rät-tät'sē, URBANO (1808–73). An Italian statesman, born at Alessandria. He studied law at Turin and became an advocate at Casale. In 1848 he was elected a member of the Sardinian Parliament, and after sitting in the Casati cabinet was called into the ministry of Gioberti. He was one of those who urged Charles Albert into a continuance of the war with Austria in 1849, and after the defeat of Novara he was obliged to retire from the ministry. He became the leader of the Left Centre, or Moderate Radical party. In 1851, when Napoleon's coup d'état complicated foreign relations, an alliance was concluded between Cavour and Rattazzi, who had hitherto been opponents. Rattazzi took the portfolio of Justice in 1853, and subsequently that of the Interior in the Cavour ministry. He disagreed with Cavour on the French alliance and retired from the cabinet in 1858, but returned upon Cavour's resignation after the Peace of Villafranca. He was opposed to the surrender of Savoy and Nice to France, and he again retired in 1860. He returned to office in 1867, but his ambiguous attitude regarding Garibaldi's expedition against Rome in that year led to the downfall of his ministry in October. Consult: S. G., *Urbano Rattazzi* (Turin, 1861); *Lettres inédites du comte de Cavour au commandeur Urbain Rattazzi* (Paris, 1862); De Rute, *Rattazzi et son temps* (ib., 1881–87). An edition of his speeches, edited by Scovazzi, was published at Rome (8 vols., 1876–80).

RATTAZZI DE RUTE, rät-tät'sē de rōō'tā, MME. DE SOLMS-. See BONAPARTE, LÆTITIA MARIE WYSE.

RAT'TIGAN, SIR WILLIAM HENRY (1842–1904). An English lawyer, born in Delhi. He was educated at the High School, Agra, and at King's College, London, and was entered at the bar in 1873. He was additional member of the Supreme Legislative Council of India in 1892–93 and member of the Punjab Legislative Council in 1898–99, and at different times between 1880 and 1886 was judge of the Chief Court of the Punjab. He was knighted in 1895 and was returned to Parliament as member for Northeast Lanarks in 1901. His works include several standard works on Hindu law; *The Science of Jurisprudence* (1888; 3d ed., 1892); *Private International Law* (1895).

RATTLE POD. A species of *Crotalaria* (q.v.).

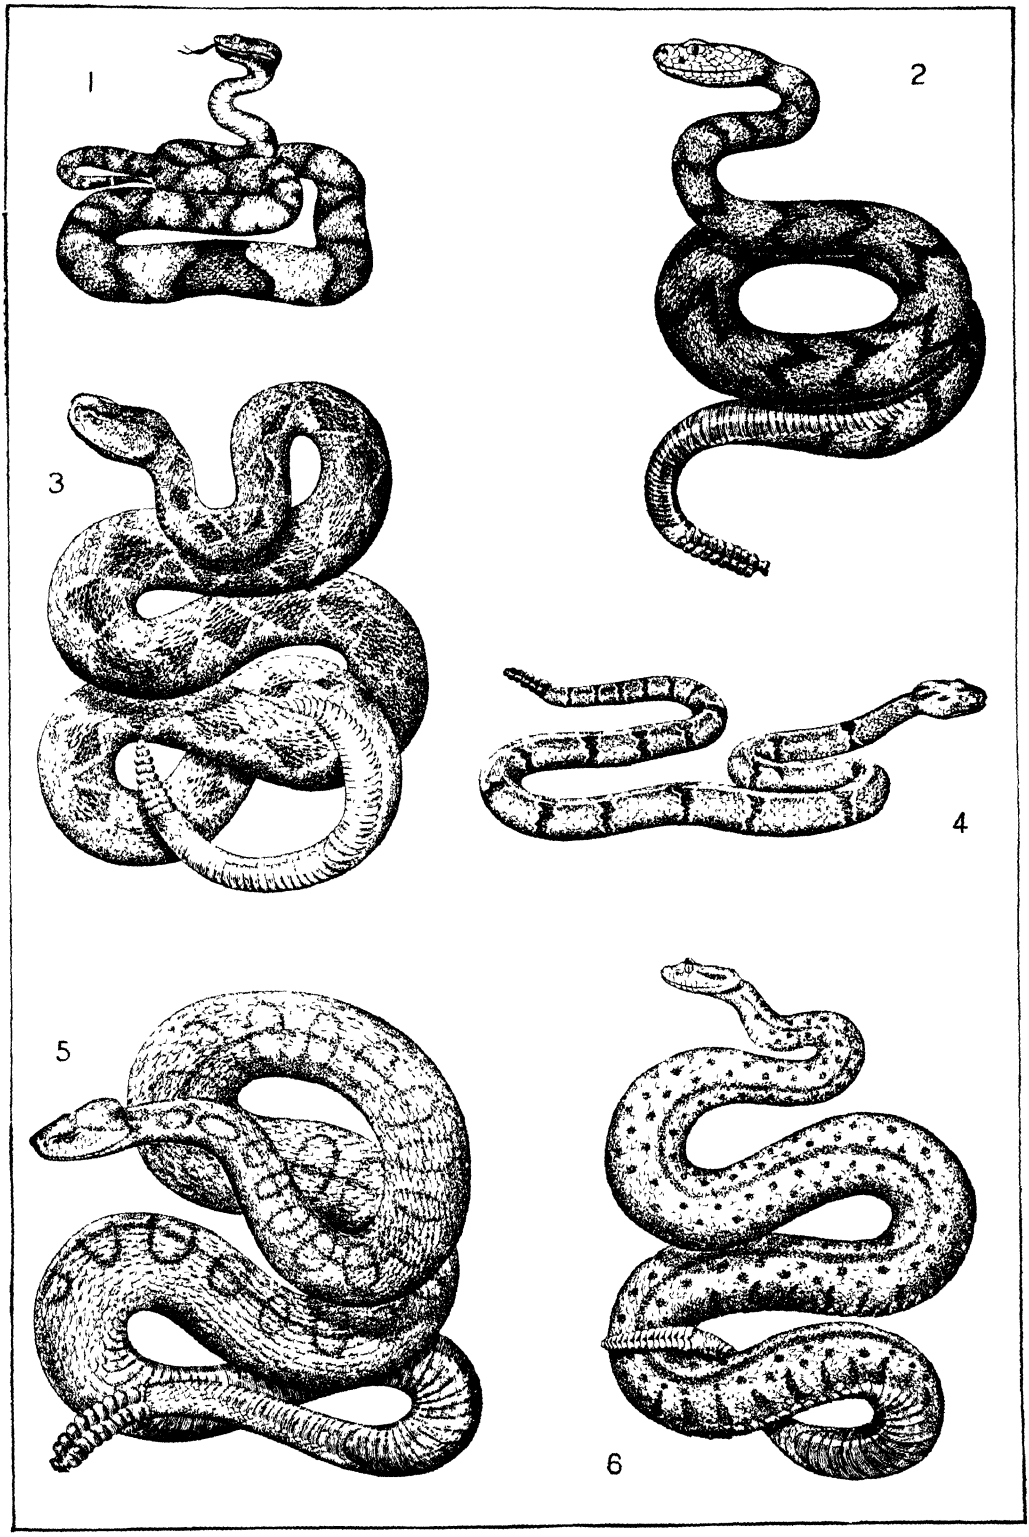


RAT'TLESNAKE'. An American venomous serpent of the family Viperidæ and subfamily Crotalinæ, distinguished from its congeners by a horny jointed appendage terminating the tail, the shaking of which causes a rattling noise likened to that of the ancient castanets or *crotala.* The Crotalinæ, until recently regarded as a family (Crotalidæ, pit vipers), stand at the head of the ophidian ranks as the "most specialized type of snake structure," and exhibit the "highest efficiency of the venom apparatus." They are viper-like serpents of moderate length —none exceeding and few approaching 8 feet— but thick, heavy, and extremely muscular. They

PATTERNS OF COLOR MARKINGS.

1, common Eastern banded rattlesnake (*Crotalus durissus*); 2, diamond rattlesnake (*Crotalus adamanteus*); 3, green rattlesnake (*Crotalus lepidus*); 4, plains rattler (*Crotalus confluentus*).

are viviparous and mainly terrestrial; but one, at least (the moccasin), is decidedly aquatic, and several in Central and South America are arboreal. In colors they vary adaptively to their haunts. All are more or less distinctly marked with darker spots and patterns of squarish form. The group is predominantly American, but several species inhabit the East Indies, some of them belonging to the American genera *Ancistrodon* and *Lachesis.* The latter includes more than half of the 60 or so species of pit vipers recognized, and is mainly Neotropical. Among its species are the large and dangerous bush master and fer-de-lance (qq.v.). Among smaller genera one is *Teleuraspis,* a species of which (*schlegelli*) is arboreal and often winds around the stems at the centre of banana bunches, where it sometimes fatally bites the first man to handle the fruit. None of these have rattles. The true rattlesnakes, then, are only those pit vipers which belong to the genera *Sistrurus* (3 species) and



RATTLE OF A RATTLESNAKE.

1, perfect rattle of a large banded rattlesnake; 2, longitudinal section of rattle; 3, separate segments of disjointed perfect rattle of *Crotalus* (side view); *a*, basal "joint"; *b*, button.

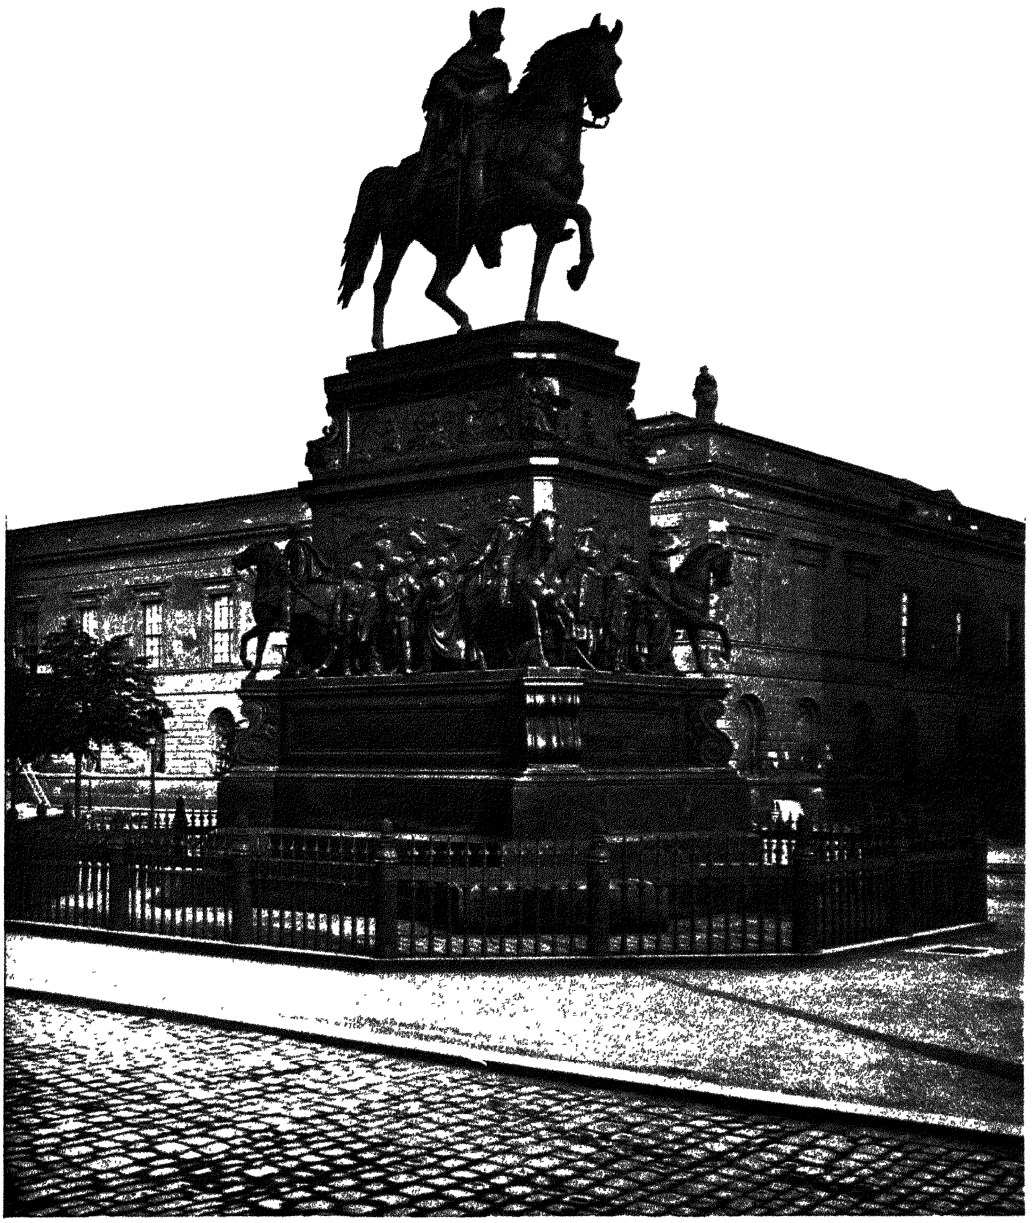
Crotalus (15 species), all of which, except two species of *Crotalus* in South America, belong to the northern continent.

The curious epidermal structure at the end of the tail consists of a tapering series of amber-colored horny flattened bells which are locked into one another. The oldest or terminal bell

RATTLESNAKES

1. COPPERHEAD (Ancistrodon contortrix).
2. EASTERN BANDED RATTLESNAKE (Crotalus durissus).
3. DIAMOND RATTLESNAKE (Crotalus adamanteus).
4. GREEN RATTLESNAKE (Crotalus lepidus).
5. PLAINS RATTLESNAKE (Crotalus confluentus).
6. HORNED RATTLER, or SIDEWINDER (Crotalus cerastes).

(the button) is in reality the horny covering of the tip of the tail which was not discarded when the skin was first molted. At each succeeding molt the tip is pushed out by the new skin, and so a bell is added at the base with each new shedding of the remainder of the skin. Theoretically these bells ought to indicate the number of moltings and the age of the snake; but wear and accident interrupt or break the set so often that the rule does not hold with any certainty.



When the serpent is excited in any way it vibrates its tail, which (unless the creature is moving) is then held upright in the centre of the coiled body, with the head erect and menacing before it. This vibration, which is indulged by many kinds of snakes under nervous excitement, produces a peculiar humming noise, which increases in intensity and pitch as the snake's alarm or anger and the speed of vibration are augmented, until it may sound like the droning of an angry bee. The origin of the rattle can only be guessed at. A tendency towards armature of the tail is apparent in several other genera of pit vipers; and in *Sistrurus* the rattle is much less well developed than in *Crotalus*. Apart from being a mere expression of emotion, the rattle serves to warn away cattle that might tread upon it or enemies that might wish to seize it. This warning is well understood among all the wild animals, but when antelopes and deer hear it they will often attack the reptile and cut it to pieces with their sharp hoofs. The rattle is also believed to be a useful means of calling the sexes together.

The poison apparatus, fangs (which are of the proteroglyphic type), and the manner and result of biting, are treated of under SNAKE. Here it needs only be said that, like the vipers generally, these snakes are sluggish and loath to bite when it can be avoided or when they are not surprised into a sudden stroke. This disposition varies, however, with the weather, their hunger, the season (all are irritable when sloughing their skin), and it differs in various species. Even the smallest may cause a man serious illness and perhaps death if it succeeds in introducing much poison into a wound; while a fairly delivered bite from the larger ones is almost certain to prove fatal. Its enemies are mainly confined to a few of the larger colubrine snakes, as the black snake, king snake, and the like; to the prong-horn, Western deer, and Southern peccaries. Against man the rattlesnakes can make feeble resistance. Domestic pigs kill and eat as many as they can find, and rarely suffer harm, because of the thickness of the skin and the layers of fat underneath it, which prevent the fangs from entering or carrying venom to the system. Hunting of rattlesnakes affords occasional profit to a few persons, who find a market for their skins and for the clear smooth oil yielded by their fat, which is esteemed by watchmakers and gunsmiths and is in demand as a medicine among the ignorant.

The most common and well known of the rattlesnakes is that one (*Crotalus durissus*, or *horridus*) formerly abundant all over the East, from the White Mountains in New Hampshire and Lake Superior in the North to the borders of the dry plains. It is larger in the Southern States than northward, and occasionally reaches a length of 5 feet, with a diameter in that case of 4 to 5 inches. The ground color above varies from bright tawny to dark brown. A light line runs from the mouth to the eye, with a dark patch below; and the body is marked with three rows of confluent irregular brown spots, forming about 21 zigzag crossbars. The head is oval in outline. This snake inhabits wooded regions, avoiding prairies. It is especially fond of rocky districts, and hence is most numerous among mountains, where it is inclined to gather in considerable numbers in certain holes and caverns in the autumn, in order to undergo the winter sleep in closely entwined companies. About nine young are born annually in midsummer. The Southern States have a still larger species known as the diamond rattlesnake (*Crotalus adamanteus*) on account of the rhomboidal black blotches, each perfect in all its angles and edged with yellow, which ornament its yellowish body. This snake sometimes reaches, on the Mangrove Islands of western Florida, a length of 8 feet, and has so great a thickness that large individuals may be regarded as the most bulky of all venomous snakes, for the Oriental cobras, although sometimes longer, are far more slender. The range of the diamond rattlesnake extends along the coast from North Carolina to Texas, and a variety ranges westward to Lower California. Two other similar and almost equally large and dreadful snakes are *Crotalus molossus* and *basiliscus*. Southern California also has a remarkable species (*Crotalus ruber*), which has an oblong head and whose markings are deep red or sometimes chestnut upon a paler reddish ground. The rattlesnake of the plains (*Crotalus confluentus*) is a light-colored, obscurely marked, rather small species. It is highly variable in form and color, and is the kind constantly found in prairie-dog towns. Several other species occur in the Rocky Mountain region and northern Mexico, one of which, the horned rattlesnake (*Crotalus cerastes*), is the characteristic snake of the deserts of the Rio Colorado and Gila, where the people call it sidewinder, from its habit of progressing sidewise instead of in the usual way. It takes its specific name from the fact that the plates above the eyes are thickened into hornlike cones, sometimes of considerable height. It is not of large size, but is dangerous because of the virulence of its poison.

The small, active prairie rattlesnakes, now greatly reduced in number, differ sufficiently from the genus *Crotalus* to be set apart into the genus *Sistrurus*. One of them (*Sistrurus miliarius*) is the ground rattler of the Southern States, too frequently met with in stubble fields and grassy places. A Northern congener is the black rattlesnake or massasauga, once common between the Alleghany Mountains and the plains, but now nearly exterminated except on the frontier. This species (*Sistrurus catenatus*) may reach a length of 30 inches, and is brown, with a series of darker brown transverse spots on the back, beneath each of which is a small brown spot, forming a linear series along the sides. Its rattle is small, but can be heard at a considerable distance, and its bite is likely to be exceedingly troublesome to men and domestic animals, although not often fatal. These snakes prefer low, wet ground, the draining of which by the spread of farming operations has been the principal agency in its decrease.

Consult: H. C. Bumpus, in *Standard Natural History*, vol. iii (Boston, 1885); L. H. Stejneger, "Reptiles of Death Valley," in *North American Fauna, No.* 7 (Washington, 1893); id., "Poisonous Reptiles of the United States," in

RAUCH

STATUE OF FREDERICK THE GREAT IN BERLIN

the base of which are groups of generals and soldiers and bas-reliefs representing scenes in the life of Frederick. Rauch's works combined, to a remarkable extent, natural truth with ideality of character, and he succeeded in the difficult task of adapting modern costume to the ideal portrait representation. He was the founder of the Berlin school of sculpture, the most important in Germany, and in which his spirit yet prevails. Consult Friedrich Eggers, *Christian Daniel Rauch* (4 vols., Berlin, 1873–87), the leading biography, upon which E. D. Cheney's *Life* (Boston, 1893) is based; Dobbert, *Rauch* (Berlin, 1877); Karl Eggers, *Rauch und Goethe: urkundliche Mittheilungen* (ib., 1889); id., *Rauch, Leben und Werke* (ib., 1891), for illustrations; also Merckle, *Das Denkmal König Friedrich des Grossen* (Berlin, 1894).

RAUCOURT, rō'kōōr', MADEMOISELLE (1756–1815). A French actress, whose real name was FRANÇOISE SAUCEROTTE. She was born at Nancy. At the age of 12 she made her début in Spain under her actor father, in 1770 played at Rouen, and in 1772 appeared at the Comédie Française, Paris, as Dido. Under the patronage of the Queen she was seen in 1779 at the Théâtre Française, where she reappeared in 1793 and 1799, after being in prison during the Revolution. Under the Empire she toured Italy with her own company. When the Paris clergy refused to give burial to the body of Mademoiselle Raucourt, whose private life had been scandalous, a crowd broke into the church and Louis XVIII had to send an almoner to officiate.

RAUHES HAUS, rou'ĕs hous. One of the earliest industrial institutions for poor boys, founded by Wichern at Horn, near Hamburg, Nov. 1, 1833, in an old house called by its former occupant Ruges Hus, which by a mistranslation into High German became Rauhes Haus. The inmates live in groups of 12 or 15, under the charge of a brother. The scope of the school has widened with its growth and now comprises: (1) Department for neglected children, who receive a common-school education and are trained for handwork and later on are apprenticed or employed in the institution. (2) Department for trades instruction. (3) Boarding department for boys of better families. (4) A training school, begun in 1845, for workers in charitable societies and institutions. The men are called brothers, and most of them have found service under the Inner Mission (q.v.). (5) Book department, including a printing office, started in 1844. The oversight and care of the children fall largely on the assistants, who are training for work in other institutions.

RAUMER, rou'mĕr, FRIEDRICH LUDWIG GEORG VON (1781–1873). A German historian, brother of Karl Georg von Raumer, born at Wörlitz, near Dessau. He studied at Berlin, Halle, and Göttingen, and held government appointments from 1806 to 1811. In the latter year he was made professor of political science at Breslau and in 1819 was called to Berlin. He traveled widely between 1827 and 1843 and published his observations. He was a member of the German National Assembly of 1848–49 at Frankfort. Subsequently he became a member of the Upper House of the Prussian Diet. His more important works are: *Geschichte der Hohenstaufen und ihrer Zeit* (1823–25; 5th ed., 1878), a standard work on that period; *Ueber die geschichtliche Entwickelung der Begriffe von Recht, Staat und Politik* (2d ed., 1826); *Geschichte Europas seit dem Ende des 15. Jahrhunderts* (1832–50); *Beiträge zur neuern Geschichte aus dem Britischen Museum, etc.* (1836–39); *Die vereinigten Staaten von Nordamerika* (1845); *Antiquarische Briefe* (1851); *Handbuch zur Geschichte der Litteratur* (1864–66). With F. A. Brockhaus he founded in 1830 and until 1867 also edited the *Historisches Taschenbuch.*

RAUMER, KARL GEORG VON (1783–1865). A German geologist and educator, born at Wörlitz, brother of F. L. G. von Raumer. After studying at several German universities and at the mining academy at Freiberg, in 1811 he became professor of mineralogy at Breslau. Raumer took part in the wars of 1813–15, and subsequently taught at Halle (1819–23), in the Dittmar training school, Nuremberg, and, as professor of natural history, at Erlangen (after 1827). Among his works are: *Geognostische Fragmente* (1811); *ABC-Buch der Kristallkunde* (1820–21); *Lehrbuch der allgemeinen Geographie* (1832; 3d ed., 1848). On education he wrote an important *Geschichte der Padagogik* (1843–51; 6th ed., 1890–98; Eng. trans.).

RAUPACH, rou'päg, ERNST BENJAMIN SALOMO (1784–1852). A German dramatist. He was born at Straupitz, Silesia, studied theology at Halle, was for 10 years tutor in Russia, and was subsequently (1816) appointed professor of philosophy, German literature, and history in the University of St. Petersburg. Raupach left Russia in 1822 and, after a visit to Italy, settled in Berlin, where he devoted the remainder of his life chiefly to writing for the stage. His facility was remarkable, and he wrote in all about 80 plays, besides letters and poems. Among his early pieces the following are noteworthy: *Die Gefesselten* (1821); *Die Freunde* (1825); *Isidor und Olga* (1826). Among his comedies may be mentioned *Die Schleichhandler, Der Zeitgeist,* and the farces *Denk' an Cäsar* and *Schelle im Monde.* Of his posthumous works are: *Der Kegelspieler* (1853); the tragi-comedy, *Mulier Taceat in Ecclesia* (1853); *Saat und Frucht* (1854). The popular drama *Der Muller und sein Kind* still holds the stage. He collected his earlier plays in two volumes, *Dramatische Werke komischer Gattung* (1829–35) and *Dramatische Werke ernster Gattung* (1830–43). Consult Pauline Raupach, *Raupach: eine biographische Skizze* (Berlin, 1853).

RAUSCHENBUSCH, rou'shen-bush, WALTER (1861–). An American Baptist theologian and writer. He was born at Rochester, N. Y., where he graduated from the university (1884) and the theological seminary. His preparatory education he had received at the Classical Gymnasium of Gütersloh, Germany, and again in 1891–92 and 1907–08 he studied abroad. From the year of his ordination (1886) to 1897 he was engaged in religious work among German immigrants in New York City. Thereafter he was connected with the Rochester Theological Seminary, becoming professor of Church history in 1902. Dr. Rauschenbusch served as Earl lecturer at the University of California (1910), as Merrick lecturer at Ohio Wesleyan in 1911, and as Gates lecturer at Grinnell College (1914). His *Christianity and the Social Crisis* (1907) and *Christianizing the Social Order* (1912; Norw. trans.) were of wide influence. Among his other writings are: *Das Leben Jesu* (1895); *Leben und Werken von Augustus Rauschenbusch* (his father) (1901); *The New Evangelism* (1904); *For God and the People: Prayers of the Social*

Awakening (1910); *Unto Me* (1912); *Dare We Be Christians?* (1914).

RAVAILLAC, rȧ'vȧ'yăk', FRANÇOIS (1578–1610). The assassin of Henry IV of France. He was born at Angoulême. He joined the Order of Feuillants in Paris, but was expelled as a visionary fanatic and then became inspired with hatred of the Huguenots and determined to kill the King. On May 14, 1610, as the King was passing in his coach through the narrow street of Laferronnerie, Ravaillac climbed upon the right rear wheel of the carriage at the moment that its advance was hindered by a heavy wagon, and leaning forward he plunged a knife into the breast of the King. Ravaillac escaped in the confusion, but was soon captured, admitted his guilt, and after a formal trial was put to death in the Place de Grève, May 27, being torn asunder by horses. He steadily refused to say whether he had accomplices. Both Martin and Poirson have examined the case against Ravaillac with care and have come to the conclusion that the real cause was fanaticism which had degenerated into monomania. Consult: B. L. H. Martin, *Histoire de France* (4th ed., Paris, 1855–61); Auguste Poirson, *Histoire du règne de Henri IV* (2 vols., ib., 1857); J. A. J. Loiseleur, *Ravaillac et ses complices* (ib., 1873).

RAVAISSON-MOLLIEN, rȧ'vȧ'sôN'-môl'-lyăN', JEAN GASPARD FÉLIX (1813–1900). A French philosopher and archæologist, born at Namur. He was educated at the Collège Rollin and at Munich. In 1838 he received his doctor's degree and was appointed professor of philosophy at Rennes. Ravaisson became inspector general of public libraries in 1840, was inspector general in the department of higher education from 1859 to 1888, and was elected a member of the Académie des Inscriptions (1849) and of the Académie des Sciences Morales et Politiques (1880). His works include: *De l'habitude* (1838); *Rapport sur le stoicisme* (1851); *La philosophie en France au XIXe siècle* (1868; 3d ed., 1889); *La Vénus de Milo* (1871); *Morale et metaphysique* (1893). His articles on archæology appeared in the *Revue Archéologique* and in the *Mémoires* of the Académie des Inscriptions.

RAVELIN, răv'lĭn. See FORTIFICATION.

RA'VEN (AS. *hræfn*, OHG. *hraban*, *raban*, Ger. *Rabe*, raven; perhaps connected with OPruss. *kracco*, black woodpecker, Lat. *corvus*, Gk. *κόραξ*, *korax*, raven, Lat. *cornix*, Gk. *κορώνη*, *korōnē*, crow, Skt. *karava*, raven, and with Lat. *crocire*, OChurch Slav. *krakati*, to croak, as well as with OHG. *hruoh*, AS. *hroc*, Eng. *rook*). The largest of corvine birds (*Corvus corax*), a species of crow usually more than 2 feet in length. The feathers on the neck are long, narrow, and pointed, forming a ruff; the bill is strong, compressed, sharp, somewhat hooked, and surrounded at the base with feathers and bristles. The wings are long and powerful; the color is uniform black, lustrous in the male, and although this bird is nowhere migratory, even enduring winter in the Arctic regions, it never turns white at that season, as do most Arctic animals. The raven was originally to be found in almost all parts of the Northern Hemisphere, but is now nearly or quite extinct east of the high central plains, though still numerous in the western half of the United States and in northwestern Canada. It goes about alone or in pairs and is one of the most omnivorous of birds, feeding on fruits and nuts, insects, worms, mollusks, birds' eggs and fledglings, and small mammals. It rejoices in carrion and not infrequently attacks weak or sickly beasts, almost invariably choosing their eyes as its first point of assault. It makes its nest of sticks, coarse weeds, wool, hair, and the like, on a narrow ledge of a precipice or in some similarly inaccessible situation, usually as early as February. The eggs are green, thickly marked with dark streaks and blotches. (See Plate of EGGS OF SONG BIRDS.) Ravens are occasionally captured when young and become interesting pets. By nature they are impudent, cunning, inquisitive, and mischievous. They destroy everything that can be destroyed, apparently with real pleasure, and they will steal anything they can carry off, particularly glittering things. Moreover, they have considerable power of imitating human speech. Newton and others regard the raven as the most highly developed mentally and physically of all birds. It is celebrated for its longevity, and instances are on record of its living 70 or 80 years. In the southwestern United States a crowlike bird is found, the white-necked raven (*Corvus cryptolcucus*), with the neck feathers of a raven, but with bases pure white. Several other species are known in various parts of the world. Consult Alfred Newton, *Dictionary of Birds* (New York, 1896), and authorities therein cited. Cf. CROW; JACKDAW; and see Plate of JAYS, MAGPIES, ETC.

RAV'ENA'LA. A Madagascar plant. See TRAVELER'S-TREE.

RAV'ENEL', HENRY WILLIAM (1814–87). An American botanist, born in St. John's Parish, Berkeley Co., S. C. He graduated from South Carolina College, Columbia, in 1832, became a planter in St. Johns, and then went to Aiken, S. C., in 1853. He made a special study of the flowering plants of South Carolina and various groups of fungi. The genus *Ravenelia* of the Uredineæ is named after him. His works include *Fungi Carolniani Exsiccati* (5 vols., 1853–60) and *Fungi Americani Exsiccati* (8 vols., 1878–82), with M. C. Cooke.

RAVENNA, rȧ-vĕn'nȧ. The capital of the Province of Ravenna, in the Compartimento of Emilia, Italy, situated on a marshy, unhealthful plain between the Lamone and the Fiumi Uniti, 6 miles from the Adriatic and 45 miles by rail east by south of Bologna (Map: Italy, D 2). Ravenna, connected with the sea by a canal, is surrounded by old bastions and low walls, where may still be seen the iron rings to which the cables of ships were formerly fastened when the city was a seaport. It lies in a compact form. On the outskirts are extensive parks and pleasure grounds. In the centre of the town is the Piazza Vittorio Emanuele, with two high columns erected in 1483 by the Venetians and bearing the statues of Sts. Vitalis and Apollinaris. The streets are wide, and the squares are adorned with interesting statues, but the houses present a gloomy appearance, and the place, in its stillness, has a rather depressing effect on the visitor. With its basilicas Ravenna is highly important in the history of Christian art from about 400 to 800, the Byzantine and the early Christian forms of architecture being here abundantly illustrated and suggestively united in the ancient churches. The basilicas here differ in many respects from those of Rome. Their interiors manifest also Ravenna's prominence in mosaic painting. The cathedral of Sant' Orso was rebuilt in 1734 and is of no great interest. Its ivory throne of St. Maximian, its

"Elijah" by Guido Reni, and the ornamentation of animals and foliage are, however, valued. The fine octagonal baptistery adjoining, supposed to be part of a Roman bath, was largely reconstructed after 1865. The interior is embellished with statues and with the oldest (fifth century) of the rare mosaics of Ravenna, one of which here represents the baptism of Christ. The interesting church of San Vitale, situated where the saint was martyred, was consecrated in 547. It is octagonal. Its choir is embellished with rich mosaics. Charlemagne patterned the cathedral at Aix-la-Chapelle after this church. In the vicinity is the noteworthy mausoleum of Galla Placidia, now the San Nazario e Celso, begun in the middle of the fifth century by that Empress. Many of the earliest buildings in Ravenna are due to Galla Placidia and her brother Honorius. These structures form, in fact, the unique period of its religious architecture. The interesting basilica of Sant' Apollinare Nuovo, containing elaborate mosaics, was built by Theodoric as an Arian church. Adjacent to the church of San Francesco is the tomb of Dante. It was reconstructed in 1780. His remains, which were kept hidden until 1865, are now inclosed in a marble urn. Another noteworthy church is the large Sant' Apollinare in Classe Fuori, dating from 535 and restored in 1779.

In the northeast portion of Ravenna stands the old city castle, the Rocca di Brancaleone, of Venetian origin and partly demolished in 1735. Still farther northeast is the mausoleum of Theodoric the Great, called the Rotonda, decagonal in shape, with a flat roof. A part of the palace of Theodoric, architecturally as well as historically of great interest, is still to be seen, together with a porphyry basin which is designated as the King's coffin. The archiepiscopal palace, decorated with excellent mosaics, was restored in the sixteenth century. The Academy of Fine Arts, founded in 1827, has nothing of great note. The Byzantine Museum contains sculptures, fragments of architecture, etc. The former monastery of Classe, dating from 1515, holds the municipal collections. The communal library, dating from 1707, has about 75,000 volumes and 800 manuscripts, including several very precious ones. Ravenna is intimately associated with the lives of Dante and Lord Byron. They made famous the ancient pine forest which extends many miles along the coast to the southeast. Directly south of the city rises the column of Gaston de Foix, who on April 11, 1512, defeated the Spanish and papal forces here and fell in the moment of victory. The principal industries are the cultivation of the vine, the spinning and weaving of silk, and the manufacture of wine, glass, leather, laces, bricks, musical instruments, and agricultural implements. A large fair is held in May. The commerce is in cereals, wine, fruits, rice, and fish. The population of Ravenna (commune) was, in 1901, 64,031; in 1911, 71,581; in 1914 (est.), 73,393.

History. Ravenna is one of the oldest towns in Italy. In Augustan times the Roman Adriatic fleet was stationed here and there was considerable commerce. In 404 the Emperor Honorius made this, then a city on the sea, his abiding place because it was well defended. Some years later it became an archiepiscopal see. Ravenna attained its distinctive prominence after the fall of the Roman Empire. It was seized by King Odoacer and passed (493) into possession of the Ostrogoth Theodoric and became a magnificent seat of royal power. It was taken by Belisarius in 539 and was a place of official importance under the Greek emperors until 752 (see RAVENNA, EXARCHATE OF); it was next ruled by the Lombards. It soon fell into the hands of Pepin the Short, who turned it over to the papal sway. Late in the thirteenth century it fell under the sway of the Polenta family. In 1441 it became subject to Venice, under whose régime it prospered greatly. In 1509 it was taken by Pope Julius II, and it remained a papal possession until 1797. After being under French control for 17 years it was restored to papal dominion by the Congress of Vienna and became a part of the Italian Kingdom in 1857.

Blashfield, in *Italian Cities* (New York, 1912).

RAVEN'NA. A city and the county seat of Portage Co., Ohio, 35 miles by rail southeast of Cleveland, on the Erie, the Pennsylvania, and the Baltimore and Ohio railroads (Map: Ohio, H 3). There are manufactories of coaches and hearses, chairs, iron goods, electrical supplies, furnaces, worsted goods, etc. Pop., 1900, 4003; 1910, 5310.

RAVENNA, EXARCHATE OF. The designation of that part of Italy which was under the rule of the Byzantine emperors from 568 to 752. The capital of the governor, or exarch (q.v.), was at Ravenna, and for a short time he ruled over the whole of Italy. When in 568 the Lombards began to invade Italy, which had been conquered by Narses (q.v.) in 553, the old Roman names and divisions rapidly disappeared, and new ones arose. A high military functionary, the exarch, was sent from Constantinople to resist the barbarians, the first one being appointed some time between 572 and 584. The Lombards soon conquered large portions of Italy, so that the various parts of the exarchate were no longer conterminous, there being finally seven separate strips of territory, the chief of which, situated about Genoa and known as Liguria, was taken by the Lombards in 640. In 752 Aistulf, King of the Lombards, captured Ravenna, and the exarchate ceased to exist. The government of the exarch was always a military one and almost independent of all control, owing to the difficulty of communication with Constantinople. The name exarchate continued to be used for the territory around Ravenna, which had been given to the papacy by Pepin in 755, as late as the twelfth century. Consult Charles Diehl, *Etudes sur l'administration byzantine dans l'exarchat de Ravenne* (Paris, 1888), and Hartmann, *Untersuchungen zur Geschichte der byzantinischen Verwaltung in Italien* (Leipzig, 1889).

RAVENNA, GUIBERT, or WIBERT, OF. See GUIBERT OF RAVENNA.

RAVENSBURG, rä'vens-burk. A town in Württemberg, Germany, situated in a fertile valley, on the Schussen, 52 miles by rail south by west of Ulm (Map: Germany, C 5). It is me-

diæval in appearance, possessing a fine sixteenth-century town hall. The leading industries are the spinning and weaving of woolen and linen fabrics. Ravensburg, founded in the eleventh century by the Guelphs, became a free Imperial city in 1280. It belonged to Bavaria from 1803 to 1810, when it passed to Württemberg. Pop., 1900, 13,444; 1910, 15,594.

RA'VENSCROFT, EDWARD (fl. 1671–97). An English dramatist, best known for his polemic with Dryden. His plays were remarkably successful translations or remodelings of the plays of others, notably Molière and Thomas Corneille. In *The Canterbury Guests* (1694) Ravenscroft actually composed a play almost entirely from his own previous work.

RAVENSCROFT, THOMAS (1593–c.1635). An English composer. He was born near London, received his musical education in St. Paul's choir, and had the degree of bachelor of music conferred on him in 1607. In 1611 appeared his *Melismata, Musicall Phansies*, etc., a collection of 23 part songs, some of them of great beauty; and three years later he brought out another collection of part songs under the title of *A Brief Discourse*, an essay on the old musical modes. Turning his attention to psalmody, he published in 1621 a collection of psalm tunes for four voices entitled *The Whole Book of Psalms, Composed into Four Parts by Sundry Authors to Such Tunes as Have Been, and Are Usually Sung in England, Scotland, Wales, Germany, Italy, France, and the Netherlands.* This was the first publication of its kind, and innumerable similar works of subsequent date have been largely indebted to it. Each of the 150 psalms has a distinct melody assigned it. Two collections of secular songs similar to the *Melismata*, and entitled *Pammelia* and *Deuteromelia*, have been assigned to Ravenscroft, but it is probable that only a few of these songs were composed by him, while he may have revised and edited the whole. A selection from his works was printed by the Roxburgh Club in 1822.

RAVENSTEIN, rä'ven-stīn, ERNST GEORG (1834–1913). An English geographer and cartographer, born at Frankfort-on-the-Main, Germany. When 18 years old, he became a pupil of Dr. August Petermann (q.v.). Removing to England, Ravenstein was for 20 years (1855–75) in the service of the Topographical Department of the War Office. For long on the councils of the Royal Statistical and Royal Geographical Societies, he was also professor of geography at Bedford College in 1882–83. He was the first to receive the Victoria gold medal of the Royal Geographical Society (1902). His *Systematic Atlas* (1884) puts in practice many of the author's helpful ideas as to methods of teaching cartography. His *Map of Equatorial Africa* (1884) was the most notable map of a large part of the continent on a large scale that had been made up to that time. Ravenstein published also: *Handy Volume Atlas* (1895; 7th ed., 1907); *A Life's Work* (1908); *The New Census Physical, Pictorial, and Descriptive Atlas of the World* (1911).

RAVESTEYN, rä've-stīn, JAN ANTHONISZ VAN (c.1572–1657). A Dutch portrait painter. He was born at The Hague, where he entered the painters' guild in 1598 and was repeatedly its dean. He is thought to have studied under Mierevelt and was the first to give an historical character to those large groups of magistrates and governors or trustees of corporations and the like in which Frans Hals and Rembrandt displayed such mastery. The Municipal Museum at The Hague contains four such pictures: "Civic Guard Issuing from the Doelen" (1616); "Banquet of the Town Council" (1618); "Meeting of the Town Council" (1636), superior to all others in coloring, full of grave harmony; "Six Officers of the White Arquebusiers" (1638). They are natural, full of vitality, and in color anticipate Rembrandt's golden brown. A large number of his portraits are in Amsterdam and in the Royal Gallery at The Hague, including 21 "Officers in the Dutch Service" (dated from 1611 to 1624). Others are in the Louvre (1633, 1634), Dresden, Berlin, and Munich. The portrait of "Lucretia van der Meulen" is in the gallery of the Historical Society, New York, and the portrait of an unknown lady is in the Metropolitan Museum, New York.

RAVIGNAN, rä'vē'nyäN', GUSTAVE FRANÇOIS XAVIER DE LA CROIX DE (1795–1858). A French pulpit orator. He was born at Bayonne, studied in the Lycée Bonaparte at Paris, and for a time practiced law. Later he prepared himself to enter the Church, in the College of Saint-Sulpice at Montrouge (as a Jesuit novice), at Dôle, and at Saint-Acheul, where in 1828 he became a professor. On the expulsion of the Jesuits from France (1830) Ravignan withdrew to Switzerland, where he taught and then preached. In 1835 he preached in the cathedral of Amiens and in 1837 was selected to succeed Lacordaire (q.v.) at Notre Dame, Paris, in conducting special conferences for men. For 10 years he occupied this pulpit with notable success. He published an apology of his order in 1844 (Eng. trans., *On the Jesuits, their Institute, Doctrines, etc.*, London, 1844) and in 1854 *Clément XIII et Clément XIV*, intended as a reply to the *Life of Clement XIV* by the Oratorian Father Theiner His *Conferences on the Spiritual Life* were translated into English (London, 1873; 5th ed., New York, 1895). Consult: Armand de Ponlevoy, *Vie du père Xavier de Ravignan* (2 vols., Paris, 1860; 16th ed., ib., 1907; Eng. trans. of 1st ed., New York, 1869); J. Poujoulat, *Le père Ravignan* (Paris, 1862); E. G. Ledos, *Le père de Ravignan* (ib., 1908).

RAVINE (rȧ-vēn') **DEER.** See CHINKARA; GAZELLE.

RAWALPINDI, rä'wūl-pĭn'dē *or* rą'al-. A municipality and the largest military station in India, the capital of a district of the Punjab, British India, between the Indus and Jhelam, 90 miles southeast of Peshawar (Map: India, B 2). It has a fort used as an arsenal and is encircled by a chain of defensive works. Its importance is purely military, although there are large locomotive works and iron foundries. It occupies part of the site of ancient Gajipur, and interesting archæological relics have been unearthed. In 1849 the Sikhs surrendered here after their defeat by Gough at Gujarat. Pop., 1901, 87,688; 1911, 86,483.

RAW'DON-HAS'TINGS, FRANCIS, first MARQUIS OF HASTINGS. See HASTINGS.

RAWITSCH, rä'vĭch. A town in the Province of Posen, Prussia, 64 miles south of Posen (Map: Prussia, G 3). It manufactures snuff, cigars, copper, iron, carpets, furniture, and horsehair goods. Rawitsch was founded in 1632 by Protestant refugees. Pop., 1905, 11,403; 1911, 11,525.

RAWLE, rąl, FRANCIS (1846–). An American lawyer, born at Freedom Forge, Pa.

He was educated at Phillips Exeter Academy and at Harvard (A.B., 1869; LL.B., 1871; A.M., 1872), was admitted to the bar in 1871, and practiced at Philadelphia. He became known as a profound student of the law and was the reviser of three editions of Bouvier's *Law Dictionary* (Boston, 1883, 1898, 1913). From its organization, in 1878, until 1902 he was treasurer of the American Bar Association, and in 1902 he was elected its president. In 1887 he was appointed delegate from the United States to the London meeting of the Association for the Reform and Codification of the Law of Nations. From 1890 to 1902 he served as overseer of Harvard University. Rawle contributed numerous articles to legal periodicals.

RAWLE, WILLIAM (1759–1836). An American lawyer, born in Philadelphia. He studied law in New York and at the Middle Temple, London, was admitted to the Philadelphia bar in 1783, and in 1791 was appointed by President Washington United States district attorney for Pennsylvania. In this capacity he prosecuted the leaders of the Whisky Insurrection. He was counsel for the United States Bank and in 1830 assisted in revising the civil code of Pennsylvania. He took much interest in science, philanthropy, and education, being the first president of the Pennsylvania Historical Society, president of the Abolition Society, and for 40 years a trustee of the University of Pennsylvania. His publications include: *Vindication of Rev. Mr. Heckewelder's "History of the Indian Nations"* (1818); *A View of the Constitution of the United States* (1825; 2d ed., 1829), *Discourse on the Nature and Study of the Law* (1832). Consult T. I. Wharton, "A Memoir of William Rawle, LL.D.," in the *Collections of the Pennsylvania Historical Society*, vol. iv (Philadelphia, 1840).

RAWLINS. A city and the county seat of Carbon Co., Wyo., 117 miles west by north of Laramie, on the Union Pacific Railroad (Map: Wyoming, D 4). It is the seat of the State Penitentiary. Rawlins has considerable commercial importance as the centre of extensive sheep-raising and gold and copper mining interests. The railroad maintains repair shops here. Pop., 1900, 2317; 1910, 4256.

RAWLINS, JOHN AARON (1831–69). An American soldier, born at East Galena, Ill. At Galena he studied law in the office of Isaac P. Stevens, with whom in 1854 he entered into partnership. By a powerful war speech, delivered shortly after the fall of Fort Sumter, he influenced Ulysses S. Grant to offer his services to the Federal government. Shortly afterward Rawlins became a major in an Illinois regiment, but at the request of Grant, who was now a brigadier general and who had been favorably impressed by Rawlins, he resigned that post in order to become Grant's assistant adjutant general. From that time until the close of the war he was Grant's close friend and adviser. He became chief of staff in November, 1862, and was honored with numerous promotions, ending with that of brevet major general, March 13, 1865. Although he had had no previous military training, Rawlins showed keen insight into military problems. Appointed Secretary of War in Grant's first cabinet, Rawlins died soon after of tuberculosis, the result of exposure during the war.

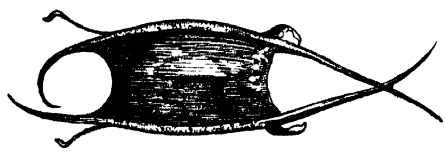
RAWLINSON, GEORGE (1812–1902). An English historian and Orientalist, brother of Sir Henry Creswicke Rawlinson. He was born at Chadlington, Oxfordshire, Nov. 23, 1812. He graduated at Trinity College, Oxford, in 1838, taking a first class in classics; was elected a fellow of Exeter College in 1840, tutor in 1841, gained the Denyer Theological prize in 1842 and 1843, and subsequently received various high university appointments, including the Camden professorship of ancient history in 1861. From 1872 he was canon of Canterbury Cathedral and was rector of All Hallows' Church, London, from 1888 until his death, which occurred Oct. 7, 1902. His Bampton lectures in 1859 were published under the title of *Historical Evidences of the Truth of the Scripture Records.* His other works include a translation of *Herodotus* (4 vols., 1858–60) with notes and appendices, in which many of his brother's discoveries are incorporated; *The Five Great Monarchies of the Ancient Eastern World—Chaldæa, Assyria, Babylonia, Media, and Persia* (4 vols., 1862–67); *Manual of Ancient History* (1869); *Historical Illustrations of the Old Testament* (1871); the *Sixth Great Oriental Monarchy—Parthia* (1873); the *Seventh Great Oriental Monarchy—the Sassanian or New Persian Empire* (1876); *The Origin of Nations* (1877); *History of Ancient Egypt* (2 vols., 1881); *History of Phœnicia* (1889); *The Story of Parthia* (1885); *Memoir of Major-General Sir H. C. Rawlinson, Bt.* (1898).

RAWLINSON, SIR HENRY CRESWICKE (1810–95). An English soldier, diplomat, and Assyriologist. He was born at Chadlington, Oxfordshire, April 11, 1810, and after education at Wrington and Ealing entered the military service of the East India Company in 1827. His facility in learning Hindustani and Persian made him interpreter at 18, and a year later he became paymaster of his regiment. In 1833, with other English officers, he was appointed to assist in the reorganization of the Persian army. While stationed at Kermanshah in 1835, he began to study the Old Persian cuneiform inscriptions. The results of his research were submitted to the Royal Asiatic Society of London in 1837; in the same year his account of his travels through Susiana was printed in the *Journal* of the Royal Geographical Society, and the following year an account of a journey through Persian Kurdistan appeared. During the course of the Afghan troubles he left Persia to take up an appointment as political agent at Kandahar in 1840 and served throughout the campaign with distinction. He was appointed political agent of the East India Company in Turkish Arabia in 1843, Consul at Bagdad in 1844, and in 1851 was promoted Consul General. His official positions facilitated his archæological researches, and in 1846 his successful decipherment of the Persian cuneiform inscriptions, especially that of Darius Hystaspis at Behistun, marked an epoch in the knowledge of Persia's history and ancient languages and also prepared the way for the decipherment of the other cuneiform alphabets. Its importance is only paralleled by the decipherment of the Rosetta stone. Later successful work was accomplished in excavations in Babylonia for the trustees of the British Museum. He returned to England in 1849, disposing of his collections of Oriental antiquities to the British Museum. In 1851 he returned to Bagdad, but after a stay of four years he resigned his consulship, returning definitely to England. In 1858 he was elected member of Parliament for Reigate, but the same year resigned on being appointed member of the Council of India. In 1859 he went to Teheran as Minis-

ter to the Court of Persia. From 1865 to 1868 he again sat in Parliament as member for Frome. In 1871 he was elected president of the Royal Geographical Society. In 1875 his *England and Russia in the East* created a considerable stir, owing to its revelations of the interior workings of Asiatic politics. Rawlinson received the honor of knighthood in 1891 and was a member of the Council of India from 1868 until his death, March 5, 1895. His *Persian Cuneiform Inscriptions at Behistun* (2 vols., 1846), printed in the *Journal* of the Royal Asiatic Society, contained his remarkable decipherment of the famous inscriptions, and his *Cuneiform Inscriptions of Western Asia*, in collaboration with Pinches and others (6 vols., 1861–91), is almost equally important. He contributed largely to Ferrier's *Caravan Journeys* (1856). Many of his discoveries are incorporated in *Herodotus* (1858) by his brother, Canon George Rawlinson (q.v.), who also wrote a *Memoir of Major-General Sir Henry Creswicke Rawlinson, Bt.* (London, 1898).

RAWLINSON, Sir Robert (1810–98). An English civil and sanitary engineer, born at Bristol. He was first employed in work on docks and harbors and then on the London and Birmingham Railway, under Robert Stephenson. After 1840 he worked in Liverpool, where he was assistant surveyor to the corporation and government inspector. In 1855 he was put at the head of the sanitary commission sent by England to the Crimea and did much to lessen the terrible mortality among the soldiers. Rawlinson was knighted in 1883 and in 1894 served as president of the Institution of Civil Engineers. His works include: *Drainage of Towns* (1854); *Lectures on Sanitary Questions* (1876); *Hygiene of Armies in the Field* (1883); *Public Works in Lancashire* (1898).

RAW'MARSH. A town in the West Riding of Yorkshire, England, 2½ miles north of Rotherham, situated on an eminence above the Don. It has collieries, foundries, machine works, and potteries. Pop., 1901, 14,587; 1911, 17,185.



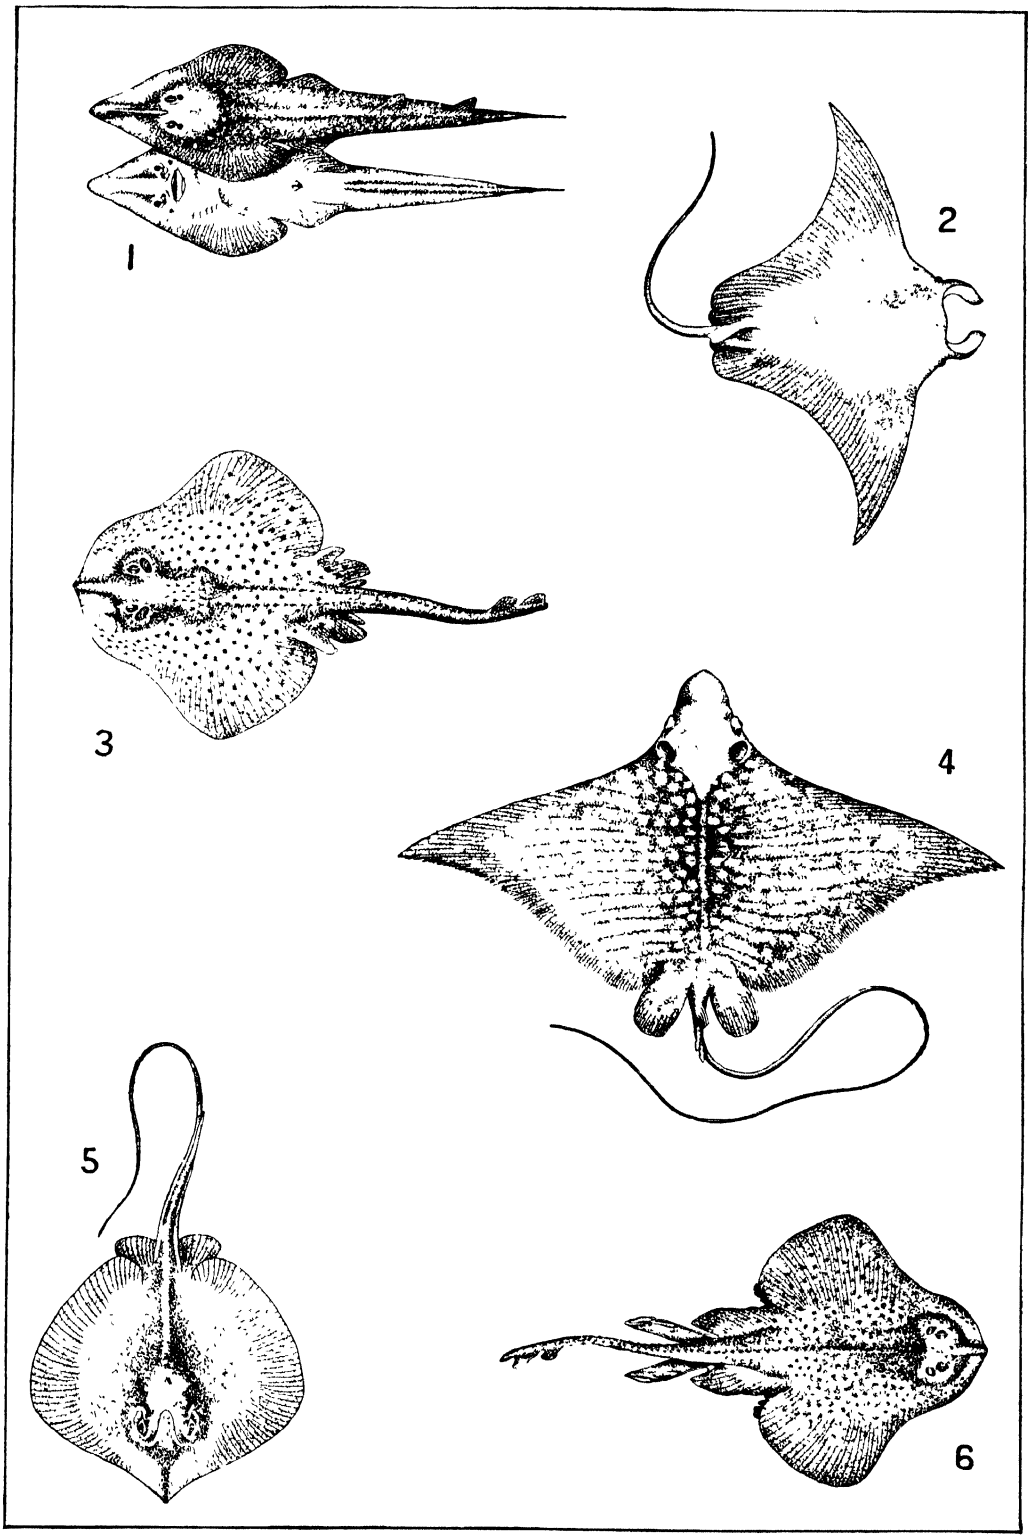
RAWNSLEY, Hardwick Drummond (1850–). An English clergyman and author, born at Shiplake Vicarage, Henley-on-Thames. After graduating from Balliol College, Oxford, he became curate at the mission of Clifton College, Bristol; vicar of Wray, Windermere (1878–83); then vicar of Crosthwaite, Keswick, rural dean, and canon of Carlisle. In 1912 he was appointed honorary chaplain to the King. He wrote: *Life and Nature at the English Lakes* (1899); *Memories of the Tennysons* (1900); *Literary Associations of the English Lakes* (1902; new ed., 1906); *Months at the Lakes* (1906); *Chapters at the English Lakes* (1913). Several volumes of verse, among them *The Sonnet Chronicle* (1906), came from his pen.

RAW'SON, Albert Leighton (1828–1902). An American Orientalist, mystic, and artist, born at Chester, Vt. Becoming much interested in esoteric orders, he was adopted as brother by the Adwan Bedouins of Moab, was initiated by the Druses on Mount Lebanon, and in America became one of the founders of the Order of Nobles of the Mystic Shrine, also a member of the Theosophical Society and the Society of the Rosy Cross. He illustrated several books dealing with the East, among them lives of Christ by Beecher, Deems, and Crosby, and he painted the portraits of Queen Victoria and other notables. He published various translations from Oriental languages; *Vocabulary of the Bedouin Language of Syria and Egypt* (1874); *Dictionary of Arabic, German, and English* (1876); *Vocabulary of Persian and Turkish Languages* (1877); *Historical and Archeological Introduction to the Holy Bible* (1879–82); *etc.*

RAWTENSTALL, rą'ten-stąl. A municipal borough in Lancashire, England, on the Irwell, 18 miles north of Manchester (Map: England, D 3). It is a busy manufacturing centre, with woolen, cotton, and carpet manufactures, collieries, and stone quarries. Pop., 1901, 31,000; 1911, 30,516.

RAXIS DE FLASSAN, Jean-Baptiste Gaétan. See Flassan, J.-B. G. Raxis de.

RAY (OF. *raie, raye*, Fr. *raie*, from Lat. *raja*, ray, roach; connected with AS. *reohhe*, LG. *ruche*, Ger. *Roche*, MDutch *roch*, OF. *roche, rosse*, Fr. *roche*, Eng. *roach*). A general name for the elasmobranch fishes of the order Selachii, characterized by the dorsoventrally flattened body. This order includes the sawfishes, sea devils, sting rays, skates, guitar fishes, and torpedoes (qq.v.). The true rays have a flat body; the pectoral fins are large and fleshy, appearing as lateral expansions of the body and along with it forming a circular disk or a rhomboid to which is attached a rather long and slender tail. The pectoral fins are prolonged till they meet in front of the snout and backward till they join the ventral fins. The eyes and spiracles look upward. The gill openings (five) are on the underside of the body, close behind the mouth; and towards the tail are the stomach, intestines, and other viscera. The males are furnished with



TYPE OF RAY'S EGG

claspers. Most of the species are egg-laying, but the guitar fishes (*Rhinobatidæ*) are peculiar in that their eggs are retained until they hatch within the body. The eggs are large and are inclosed in thin horny cases resembling those of sharks, but more rectangular in form, with projections at each of the four corners by which they catch upon and are held to eelgrass or other supports until they hatch. These eggs are familiarly known in England as skate barrows and in America as mermaids' purses. Rays are found in all seas, especially in the warmer ones, and commonly inhabit sandy or muddy shores, lying on the bottom, where they feed on mollusks and are often cast up on the beach.

The most common rays in the United States are those of the typical family Rajidæ, usually called skates. Those of the family Myliobatidæ are called eagle rays (q.v.). A large section of the order is known as the suborder Masticura, or whip-tailed rays, in allusion to the very long slender tail, which in most species, especially of the family Dasyatidæ, is armed near its base by one or more large, jagged, erectile spines, capable of inflicting a severe and even dangerous wound. This has given to those fishes the name of sting ray. The common sting ray of the Atlantic shore is the clamcracker (*Dasyatis centrura*), which abounds from Maine to Cape Hatteras and sometimes reaches a length of 10 to 12 feet. The color is olive brown above and nearly

RAYS AND SKATES

1 GUITAR-FISH (Rhinobatus lentiginosus); upper and lower surfaces.
2. DEVIL-FISH (Manta birostris).
3. BIG SPOTTED SKATE (Raja ocellata).
4. SPOTTED STING-RAY (Aetobatus narinari).
5. FLORIDA STING-RAY (Dasybatis sabina).
6. COMMON SKATE (Raja erinacea).

white below. Until half grown the young are smooth, but as they approach maturity broad conical bucklers appear on the back and tail and many flattened tubercles. This tendency to grow rough with age characterizes most of these fishes, but is sometimes checked, as in the case of the smooth sting ray or batfish (*Myliobatis californicus*) of the Pacific coast. Sting rays gather upon beds of cultivated oysters or in places where clams abound and destroy great numbers of these valuable mollusks. No trace of any poison glands has been found, but Kingsley says that the mucus of the fish probably possesses poisonous qualities.

Fossil selachians allied to the rays are represented by fragmentary remains from Devonian and Carboniferous rocks and by more perfect and abundant material in the Mesozoic and Tertiary deposits. Exquisitely preserved skeletons of *Rhinobatis* from the Jurassic lithographic stone of Bavaria present few differences from modern species of the same genus. Consult: G. B. Goode, *Fishery Industries*, sec. i (Washington, 1884); J. S. Kingsley, *Standard Natural History* (Boston, 1885); Jordan and Evermann, *American Food and Game Fishes* (New York, 1902). See Plate of RAYS AND SKATES.

RAY, EDWARD (1879–). A British golf champion, born in Jersey. He won the open championship in 1912 at Muirfield and in the following year played in the United States in company with Harry Vardon (q.v.). Both were defeated in the national open championship tournament at Brookline, Mass., by Francis Ouimet, the youthful American amateur champion. Subsequently they played matches in Canada before their return to England. Ray is author of *Inland Golf* (1913)

RAY, ISAAC (1807–81). An American physician, born at Beverly, Mass. He graduated in medicine at Bowdoin College in 1827 and in 1841 was appointed superintendent of the Augusta (Me.) State Insane Asylum. He was superintendent of the Butler Hospital for the Insane at Providence, R. I., from 1845 to 1866, when he removed to Philadelphia. He was the author of *Conversations on the Animal Economy* (1829); *Medical Jurisprudence of Insanity* (1838); *A Treatise on Medical Jurisprudence and Insanity* (1839; 5th ed., 1871); *Education in Relation to the Physical Health of the Brain* (1851); *Insanity of King George III* (1855); *Mental Hygiene* (1863); *Contributions to Mental Pathology* (1873).

RAY, JOHN (1628-1705). An English naturalist. He was educated at Cambridge, where he became a fellow and took orders in the Church of England. He resigned his fellowship in 1662 and for a time lived with his friend Francis Willughby, with whom he afterward traveled extensively in England and on the Continent, studying botany and zoölogy. Ray published the following important works on the classification of plants and animals: *Catalogus Plantarum Angliæ* (1670); *Ornithologia* (1676), with Willughby; *Methodus Plantarum Nova* (1682); *Historia Piscium* (1686), with Willughby; *Historia Plantarum* (1686–1704); *Synopsis Methodica Animalium Quadrupedum, et Serpentini Generis Vulgarium* (1693); *Historia Insectorum* (posthumous, 1710). Ray's position in science is an important one in that he was the first to attempt a classification of animals and plants which should express their natural relationships, and he first introduced a workable definition of the term "species." His work furnished the basis upon which Linnæus and Cuvier constructed the modern systems of classification. The Ray Society of London perpetuates his worthy fame. Consult Edwin Lankester (comp.), *Memorials of Ray* (London, 1846).

RAYET, rȧ'yȧ', OLIVER (1847–87). A French classical archæologist, born in Cairou (Lot) and educated at the Normal College and in the French School at Athens (1869), whither he returned after the Franco-Prussian War. Soon afterward (1872–73) the Rothschilds sent him with Albert Thomas to carry on excavations in Miletus (q.v.). In 1884 he became professor of archæology at the Bibliothèque Nationale. The *Monuments de l'art antique* (1884 et seq.) was begun under his editorial charge. His other works appeared mostly in periodicals, but in 1888 were published a *Histoire de la céramique grecque*, edited by Max Collignon, and a series of essays, *Etudes d'archéologie et d'art*. Consult J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

RAYLEIGH, rā'lī, JOHN WILLIAM STRUTT, third BARON (1842–). A British physicist. He was born Nov. 12, 1842, and was educated at Trinity College, Cambridge, graduating in 1865 as senior wrangler in the mathematical tripos and being elected a fellow of his college the next year. He succeeded to the family title in 1873. Lord Rayleigh served as professor of experimental physics in the University of Cambridge during 1879–84 and as professor of natural philosophy in the Royal Institution, London, from 1887 to 1905. He became a fellow of the Royal Society in 1873, vice president of the British Association (section A) in 1882, foreign associate of the National Academy of Sciences (United States), correspondent of the Institute of France, and Officer of the Legion of Honor. In 1896 he was appointed scientific adviser to Trinity House, the British Lighthouse Board. In 1894 he discovered, in conjunction with Sir William Ramsay (q.v.), a new element present in the atmosphere, which he afterward prepared in quantity and named argon. (See ARGON and consult the treatise by Rayleigh and Ramsay, Washington, 1896.) For this discovery he received the Barnard medal from Columbia University. His experimental work was in the field of electrical standards and in physical optics, but he carried on important researches in nearly every branch of physics and especially in acoustics. His work was characterized by extreme care and accuracy and the use of the most simple apparatus, often home-made. In 1904 he was awarded the Nobel prize for physics, from 1905 to 1908 he held the presidency of the Royal Society, in 1905 he became a member of the Privy Council, and in 1908 was chosen chancellor of Cambridge University. When the Order of Merit was instituted in 1902, he was admitted as one of the original civil members. He wrote, besides many valuable papers for the *Philosophical Magazine* and the *Philosophical Transactions*, *The Theory of Sound* (2 vols., 1877–78 and 1894–96), and edited J. Clerk-Maxwell's *Heat*. His collected papers were published in five volumes (London, 1899–1912).

RAYMOND VI. Count of Toulouse. See TOULOUSE, COUNTY OF.

RAY'MOND, ANDREW VAN VRANKEN (1854–). An American Presbyterian clergyman and educator, born at Vischer Ferry, N. Y. He graduated at Union College in 1875 and at

the New Brunswick Theological Seminary in 1878. He served as pastor of Reformed churches at Paterson in 1878–81 and at Plainfield in 1881–87, and of the Fourth Presbyterian Church at Albany in 1887–94. He was president of Union College from 1894 to 1907 and then returned to the ministry, when called to the First Presbyterian Church of Buffalo. He published a history of *Union University* (3 vols., 1907).

RAYMOND, BRADFORD PAUL (1846–1916). An American educator, born near Stamford, Conn. He served through the last year of the Civil War and in 1866 entered Hamline University, Red Wing, Minn. On its suspension in 1869, for lack of funds, Raymond hired the college buildings and conducted the institution to the close of the year. Graduating in 1870 from Lawrence University (Appleton, Wis.), he afterward studied theology at Boston University and philosophy at Leipzig and at Gottingen. Between 1874 and 1883 he was pastor of Methodist churches at New Bedford, Mass., Providence, R. I., and Nashua, N. H., and afterward was president of Lawrence University (1883–89), president of Wesleyan University (1889–1908), and, at the latter institution, professor of ethics and biblical literature (after 1909).

RAYMOND, RÄ'MÔN', FULGENCE (1844–1910). A French neurologist, born at Saint-Christophe (Indre-et-Loire). He studied at the Ecole Vétérinaire at Alfort, where he became instructor of anatomy and physiology in 1866. Subsequently, after graduating in medicine at Paris in 1875, he settled in the French capital and became hospital physician (1878), agrégé (1880), and professor of neurology at the Saltpêtrière (1894), succeeding Charcot. In 1899 he was elected a member of the Academy of Medicine. Raymond, the leading French neurologist of his time, made valuable contributions in his special field. His writings deal mostly with nervous and mental pathology, tabes dorsalis, poliomyelitis, and progressive muscular atrophy in syphilis. Among his works are: *Etude anatomique, physiologique, et clinique sur l'hémianasthésie* (1876); *Maladies du système nerveux* (1888–94); *Leçons sur les maladies du système nerveux* (1896 et seq.), published yearly and giving a splendid review of the progress of neurology, especially of the author's own school; *La psychasthénic* (1907); *Neurasthénie* (1907).

RAY'MOND, HENRY JARVIS (1820–69). An American journalist and politician, born at Lima, Livingston Co., N. Y. He graduated at the University of Vermont in 1840 and removed to New York City, where he studied law and contributed to the *New Yorker*, edited by Horace Greeley. When in 1841 Greeley founded the *Tribune*, Raymond became associated with him as assistant editor. In 1848 he left the *Tribune* and took an editorial position on the *Courier and Enquirer*, becoming at the same time associated with the publishing house of Harpers as a literary adviser. In 1851 he founded the New York *Times*, the first number of which appeared on September 18 of that year. He was a strong antislavery Whig, and, after serving in the State Assembly, in 1854 he was elected Lieutenant Governor of the State. In 1856 he became one of the most active and influential leaders of the new Republican party in New York, was a member of its first national convention, and drafted the famous *Address to the People*. In 1861 he was again elected to the State Assembly and chosen Speaker. In 1864 he was elected to Congress. After Lincoln's death he took the position that the Southern States had never actually been out of the Union and gave his partial support to Johnson's plan of reconstruction. In 1866 he left the Republican party, was one of the promoters of the National Union Convention at Philadelphia, and wrote the *Address and Declaration of Principles* adopted by it. As a newspaper editor he ranks as one of the great figures of American journalism. Raymond was the author of *A Life of Daniel Webster* (1853); *Political Lessons of the Revolution* (1854); *Letters to Mr. Yancey* (1860); *A History of the Administration of President Lincoln* (1864), enlarged and republished in 1865 as *The Life and Public Services of Abraham Lincoln*. Consult Augustus Maverick, *Henry J. Raymond and the New York Press for Thirty Years* (Hartford, 1870).

RAYMOND, JOHN HOWARD (1814–78). An American educator, born in New York City. He studied at Columbia College, but graduated at Union College in 1832, studied law at New Haven, and in 1834 entered the theological seminary at Hamilton, N. Y. In 1839 he became professor of rhetoric and belles-lettres at Madison (succeeded by Colgate) University, and in 1850 professor of belles-lettres at the University of Rochester. He organized the Brooklyn Collegiate and Polytechnic Institute in 1856 and from 1865 until his death was president of Vassar College and professor of mental and moral philosophy there. Consult H. R. Lloyd, *The Life and Letters of John H. Raymond* (New York, 1880).

RAYMOND, JOHN T. (1836–87). An American comedian, whose real name was O'Brien. He was born in Buffalo, N. Y. In 1858 he made his early success with Sothern in *Our American Cousin*, in which he afterward appeared in London and in Paris. His greatest popular hit, however, was as Col. Mulberry Sellers in a dramatization of Mark Twain's *Gilded Age* (1873), a character that became completely identified with his own breezy optimism. Consult Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (New York, 1886), and McKay and Wingate, *Famous American Actors of To-Day* (ib., 1896).

RAYMOND, MINER (1811–97). An American Methodist Episcopal clergyman, educator, and theologian, born in Rensselaerville, N. Y. He was educated at the Wesleyan Academy (Wilbraham, Mass.), where he was in charge of the English department (1834–38) and president (1847–64). In 1838 he entered the ministry, joining the New England conference of his denomination, and later the Rock River conference. For many years after 1864 he served as professor of systematic theology in Garrett Biblical Institute. Dr. Raymond was a member of several General Conferences. He was the author of *Systematic Theology* (3 vols., 1877), which was translated into Japanese.

RAYMOND, ROSSITER WORTHINGTON (1840–). An American mining engineer and metallurgist, born in Cincinnati, Ohio. He graduated at the Brooklyn Polytechnic Institute in 1858. After three years at Heidelberg, Munich, and Freiberg he entered the Federal army as additional aid-de-camp with the rank of captain. In 1864 he began practice in New York as a consulting engineer and in 1868–76 was United States Commissioner of Mining Statistics. After 1867 he was connected with leading American mining journals. From 1870 until 1882 he was

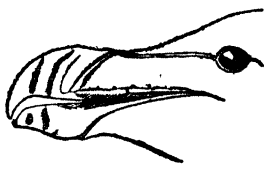
also lecturer in Lafayette College on economic geology. An original member of the American Institute of Mining Engineers Raymond was president of the Institute (1872–74), secretary (1884–1911), and thereafter secretary emeritus. He also became a member of many foreign engineering societies and in 1911 was awarded the Japanese Imperial Order of the Rising Sun (fourth class). Throughout his active life he was identified closely with all that pertained to his profession. He published annual reports of mining statistics (1868–75), *Peter Cooper* (1901), and a number of stories.

RAYMOND OF PEÑAFORTE, pī'nyȧ-fôr'tȧ (SAN RAIMUNDO DE PEÑAFORT) (c.1175–1275). A Spanish theologian, born at the castle of Peñafort in Catalonia and educated at Barcelona and Bologna, where he obtained the degree of J.U.D. On his return to Spain he became canon of Barcelona (1219), then archdeacon, and in 1222 a member of the Dominican Order, of which he was made general in 1238. In 1230 he was appointed by Gregory IX to codify the canon law. His *Decretalia* form the fifth volume of the present canon law, and his *Summa de Pœnitentia* (printed in 1603) make a compendium of ecclesiastical jurisprudence. Raymond became Archbishop of Tarragona in 1235 and was prominent in the work of the Inquisition in France and Aragon, and in preaching crusades against the Moors. He was canonized in 1601, and January 23 was made his day. Consult Danzas, *Raymond de Pennafort* (Poitiers, 1885).

RAYMOND OF SABUNDE, sȧ-bo͝on'dȧ (?–1437). A Spanish theologian. He was born in Barcelona, taught theology, philosophy, and medicine at Toulouse (1430–32), and died as rector of the university there. His fame rests upon his natural theology, which he wrote in Spanish, but which appeared in a Latin translation after his death and has been widely circulated (latest ed., Sulzbach, 1852). Montaigne translated it into French (Paris, 1569; latest ed., 1605). This famous book employs the expression now so familiar, that there are two books by which the truth can be known, the book of Nature and the book of Revelation. The difference is that in the latter truth is given dogmatically in the shape of precept, whereas in the former truth is arrived at by means of investigation and ratiocination. He was a mystic of the school of Raymond Lully (q.v.). Consult: Matzke, *Die naturliche Theologie des Raymundus von Sabunde* (Breslau, 1846); Huttler, *Die Religionsphilosophie des Raymundus von Sabunde* (Augsburg, 1851); Kleiber, *De Raymondi Vita et Scriptis* (Berlin, 1856); D. Beulet, *Un inconnu célèbre: recherches historiques et critiques sur Raymond de Sabunde* (Paris, 1875).

RAYNAL, rȧ'nȧl', GUILLAUME THOMAS FRANÇOIS (1713–96). A French author. He was born at Saint-Geniez and was educated for the priesthood with the Jesuits of Pézénas. In 1747 he went to Paris and was attached to the church of Saint-Sulpice. His peculiarities soon led him out of the Church, and he became one of the editors of the *Mercure de France*, where his philosophic mind found associates and scope and his taste for history made him an historian. His works, though not now of high value, were conspicuous in their time, when philosophy and literary independence were novelties. Among them was *Histoire philosophique et politique des établissements et du commerce des Européens dans les deux Indes* (1770), which contained writings of Diderot as well as Raynal and fell under the condemnation of the Parliament in 1781. His *Révolution d'Amérique* appeared in an English translation in London (1781), and was severely criticized by Thomas Paine. Consult his *Life* by B. Luneb (Rodez, 1856).

RAY'NER, ISIDOR (1850–1912). An American lawyer and statesman, of Jewish extraction. He was born in Baltimore and was educated at the universities of Maryland and Virginia. He was admitted to the bar in 1871 and began to practice in Baltimore. A Democrat, he served in the Maryland House of Representatives in 1878–80 and in the Senate in 1886–87. While a member of Congress (1887–89, 1891–95) he became known for his eloquent advocacy of the repeal of the silver-purchase clause of the Sherman Act. From 1899 to 1903 he was Attorney-General of Maryland. As counsel for Admiral Schley before the naval board of inquiry, he astonished the country by his eloquence and knowledge of admiralty law and naval technology. Rayner served as United States Senator from 1904 till his death. In the Senate he early became a Democratic leader and one of the severest critics of President Roosevelt. As a student of constitutional law he opposed what he considered the presidential usurpation of power and upheld the traditional division of control among the three departments of government. He was also one of the foremost critics of the Railroad Rate Bill. In 1912 he made a notable reply to Roosevelt's "Charter of Democracy" speech.



RAYNEVAL, JOSEPH MATHIAS GÉRARD DE. See GÉRARD DE RAYNEVAL, J. M.

RAYNOUARD, rȧ'no͝o'ȧr', FRANÇOIS JUSTE MARIE (1761–1836). A French philologist and poet, born at Brignoles. He studied at Aix, became advocate, entered politics as a Girondin deputy (1791), was imprisoned during the Terror, and, achieving reputation as a dramatist and poet, was elected to the Academy (1807), of which he became perpetual secretary in 1817. After the fall of the Empire he distinguished himself by linguistic researches, especially in Provençal. His theories, though often false, stimulated the progress of Romance philology. (See ROMANCE LANGUAGES.) Noteworthy are his poem *Socrate dans le temple d'Aglaure* (1803), the tragedy *Les templiers* (1805), his anthology of troubadour poetry (1816–21), and a troubadour lexicon *Lexique roman* (1838–44). His linguistic theories are embodied in the *Recherches sur l'ancienneté de la langue romane* (1816) and the *Grammaire comparée* (1821).

RAZIN, rä'zĕn, STENKA (?–1671). A Russian Don Cossack, instigator of several rebellions in the seventeenth century. First mentioned in 1665, he was elected leader of the rebellious Cossacks in 1667. After plundering the caravans and fisheries along the Volga and meeting defeat in Persia (1668), he attacked Russia. Pardoned once by Alexis, he rebelled again. Joined by dissatisfied elements, Razin was at first successful, captured many cities, and ruled along the Volga as far as Nizhni Novgorod. Then he was several times defeated, and in 1671 was executed at Moscow. He was a hero of the popular *byliny*, and Kostomarov made him the subject of a special historical monograph (St. Petersburg, 1859).

RA'ZORBACK'. A whale, the finback (q.v.). Also a name in the United States for a semi-wild hog, common in the Southern States.

RA'ZORBILL', or RAZOR-BILLED AUK. An auk (*Alca torda*), very common on the coasts of the North Atlantic, frequenting lofty precipices, from which its eggs are taken, with those of guillemots, by persons who are let down by ropes. The eggs are esteemed a delicacy and the flesh of the bird itself is much used for food. The razorbill is about 17 inches long and takes its name from its sharp-edged, puffin-like beak. The anterior parts, back, wings, and tail, are black, the breast and belly white. It is a very fierce bird, and, if seized, will lay hold of the hand in return. The egg is about 3 inches long, bluish white or buffy, heavily spotted with brown. Great numbers of razorbills are annually killed for the sake of their feathers, particularly on the coast of Labrador, where they are extremely abundant. See AUK.

BILL OF RAZORBILL.

RAZOR CLAM. An edible bivalved mollusk of the family Solenidæ, whose elongated shell, gaping at each end, suggests the handle of a razor. (See Colored Plate of CLAMS.) The species are numerous and inhabit the sands of all shores except in the coldest parts of the world. The common species of the eastern coast of the United States is *Ensatella americana*, which is an inhabitant of sand flats and bars where the water is pure. They live in holes which run down vertically 2 or 3 feet and into which they retreat when alarmed. It is useless to attempt to dig them out, as they burrow so rapidly that they are soon beyond the reach of the spade. This species is 5 or 6 inches long, about 1 inch broad, and handsomely colored.

RAZORS. See CUTLERY.

RÊ, rā (less correctly RA). The name by which the sun god was most generally known in ancient Egypt. According to the Egyptian myths Rê appeared upon the surface of the primeval ocean and, overcoming the powers of darkness, brought order out of chaos and assumed the government of the world. He reigned for a long period, but finally grew old, the gods became unruly, and the great goddess Isis, who was profoundly versed in magical lore, took advantage of his failing strength to wrest from him by a stratagem his secret name, the source of his power. Even men rebelled against him, and in his anger he sent down the goddess Hathor to destroy them, but he relented at the sight of the terrible slaughter and turned the goddess from her purpose. Wearied at length with the struggle, Rê gave up the government of the world and retired to rest in heaven upon the back of the celestial cow. With the spread of the solar religion throughout Egypt, Rê was identified with a number of local deities who were regarded as special manifestations or phases of the same god. Horus of Edfu, e.g., was the morning sun rising upon the horizon or the sun of spring coming forth in renewed activity after the gloom of winter. Tum or Atum of Heliopolis, the great centre of solar worship, was the sun setting in the west, and Osiris represented the same phase. The identification was gradually extended to divinities like Ammon of Thebes and Min of Koptos, who originally possessed no solar character whatever, and in course of time nearly every divinity in the Egyptian pantheon came to be identified with Rê. Amenophis IV, of the eighteenth dynasty, carrying this theological tendency to its logical conclusion, endeavored to establish a species of monotheism based upon the worship of Rê, under the new name of Aten or the solar disk, as the universal source of life, but the reformed religion died with its founder. Rê is usually represented as a hawk-headed man holding in one hand the symbol of life and in the other the royal sceptre. Upon his head is the solar disk in the coil of the uræus serpent. In the Book of the Dead (q.v.) the god is conceived as sailing through the heavens during the day in his bark, giving light to the world, and as continuing his voyage at night through the lower world, to rise again the following day. As he advances his brilliant rays overwhelm the fiends who would impede his progress. The Egyptian Pharaohs were believed to be direct descendants of the god, and from the time of the fifth dynasty the title Son of Rê formed an essential part of the royal titulary. Consult E. A. T. Wallis Budge, *The Gods of the Egyptians* (London, 1904), and Adolf Erman, *Die agyptische Religion* (Berlin, 1905). See also EGYPT, *Ancient Egypt*, Ancient Religion.

RÉ, rā, ILE DE. A small island on the coast of the Department of Charente-Inférieure, France, opposite the city of La Rochelle, from which it is separated by the Pertuis Breton (Map: France, N., D 6). It is about 16 miles long and 3 miles broad and consists mainly of sand dunes, with cliffs on the southeast coast, where there are several forts. Saint-Martin (pop., 1911, 2265), the capital of Ré, is a well-fortified little town, with a good harbor and trade. The chief occupations of the inhabitants are fishery, oyster farming, viticulture, and the manufacture of salt. In 1627, while the Huguenot stronghold of La Rochelle was besieged by the forces of Louis XIII, the English, under the Duke of Buckingham, made a powerful but unsuccessful expedition against the island.

REA, rā, SAMUEL (1855–). An American engineering expert and railroad president, born at Hollidaysburg, Pa. At 15 he entered the engineering department of the Pennsylvania Railroad. Later he also managed the construction of the Baltimore and Ohio Railroad tunnels under the city of Baltimore. After being connected with several roads he returned to the Pennsylvania, from 1892 to 1897 serving as special assistant to the president and then till 1899 as his first assistant. Between 1899 and 1909 he rose from fourth to first vice president, and in 1913 he was made president of the entire system and affiliated lines. Rea had general charge of the construction of the Pennsylvania station and approaches in New York, including tunnels under the Hudson and East rivers, an engineering accomplishment of very high order. In recognition of the completion of this undertaking the University of Pennsylvania gave Rea the degree of Sc.D. in 1910. In 1914, before the Interstate Commerce Commission, he advocated the increase of freight rates. He published *The Railways Terminating in London* (1888).

REACTION. In psychology, a term used to denote response to sensory stimuli. In experimentation this response takes the form of

physical action, and as the stimulus applied is also physical, the time between the giving of the stimulus and the response may be readily measured by means of electrical appliances and delicately adjusted clocks. This time is called the reaction time and includes physical and physiological factors in the process measured. The physiological factor is made up of an afferent (sense organ to brain), a central (brain), and an efferent (brain to reacting muscle) process. Reaction time varies both with individuals and with practice and since the physical and the afferent and efferent physiological processes may be assumed or shown to be fairly constant, it affords a fair test of variation in the times of the central factor and its concomitant mental processes.

Simple reaction time may be determined in many ways. Let us suppose that a clock, recording to the thousandth of a second, is connected electrically with a hammer and an electric key. The connections are so arranged that the hands of the clock begin to move when the hammer falls upon its block. The sound thus made serves as stimulus to the reactor, who presses the button of the key as soon as he has heard it; the pressing of the button stops the clock hands, and the time of reaction (the time elapsing between the giving of the simple stimulus and the execution of the simple movement made in response to it) is thus registered in thousandths of a second. Very many observations have been made with auditory, visual, and tactual stimuli, so that the norms of reaction are now well established.

The simple reaction time varies largely with direction of the attention. The reactor may seek to distribute his attention, to attend both to the coming stimulus and to the movement of reaction; or he may attend predominantly (almost exclusively) to the sensory stimulus; or again to the movement. So we have three norms of reaction time—the central or natural time, the sensorial or complete time, and the muscular or abbreviated time. The natural time of an untrained subject will differ, according as he is disposed by mental constitution to attend mainly to his own movement or to the stimulus presented to him; but it will, in every case, lie somewhere between the two extreme times. The norms for these extremes (in thousandths of a second), as determined with practiced subjects, are:

SENSE ORGAN	Sensorial	Muscular
Sight	270	180
Sound	230	120
Touch	210	110

These times differ with differences of sense organ appealed to; and the average difference between the two times for the same sense department is one-tenth second.

The simple reaction experiment under its qualitative aspect presents the exact type of a voluntary action; it is an impulsive action reduced, by laboratory devices, to its lowest terms; it differs from the impulsive actions of real life only by greater simplicity of motive (stimulus) and greater simplicity of responsive movement. We may therefore make it the basis of an introspective examination of action at large; in which case the time values have merely a regulative importance, as an external check or control upon the validity of introspection.

We note that the course of the simple reaction may be qualitatively changed in various ways. The subject may be required to react to stimuli of different quality (e.g., tones, colors); to stimuli of different intensity (e.g., weak and strong pressures); to stimuli of varying intensity or quality (e.g., irregular alternation of loud and weak noises); under distraction; and without preadjustment of attention, i.e., without any signal that the experiment is about to begin. Further, the complex types of action may be studied. (See ACTION.) The subject may react to one of two or more known stimuli; he is told, perhaps, that either black or white will be shown and that he is not to move until he has made sure of the nature of the impression (discriminative reaction). Or he may be left in the dark, save in a general way, as to the nature of the stimulus: he is to react to a visual impression and not to move until he has made sure of it, but the impression may be a black, white, gray, or a color (cognitive reaction). Again, he may be told that either black or white is to be shown and that he is to respond to black by a right-hand and to white by a left-hand movement. Here we have the conflict of impulses characteristic of selective action (choice reaction).

We further note, first, that an association may be interpolated into the course of the reaction. The reactor is shown a color; he is not to move until he has associated some idea to the color. The time of the association reaction minus the time of the simple reaction to the same stimulus gives us a rough measure of the duration of association. It averages three-quarters of a second. Secondly, we find that the cognition of intensities takes a longer time than that of qualities. Thirdly, the reaction time to tonal fusions lasts longer the higher the fusion degree; we cognize a minor third more quickly than we cognize a major third. Finally, the reaction method enables us to trace the course of habituation, fatigue (q.v.), expectation, and practice (q.v.). See PSYCHOLOGICAL APPARATUS.

It has been proposed to use the association reaction, diagnostically, for the detection of repressed ideational complexes, both when the repression is voluntary, as it is in the criminal who attempts to conceal his knowledge of a crime, and when it is involuntary, as it is in the case of an hysterical person. (See HYSTERIA.) Reactions are taken to a list of words, some of which are related to the topic suspected of being repressed or concealed. In a case of concealment one should find either that the character of the replies to the significant words indicates by logical connection the concealed ideas or, if the replies are entirely noncommittal, that the reaction times for the significant words are longer.

Jung, *Lectures and Addresses at the Twentieth Anniversary of Clark University* (Worcester, 1910).

REACTION, CHEMICAL. A term applied to the transformations of substances into other substances having more or less different properties. (See CHEMISTRY.) It is noteworthy that the mutual transformations of the allotropic modifications of one and the same element must be considered as chemical reactions. Thus, the transformation of yellow phosphorus into red phosphorus is a chemical reaction. In essence the two substances are identical, but they nevertheless differ in their chemical behavior, and under the same physical conditions they possess different physical properties; so they must be considered as two distinct chemical individuals and their transformation into each other must be considered as a chemical reaction.

The general laws according to which chemical reactions take place include the law of the conservation of matter, the law of the conservation of the elements, the law of definite combining masses, the law of combining volumes, the law of mass action, and, of course, the law of the conservation of energy. The conservation of energy plays an important part in thermochemistry and electrochemistry (qq.v.). The other laws, with the exception of that of mass action, have been considered in the general article CHEMISTRY (q.v.). In the present article it remains to discuss briefly the action of masses.

At first consideration the concept of mass action appears to contradict the law of definite proportions. According to the latter, while substances may be mixed in any proportion whatever, chemical combination takes place only between definite relative quantities. Thus, oxygen combines directly with hydrogen only in the proportion of eight parts (by weight) of the former to one of the latter, whether a given mixture in which the reaction is caused to take place contains the two gases in this or in any other proportion. What, then, can the masses of the reacting substances have to do with the course of the reaction? A simple example may serve to illustrate the point in question. Ordinary alcohol and acetic acid combine in the proportion of 46 parts of the former to 60 parts of the latter. If 46 grams of the alcohol should be left in contact with 60 grams of the acid for a sufficiently long time, 30.7 grams of the alcohol would combine with 40 grams of the acid (30.7 : 40 = 46 : 60), yielding 58.7 grams of ethyl acetic ester and 12 grams of water. The rest of the alcohol (15.3 grams) and of the acid (20 grams) would remain uncombined, side by side with the ethyl acetic ester and water, no matter how long the mixture was kept (in one experiment the mixture was actually kept for 17 years). Now, if instead of 46 grams a larger quantity of alcohol were left in contact with 60 grams of acetic acid, more of the latter would ultimately be found to have entered into combination, and consequently less than 20 grams of it would ultimately remain free. But the proportion of alcohol and acid combined would still be 46 parts of the former to 60 parts of the latter. This example illustrates the following principles: (1) whatever the proportion of the reacting substances present, chemical combination takes place between the same relative quantities; (2) whatever the proportion of the reacting substances present, the possible maximum of each may not enter into combination, a fraction of the several substances present refusing to combine at all as long as they remain in contact with the products of the reaction; (3) the amounts of the substances present determine the fraction that will enter into combination and the fraction that will remain free. The first of these principles is nothing else than the law of definite proportions. On the other hand, the doctrine of mass action has reference to the second and third of these principles, dealing, not with the relative combining quantities, but with the extent to which combination takes place.

A fact of the greatest importance for the theory of chemical transformations is that the course of many reactions can be reversed. For instance, we just said that ordinary alcohol and acetic acid partly combine to form ethyl acetic ester and water. But ethyl acetic ester and water, if allowed to remain mixed for a sufficient length of time, will react and produce free acetic acid and alcohol. In this transformation again the ester and water would partly react (in accordance with the law of definite proportions) and partly remain unchanged. Quantitative experiment would reveal the following facts: (1) if we should mix 88 grams of the ester with 18 grams of water (88 and 18 are, respectively, the reacting weights of the two substances), then 20⅓ grams of the former and 6 grams of the latter would react to form 20 grams of free acetic acid and 15⅓ grams of alcohol, while the remaining 58⅔ grams of the ester and 12 grams of water would refuse to enter into reaction; (2) if, after all change has ceased in our mixture, we should add to it a further quantity of either ester or water, then a further (but not complete) decomposition of ester into alcohol and acid would take place; (3) if, on the contrary, after all change has ceased in our mixture, we should add to it, not ester or water, but either free acetic acid or alcohol, a further change would take place, resulting in the formation of more ester and water. It would thus become clear that in a mixture of reacting substances with the products of their reaction, when the mixture is in a state of chemical equilibrium, we may cause a reaction to take place either in one direction or in the opposite direction by changing the relative masses of the ingredients. In other words, the masses of substances may determine the course of a chemical reaction. The importance of this statement in chemical theory will be so much the more obvious if we consider that there is good reason for assuming that all reactions are reversible. Says Nernst: "It has been formerly often maintained that 'reversible reactions' are exceptional, or that two different classes of reactions must be distinguished, reversible and nonreversible. But no such definite

line of demarcation exists by any means, and there is no doubt that under appropriate experimental conditions it will be possible to cause any reaction whatever to take place now in one, now in the opposite direction; that is to say, *in principle every reaction is reversible.*"

The old notion of chemical affinity as the sole cause of reactions must be either discarded or essentially modified. The course of reactions and the final equilibrium to which that course leads are certainly influenced by the chemical affinities (whatever may be their ultimate nature); but those affinities are not alone in determining the chemical phenomena which they influence. In studying reversible reactions it is found that the action of masses comes in as a factor in all cases, without an exception. But it is also found that if chemically equivalent masses are started with in all cases, the fractions of those masses actually entering into reaction and the fractions remaining unchanged vary from case to case. In other words, as just stated, the equilibrium finally attained depends both on the nature of the reacting substances and on the masses present to start with.

Still another factor takes part in influencing the course and end of reactions, viz., the temperature. Or, more exactly, the specific affinity factor at work in each case varies with the temperature. But this variation will be considered under THERMOCHEMISTRY, and may be left out of account in the present discussion, in which all reactions are assumed to take place at constant temperature.

We have seen above that the total fraction found transformed when a reaction is over depends, among other things, on the masses present at its beginning. Similarly it may be demonstrated by facts that the fraction transformed in a given interval of time during the reaction depends on the masses present at the beginning of that interval. And since the reaction itself obviously changes the masses present, part of the original substances gradually disappearing as such and masses of the products of the reaction gradually appearing in their stead, it is evident that the magnitude of the fraction transformed in unit of time varies from instant to instant. Were this not so, the velocity of a chemical reaction might be defined in terms of the amounts found transformed in any finite interval of time. But since, as just explained, the velocity is variable, it can be defined only in terms of the infinitely small amounts transformed in infinitely short intervals of time. (If this does not seem clear, see the article CALCULUS.) It may, however, be asked: But why consider at all the velocity of reactions? The answer is, Because it is the velocity that is immediately determined by affinity and mass action; and so, conversely, it is by measuring the velocity that affinity and mass action can be studied quantitatively. In the case of a reversible reaction the direction of the change is the direction in which the velocity of reaction is the greater; the amount actually found transformed in any time depends on the difference between the velocities with which the two opposite reactions take place; and when the two velocities are equal there is equilibrium. Thus the velocities of a reaction described its course completely.

An even more important reason for studying the velocities of chemical reactions is as follows. Every ordinary chemical equation indicates that a certain number of molecules of a first substance react with a certain other number of molecules of a second substance to produce so many molecules of the reaction products. But the numbers thus involved are merely the smallest integral numbers that can be taken; the equation expresses the working, in the given case, of the law of conservation of mass (see CHEMISTRY), but it tells us nothing as to the actual mechanism of the reaction, nothing as to the numbers of molecules actually taking part in the reaction. Such information, as Van't Hoff has shown, can be obtained only by a study of the velocity of the reaction. In other words, a chemical reaction is only very superficially understood until the velocities involved become known.

The velocities of all reactions increase rapidly with rising temperature. They are also affected by the presence of certain substances that do not figure in the chemical equation at all. See CATALYSIS.

The development of the principles discussed in the preceding paragraphs forms the object of chemical kinetics and statics, the two subdivisions of the modern science of chemical dynamics. Chemical kinetics deals with chemical change; chemical statics with chemical equilibrium. At the basis of both is the law of mass action in its precise mathematical form, which may now be considered as established beyond the slightest possibility of doubt. For it has been demonstrated in three different ways: (1) by mathematical deduction from the kinetic theory of gases; (2) in its static form, by mathematical deduction from the laws of thermodynamics; and (3) by extensive experimental observation.

Correctly, but vaguely, the action of masses was first understood by the Frenchman Berthollet in the beginning of the nineteenth century. In 1867 Guldberg and Waage, two Norwegian investigators, published a work (*Etudes sur les affinatés chimiques*) in which the principles of chemical statics and kinetics were first stated and demonstrated in their rigidly mathematical form. Van't Hoff discovered the law of mass action independently in 1877; and from this date may be said to commence a new epoch in theoretical chemistry. The principal names connected with the demonstration and the mathematical and experimental development of the law are, besides those of Guldberg and Waage, the names of Van't Hoff, Horstmann, Willard, Gibbs, Arrhenius, and Ostwald.

For further information, consult the works on theoretical and physical chemistry recommended in the article CHEMISTRY. See also ACIDS; CATALYSIS; DECOMPOSITION; DISSOCIATION; ELECTROCHEMISTRY; ESTERS; SOLUTION; THERMOCHEMISTRY.

REACTION TIME. See IRRITABILITY; PSYCHOLOGICAL APPARATUS; REACTION.

READ, CHARLES (1819–98). A French scholar, born in Paris, where he studied law. He was a magistrate and then an official in the department of religious education (1852–58) and in that of historical documents (1865–70). In 1852 he founded the French Protestant Historical Society. His own labors preliminary to a history of the Reformation in France, which he did not complete, were mostly editorial, and include editions of Chamier's journal (1859), of Agrippa d'Aubigné's *Tragiques*

(1872) and his *Enfer* (1873) and *Printemps* (1874), and of Hotman's *Tigre* (1875).

READ, GEORGE (1733–98). An American patriot, one of the signers of the Declaration of Independence. He was born in Cecil Co., Md., received an academic education at Chester, Pa., studied law, and in 1752 was admitted to the bar in Philadelphia. Two years later he established himself in practice in Newcastle, Del. From 1763 to 1774 he was Attorney-General for the crown for the counties of Kent, Delaware, and Sussex. In 1774 he was elected to the first Continental Congress. He was conservative and at first stoutly opposed the idea of independence, but finally became convinced that independence was the only course and affixed his signature both to the petition to King George and to the Declaration. Thenceforward he was enthusiastic in his support of the Colonial cause, and as chairman of the first Naval Committee (1775–77) was largely instrumental in the establishment of the first American navy. In 1776 he framed the new constitution of Delaware, presided over the convention which adopted it, and became Vice President and acting President (Governor) of the new State. He codified the Delaware laws, and in 1782 became a judge of the United States Court of Appeals for Admiralty Cases. He was a delegate to the Annapolis Convention of 1786, and in 1787 to the convention in Philadelphia which framed the Constitution of the United States. He was elected United States Senator in 1789 and again in 1791, but resigned in 1793 to take the position of Chief Justice of Delaware, which he continued to hold until his death. Consult W. T. Read, *Life and Correspondence of George Read* (Philadelphia, 1870).

READ, SIR (CHARLES) HERCULES (1857–). An English archæologist. He was privately educated. In 1880 he became assistant in the British Museum and in 1896 keeper of British and mediæval antiquities there. He wrote important contributions for *Archæologia*, edited *Notes and Queries on Anthropology* (1892), and published *Antiquities from Benin* (1899), *Catalogues of the Waddesdon Bequest* (1899, 1902), and catalogues and guides of various collections in the British Museum.

READ, JOHN MEREDITH, JR. (1837–96). An American diplomat and writer. He was born in Philadelphia, graduated at Brown University in 1858 and at the Albany Law School in 1859, and was admitted to the bar. From 1860 to 1866 he was Adjutant-General of New York State and was an active political organizer. In 1869 he was appointed the first United States Consul General to France and Algeria and in 1873 became Minister to Greece. His skill and energy, especially during the critical period following Russia's defeat of Turkey in 1878, earned the thanks of his government. In 1879 he resigned and aided Greece in securing the territory which had been ceded to her by Turkey. In 1881 King George created him a Knight Grand Cross of the Order of the Redeemer, the highest honor in the gift of the Greek government. His later years he spent mostly in Paris, engaged in study and research. He published: *Military Reports and Suggestions* (1861); *Historical Inquiry Concerning Henry Hudson* (1864–66); *Charles Reade at Home* (1873); *The English Ancestry of Washington* (1894); *Historic Studies in Vaud, Berne, and Savoy, from Roman Times to Voltaire, Rousseau, and Gibbon* (?1897).

READ, NATHAN (1759–1849). An American inventor. He was born at Warren, Mass., graduated at Harvard in 1781, and was tutor there from 1783 to 1787. In 1788 he conceived the idea of utilizing the steam engine for propelling boats and carriages and, with that end in view, began a series of experiments which resulted in the invention (1789) of the vertical multitubular fire-box boiler (patented Aug. 26, 1791) now in general use. In 1796 he established the Salem Iron Foundry for the manufacture of anchors and chain cables, and in 1798 patented a machine for cutting and heading nails at one operation. He was a member of Congress from 1800 to 1803, and in 1807 removed to the vicinity of Belfast, Me., where he was for some years Chief Justice of the Court of Common Pleas. Consult David Read, *Nathan Read: His Invention of the Multitubular Boiler and Portable High-Pressure Engine* (New York, 1870).

READ, OPIE (PERCIVAL) (1852–). An American author and editor, born in Nashville, Tenn. He edited the *Arkansas Gazette* in 1878–81 and in 1883 established the *Arkansaw Traveller*, a humorous paper, which he edited until 1891. Thereafter he was engaged in literary work at Chicago. He wrote: *A Kentucky Colonel* (1889); *A Tennessee Judge* (1893); *The Wives of the Prophet* (1894); *An Arkansas Planter* (1896); *Bolanyo* (1897); *Old Ebenezer* (1898); *A Yankee from the West* (1900); *In the Alamo* (1901); *The Starbucks* (1902); *An American in New York* (1905); *Old Jim Lucklin* (1905); *The Son of the Swordmaker* (1905); *The Mystery of Margaret* (1907); *Tom and the Squatter's Son* (1910); *The New Mr. Howerson* (1914).

READ, THOMAS BUCHANAN (1822–72). An American poet and artist, born in Chester Co., Pa. He learned several trades in various cities, in 1843 published newspaper verse in Boston, and devoted himself mostly to painting, visiting Europe several times and finally settling in Rome. He is best known as a poet, especially for his stirring "Sheridan's Ride" and for his verses called "Drifting." His works include: *Poems* (1847); *Lays and Ballads* (1848); *The New Pastoral* (1854), an elaborate description of Pennsylvania life; *The House by the Sea* (1856). In 1848 he compiled *Female Poets of America*, illustrated by engravings of portraits painted by himself. He died in New York. Consult his *Poetical Works* (Philadelphia, 1865; new ed., 3 vols., ib., 1903).

READE, CHARLES (1814–84). An English novelist and playwright, born at Ipsden House, in Oxfordshire, June 8, 1814. He entered Magdalen College, Oxford, graduating B.A. in 1835 and M.A. in 1838; was elected lay fellow of his college (1835); made dean of arts at Magdalen (1845) and vice president (1851); in the meantime had studied at Lincoln's Inn and was admitted to the bar (1843). Reade never married, but formed a platonic friendship with an actress named Laura Seymour. He passed several years at his rooms in Magdalen, made many tours abroad, but lived mostly in London. Combative by nature, he was engaged in numerous lawsuits. He died at Shepherd's Bush (London), April 11, 1884.

Reade began his literary career as a playwright, and to the end continued to write plays

either single-handed or with others. He had great facility in expanding a play into a novel or in reducing a novel to a play. In 1852 *Masks and Faces*, written with Tom Taylor, was brilliantly received at the Haymarket. Reade turned this play into the novel *Peg Woffington* (1853), which was soon followed by the delightful *Christie Johnstone* (1853), having as heroine a Newhaven fisher lass. In 1856 appeared *It Is Never Too Late to Mend*, exposing prison discipline in England and Australia. This novel with a purpose, which created a sensation, was succeeded by *Hard Cash* (1863), dealing with the iniquities of insane asylums; *Griffith Gaunt* (1865), on the marriage problem; *Put Yourself in his Place* (1870), on the terrorism of trade-unions; *A Terrible Temptation* (1871); *A Woman Hater* (1877), in which the degrading conditions of village life are exposed. All these novels are powerfully written. By itself stands Reade's masterpiece, *The Cloister and the Hearth* (1861), an historical romance, having as hero the father of Erasmus and dealing in a wonderfully vivid manner with student and vagabond life in Europe towards the close of the Middle Ages. After Reade's death appeared *The Jilt and Other Tales* (1884) and *Good Stories of Man and Other Animals* (1884).

Reade is not among the greatest novelists. He had not a keen artistic sense. His character drawing is picturesque rather than psychological, and he often develops his situations in a highly sensational way. But he always had a story to tell, and takes a secure place among his contemporary novelists of the second rank. Consult: Compton Reade, *Charles Reade: A Memoir* (London, 1887); John Coleman, *Charles Reade as I Knew him* (ib., 1903); and for a cordial estimate, A. C. Swinburne, *Miscellanies* (ib., 1886).

READE, JOHN (1837–). A Canadian journalist and author. He was born in Ballyshannon, Ireland, was educated at Queen's College, Belfast, and in 1856 went to Canada, where he established the *Montreal Literary Magazine*. In 1864 he was ordained to the ministry of the Church of England, but after a few years' service in the Eastern Townships returned to Montreal and later relinquished the ministry. In 1870 he became literary and general assistant editor of the Montreal *Gazette*. He was appointed in 1882 one of the original fellows of the Royal Society of Canada, and was elected president of the Society of Canadian Literature and in 1896 a fellow of the Royal Society of Literature of Great Britain. Apart from his journalistic work he was a close student of philology, ethnology, and folklore. His writings include: *The Prophecy of Merlin and Other Poems* (1870); *Language and Conquest* (1883); *The Making of Canada* (1885); *Literary Faculty of the Native Races of America* (1885); *The Half-Breed* (1886); *Vita sine Literis* (1886); *Aboriginal American Poetry* (1887); *Some Wabanaki Songs* (1888); *The Basques in British North America* (1889). Excepting the volume of poems, all these publications first appeared in the *Transactions of the Royal Society of Canada*. He edited a memorial volume of the *Poems* of George Murray in 1912.

READER (from *read*, AS. *rædan*, Goth. *rēdan*, OHG. *rātan*, Ger. *raten*, to counsel, advise; connected either with Lat. *reri*, to think, or with OChurch Slav. *raditi*, to be anxious for, Lith. *rodas*, willing, Skt. *rādh*, to be successful), or LECTOR. The title of the second among the four minor orders of the Roman Catholic church, designating a class whose duty it was originally to read the lessons (q.v.) of Holy Scripture in public worship. Traces of their existence as a distinct clerical class are found as early as Justin Martyr, Tertullian, and Cyprian. By present usage, however, the office is nothing more than a formal step to the priesthood. Consult Adolf Harnack, "Ueber den Ursprung des Lectorals und der anderen niederen Weihen," in *Texte und Untersuchungen*, vol. iv (Leipzig, 1886). See also LAY READER.

READING, rĕd'ĭng. A municipal, parliamentary, and county borough, the capital of Berkshire, England, on the Kennet, near its confluence with the Thames, 36 miles west of London (Map: England, F 5). The town is irregular in plan, but well built, and has fine buildings which include a municipal block with two town halls, clock tower, free library, valuable museum, concert hall, etc. Other buildings are the assize courts, the grammar school, founded in 1445, University College, and Sutton's Abbey Hall. Reading has interesting churches and the remains of a magnificent Benedictine abbey, founded in 1121 by Henry I, whose burial place it became. Of its three parks the Palmer Park forms a fine recreation ground. The town owns valuable real estate, water, abattoirs, and markets, maintains bathing places, libraries, museum, art gallery, sewage farm, and provides technical instruction. It has an important trade in corn and agricultural produce; there are also famous seed farms and biscuit manufactories, iron works and foundries, breweries, and manufactures of silks, ribbons, velvets, paper, and sauce. The town was of importance in 871, when the Danes made it their headquarters. Domesday mentions it as Radynges. Stephen built a castle, which was destroyed by Henry II. Nine parliaments were held within the abbey, which Henry VIII converted into a palace. In 1643 Reading surrendered to the Parliamentarians, who destroyed the abbey palace. Pop., 1901, 72,214; 1911, 75,214. Consult Jones, *Sketches of Reading: Historical, Archæological, and Descriptive* (Reading, 1870).

READING. A town in Middlesex Co., Mass., 12 miles north of Boston, on the Boston and Maine Railroad (Map: Massachusetts, E 2). Chiefly a residential town, it has a public library and manufactures of organ pipes, carriages, boots and shoes, shoe stock, rubber, rubber cloth, imitation leather, games, and wire brushes. Reading was settled in 1638 and was incorporated in 1644. Pop., 1900, 4969; 1910, 5818.

READING. A village in Hamilton Co., Ohio, 15 miles by rail from Cincinnati, on the Pittsburgh, Cincinnati, Chicago, and St. Louis Railroad. It has a convent of the Sisters of Notre Dame. The chief manufactures are bottles, fireworks, cigars, etc. Pop., 1900, 3076; 1910, 3985.

READING. A city and the county seat of Berks Co., Pa., 58 miles northwest of Philadelphia, on the Schuylkill River and the Schuylkill Canal and on the Philadelphia and Reading and the Pennsylvania railroads (Map: Pennsylvania, K 7). The city of Reading covers an area of about 6 square miles and is regularly

laid out, having 89 miles of paved streets. The public park system comprises 295 acres. The summits of Mount Penn, to the east, and the Neversink Mountain to the south of the city, which afford magnificent views, are reached by inclined electric railways. Noteworthy features include the county courthouse, city hall, opera houses, museum and art gallery, Y. M. C. A., Schuylkill Seminary, natatorium, Y. W. C. A., high school for boys, which cost $400,000, the girls' high school building, Masonic Temple, public and Berks County law libraries, and the Reading, Homœopathic, and St. Joseph's hospitals. The annual county fair is held here, handsome grounds and a race track being maintained by the association north of the city. Reading is situated in a rich agricultural district, the chief products of which are apples, corn, wheat, oats, rye, potatoes, forage, and vegetables; it is also quite important as a manufacturing centre. In the year 1914 an aggregate capital of $45,334,000 was invested in the various industries, which had an output valued at $53,232,000. The manufacturing establishments numbered 486, and these employed 26,801 persons, of whom 24,185 were wage earners. There are extensive shops of the Philadelphia and Reading Railroad and the Reading Iron Company, large iron and steel works, and machine shops, breweries, and manufactories of hardware, brick, cigars, hosiery, knit goods, hats, carriages, spectacles, boots and shoes, confectionery, woolen, worsted, and felt goods, and paper.

Since 1913 the government has been vested in a commission chosen every two years. The school board of nine members is chosen by popular vote. The city in 1913 had a net debt of $1,917,000; and the assessed valuation of property (real and personal) was $56,241,000. For maintenance and operation there was spent in the same year $899,000, the main items being $318,000 for schools, $82,000 for the water department, $137,000 for streets, $88,000 for the police department, $68,000 for the fire department, and $80,000 for sanitation. The water works, which were constructed at an expenditure of $2,757,249, are owned by the municipality. Laid out in 1748 and settled mostly by Germans, Reading (named from Reading, England) was incorporated as a borough in 1783, its population then being 2100, and in 1847, with a population of about 12,000, it was chartered as a city. Its boundaries were extended in 1867 and 1869. Pop., 1890, 58,661; 1900, 78,961; 1910, 96,071; 1915 (U. S. est.), 107,594.

READING, rēd'ĭng. The process of conveying to the mind by sight written or printed words or symbols. Almost as commonly the word refers to the vocal expression of that which written or printed symbols are intended to convey. Still more broadly "reading" is used to designate the art of speaking to an audience what has been composed by another.

The oldest method of teaching reading and the one that has been most widely followed is the alphabetic or synthetic method. By this a pupil first learns to identify the letters of an alphabet with certain sounds and then to group these sounds in such a way as to produce others which stand for mental images. In the sixteenth century Ickelsamer, the publisher of a German primer, pointed out that the sounds representing letters only confused the beginner when he tried to combine them into words; but it was not until the latter part of the eighteenth century that any other method was able really to establish its claim to superiority. Since then the analytic method, usually subdivided into the look-and-say or word method and the syllabic method, has been constantly growing in favor. By this pupils are first taught to associate a mental image with a single word or combination of words, and only later to analyze these combinations into their phonetic or alphabetic elements.

Husy, *The Psychology and Pedagogy of Reading* (ib., 1908); S. H. Clark, *How to Teach Reading in the Public Schools* (Chicago, 1908).

READING (rĕd'ĭng) **OF EARLEY,** RUFUS ISAACS, first BARON (1860–). An English lawyer and jurist, of Jewish descent. He was born in London, the son of a successful fruit merchant, and was educated at University College School, London, and in Brussels and Hanover. For a time he was a seaman on a coal ship running to Rio de Janeiro, was his father's agent in Magdeburg, and finally studied law. In 1898, 11 years after he was called to the bar, he became a queen's counsel, and soon afterward was considered a leader of the English bar. He was elected to the House of Commons as a Liberal from Reading in 1904. Early in 1910 he was named Solicitor-General, and in the autumn of the same year Attorney-General. His part in the libel suit against Edward Mylius, who had accused King George V of an early secret marriage, won Isaacs royal favor. He had been knighted in 1910 and had a high reputation as an eminently fair attorney, with a remarkable mastery of financial and technical detail and great ability as a cross-examiner. In June, 1912, he received a seat in the cabinet, being the first Attorney-General to be so honored. Like Chancellor Lloyd-George, he was accused of speculation in Marconi stock, admitted the charge, and seemed to lose nothing in political prestige. He was one of the foremost defenders of the Liberal financial policy in the Home Rule Bill of 1913. Late in that year he was made Lord Chief Justice and in the New Year's honors for 1914 was elevated to the peerage. In 1915 he went to the United States as head of the Anglo-French Commission which arranged for the American loan of $500,000,000 to the allies. Consult A. G. Gardiner, *Prophets, Priests, and Kings* (London, 1908).

READJUST'ERS, or **REFUNDERS.** The name applied to a political party in Virginia, from 1878 to 1885, which favored the readjustment or scaling down of the State debt. At the close of the Civil War the public debt of Virginia amounted to about $41,000,000, which was increased by the extravagance and corruption of the reconstruction governments. On account of the general impoverishment of the time, the interest account could not be met,

although the rate of taxation had been enormously increased. An Act of 1870–71 to refund the debt was repealed in the following year, but the repealing Act was not sustained by the courts. Still the arrears of interest increased, and by 1878 the State was pretty well divided between debt payers and readjusters. During that year the Legislature passed the McCulloch Bill, which provided for the issue of new bonds to be exchanged for outstanding bonds dollar for dollar and to bear interest at 3 per cent for 10 years 4 per cent for 20 years, and 5 per cent for 10 years, making an average of 4 per cent for 40 years. The readjusters organized themselves into a political party and succeeded in gaining a majority of the seats in both Houses of the Legislature. Their leader was H. H. Riddleberger, who won notoriety by his bill declaring that the State ought not to pay any part of the interest upon the public debt which had accrued during the Civil War and the period of reconstruction. The bill proposed to scale down the public debt from $31,102,571 to $19,665,196 and to devote to its payment only that portion of the State revenues for which no other use could be found. The bill passed both Houses of the Legislature, but was vetoed by the Governor. In the State election of 1881 the readjusters, with the help of the Republicans, defeated the Conservative Democratic party, which approved the McCulloch Bill. The readjusters now passed three important measures. The first two, popularly known as coupon killers, were designed to prevent the payment of State taxes by means of coupons from bonds issued in pursuance of the McCulloch Act and the Act of 1871. The third measure was substantially the Riddleberger bill reënacted. The majority of the bondholders refused to accept the settlement and tested the constitutionality of the coupon-killer acts in the courts. In nine decisions, generally known as the Virginian Coupon Cases, the United States Supreme Court declared in substance that the later Act forbidding the receipt in payment of taxes of those coupons which were received under the Act of 1871 was an impairment of the obligation of contracts in conflict with the Constitution of the United States and therefore void. In the legislative session of 1884, before the final decision was made, several acts were passed for the purpose of rendering the coupons worthless, and in the sessions of 1886 and 1887 still further attempts of this kind were made. Afterward a final settlement in the nature of a compromise between the State and the bondholders was effected, and the long-continued controversy over the debt question seemed to come to an end. Consult W. A. Scott, *The Repudiation of State Debts* (New York, 1893).

REAGAN, rē'gan, JOHN HENNINGER (1818–1905). An American statesman, born in Sevier Co., Tenn. In 1839 he removed to the Republic of Texas and settled east of the Brazos. He was admitted to the bar in 1846 and from 1852 to 1857 was judge of the Ninth Judicial District. From 1857 to 1861 he was a member of Congress, but resigned to serve as delegate to the Texas Secession Convention, by which he was elected a deputy to the provisional Congress of the Confederate States. During the Civil War he was Postmaster-General of the Confederacy, and in 1865 he was also acting Secretary of the Treasury. Captured with Jefferson Davis, May 10, 1865, Reagan was confined in Fort Warren until October. While in prison he wrote the celebrated *Fort Warren Letter* to the people of Texas, advising them to confer civil rights upon the negro and admit the more intelligent to the suffrage, lest worse and more radical measures should follow. This was misconstrued and subjected him to much harsh criticism in the State. From 1875 to 1887 he was a member of Congress, and for 10 years he was chairman of the Committee on Commerce. He was one of the authors of the Cullom-Reagan Interstate Commerce Act, which became law in 1887. In that year he was elected United States Senator but resigned in 1891 to become chairman of the Texas State Railroad Commission.

REAL, CORTE. See CORTE-REAL.

REAL ACTION. Under the common-law system of pleading, an action brought for the recovery of real property. A real action may be based merely on the right of possession, as where a tenant under a lease is ejected and seeks to recover back possession, in which case it is classed as *possessory;* or it may be based on right of title in the property, as where an heir claims real estate by inheritance, in which case the action is said to be *droitural.* A real action was begun by a writ. Thus, a possessory real action was begun by a writ of entry or writ of assize, whereas a droitural real action was commenced by a writ of right, writ of formedon, or writ of dower, according to the nature of the right or title involved. A real action was distinguished from a mixed action by the fact that in the latter damages could be recovered.

The old forms of real actions have been superseded in all jurisdictions by the more modern action of ejectment, and in code States by statutory proceedings to recover real property. See ACTION; EJECTMENT; FORMS OF ACTION.

REAL DE LOS ALAMOS. See ALAMOS.

REAL ESTATE. Land, together with such growing crops, trees, etc., and improvements thereon as are considered to be a part of and pass with it, or any interest in land greater than a term of years. In general, all movables and interests in land less than a freehold are called personal property to distinguish them from the above. Real estate descends to the heirs of a deceased owner and is subject to dower and curtesy. Greater formalities are required to convey or incumber real estate than are necessary in dealing with personal property. The terms "real estate" and "real property" are used interchangeably. For a further discussion of the rules of law applicable thereto, see ESTATE; PROPERTY; REAL PROPERTY. Consult: Sir William Blackstone, *Commentaries* (4th ed., 2 vols., Chicago, 1899); Emory Washburn, *American Law of Real Property* (6th ed., 3 vols., ib., 1902); S. M. Leake, *Elementary Digest of the Law of Property in Land* (2d ed., Toronto, 1909).

REALGAR, rē-ăl'gar (from Ar. *rahj al ghār,* powder of the mine, mineral powder). A mineral arsenic monosulphide that crystallizes in the monoclinic system and is of a red or orange-yellow color, with a resinous lustre, and is generally translucent, though sometimes transparent. It occurs with lead and silver ores. Realgar was formerly somewhat used as a pigment; it is also called red orpiment, or ruby sulphur.

REALGYMNASIA, rā-ăl'gĭm-nā'zĭ-ȧ. See GYMNASIA.

REALI DI FRANCIA, rā-ä'lē dē frän'chà, I (It., The Royal Men of France). A chivalric romance attributed to Andrea da Barberino and therefore of about the end of the fourteenth or the beginning of the fifteenth century. It is a legendary account of the kings of France, from their supposed Roman origin in Constantius, the banished son of Constantine the Great, down to Charlemagne. Consult the critical edition of the *Reali* by Vandelli (Bologna, 1892), and P. Rajna, *Ricerche intorno ai Reali di Francia* (Bologna, 1872).

REALISM. In philosophy, a term used to denote (1) the mediæval metaphysical theory that universals have an existence independent of individual objects (see NOMINALISM); and (2) the metaphysical view that there are realities which have an existence independent of conscious experiences; opposed to idealism (q.v.).

In the second meaning of the term realism in an unreflective form is the view taken by the ordinary man in societies which have outgrown primitive animism, and it has been the prevailing philosophy in Europe since reflection began with Thales. Practically all Greek philosophy, with the questionable exception of the sophists and the skeptics, were realists, although the kind of reals which they assumed varied greatly Mediæval philosophy was also diversifiedly realistic, and modern philosophy began with a realistic bias. Indeed, idealism did not find clear expression till Collier, Berkeley, and Malebranche developed it; but since the beginning of the eighteenth century it has been increasingly popular in philosophical circles, most of the great names in philosophy being identified with idealism, with the notable exception of Kant, who stoutly held to the belief in unknowable things-in-themselves, of the materialists, and of the Scottish philosophers led by Reid; in Germany Herbart and his school should also be mentioned as realistic.

The explanation of the modern switching of philosophers from realism to idealism is largely to be found in the fact that our knowledge of things varies with the physiological changes in the human body, ultimately with the brain changes. Everything known seems to be a mere function of the brain, and likewise the fact of knowing itself seems so to vary. Now, calling everything that appears in experience ideal, it would seem that whatever is assumed to lie outside of any experience is merely an *ideal* assumption, i.e., the very assumption is just nothing but a fact within some experience. Even the brain of the experient is his own assumption and is ideal. There is nothing but conscious experiences and their conscious contents. Such is the bald conclusion drawn by idealism in its earlier stages. This conclusion was modified in more developed forms of idealism (q.v.). Against such reasoning realism held its own only by reliance upon intuition as furnishing indubitable evidence of the existence of things independent of experience. In other words, realism could be only a *faith*, protesting against the rigid conclusions of idealism. This was, e.g., the type of realism found in Reid. We have intuitive certainty that there are realities which we cannot intuit. Realism of this type was a form of anti-intellectualism, a revolt against rigorous logic, with an appeal to a higher court.

Neorealism. The beginning of the twentieth century brings another form of realism, which is distinguished from the older in that it is more radical. Its radicalism is expressed in its declining to accept the premise from which idealism started, viz., that whatever appears in experience is ipso facto intrinsically experiential, i.e., that it can only be what it is in the kind of experience in which it appears. This can be made more clear by calling attention to the dualistic nature of the earlier realism, which believed in transexperiential realities, but, with idealism, denied that such realities ever actually enter into experience, being only *represented* therein by some experiential surrogate. Thus, everything in experience for this older realism is just as intrinsically experiential in its nature as the idealists maintained it to be; but in addition to this experiential reality realism maintained the existence of another kind of reality which lies unattainably beyond any human experience, like Kant's things-in-themselves. The new realism is not *fundamentally* and "epistemologically" dualistic; it begins with the assumption that the things in experience, or at least some of them, are just the very things which exist outside of experience. This assumption would be difficult or impossible if experience were considered as an affection of a substantial *mind*, such as the older realism held it to be; for how can one independent thing be or become a state of another independent thing? But this assumption of a substantial mind was gradually outgrown by idealism itself in its later developments and was definitively discarded by William James, when he startled the philosophical world by the denial that even consciousness exists as an independent entity. Consciousness as entity is, according to James, nothing but "the faint rumor left behind by the disappearing 'soul' upon the air of philosophy." Consciousness is only a *relation:* thus was launched the now much discussed "relational theory" of consciousness, but not as a floater for realism.

But if consciousness is nothing but a relation there is no reason why things that are "in consciousness" should not also have an existence at other times "outside of consciousness," much in the same manner in which two persons standing to each other in the relation of mutual love may have previously been independent of this relation and may even survive the extinction of this relation. Thus, the relational theory of consciousness made possible the development of a realism without a substantial mind and without the special difficulties of the older realism born of its union with such a substantial mind. But this new realism has difficulties of its own, which it tries to meet in various ways according to the temper and habits of the individual realist. One of these difficulties is the precise identification of the consciousness relation; on this point there is much divergence of view. Another is whether the consciousness relation is merely "external," i.e., whether it makes any *difference* to the things related. On this matter there is also difference of opinion. Another difficulty is concerned with the so-called belatedness of perception: we never perceive things at just the exact instant in which they exist as perceived. Perception is just a little behind time always, sometimes quite out of date, as in the case of the perception of a distant star, which may have been extinct years before the date of our perceiving it. But how can a thing which is past yet now be present in a rela-

tion? Still a fourth difficulty concerns the status of illusions and mistakes of all sorts. If what we see when we look at a real house is something that existed unseen before we saw it, what about the things we see when we have an hallucination? These and various other difficulties are being attacked by neorealism, with success or failure according to the standpoint of the critic. Appearances seem to indicate that the neorealistic movement is gaining ground, but it is either vigorously attacked or ignored by the idealists, and it is sometimes in alliance with and sometimes opposed by pragmatism. With a liberal interpretation of the term "realism" perhaps all pragmatists are realists, but many of them are strenuously attacking the specific forms of neorealism proposed by neorealists, and the outcome of the whole discussion is still a matter of the future. Realism may claim along with pragmatism to have introduced new life into philosophical interests.

Among the new realists mention may be made of Bertrand Russell, G. E. Moore, R. B. Perry, E. B. Holt, F. J. W. Woodbridge, W. P. Montague, W. T. Marvin, W. B. Pitkin, E. G. Spaulding, G. S. Fullerton, J. E. Boodin, and E. B. McGilvary. See KNOWLEDGE, THEORY OF; METAPHYSICS.

REALISM AND NATURALISM. The doctrine of a school of novelists who opposed and still oppose idealism or romanticism. Realism soon spread throughout Europe and the United States. Although we technically apply realistic to a nineteenth-century school of writers, realism may be traced back through the ages. We find it in Boccaccio and in Chaucer, in the picaresque novels of Spain, in Nash, in Voltaire, and in Richardson, still more in Fielding, Smollett, and Defoe, each of whom intended to produce illusions of actual everyday life or reality in exceptional phases. Each of these writers is quite as realistic in the main as the authors of *Madame Bovary* and of *Une vie*. The early modern realists were at last submerged in romanticism.

The romantic school had regarded the function of the novelist as one of the imagination. His task was to imagine a series of incidents more or less probable and a set of characters more or less heroic or unusual. His world was in many respects an ideal world. The idealist, who has always existed, wishes for his part to choose beautiful themes, to improve on men—one might almost say, to make angels out of them at times—in a word, to paint things not as they are, but as the idealist would have them. Poets have lived in a dream world oftener than writers of prose. Fairy tales are mostly idealistic, even when their personages are witches and goblins, for such beings are merely, if such a thing is possible, idealizations of evil. Realism is avowedly closest to nature; romanticism clings to nature in spirit, perhaps, but cares little for detail and is fond of the exotic, the remote, the strange, the mysterious, as contrasted with near and familiar things on the levels of ordinary life. A romantic idealism, in one acceptation of the word, presents people who are preternaturally beautiful or good or bold or even wicked, whose conversations sparkle with epigrams, whose main business, in fine, is not closely related to the everyday world or to average truth. But realism, naturalism, romanticism, and idealism—vague words, to say the least—are all only nature reflected by various mirrors held up to her in countless ways. Each denotes a tendency stronger at one period than at another, and the tendency is never hard to feel, yet always too subtle, too shifting, to be defined. Again, the realism of literature in another phase is the realism of sculpture and the graphic arts. The extreme realists conceive of the vocation of the novelist as that of an accurate reporter of what he has carefully observed in the everyday life of the world about him. Fancy, they say, hinders this exact reproduction of truth, for the realistic school deals only with facts. To it nothing is too trivial or too commonplace or too unpleasant to be recorded. In a word, "any corner of nature," if accurately depicted, will be profoundly interesting

The progenitor of this school is said by the French nineteenth-century realists themselves to have been Rousseau, who in his *Confessions* adopted the plan of setting forth minutely the exact details of his life, concealing nothing, not even those incidents that were in the highest degree discreditable and shameful. But Rousseau merely furnished the suggestion of the tremendous force that lies in outspoken truth and did not himself apply the theory to fiction. This was done by Marie Henri Beyle (1783–1842), better known by his pseudonym Stendhal (q.v.), who, in his novels *Armance*, *Le rouge et le noir*, and *La chartreuse de Parme*, developed a process of ruthless vivisection based on observation of social and physiological phenomena. The realistic method was carried out on a grand scale by Honoré de Balzac (q.v.) in his *Comédie humaine*. In this marvelous series of works Balzac attempted to delineate the entire life of his time, extenuating nothing, glozing over nothing, but setting forth motive and action with minute fidelity to truth The discrepancy between Balzac's theories and his practice is obvious to those who would hold him to his word. Closely following him came Gustave Flaubert (q.v.), whose *Madame Bovary* (1857) achieved forthwith a great success and as great a scandal. It was a study of provincial life, as unsparing as any study of Balzac's, but superior in style. Joris-Karl Huysmans (1848–1907) (q.v.) pushed realism to extreme lengths, choosing subjects and scenes that are usually banished from polite society, and his *Marthe* (1876), which was too crude for even the indulgent censorship of modern France, may be taken as a sublimated type of the naturalistic, as distinct from the merely realistic, novels.

The naturalists of fiction are realists and something more. They profess to derive from Stendhal through Balzac and Flaubert. That is to say, they adopt the analytic method and devote themselves chiefly to the study of character. But they go further and object to the processes of art. According to them, literature, to be strictly "scientific," is comparable, not with painting or drawing, but with anatomy and dissection. It is worth our while to observe that the so-called Realistic and then the Naturalistic school rose with, or after, the great rise of experimental science in the early years of the nineteenth century. Yet few genuine scientists would admit the scientific pretensions of the most conscientious realists or naturalists; for, even when their science is not imaginary or the work of dabblers, it is necessarily perverted or modified so as to give a continuous picture of life. No biologist, psychologist, or any other scientist, save the linguist, would think of looking for trustworthy observations in the works of realistic or naturalistic novelists. Unfortunately, too, the extreme Realistic school, and later the naturalistic writers, sought their material in the baser walks of life, for they found little in the humdrum existence of decent mediocrity wherewith to stir their readers. True, some realists asserted that "truth" (meaning their observations) is never dull, and it must be confessed that the Goncourts combined to "report" with extraordinary interest, and often charmingly, many scenes which at first blush would be called dull and unsuggestive; but this result was achieved by dint of talent, which found a hundred new thoughts in relations and presented them with skill. If, however, we were to gather statistics from the more modern Realistic school, especially in the Romanic countries, we should almost certainly find that the school called Realistic has dealt rather slanderously with the national life. It has dwelt on freakish or morbid themes and has made its appeal to the beast in man. On the other hand, it has served to awaken readers to the falsehoods or to the fatuous aspects of the Romantic and Idealistic schools. But there are no hard and fast boundaries. Zola is often romantic; Victor Hugo is often realistic. Realism is a tendency in authorship and not a definite province in literature. In England the later realists had their greatest representatives in Thackeray, Dickens, and George Eliot. Here, again, it may be said that the most consistently realistic of these, George Eliot, was closely affiliated with experimental scientists, just as was the case in France. But English realism was never extreme. It has not wallowed; it has not treated its fictitious personages with the cynical scorn of the French school. It has had no Zola to be repudiated by his "master" Taine. Realism, however, took a firm foothold in England. Thackeray and George Eliot have been followed by George Meredith, Thomas Hardy, George Moore, John Galsworthy, and, in his novels of social life and its problems, H. G. Wells, and by W. D. Howells in the United States.

Those whom we are wont to reckon in the Realistic school are novelists or tellers of short tales. Their object ostensibly is to observe, analyze, and describe the actions of others, or their thoughts as uttered or it may be only as implied. This condition requires imagination; for fragmentary manifestations in other beings must be supplemented by the experiences of the author in order to make a continuous narrative. If now we turn to the diarist and the autobiographer, we shall find that realistic portrayal is not thus hampered; for the diarist and the autobiographer find a ready-made continuity in their own experience. Fancy is not a necessary factor of their art. Hence Pepys is a realist of the first order; so, too, is Benvenuto Cellini; nor need we wonder that the French Realistic school discovered a prototype, if not a pattern, in Jean Jacques Rousseau.

REAL PROPERTY. In the artificial classification of property rights adopted by the English and American law, real property comprehends the larger part of the rights (those, viz., known as "freehold" interests) in land, together with a limited number of other rights which have, for one reason or another, been subjected to the same rules of law. The most important of the latter are certain "incorporeal" interests, as they are called, such as hereditary offices, titles of honor, franchises, annuities, tithes, and the like; while, on the other hand, not a few interests in land, such as leaseholds, mortgages, and certain other creditor's estates, have, for historical or practical reasons, found their place in the rival category of personal property. The famous expression, "lands, tenements, and hereditaments," usually employed as an exhaustive description of real-property rights, is thus an inaccurate statement of such rights, certain landed interests, as has been seen, not being included in the description of real property, while other forms of such property, as heirlooms and the "incorporeal" interests above referred to, not being in the feudal sense "held" of a superior lord, cannot be described as tenements. The term "hereditament," alone, has come to represent all the varieties of property known as "real," and to be in a sense coextensive in meaning with that class of interests, as they all have the common quality of heritability. Indeed, from the conception of heritability as a quality or incident of estates in real property, we have, by a curious process of inversion, arrived at the notion of real property as anything capable of inheritance and have included in the category of real property many classes of rights having nothing to do with land, for no better reason than that, by local custom or otherwise, they descend, like freehold estates in land, to the heir of the possessor.

The ordinary division of real property into "corporeal" and "incorporeal hereditaments" has been considered in the general discussion of property rights. (See PROPERTY.) Though not free from objection, it may be taken as a convenient description of such interests in land as rest on possession and such as do not involve possession respectively. The former comprise the so-called freehold estates of possession (fee simple, fee tail, and life estates), and the latter

all future estates (as remainders, reversions, and the like), a great variety of equitable interests in land (of which the most important are trusts and equities of redemption), and the large class of interests in the land of others, known as easements and profits.

The feudal origin of our real-property law and the strange conception derived therefrom that lands are not, like chattels, susceptible of absolute ownership, but only of tenure and of the qualified ownership described by the term "estate," has been considered elsewhere. (See ESTATE; FEE; PROPERTY.) It remains to be noted that incorporeal as well as corporeal hereditaments are subject to be "held" as estates rather than owned outright, and that there may as well be a fee simple, a fee tail, or a life estate in a remainder, a trust, or an easement as in the visible land with which all of these terms are concerned. The difference between the two classes of hereditaments lies rather in the processes by which they may be acquired and transferred. Both descend to the same heir upon the same event, and both are alike subject to the free power of alienation, but the nature of the one renders it incapable of seisin or possession and therefore alienable by the ancient process of livery of seisin, wherefore it "lies in grant," i.e., is transferable only by deed. Our modern instrument of conveyance is merely the ancient deed of grant, originally appropriated to the incorporeal hereditament, but now employed for the alienation of corporeal property as well. See ALIENATION; DEED; GRANT; HEREDITAMENT.

REALSCHULE, rā-äl'shōō'le. A German school of secondary instruction, differing from the Gymnasium inasmuch as it offers no instruction in the classical languages and lays stress on science. The Realschule is an outgrowth of the realistic tendencies of the seventeenth and eighteenth centuries. The institutions that Francke established at Halle towards the close of the seventeenth century laid unusual stress on the study of nature. At the same time notable efforts were being made to introduce more science into the classical schools generally. In 1747 Hecker established at Berlin an ökonomischmathematische Realschule, which may be regarded as the prototype of the Realschule of to-day. It gave instruction in the German, French, and Latin languages, in writing, arithmetic, drawing, history, geography, the elements of geometry, mechanics, and architecture, and in religion and ethics. Some optional study of occupations and trades also was provided.

The Realschule of to-day has a six years' course, and its graduates go directly into business life. Those who wish to take the university courses in science and mathematics attend the *Oberrealschule*, which has a nine years' course. The programme in this school is like that in the Realgymnasium, with the exception of the omission of Latin and the substitution therefor of more work in mathematics, natural history, chemistry, mineralogy, French, and English. Graduates of these two types of schools are regarded as on the same plane educationally, but both are regarded as somewhat inferior to the graduates of the Gymnasium. The Realschule grants to its graduates only one of the secondary-school privileges, that of the *Einjahrig Freiwilliger*, or military service for one year with certain privileges. Consult F. E. Bolton, *Secondary School System of Germany* (New York, 1900), and J. E. Russell, *German Higher Schools* (ib., 1907). See GYMNASIA AND REALGYMNASIA; NATIONAL EDUCATION.

REAM, NORMAN BRUCE (1844–1915). An American capitalist, born in Somerset Co., Pa. He served as private and lieutenant in the Eighty-fifth Pennsylvania Volunteers during part of the Civil War, was engaged in business at Princeton, Ill., and at Osceola, Iowa, between 1866 and 1871, and was afterward a live-stock and grain-commission merchant in Chicago until 1888. The foundation of his fortune was laid in the great Armour pork corner in 1879, Ream acting as one of the Armour brokers. In 1883 he formed one of the "Big Four" combination that bolstered up the tottering grain market Two years later he became a member of the New York Stock Exchange. Ream was one of the organizers of the National Biscuit Company and of the United States Steel Corporation and at the time of his death possessed extensive interests in railroads, banks, and Chicago real estate.

REAM, VINNIE. See HOXIE, VINNIE REAM.

REAPERS, REAPING (from *reap*, AS. *rīpan*, to reap; connected with OHG. *rifi*, Ger. *reif*, AS. *rīpe*, Eng. *ripe*). The first implement used for reaping was the reaping hook or sickle, dating from the Stone and Bronze ages (Fig. 1,

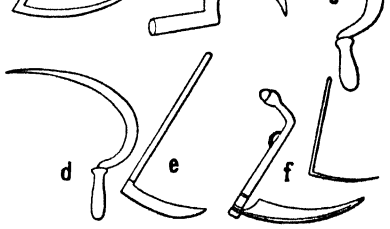

FIG. 1. VARIOUS FORMS OF SICKLES AND SCYTHES.

a, b, c, d). Records of this implement are found in Egyptian history 1400–1500 B.C. The earliest form of the sickle had a slightly curved blade with straight handle; later the blade was toothed or serrated, and its form approached that of the modern sickle. As a rule, the edge was made plain and sharp like a knife. The ancient Jews used a sickle of the Egyptian form. In China and Japan to-day are found sickles of much the same form as those which have been used there from time immemorial. The Greeks and Romans used smooth-bladed sickles or a

sickle with toothed blade attached to a curved stick. The latter also used a small hooked knife resembling a pruning hook. The scythe (Fig. 1, *e*, *f*) followed the sickle and was apparently introduced by the Romans, by whom it was employed mainly for cutting grass. Pliny, in his writings, distinguishes between the sickle and the scythe, and Crescenzio described both in 1548. At first the scythe was intermediate in construction between the sickle and the modern scythe, as in the Hainault scythe (Fig. 1, *f*), which is operated with the right hand while the grain is gathered with a hook in the left

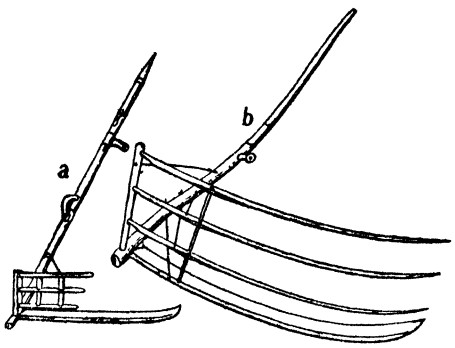

FIG. 2. FORMS OF CRADLE SCYTHES.

hand In time the blade became lighter and the handle underwent numerous changes in form and material until the modern crooked wooden pattern was evolved. The next step was the fastening of fingers (one to four) to the scythe parallel with the blade, thus evolving the so-called cradle scythe (Fig. 2, *a*). The fingers were at first made shorter than the blade, and the operator cut towards, and left the cut grain leaning against, the standing grain. The Americans made improvements in these old forms and developed the American cradle scythe or cradle (Fig. 2, *b*) about the period from 1776 to 1800. This implement was in universal use in America at the beginning of the nineteenth century. It is now employed in the United States only where the use of reaping machines is impracticable, although still used to a considerable extent in many other countries. Both sickle and scythe are widely useful agricultural implements

The first reaping machine recorded in history

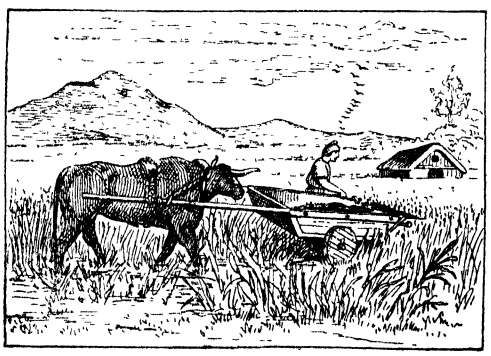

FIG. 3 THE GALLIC HEADER.

is the Gallic header (Fig. 3) mentioned by Pliny (23 A.D.) as used in the extensive fields of the lowlands of Gaul. This consisted of a large box with projecting teeth along its front edge, which was pushed through the grain by an ox hitched in rear. The heads were caught and torn off by the teeth and were raked into the box by an attendant. This machine, however, was forgotten for ages. During the latter part of the eighteenth and the early part of the nineteenth centuries a number of machines, including especially those of Gladstone (1806) and Salmon of Woburn (1807), were invented and

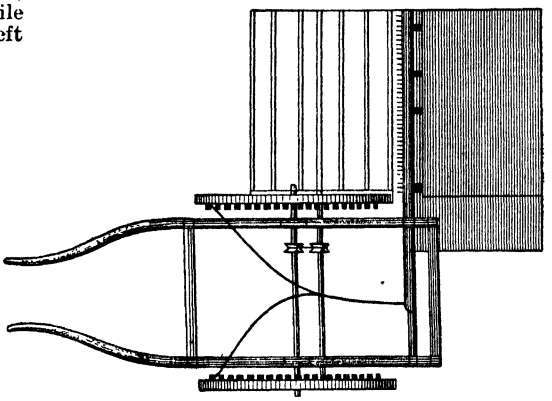

FIG. 4. OGLE'S REAPING MACHINE.

given trial in England, but little practical progress was made until 1822, when Henry Ogle brought out his side-draft machine (Fig. 4), with reels, reciprocating knife (straight-edged) over stationary fingers, dividers, and platform, thus foreshadowing the essential features of the modern reaper. In 1827 Patrick Bell invented a machine which was used with considerable success in England and Scotland. Its cutter worked on the shear principle. The cut grain was carried to one side by means of revolving rollers. It had reels and dividers and was pushed through the grain by a team hitched in the rear. This machine, although built on wrong principles, is important because it was simple in construction and fairly efficient in practice.

The first patent for a reaping machine in America was granted to Richard French and T. J. Hawkins, of New Jersey, in 1803. In 1812 a patent was granted to Peter Gaillard, of Pennsylvania, for a grass-cutting machine, which was the first of its kind in America or England. A more successful grass cutter was invented by Jeremiah Bailey, of Pennsylvania, in 1822. It was built on the revolving-cutter plan, with side draft and an arrangement for keeping the cutter at a uniform distance from the ground. Several other machines followed these, the most important of which was that of William Manning, of New Jersey, patented in 1831, which had a cutting device very closely resembling those of Hussey and McCormick, which afterward became so important. It also had a grain divider, the first recorded on an American machine. At this epoch American genius combined all the best features of preceding inventions, English and American, in two practical machines—that patented by Obed Hussey, of Maryland, in 1833 and that patented by C. H. McCormick, of Virginia, in 1834. These machines were very similar in principle. Hussey's was provided with a cutter of pointed blades attached to a bar, which vibrated through slots in iron fingers

projecting from the front of the cutter bar. The grain fell on a platform and was raked off by a man riding on the machine. It had no reels. McCormick's had a serrated edge knife with wavy outline instead of pointed sections as in Hussey's. It was provided with a divider and reels, but no seat for the attendant, who raked off the cut grain. Both were side-draft machines. McCormick's was arranged so that it could be either drawn or pushed. These two machines furnished the basis upon which all successful modern machines have been constructed.

In 1848 Nelson Platt, an American, invented a self-acting rake, which swept over a quadrantal platform and left the grain in gavels at the side of the machine. This was the first of the sweep-rake type, although numerous devices for delivering the grain in gavels at the side of the machine had been patented. In 1851 Palmer & Williams and William H. Seymour obtained patents for sweep rakes over quadrant platform. In 1856 Owen Dorsey, of Maryland, patented a self-rake which was an improvement of Hoffhein's type, invented in 1852. McCormick introduced his self-rake in 1861, based on S. A. Lindsay's patent of 1859.

The first recorded attempt to bind grain by machinery was made by John E. Heath, of Ohio, who obtained a patent in 1850 for a twine or cord binder. Other patents rapidly followed for machines using cord, straw, and wire. The most practical of these earlier machines, although not strictly a binder, was that known as the Marsh harvester, patented in 1858, in which the cut grain was elevated to a receiving box from which it was taken and bound by two men riding on the machine. This machine contained many features of the modern binder, especially the delivery of the grain by a canvas carrier over the drive wheel as distinguished from the "low-down" type in which the binding device was attached to the self-rake In 1864 Jacob Behel invented the knotting bill, which with slight modifications is used in almost all modern binders. In the meantime various fairly successful wire-binding machines were put on the market by different manufacturers, but in 1875 John F. Appleby, who had invented a successful twine knotter as early as 1859, made a binding apparatus, which with subsequent improvements furnished the basis for the binding apparatus of almost all modern binders, which are essentially a combination of this binding device with the Marsh type of harvester.

The most advanced and complicated type of harvester is probably the combined header and thresher which is used to a considerable extent in some parts of the western United States and in Australia, where there is no fear of rain during the harvest. This machine heads, threshes, cleans, and sacks the grain at one operation. Machines of this kind are pushed through the grain either by a traction engine or by horses, 30 to 40 of the latter being required for each machine, which latter have a capacity of from 60 to 125 acres per day. It is stated that as early as 1850 a machine was invented and successfully tried in Devonshire, England, which stripped the grain from the straw, cleaned it, and ground it into flour at one operation. Headers are also made for use uncombined with a thresher. The cut grain is deposited by means of elevators in wagons which are drawn beside the headers. A patent for a machine of this kind was granted to Jonathan Haines in 1849.

The mower developed simultaneously with the reaper. In fact, many of the earlier machines were designed to be used either as a mower or as a reaper. A separate machine for cutting grass was patented as early as 1812 by Peter Gaillard, of Pennsylvania. Hussey's original machine was really a mower, being built on principles afterward adopted and developed in the construction of mowers. The most prominent name connected with the early development of mowers is that of W. F. Ketchum, who patented in 1847 a mower of simple design, having a single driving wheel. After the adoption of the Hussey type of cutter this machine proved a very successful mower of the rigid-bar class. The first patent for a mower of the flexible-bar type was granted to Cyrenus Wheeler in 1854. The flexible-bar idea was further developed in a machine invented by Jonathan Haines in 1855 This had two drive wheels and a cutter bar jointed to the main frame in such a manner that it could be lifted over obstructions. In 1856 Aultman & Miller patented a machine which contained practically all of the essential features of the successful modern mower, viz., two driving wheels (the best types of modern reapers have one), the flexible cutter bar, with rapidly reciprocating blades, having smooth-edge sections, which was so hinged to the main frame that it could be raised and folded over against the latter when the machine was not in use. While combined reapers and mowers are still made, separate machines for the two purposes are considered preferable.

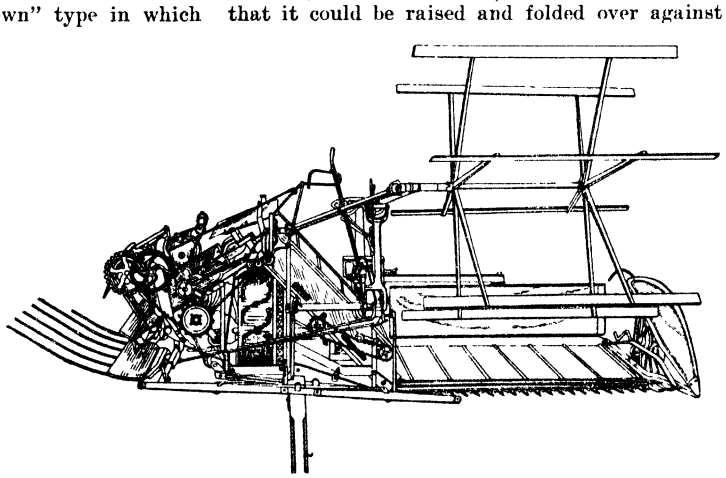

FIG. 5. A MODERN HARVESTER AND BINDER—FRONT VIEW.

Corn (maize) harvesters have been highly developed. The most successful types include the harvester with automatic knife guards, which is drawn between the rows, cutting two rows of corn at once; the binder, which cuts and binds the stalks into bundles; and the shocker,

which cuts the corn and gathers and binds it into shocks. These machines harvest an acre of corn at a net cost of $1 to $1.50. Corn pickers which pick the ears from the standing stalks and husk them are in use to some extent in the purely corn-growing regions.

REAR ADMIRAL. See ADMIRAL.

REAR GUARD. Security embraces all those measures taken by a military command to protect itself from observation or surprise by the enemy. This security for the rear of a marching force is obtained by the use of a covering detachment called a rear guard. A strong rear guard is of vital importance in covering a retreat. When a commander decides to retreat, he issues the necessary order. During the retreat the outpost (q.v.) for the night usually forms the rear guard of the following day. The strength of a rear guard depends upon the nature of the country and the strength and character of the pursuing force. It cannot, like the advance guard (q.v.), count on the support of the main body. Machine guns are especially useful in the passage of defiles and in covering the crossings of rivers. Engineers and ambulance companies are usually assigned to rear guards. The troops of a rear guard are selected from those that have had previous local successes or have suffered little loss and are comparatively fresh. The proximity and the conduct of the enemy control to a large extent the formation of a rear guard. When it is not necessary to withdraw in deployed lines, the greater part of the rear guard marches on the road in column of route, taking up a formation resembling that of an advance guard (q.v.) faced to the rear. The distribution of troops is therefore similar to that of an advance guard, viz., reserve, support, rear cavalry.

The rear cavalry is that portion of the rear-guard cavalry following the support. The support, as in an advance guard, is divided into two parts; that part nearest the enemy is called the rear party and marches with a rear point. Mounted engineers usually accompany the support and may be attached to the rear party. When the cavalry is of sufficient strength and has horse artillery attached, the entire rear guard, excepting the reserve, may be composed of that arm. The reserve is composed mainly of infantry and artillery. The small rear guard of an advancing force is conducted practically the same as that of a retreating force, usually marching in rear of the trains to guard them against guerrillas or other marauders.

Since the function of a strong rear guard, covering the retreat of a beaten force, is to delay the pursuing enemy, it is usually impracticable to prescribe in orders the distance from the main body or the distances between the parts of the rear guard. As a rule, however, circumstances will require that such distances be greater than those employed in the case of the advance guard (q.v.). The enemy must not be allowed to push the rear guard too close to the retreating main body. The rear guard commander must select successive defensive positions to hold against the advancing pursuers and be prepared to sacrifice his last man and gun in fulfilling his mission, as little or no help can be expected from the retreating main body. For such delaying actions field artillery is especially fitted on account of its long range, by means of which it can delay the approaching enemy by causing him to deploy promptly. From a consideration of the mission required of a rear-guard commander it is seen that he must be allowed a wide discretion in the methods employed. Consult *Field Service Regulations of the United States Army* (1914), and Bond and McDonough, *Technique of Modern Tactics* (Menasha, Wis., 1913).

RÉAUMUR, rā'ō'mŭr', RENÉ ANTOINE FERCHAULT DE (1683–1757). A French naturalist and physicist, born in La Rochelle, Feb. 28, 1683. He was educated in the Jesuits' College at Poitiers and at Bourges, and in 1703 he went to Paris, where he continued the study of physics and mathematics. His earliest publications were mathematical and obtained him an election to the Académie des Sciences in 1708. He then interested himself in the study of marine animals; he proved the power of regeneration in crustaceans, studied locomotion in star fishes, showed that zoöphytes were animals, studied the action of the electrical organ of torpedo and the phosphorescence of marine animals. In 1710 he began to compile a large work for the government, *Description de divers arts et métiers.* Somewhat later a series of important memoirs on the production of steel and on improvements in the manufacture of iron won him a yearly pension of 12,000 livres. He discovered the method of tinning iron, studied the production of fine porcelain, also the condition of forests, mines, auriferous rivers, and the fossil beds of France. He invented the Réaumur thermometer, in which for the first time the zero point was made to coincide with the freezing point. (See THERMOMETER.) Amid all these activities Réaumur was constantly carrying on his investigations in the field of natural history. The most important of all his publications are his works in this department; of these the greatest is *Mémoires pour servir à l'histoire des insectes* (6 vols., 1734–42). He left materials for a history of quadrupeds and birds afterward made use of by Brisson and Buffon.

RÉAUX, GÉDÉON TALLEMANT DES. See TALLEMANT DES RÉAUX GÉDÉON.

REBATE. See RAILWAYS.

RE'BEC (OF. *rebec, rebeke*, Fr. *rebec*, from Ar. *rabāb*, rebec, from *rabba*, to be master). A three-stringed instrument played with a bow. It was of Indian origin, and from Persia it was carried to Arabia, northern Africa, and, about the eighth century, by the Saracens into Spain. It was in outline shaped like the half of a

pear, with a long neck, generally finished by a grotesquely carved human or animal head. Two trefoil-shaped sound holes ornamented the belly, and the instrument was fitted with a bridge and sound post. It was held against the breast or under the chin, like a violin. The rebec was the parent of the violin, and the three gut strings were tuned like the three lower violin strings, g, d^1, and a^1. The tone was loud and harsh, but powerful, which made it a favorite in mediæval orchestras. Specimens are very rare. For illustration, see Plate of MUSICAL INSTRUMENTS.

REBEC'CA. The beautiful Jewess, daughter of Isaac of York, in Scott's *Ivanhoe*.

REBEK'AH. See ISAAC.

REBEKAH'S CAMELS BIBLE. See BIBLE, CURIOUS EDITIONS OF.

REBEL'LION (Lat. *rebellio*, from *rebellis*, making war again, from *re-*, back again, anew + *bellum*, war). In its narrowest sense, open resistance to authority. In its public-law signification rebellion is the armed opposition to the government of a portion of its subjects for the purpose of securing a change in the constitution or laws or with a view to preventing the execution of the laws. Unless the authority against which the resistance is directed be lawful there is no rebellion. Thus, resistance to an officer who is acting beyond his legal powers is not an act of rebellion. Rebellion is sometimes said to differ from insurrection in that it is a more general and more perfectly organized resistance than insurrection and usually undertaken with a view to subverting the government, i.e., the difference chiefly is one of degree. This is the view taken by the United States Supreme Court. (*Prize Cases*, 2 Black.) Other authorities hold the reverse to be true. According to the latter view a rebel is one who openly refuses to obey the authority of the state, while an insurgent goes further and attacks the government with the intent of overthrowing it or replacing it by another. According to the public-law view civil war is a struggle between two parties occupying substantially the same geographical limits for the possession of the government, each claiming to be the legitimate party. Rebellion, on the other hand, in its advanced stage (or insurrection, according to the second view propounded above), is the attempt of a section of the people to overthrow the government or its authority with a view to replacing it by another of a different type, or for the purpose of constituting a separate nation with a separate sovereignty. Finally, there is the distinction between rebellion and revolution, which may be summed up as the difference between failure and success.

Every person who engages in rebellion is liable to the criminal penalties for treason established by the government against which he rebels, and he is dealt with by the ordinary civil authorities, but when the rebellion becomes so widespread as to embrace a vast majority of the inhabitants of a considerable portion of the country, and when the rebels have succeeded in establishing a government and raising an army or navy, and especially if they have won recognition as belligerents from foreign nations with the rights incident thereto, those who are captured are usually treated as belligerents in conformity with the rules of civilized warfare. While endeavoring to enforce its constitutional rights against armed rebellion, a nation has all the powers, not only of a sovereign, but also of the most favored belligerent. The Constitution of the United States authorizes Congress to provide for calling out the militia to suppress insurrections, and Congress has done so by empowering the President to call upon the militia whenever in his judgment danger from rebellion requires that step. The Supreme Court has decided that the President is the sole judge as to when the exigency shall have arisen.

REBELLION, WAR OF THE. See CIVIL WAR IN AMERICA.

REBENSTEIN, rā'ben-stīn, A. See BERNSTEIN, AARON.

REBER, rā'bĕr, FRANZ VON (1834–). A German art historian, born at Cham, Bavaria. After studying at the universities of Munich and Berlin he went to Rome, and in 1858 became privatdocent and an associate professor at the University of Munich. He was appointed professor at the Polytechnicum there in 1863 and served as director of the Royal Gallery from 1875 until his retirement in 1907. He wrote with sound scholarship on almost all phases of artistic development, but his works have been largely superseded by more recent research. His writings include: *Die Ruinen Roms und der Campagna* (2d ed., 1879); *Geschichte der Baukunst im Altertum* (1864–67); *Kunstgeschichte des Altertums* (1871); *Kunstgeschichte des Mittelalters* (1886; trans., 1887). The two last named, as translated into English by Clarke under the titles *History of Ancient Art* (New York, 1882) and *History of Mediæval Art* (ib., 1887), are widely known in the United States. With Baiersdorfer Reber edited the well-known publication *Klassischer Bilderschatz* (1888–90), for which he furnished the text, and *Klassischer Skulpturenschatz* (1896–1900).

REBER, rā'bâr', NAPOLÉON HENRI (1807–80). A French composer, born at Mühlhausen, Alsace. He studied with Reicha and Le Sueur, wrote chamber music, and set to music the new songs of the best French poets. He became professor of harmony at the Conservatory in 1851 and succeeded Halévy as professor of composition in 1862. He was inspector of the branch conservatories from 1871 and elected to Onslow's chair in the Academy in 1853. Among his works are a ballet, *Le diable amoureux* (1840); the comic operas, *La nuit de Noel* (1848), *Le père Gaillard* (1852), *Les papillotes de M. Benoist* (1853), and *Les dames capitaines* (1857). His works, which are written in the spirit of the German classics, include also four symphonies, one overture, and one suite for the orchestra, considerable chamber music, pieces for the pianoforte and violin, and about 30 songs, besides *Vocalises* for soprano or tenor. His *Traité d'harmonie* (1862) ranks among the best modern works on theory and has been reprinted several times. He died in Paris.

REBIKOV, rā'bê-kôf, VLADIMIR IVANOVITCH (1867–). A composer of the ultra-modern school, born at Krasnoyarsk, Siberia. He studied music in Germany under Mühler and Jaksch, founded in 1897 the Composers' Society at Odessa, and until 1902 conducted the Imperial Musical Society at Kishinev. In 1901 he settled in Moscow and after a short stay at Berlin settled definitely in Vienna, devoting himself to musical composition. Rebikov's music, apparently written solely for certain effects, is vague and formless when judged by accepted standards.

His "melomimics," short lyric pieces without words in which music and mimicry are supposed to explain or interpret one another, are scarcely to be taken seriously. His works include two operas, *The Storm* and *Elka;* three orchestral suites, *The Ballet, Dreams,* and *Suite Miniature;* three symphonic poems; many choral compositions, and soli for voice and orchestra.

REBMANN, rĕp'man, JOHANNES (1820–76). A German missionary and African explorer, born at Gerlingen, Württemberg. He was sent by the British Church Missionary Society to Mombasa, East Africa, as an assistant to Krapf, with whom in 1849 he discovered the mountains Kilimanjaro and Kenia. Rebmann spent 38 years in Africa and acquired considerable knowledge of several of the native languages. He published a *Dictionary of the Kimiassa Language* (1877) and a map of East Africa (1856) in Petermann's *Mitteilungen.*

REBOLLEDO, rā'bō-lyā'dō, BERNARDINO DE, COUNT (1597–1676). A Spanish poet, born at León. From his youth he was a soldier and fought against the Turks and in Barbary and in the Thirty Years' War He was made Ambassador to Denmark (1647) and afterward to Sweden and lived for many years in the North. In 1663 he was appointed Minister of State, a post he held until his death. His works include: *Ocios* (1650), a poem; *Selva militar y política* (1652), a didactic poem; *La constancia victoriosa* (1655), and some epistles, epigrams, and excellent ballads. His style is prosaic, but it is simple and usually unaffected. The three-volume edition of his works (Madrid, 1778) contains a biography.

REBOUX, rē-bōō', PAUL (1877–). A French poet and novelist, known particularly for his exotic fiction He was born in Paris and became director of the review *Les Lettres.* His verse includes: *Les matinales* (1898); *Les iris noirs* (1899); *Missel d'amitié* (1900). Among his novels are: *Josette* (1903); *La maison de danses* (1904); *Le phare* (1907); *A la manière de . . . pastiches* (1908); *La petite papacoda* (1911); *Le jeune amant* (1913).

RE'CALES'CENCE. See HEAT.

RECALL. A method of removing from office before the expiration of his term an official who has proved unsatisfactory to his constituency. Such an institution appeared in the Continental Congress and has long been employed in the Swiss canton of Schaffhausen. As a result of a quite independent political development, a provision for recalling elective officials was incorporated in the Los Angeles charter of 1903 Seattle adopted the recall in 1906, and in the succeeding five years it made its appearance in numerous municipal charters throughout the country, especially associated with the commission form of government. In the same period the recall was incorporated in several State constitutions, extending to legislative and administrative officers, and, in the case of Oregon, Arizona, and California, to judicial officers as well.

The machinery of the recall differs in detail from jurisdiction to jurisdiction. In order that a recall election may be instituted, a petition, signed by a specified proportion of the voters, must be filed with the appropriate officials, who, after satisfying themselves as to the genuineness of the signatures, order an election. There is considerable variety in the proportion of voters required for a recall petition. In St. Joseph, Fort Worth, Grand Junction, and Berkeley only 20 per cent of the voters are required. In Iowa, Kansas, Oregon, and in many cities the proportion is 25 per cent; in a few instances the proportion runs to 35 per cent or even higher. In Iowa cities the voting population, of which the recall petitioners must represent a definite proportion, is determined by the aggregate vote for all candidates for mayor in the next preceding election. In Los Angeles it is determined by the total vote for candidates for the particular office it is sought to vacate; in Fort Worth, by the entire population entitled to vote at the election.

In most instances some restriction is placed upon the employment of the recall. In Oregon no petition may be circulated against a State official unless he has held office for six months, excepting members of the Legislature and Senate, who may be recalled after five days from the opening of the legislative session following their election. After one unsuccessful recall election has been held, no further petition will be entertained unless the petitioners pay into the public treasury a sum sufficient to defray the cost of the election.

The recall has been vigorously attacked on the theoretical ground that it creates an insecurity in office that tends to deter the better sort of men from becoming candidates for office, and that, when extended to judges, it destroys the independence of the judiciary. Practical experience with the institution indicates that it is too cumbersome a device to be employed freely. The instances in which the recall has been applied to judges have been very few and discriminating. Nor in the case of elective officers has the complaint arisen that the recall has been used without good ground. Many political scientists look upon the recall as a natural complement of the tendency towards concentrating responsibility in the hands of a small number of officials, as in the commission form of government.

Phelps (comp.), *Selected Articles on the Recall* (2d ed., ib., 1915).

RÉCAMIER, rā'kà'myā', JULIE, MADAME (1777–1849). A French leader of social and political circles, born at Lyons. In 1793 she married a wealthy but aged Parisian banker, Jacques Récamier, and his wealth enabled her to shine in society. Her salons became famous as the rendezvous of the foremost writers and thinkers of the time. For Madame de Staël she had a great and lasting regard, and in 1806, after M. Récamier was ruined, she was the guest of Madame de Staël at Coppet in Switzerland. In 1811 Napoleon ordered her to leave Paris on account of her political views, and she then resided for several years in Switzerland. In 1815, however, she returned to Paris and established herself in the Abbaye-aux-Bois, where she was the centre of a group of the brilliant men and women of the time. The only suitors for her hand towards whom she evinced any partiality were Prince August of Prussia and, later, Châteaubriand. The history of their efforts to win her in marriage is well known, but, though

her husband died in 1830, she remained a widow until her death. Consult: *Souvenirs et correspondance tirés des papiers de Madame Récamier* (Paris, 1859); Madame Lenormant, *Madame Récamier* (ib., 1872; Eng. trans. of these two, Boston, 1867, 1869); Châteaubriand, *Mémoires d'outre tombe*, vols. viii–x (Paris, 1848); H. N. Williams, *Madame Récamier and her Friends* (London, 1901); E. Herriot, *Madame Récamier* (2 vols., New York, 1906).

RECANATI, rā'kä-nä'tē. A town in the Province of Macerata, Italy, situated on a hill between the Musone and the Potenza, 15 miles south of Ancona. It has a fourteenth-century Gothic cathedral, a statue of the poet Leopardi, a library, and a new town hall. There are manufactures of silk, and wine and olive oil are made. Pop. (commune), 1901, 15,586; 1911, 15,297.

RE'CAPIT'ULA'TION THEORY (Lat. *recapitulatio*, from *recapitulare*, to recapitulate, from *re-*, back again, anew + *capitulum*, chapter, dim. of *caput*, head), or BIOGENETIC LAW. A statement of the fact that the development of the individual is an epitome of that of the order or class to which it belongs. The basis of the law or principle is the well-grounded view or assumption now universally held by biologists that all animals have had a common ancestry, proved by the fact that all the animals whose embryological development has been carefully studied pass through stages or temporarily inherit structures or states of structures which are permanent in and characteristic of the more primitive or ancestral members of the class to which they belong. Cf. PALINGENESIS. See BIOGENESIS.

RECAP'TION. In law, the right which a person has to retake without legal process goods and chattels of which he has been illegally deprived by another. The right is one of the surviving forms of self-help (q.v.), or of direct remedy for a wrong suffered. In general one may pursue a thief and retake by force an article which the latter has wrongfully seized, but the right extends even to the case where a person has under a claim of right taken a chattel out of another's possession and detains it on his own premises, or where one has, however innocently, come into possession of goods and chattels of another, or where a person's goods have by accident fallen upon the land of another. But the right is in every case, except that of a forcible taking out of possession, restricted to a peaceful reception and will not justify an assault on the person of the wrongful possessor or a breaking into the house in which the property is detained. See REPLEVIN; TRESPASS.

RECAP'TURE. In international law, a term having reference to the retaking by an armed vessel of one belligerent or its ally of a prize captured by a vessel of the other belligerent from a subject or citizen of the first. To adjust the conflicting rights of original owner and recaptor, a legal fiction, the *jus postliminii* of the Romans, was devised. According to this rule the title to property recaptured from an enemy in war was revested in the original owner upon payment of salvage to the recaptors. The rights of persons recaptured from the enemy were restored upon the payment of a certain sum. The amount of salvage is determined by a prize court in accordance with the law of the state to which the recaptor belongs. The law of the United States recognizes the principle of reciprocity as regards the amount paid foreign vessels recapturing American vessels from the enemy.

RECEIPT' (OF. *recete, recepte*, Fr. *recette*, from ML. *recepta*, receipt, fem. sing. of Lat. *receptus*, p.p. of *recipere*, to receive, from *re-*, back again, anew + *capere*, to take). The transaction by which one takes into his possession or custody property delivered to him by another. It is also the technical name for an acknowledgment of the receipt of property executed in writing by one who has taken the property into his possession or custody.

A written receipt is evidence only of the fact that money or property was received by the persons executing it. It does not differ in legal effect from any other evidence of the fact of receipt, although it may be more conclusive than mere verbal testimony. A written receipt may accordingly be explained or contradicted by other evidence and will have no effect if fraudulently procured or if untrue in fact. It is owing to its character as evidence that a receipt is to be distinguished from a release (q.v.), which operates as a discharge or extinguishment of a legal obligation. In a few States, however, notably New York, it has been held that a simple receipt, when given with intent to extinguish a debt, would be deemed a gift of the debt, although given without consideration, and would thus extinguish the debt. A receipt is not subject to the parol-evidence rule. (See EVIDENCE.) It may, however, be incorporated in a contract, as in the case of bills of lading (see BILL OF LADING) or warehouse receipts (see WAREHOUSE RECEIPT), which may and usually do contain both a receipt for the goods delivered to the carrier or warehouseman and a contract fixing the terms of the bailment. So far as the bill of lading or warehouse receipt is a contract it is subject to the parol-evidence rule and cannot be contradicted by oral testimony, but its effect as a receipt may be explained or contradicted by such testimony. This rule, however, varies when the bill of lading or warehouse receipt has been indorsed to an innocent holder for value. The carrier or warehouseman will then be estopped to deny the receipt as written. It seems probable that one delivering property or paying money in performance of a legal obligation may not lawfully demand a receipt as a condition of the performance of his obligation. The question, however, is not settled. Receipts are required by statute to be given in some cases. Consult the authorities referred to under CONTRACT.

RECEIV'ER (OF. *recevour, receveur*, Fr. *receveur*, from *recevoir*, to receive, from Lat. *recipere*, to receive). An indifferent person between the parties to a litigation appointed by a court of equity to take charge of and preserve property or money involved in the litigation and to collect the rents, issues, and profits thereof pending a final disposition of the controversy. A receiver is an officer of the court. Property placed in his care is regarded as being *in custodia legis*, to be administered by him under direction of the court; and it is thus not subject to other judicial process, and jurisdiction cannot be acquired over it by other courts having concurrent jurisdiction over the subject of the suit. See JURISDICTION.

The appointment of a receiver is one of the important forms of the preventive remedy exercised by courts of equity and is of great benefit when there is danger that property which is the

subject of judicial controversy may be wasted, destroyed, or removed from the jurisdiction of the court pending the litigation. By the appointment of a receiver the court insures the preservation and final appropriation of the property as its decree may direct. As the mere legal custody of the receiver is sufficient for this purpose, he acquires no title to the property. He is a ministerial officer, and in general his powers are those only which are granted by the order or decree appointing him. If acting within his powers he has some discretion and may exercise his judgment as to the manner of their exercise. In that case he is not liable for errors of judgment, but if negligent or acting outside his authority, he is personally liable for his misconduct. When in doubt as to his powers he may apply to the court for authority and direction. A creditor or other interested party may also apply to the court for modification of the order appointing the receiver or for supplementary orders to govern his conduct or in a proper case for an order removing him. In general a receiver has no authority to sue unless directed by the court to bring an action; and action may not be brought against him without the express authority of the court. The powers and duties of receivers are now generally regulated by statute or by rules of court.

The following are the more important cases in which a receiver will be appointed: (1) When there is no present legal owner of property involved in the proceeding, although the parties to the litigation are equitably entitled to it, as in case of an intestate's personal property. The same relief is now generally obtained by the appointment of a temporary administrator. (2) When the legal owner is incompetent to manage his property, as in case of infancy or lunacy, and there is no guardian or commission having legal authority to protect the property. In most jurisdictions guardians of infants and committees of lunatics have statutory authority sufficient to render the appointment of a receiver in such cases unnecessary. (3) When the litigants are equally entitled to the custody of the property and justice requires that neither one should be permitted to control it to the exclusion of the other and circumstances do not permit their joint control, as in the case of the dissolution and winding up of a partnership or the partition of real estate. (4) When the title or possession of property is held by one in a fiduciary capacity or relation who is not properly performing his trust, as a mortgagor in an action to foreclose a mortgage, a trustee in an action for an accounting, or one having property claimed in a judgment creditor's action. (5) When the appointment of a receiver is necessary to assist in carrying out the decree of the court, as where in judgment creditors' actions, in order to satisfy the judgment, a receiver must sell property which had been conveyed in fraud of creditors.

The appointment of a receiver is always a matter within the discretion of the court and cannot be claimed as an absolute right.

The expenses of a receivership, including the receiver's own fees, are a first lien on the property held by him as receiver. In some cases the court will authorize a receiver to raise money for the purpose of preserving the property and continuing it in business by issuing receiver's certificates, which are made a first lien on the property. This will ordinarily be done only when some public interest will be subserved by the continuance of the business, as in the case of railroads or other public-service companies. Such certificates, when issued, are nonnegotiable securities, payable out of the fund in the receiver's hands. They create no personal liability, and their validity depends upon their compliance with the order authorizing their issue. If issued below par the holder can recover only the amount actually received for them by the receiver unless he was authorized to issue them at a discount. One who indorses a receiver's certificate does not become liable as an indorser of negotiable papers, but as a mere assignor only. The holders in general will not be allowed to sue upon them, but may in a proper case obtain an order of the court directing their payment. Consult: J. W. Smith, *The Law of Receiverships* (Chicago, 1897); W. A. Alderson, *Practical Treatise on the Law of Receivers* (New York, 1905); J. L. High, *Treatise on the Law of Receivers* (4th ed., Chicago, 1910); W. W. Kerr, *Law and Practice as to Receivers* (6th ed., Toronto, 1912). See CHANCERY; EQUITY.

RECEIVING SHIP. In the United States navy vessels are stationed at each navy yard for the enlistment of men and to furnish quarters for them from the time of their enlistment until drafted into seagoing ships. While on board these receiving ships the men are drilled and trained as far as the time of their retention and other circumstances will permit. On some receiving ships there are schools for yeomen (ship's clerks), petty officers, etc.

RECEIVING STOLEN GOODS. A criminal offense which consists in taking possession or control of stolen goods with a guilty knowledge of the fact and with the fraudulent or dishonest intention of continuing to deprive the rightful owner of the possession of his property. By the early common law in England the offense was merely a misdemeanor, but by statute it has been made a felony. In the majority of the United States it is a distinct criminal offense, classed as a felony, and is punishable with about the same severity as larceny. A number of States classify the offense under the general head of larceny. Consult the authorities referred to under CRIMINAL LAW. See STOLEN GOODS.

RECENT PERIOD (Lat. *recens*, fresh, new). In geology, the name given to the epoch that has elapsed since the Pleistocene and the beginning of history. Many geologists now include it under the Pleistocene period (q.v.).

RECERCELÉE. See CERCELÉE.

RECESSIVE CHARACTERS. See HEREDITY.

RECHABITES, rĕk'ă-bīts (Heb. *Rēkābim*, from *Rēkāb*, Rechab). A Kenite clan (see KENITES) who retained their nomadic habits and mode of life in the midst of agricultural Palestine. The notices of them in the Old Testament are too few to make it possible to trace with any definiteness either their origin or history. According to 2 Kings x. 15–28, Jehonadab, the son of Rechab, displayed great zeal for the Yahwe worship in the days of Jehu. The Rechabites are said to have taken refuge in Jerusalem when Nebuchadnezzar invaded the land (Jer. xxxv). In Neh. iii. 14 Malchiah, the son of Rechab, is mentioned as one of those who assisted in rebuilding the walls of Jerusalem. The Rechabites seem to have maintained the old nomadic customs and rites and opposed the higher forms of culture. They lived in tents, built no houses, sowed no seed, planted no vineyard, and drank no wine, obeying the injunction

of Jehonadab, the son of Rechab. The same conservative tendency appears in various incidents in the Old Testament. For example, in the narrative of Cain and Abel a distinct preference is shown for Abel, the pastoral nomad, over Cain, the agriculturist. And again in Gen. ix. 20–27 a point of view similar to the Rechabite seems to be represented in the story of Noah and the vineyard which he planted. In 1 Chron. ii. 55 certain families of scribes dwelling at Jabez, such as the Tirathites, the Shimeathites, and the Suchathites, are said to be Kenites "that came of Hemath, the father of the house of Rechab." The promise that there would always be a man of the Rechabites to stand before Yahwe (Jer. xxxv. 10) was interpreted by R. Jonathan to mean that they were to become scribes and members of the Sanhedrin. But the phrase seems to refer to some priestly function; and it is not improbable that the abandonment of the nomadic life and elevation into some position in the lower clerus led to the justificative story in Jer. xxxv. Consult: W. H. Bennett, *Commentary on Jeremiah* (London, 1895); Karl Budde, *The Religion of Israel to the Exile* (New York, 1899); Nathaniel Schmidt, "Book of Jeremiah," in *Encyclopædia Biblica* (ib., 1901); Barton and Eisenstein, "Rechabites," in *The Jewish Encyclopædia* (ib., 1905); W. R. Smith, *Lectures on the Religion of the Semites* (new ed., ib., 1907).

RECHBERG UND ROTHENLÖWEN, rĕK'-bĕrK ụnt rō'tɛn-lē'vɛn, JOHANN BERNHARD, COUNT VON (1806–99). An Austrian statesman. He studied at Strassburg and Munich and, entering the Austrian diplomatic service as attaché of the Embassy at Berlin in 1828, became Secretary of Legation at London in 1830, and later held appointments at Darmstadt (1833–36), Brussels (1836–41), Stockholm (1841–43), and Rio de Janeiro (1843–47). Returning to Austria he aided Prince Metternich during the revolution of 1848, became Austrian *internuncius* at Constantinople in 1851, and in 1853–55 was associated with Radetsky in the government of Lombardo-Venetia. In 1855 he went to Frankfort as Austrian representative and as President of the Federal Diet. Rechberg was Minister-President in 1859–60, and Minister of Foreign Affairs in 1859–64. For history of the period of his ministry, see sections on *History* under GERMANY and AUSTRIA-HUNGARY.

RECIDIVISTS (from Lat. *recidivus*, falling back, from *recidere*, to fall back, from *re-*, back again, anew + *cadere*, to fall). The term applied in penology to those who have been more than once sentenced for crime, i.e., old offenders. It is a striking commentary on the effectiveness of penal systems that according to official returns from the leading nations of the world the recidivists are 40 per cent or more of the prison population. Z. R. Brockway estimated the percentage in the prisons of New York at not less than 60; while W. D. Morrison, of England, estimates that the percentage is not less than 70. It is even possible to find an individual who has been arrested 1000 times, while in the large cities, even of America, individuals who have served more than 100 short sentences are by no means unknown. H. M. Boies estimates that "at least two-thirds of the crimes in America are committed by recidivists and that the yearly cost of their incarceration could be estimated at $400,000,000."

In his intensive study of the *English Convict* Dr. Goring shows that recidivism is especially common among defectives, among persons not used to regular labor before their first conviction (unemployables), and among those of a demonstrably neglected childhood. To meet the problem of recidivism the traditional method is increasing severity of punishment for second and later offenses. The modern tendency, still far from paramount, is to strike at the roots of recidivism through provision of satisfactory employment for discharged convicts, through industrial training in penal institutions, permanent segregation of defectives, systematic care of orphaned and deserted children, etc. See CRIMINOLOGY; PENOLOGY; and the references there given.

RECIFE, rā-sē'fā. The capital of the State of Pernambuco, Brazil. See PERNAMBUCO.

RECIPROCAL (from Lat. *reciprocus*, alternating, reciprocal, probably from **recus*, backward, from *re-*, back again, anew + *procus*, forward, from *pro*, before). One number is said to be the reciprocal of another if their product is unity. For example, $a \cdot \frac{1}{a} = 1$, hence a and $\frac{1}{a}$ are reciprocals. Also $\frac{a}{b} \cdot \frac{b}{a} = 1$, hence $\frac{a}{b}$ and $\frac{b}{a}$ are reciprocals. The term is variously used in geometry. See DUALITY; POLE AND POLAR.

Reciprocal Equations. An equation is said to be reciprocal when its roots admit of being arranged in pairs of the form $r, \frac{1}{r}$. In the case of a reciprocal equation of even degree the coefficients of the terms equidistant from the extremes are equal and have the same sign. In the case of those of odd degree the coefficients of the terms equidistant from the extremes have the same absolute value and have either the same or opposite signs. One root of a reciprocal equation of odd degree must therefore be + 1 or − 1. Dividing by $x \pm 1$, such an equation reduces to one of even degree.

RECIPROCITY, rĕs'ĭ-prŏs'ĭ-tĭ (from Lat. *reciprocus*, alternating, reciprocal). A tariff policy under which two or more sets of tariffs contemporaneously exist; a high schedule of duties for countries which have entered into no special agreement with the enacting country, and one or more lower schedules for such others as may be willing to offer correspondingly reduced schedules in return. The reciprocity system sprang up as a means of relief from the old navigation laws, and was then gradually extended, not only to tariff duties, but to general matters of commercial privilege as well. The organization of the German Zollverein (q.v.) gave a strong stimulus to the idea of mutual freedom of exchange, and the movement thus begun gradually developed into a semi-free-trade era, which lasted until about 1870. Great Britain repealed the Corn Laws during the years succeeding 1846, and in 1860 negotiated a treaty with France containing liberal commercial concessions. This was followed by some 27 other reciprocal arrangements between the leading European states, which resulted in great freedom of exchange and largely stimulated trade. A similar movement in the United States culminated in the liberal tariffs of 1846 and 1857. Very generous treaties of reciprocity were negotiated by the United States with the German Zollverein and Mexico, respectively (1844 and 1859), but both failed of ratification.

The first real experiment in reciprocity made by the United States is found in the Canadian Treaty of 1854. Between the years 1846 and 1855 it was several times sought to secure the passage of concurrent legislation by the making of mutual tariff concessions by the two countries. These efforts failed, partly for political reasons, but largely because of difficulties connected with the allied questions of fisheries and the navigation of the St. Lawrence. Finally the reciprocity treaty was negotiated, and passed by the Senate (receiving the President's signature Aug. 5, 1854), owing largely to personal work in Washington by Lord Elgin, then Governor-General of Canada. As ultimately adopted the Canadian treaty covered the navigation of the St. Lawrence, the fishery question, and provided for mutual free trade between Canada and the United States in a long list of articles, the growth or the products of the two countries. This list included most foodstuffs, a wide variety of raw materials, and coal, wood, rough lumber, etc. The immediate effect of the treaty was apparently to stimulate trade. Its popularity, however, received a severe blow in the crisis of 1857, which reduced both the imports and exports of the United States in the Canadian trade, but the volume of business almost immediately revived. Various complaints, however, arose against continuing under the treaty, a principal objection being that the Canadians were not keeping good faith. Commissioners of the United States examining into the advisability of the reciprocity relations made diametrically opposite reports. Between 1860 and 1865 the question of abrogating the treaty was much discussed in Congress. The strained relations with England on account of the *Alabama* claims brought the question to the front and finally, in 1865, a Senate resolution terminating the agreement was concurred in by the House, being signed by the President on Jan. 18, 1865. The relations of the United States with Canada under the treaty closed March 17 of the same year. Since that time numerous efforts have been made to renew the reciprocity trade relations between the two countries—in 1866 by a Canadian delegation, followed by other Canadian attempts in 1869 by Sir John Rose and in 1873 by George Brown and Sir Edward Thornton—all with no result In 1890–92 Hon. (now Sir) Robert Bond, of Newfoundland, was a delegate to Washington in behalf of a reciprocity treaty with that colony and succeeded in negotiating the Bond-Blaine convention, but it was never ratified. So also various bills and resolutions for reciprocity with Canada were tabled or voted down in Congress from time to time. Attempted amendments to tariff bills met the same fate. A later development in the struggle for better trade relations with Canada was the appointment of the Anglo-American Joint High Commission, on which the United States, Britain, Canada, and Newfoundland were represented, which was to settle practically all points in dispute between the British Empire and the United States, including reciprocity. Its work was without practical result. During the years 1902–03 an unusually strong agitation for reciprocity with Canada sprang up in the Northwest and in New England. This was due to the growing need for cheap lumber, ores, and coal along the northern boundary of the United States. The subject of reciprocity with Canada came into prominence with the passage of the Payne-Aldrich Tariff Law in 1909. Canadian and American commissioners worked out a project to be submitted to their respective national legislatures, providing for mutual free trade in many of the products of the two countries, such as foodstuffs, and reduced rates on manufactures. The project, though very unpopular in parts of the country, especially the Middle West, carried in Congress in 1911. The opposition in Canada was stronger, and after an unsuccessful appeal to the country the Liberal party went out of power and the reciprocity project was abandoned.

An important experiment in reciprocity was undertaken in the Treaty of 1875 between the United States and Hawaii. The plan of annexing the Hawaiian Islands had been brought forward several times before 1875, and one or two abortive efforts to secure a reciprocity treaty with them had been made. What finally forced the question upon the attention of Congress was the growing power of England in the Pacific and the development of British trade with the islands, added to the fact that American citizens had acquired large holdings of land in Hawaii and were desirous of receiving discriminating trade advantages. The signal for action was given by internal disturbances in the islands in 1874 and the accession of a king strongly favorable to American interests. A treaty was finally negotiated and was signed by the President on April 17, 1875, going into effect June 30. A bill to make the modifications of duties rendered necessary by the treaty was brought up and passed in the House of Representatives. By this treaty the United States admitted, free of duty, sugar and a few tropical products, including rice, while Hawaii relieved of duty various kinds of agricultural and meat products as well as machinery and other manufactures. At the time the treaty was adopted United States imports from Hawaii amounted to about $1,300,000 annually, exports being a little over $600,000. No reduction in the price of sugar resulting, there naturally occurred a great increase in the price of sugar lands in Hawaii and a great growth in exports of sugar to the United States. This meant, of course, a corresponding loss of duties to the government without any compensating growth of exports to the islands. It was estimated that the duties lost to the United States during the life of the treaty ranged from $2,000,000 to $12,000,000 a year. In 1883 the question of renewing the treaty (first concluded for seven years) came up in Congress and strong opposition to it was shown; but a new agreement was finally ratified and put into effect (Dec. 7, 1887). The growth of hostile feeling displayed during this reciprocity struggle had, however, alarmed the sugar interests, who now began to fear the ultimate abrogation of their reciprocity privilege. This fear led to a vigorous annexation movement in the islands, resulting eventually in the annexation of the islands in 1898.

During the decade 1880–90 reciprocity first began to be advocated in the United States as a definite tariff policy. The revision of the tariff by the Republicans in 1883 was unsatisfactory to the manufacturers, who were beginning to build up an export trade and who wanted larger foreign markets. In 1883 a treaty was negotiated with Mexico, and in 1884 one with Spain for Cuba and Porto Rico

and another with Santo Domingo were arranged, but they were all either killed or withdrawn by President Cleveland. In 1884 President Arthur, under authority from Congress, sent a commission to visit the South American countries and discuss the question of reciprocity with their governments. On its return a report was made by the commission in which tariff reductions on wool and sugar were laid down as a necessary basis for reciprocity with South America, and practical failure in negotiations was reported as a result of the commission's lack of power to hold out promises of such concessions. About this time President Cleveland took office (1885) and sought to secure general tariff revision in place of further efforts to get reciprocity treaties. A Republican majority, however, appeared in the Congress which met in 1889, and that party concluded to act upon the recommendation made by the South American commission that a Pan-American Congress be summoned to discuss trade relations. Such a congress met in 1889 at Washington under the title of the International American Conference. This body favored reciprocity, but indicated that tariff treaties must be based upon real reductions of duty on important articles. Many delegates expressed great doubt as to the intentions of the United States in this respect, and the general result of the conference was rather discouraging.

A considerable surplus had been accumulated in the national treasury during the first Cleveland administration, and it was desired by the Republicans on coming into office in 1889 to reduce income without lowering the tariff in general. This was done by the McKinley Act (1890), which admitted raw sugar free of duty and offered a bounty to domestic sugar growers. At the same time it was sought to appease the exporters (who wanted large markets) by using the reduction of sugar duties as a means of forcing corresponding reductions in foreign tariffs. This attempt was made in Section 3 of the McKinley Act, known as the reciprocity section, in which the President was ordered to impose specified duties upon raw sugar, molasses, coffee, tea, and hides, otherwise to be admitted free, unless the countries of origin should grant compensating tariff concessions. The principal article included in the reciprocity section was, of course, sugar; and this was admirably adapted for use as a basis for tariff bargaining, because of the sugar-bounty system of Europe. The bounty system had resulted in tremendous overproduction of sugar and had thus led to a great desire to find outside free markets for it. In the debate on the McKinley reciprocity section the meaning of the policy was explained with greater fullness than ever before. It was shown (1) that the products admitted to the United States must not compete with those produced there; (2) that the countries traded with must be such as would take the surplus of manufactures and farm-produce; and (3) that the volume of trade gained by the United States under any agreement must be equivalent to that granted to the foreign country. The McKinley Act was adjudged constitutional by the Supreme Court (Fields *v.* Clark and Boyd *v.* U. S.), and Mr. John W. Foster, representing the State Department, negotiated treaties under it with Brazil, Spain for Cuba and Porto Rico, and England for Jamaica, Trinidad, Barbados, Guiana, and the Leeward and Windward islands. Treaties were also signed with Santo Domingo, Guatemala, Salvador, Costa Rica, Honduras, and Nicaragua. These treaties closely resembled one another and were designed to carry out the idea of South American reciprocity. They all included reductions of duty on live animals, some grains, corn, meat products, bridge-building materials, cottonseed and its products, cars, wagons, etc., railway material, timber, and iron for shipbuilding, and engines. Colombia, Haiti, and Venezuela declined to make tariff treaties; and President Harrison, therefore, enforced against them the retaliatory duties provided in the McKinley Act. Treaties of a rather different sort were negotiated with Germany and Austria-Hungary, by which were secured some reductions on certain cereals, meat products, flour, etc., and on sundry manufactures of cotton, wood, chemicals, and machinery. These were the so-called beet-sugar treaties. Little effect could be seen as a consequence of the reciprocity treaties, but it should be noted that during the life of these agreements trade conditions all over the world were much disturbed, so that the period was not a good one for observing their working.

The accession of President Cleveland to office for the second time (1893) was the signal for an effort to reduce the tariff. A bill introduced by William L. Wilson for this purpose retained raw sugar on the free list as well as coffee, tea, and hides, and reduced the bounty to domestic growers. In the Senate, however, the tariff on raw sugar was restored. It had not been intended by Mr. Wilson to interfere with the existing reciprocity treaties, although he did not intend to repeal the section granting power to impose retaliatory duties. The reimposition of the sugar tariff, however, ipso facto abrogated the treaties, and protests were filed by the representatives of Germany and Austria, while complaints were made by Brazil, Guatemala, Nicaragua, Costa Rica, and Santo Domingo. Trade, however, does not appear to have been materially affected by the abrogation of the reciprocity treaties, save in one or two unimportant cases. In some instances an improvement in trade followed. One of the first acts of the Republicans, as they gradually regained power after the passage of the Wilson Bill, was to announce their allegiance to reciprocity as a policy. A crop of bills and resolution on the subject came up in the first session of the Fifty-fourth Congress and were referred to the House Committee on Ways and Means.

The Republican victory of 1896 was interpreted as a verdict in favor of higher tariff duties and of reciprocity treaties. A bill providing for both had been drafted, and was early introduced, by Mr. Dingley. In this bill as first presented, reciprocity like that of the McKinley Act was contemplated. The original draft offered moderate reductions of duty upon various commodities, but while the bill was under debate an amendment was offered authorizing the President to negotiate reciprocity treaties which should later be ratified by the Senate. As finally passed the Act thus authorized the Executive to conclude treaties based upon a few unimportant commodities and to negotiate such other reciprocity treaties as he might deem appropriate for submission to the Senate. President McKinley, under this Act, appointed Hon. John A. Kasson special com-

missioner for the negotiation of reciprocity treaties. Treaties were negotiated and proclaimed with France, Portugal, Germany, and Italy. Later an arrangement with Switzerland was executed. No agreements with South American countries were entered into. The treaties with the European countries mentioned secured favorable treatment for a few agricultural products, oils, and some machinery. These reciprocity treaties were the only ones in operation in 1915. Mr. Kasson, however, negotiated treaties with various countries under the clauses of the Dingley Act authorizing the President to secure such agreements as he might deem best for submission to the Senate. These Kasson treaties included treaties with France, Great Britain on behalf of Barbados, British Guiana, Turks and Caicos islands, Jamaica, and Bermuda, Denmark for St. Croix, and with Ecuador, Nicaragua, and Santo Domingo. These had nearly all been sent to the Senate by the end of 1899. They were coldly received and referred to the Foreign Relations Committee. The treaties with South American countries were chiefly concerned from the side of the United States with reductions on cane sugar, tropical fruits, wool, and a few other products; that with France made some concessions on knit goods, bric-a-brac, cheap jewelry, cutlery, and similar small articles. None of them was seriously discussed except that with France, and even in that case so loud a protest was raised by manufacturers who conceived their interests to be attacked that the treaty was pigeonholed. It was, however, very generally conceded that the terms of this agreement were unexceptionable. A general reciprocity discussion began in the newspapers, and protectionists displayed a strong disposition to repudiate the whole reciprocity policy. It was more and more felt that danger inhered in the discussion of such treaties because of the probability that they would make a breach in the protection system which might lead to too general tariff revision. This opinion was distinctly voiced in the so-called reciprocity convention of manufacturers which met in Washington in October, 1901. President McKinley, however, seemed inclined to recede from his advanced protectionist position, and in a noteworthy speech at the Buffalo Exposition, just prior to his assassination, in September, 1901, had taken strong ground for reciprocity.

No treaty with Cuba had been negotiated by Mr. Kasson. This was due to the fact that the war and subsequent negotiations with Spain lasted during the time that his reciprocity negotiations with the various countries were in progress. After the United States had assumed control of Cuba, it imposed upon the constitutional convention of the Cubans the so-called Platt amendment, which was passed, after much opposition, partly on the strength of an alleged promise made by President McKinley to a delegation of Cubans that, should the amendment be accepted, he would secure a large tariff reduction for Cuban sugar exported to the United States. President Roosevelt attempted to fulfill this supposed promise by urging Cuban reciprocity upon Congress at the session 1901–02. A bill providing for a mutual 20 per cent reduction of duties on Cuban and American products was introduced in the House of Representatives, but met with strong opposition from those representing beet-sugar interests, which had sprung into prominence subsequent to 1890. These men charged that the advocates of reciprocity with Cuba were playing into the hands of the refining combination, which, it was said, had bought largely of Cuban lands and was seeking to secure cheap raw material through reciprocity. As a compromise it was proposed to grant the desired reductions, provided that the protection accorded under the Dingley Act to the process of refining (sugar differential) should be revoked. Such an amendment was incorporated into the reciprocity bill and it was passed by the House. The Senate, however, objected to the amendment and the bill was killed in committee. The autumn elections (1902) strengthened the administration. During the recess a reciprocity treaty was negotiated with Cuba and placed before the Senate at the session 1902–03. Although nothing was then done, a special session of the Senate in the spring of 1903 passed the Cuban treaty. In its original form it secured important reductions on American agricultural and manufactured products exported to Cuba in return for the concession of 20 per cent on Cuban imports to the United States, but the beet-sugar interests contrived to have it amended by a clause providing that no reductions should be granted to any but Cuban sugar during the life of the treaty. This stipulation necessarily implied the destruction of all prospect of passing the other treaties negotiated by Mr. Kasson with South American countries, inasmuch as these were largely based on sugar. Meantime Secretary Hay had negotiated (October–November, 1902) a reciprocity treaty with Newfoundland whereby certain American products were to be admitted to that colony in exchange for bait privileges for American fishing vessels in Newfoundland ports. This treaty was pigeonholed during the session 1902–03, owing to the influence of New England fishing interests.

At the beginning of the European War in 1914 reciprocity in Europe had assumed a form somewhat different from that which has been developed in the United States. That is primarily due to the interpretation put upon what is known as the most favored nation clause in international agreements, an interpretation differing from the meaning assigned to that clause in American diplomacy. According to European usage treaties incorporating the most favored nation clause assure to the signatory countries treatment as favorable as that granted to any other nation. Tariff concessions made to others become at once common to all nations having most favored relations with the country making such concessions. On the other hand, America's statesmen have adhered consistently to the view that trade concessions offered by it to some other country need not become common to a third country unless that third country grants concessions similar to those of the second country. It has been noted that under the European view of the most favored nation clause the reciprocity treaties adopted subsequent to 1860 inaugurated an era of very free trade. This was terminated shortly after 1870, owing partly to the desire to increase national customs revenues and partly to the hostilities engendered by war and political struggles. Elaborate tariffs were adopted by most European countries between 1870 and 1885. These gradually developed into two principal systems—that of general or conventional tariffs and that of maximum and

minimum tariffs. The former is the plan adopted by Germany, Austria, Switzerland, and Italy, while the latter is pursued by France, Russia, Spain, Norway, Greece, and Brazil. Under the general or conventional tariff system a higher schedule is applied to those countries which have entered into no special commercial arrangement, while another or conventional tariff is granted to those which receive favored-nation treatment. Under the maximum and minimum system minimum rates are given to most-favored nations, and the home produce is thus assured fixed protection. Maximum rates, or such others on such articles as the Executive may see fit, are enforced against nations not receiving favored-nation treatment, and the Executive is allowed to bargain with these other countries for mutual tariff concessions. The latter system is of course more flexible than the general or conventional tariff. As against these methods, which might be regarded as general reciprocity, American reciprocity must be placed in the light of a series of special bargains based on no systematic plan. Reciprocity in Europe to-day is represented by the network of commercial treaties existing under these two systems. These have become exceedingly complex and interdependent. Whereas the older notion of reciprocity seemed to be based on mutual concession, the essential idea of the policy to-day seems to be that of retaliation. A movement for higher and higher retaliatory duties seems to be growing very general in Europe, while the introduction of such a system is vigorously urged in England, the classic country of free trade. This is shown by Mr. Chamberlain's proposal in the early summer of 1903 for an Imperial customs tariff, or reciprocity, union between the colonies and the mother country, which would simply mean lower colonial tariffs to English exports, in exchange for retaliatory English tariffs against foreign products competing with those of the colonies. The difficulty, of course, lies in the danger of making food dearer in Europe. It is to be observed that so soon as reciprocity becomes general in scope it is indistinguishable on the one hand from the idea of tariff revision and reduction and on the other from that of tariff retaliation. When not general in scope it implies special arrangements carrying benefits usually to special classes in the community at the expense of other classes.

RECITATIVE, rĕs'ĭ-tȧ-tēv' (It. *recitativo*, from It., Lat. *recitare*, to recite). A species of vocal composition in the older operas and oratorios which differs from an air in having no definite rhythmical arrangement and no decided or strictly constructed melody, but approaches, in tonal succession and rhythm, to the declamatory accents of language; it is, in fact, as near an approach as possible to speech delivered in musical sounds. When any part of a recitative is to be performed in strict time, this is indicated by the words *rec. a tempo.* When a recitative is accompanied merely by a few simple chords of an instrument it is called *recitativo secco* or *parlante*, declaimed recitative. When the voice is accompanied by a considerable portion of the instruments of the orchestra, either in sustained chords or florid passages, it is termed *recitativo accompagnato, stromentato*, or *obligato.* Wagner's recitative is invariably supported by a rich and elaborate orchestral part, a method adopted by all subsequent operatic composers. See LEITMOTIV; MELOS.

RECKE, rĕk'e, CHARLOTTE ELISABETH CONSTANTIA VON DER, usually known as ELISA (1756–1833). A German author, born on the estate Schönburg, in Courland, a daughter of Count Friedrich von Medem. In 1771 she married Baron von der Recke, from whom she was divorced six years later. Her unhappy married life and the untimely death of her daughter produced in her an inclination to mysticism and spiritualism, which was increased through acquaintance with Cagliostro, whom she met at the court of her sister Dorothea, Duchess of Courland. In 1784, while she was living at Karlsbad, she was made aware of Cagliostro's character and was thereupon prompted to write *Nachricht von des berüchtigten Cagliostro Aufenthalt in Mita* (1787), which aroused interest throughout Europe. But her poetic works are mediocre. Catharine II of Russia gave her a valuable country seat. Besides the book mentioned above she wrote *Geistliche Lieder einer vornehmen kurländischen Dame* (1780–1815) and *Gebete und religiose Betrachtungen* (1826). Consult Eberhard, *Blicke in Tiedges und Elisas Leben* (Berlin, 1844).

RECKE, ERNST FREDERIK VILHELM VON DER (1848–). A Danish poet, born in Copenhagen. His first lyric drama, *Bertran de Born* (1873), with music by P. Heise, achieved an immediate success at the Royal Theatre and retains its popularity. His other works also show marked dramatic ability. They include: *Lyriske Digte* (1876); *Kong Liuvigild og hans Sonner* (1878), a tragedy; *Knud og Magnus* (1881), a tragedy; *Fru Jeanna* (1891), an opera; *Hertuginden af Burgund* (1891), a play. He also wrote two creditable books on Danish verse, *Principerne for den danske Verskunst* (1881), with which he gained the doctorate, and *Dansk Verslære i kortfattet Fremstilling* (1885).

RECKLINGHAUSEN, rĕk'lĭng-hou'zĕn, FRIEDRICH VON (1833–1910). A German pathologist, born in Gütersloh, Westphalia. He studied at Bonn, at Würzburg, and at Berlin, where he graduated in 1855. He took up pathology under Virchow and did further work in Vienna, Rome, and Paris. After serving as an assistant to Virchow in the Pathological Institute in Berlin, he became, in 1864, professor of pathological anatomy in Königsberg, whence he was called six months later to Würzburg and thence, in 1872, to the University of Strassburg. His

researches in pathology, especially of the nervous system, were distinctly valuable. He described the "migrating cells of the tissues" and pronounced them identical with the leucocytes. Among his contributions to medical literature are: *Die Lymphgefasse und ihre Beziehung zum Bindegewebe* (1861); *Ueber die multiplen Fibrome der Haut und ihre Beziehung zu den multiplen Neuromen* (1882); *Handbuch der allgemeinen Pathologie des Kreislaufs und der Ernahrung* (1883); *Die Adenomyome und Cystadenome des Uterus und Tubenwandung* (1896).

RECK'ONING (from *reckon*, AS. *ge-recenian*, Goth. *rahnjan*, OHG. *rehhanōn*, Ger. *rechnen*, to reckon; connected with AS. *racu*, account, OHG. *rahha*, thing). In navigation, the reckoning is the calculation of the position of the ship by means of observations of heavenly bodies and the record of courses and distances sailed which is to be found in the log. Dead reckoning (q.v.) is the computation of the ship's position from the record of its movements made in the log without making astronomical observations. See NAVIGATION; SAILINGS.

REC'LAMA'TION. A term applied to the improvement of land for agricultural purposes by draining or irrigation. Below are listed the larger of the irrigation projects of the United States, with the acreage reclaimed or to be reclaimed. *Arizona:* Salt River, 182,000. *Arizona-California:* Yuma, 158,000. *California:* Orland, 20,000. *Colorado:* Grand Valley, 53,000; Uncompahgre Valley, 140,000. *Idaho:* Boise, 207,000, Minidoka, 120,500. *Kansas:* Garden City, 10,677. *Montana:* Blackfeet, 122,500; Flathead, 152,000; Fort Peck, 152,000; Huntley, 32,405; Milk River, 219,557, Sun River, 174,046. *Montana-North Dakota:* Lower Yellowstone, 60,116. *Nebraska-Wyoming:* North Platte, 129,270. *Nevada:* Truckee-Carson, 206,000. *New Mexico:* Carlsbad, 20,261; Hondo, 10,000; Rio Grande, 155,000. *North Dakota:* North Dakota Pumping, 26,314. *Oregon:* Umatilla, 36,300. *Oregon-California:* Klamath, 70,600. *South Dakota:* Belle Fourche, 100,000. *Utah:* Strawberry Valley, 50,000. *Washington.* Okanogan, 10,099; Sunnyside, 102,824; Tieton, 34,071. *Wyoming:* Shoshone, 164,122. See AQUEDUCT; CANAL; CONSERVATION; DAMS AND RESERVOIRS; DRAINAGE; FLUME; IRRIGATION; PUMPS AND PUMPING MACHINERY; TUNNEL; WASTE LAND; WATER METER; WATER SUPPLY.

RECLUS, *re-klu'*, (JEAN JACQUES) ELISÉE (1830–1905). A French geographer, born in the Gironde. He was educated in Rhenish Prussia and subsequently studied at Montauban and under Karl Ritter at the University of Berlin. His republican principles forced him to leave France after the coup d'état of Louis Napoleon in 1851, and he then traveled in Great Britain, the United States, and South America. After his return to France in 1858 he published the results of his travels and geographical studies in several geographical works and in contributions to the *Revue des Deux Mondes* and the *Tour du Monde.* His repugnance to the Napoleonic reign induced him to join the Internationals in 1869 and, arrested as a soldier of the Commune during the siege of Paris in 1871, he was sentenced to transportation for life. Charles Darwin and other distinguished scientists united in a petition to the French government for his recall, on the ground of the services which he had rendered to science and popular education, and in 1872 his sentence was commuted into one of banishment. He then established himself in Italy and later in Switzerland until he returned to France under the amnesty of 1879. In 1882, however, he was condemned with Prince Kropotkin as a leader and organizer of the anarchist movement and again fled to Switzerland. Twelve years later he was sentenced to transportation for 20 years. While in exile in Switzerland he began his masterpiece, *Nouvelle géographie universelle* (20 vols., 1874–94). This work, which was published in English under the title *The Earth and its Inhabitants*, containing over 3500 maps, in addition to numerous engravings, is an evidence of Reclus's remarkable talent for exposition and his extraordinary scientific knowledge. Of his other geographical works mention should be made of *La terre* (1867; 4th ed., 1877; Eng. trans., *The Earth*, 1871); *Les phénomènes terrestres, le monde et les météores* (1872); *Introduction à la géographie de la France* (1905). In 1892 he became professor of comparative geography at the University of Brussels. At the outbreak of the Civil War in the United States his articles were of conspicuous value in arousing public sympathy in France for the administration of President Lincoln. He was a brother of Paul Reclus.

RECLUS, PAUL (1847–1914). A French surgeon, brother of Elisée Reclus, born in Orthez, Basses-Pyrénées. He studied medicine in Paris, graduating in 1876. In 1879 he became hospital surgeon, the next year *agrégé*, and in 1895 professor of clinical surgery in the medical faculty of Paris. He was a member of the Academy of Medicine and was created Commander of the Legion of Honor in 1913. His name is associated with local anæsthesia by cocaine and novocaine and with the disinfection of wounds with tincture of iodine. He is the author, among other works, of *Traité de chirurgie* (1897) and of *Pratique médicochirurgicale* (1907). With Emile Forgue he wrote *Traité de thérapeutique chirurgicale* (1891; 2d ed., 1898).

RECLUSE, *rē-klōōs'* (OF., Fr. *reclus*, from Lat. *reclusus*, p.p. of *recludere*, to shut up, from *re-*, back again, anew + *claudere*, to close). A hermit; more especially one of a class of hermits who, from a motive of special penance or with a view to the more strict observance of Christian perfection, remained shut up from all converse, in a cell or other place of strict retirement. To avoid the danger of the practice of ministering to mere self-will or to fanatical and unbalanced austerity, it was strictly regulated from the middle of the seventh century; and the recluse, who must be a person of tried virtue, was with due solemnity locked up in the presence of the abbot or the bishop, who placed his seal upon the door, not to be removed without the authority of the bishop himself. Nuns also were found to practice the same voluntary seclusion, especially under the rules of the Benedictine, Franciscan, and Cistercian orders. Consult: Ignaz Hauber, *Leben und Wirken der Eingeschlossenen* (Schaffhausen, 1844); L. A. A. Pavy, *Les recluseries* (Lyons, 1875); Armin Basedow, *Die Inclusen in Deutschland* (Heidelberg, 1895).

REC'OGNI'TION (Lat. *recognitio*, from *recognoscere*, to know again, from *re-*, back again, anew + *cognoscere*, from *co-*, together + *gnoscere*, to know). An object is said to be recognized when it appears as familiar. Thus, one recognizes an acquaintance or a locality that has been visited before. It was formerly be-

lieved that the process of recognition consisted in part of the reproduction of earlier experience in the form of images. Experiments have shown, however, that this is not necessarily the case and that the one thing essential to the recognitive consciousness is the feeling of familiarity. (See FAMILIARITY.) Recognition is closely related to memory; in the former the feeling of familiarity is aroused by perception, in the latter by idea. (See MEMORY.) Recognition may be of various degrees of definiteness; thus, we may recognize a face as familiar and yet be unable to name or place it; here the perception arouses the feeling of familiarity without associated ideas; or, to take the other extreme, the perception may call up not only the feeling of familiarity, but also a context of images which name, place, and date the original experience.

There are two forms of recognition, direct and indirect. In direct recognition there arises at once a belief that the object perceived is known; i.e., the perception, of itself, immediately calls up the feeling of familiarity. In its indirect form recognition is brought about mediately; i.e., an object is recognized by means of its environment, by reason of the surroundings in which it is set. This takes place when the object itself fails to arouse the feeling of familiarity and is known only through attendant circumstances either past or present. In process of time objects which have become very familiar, such as one's tools, or breakfast table, or writing desk, are taken for granted; they fail to arouse the feeling of familiarity and are apprehended directly. The feeling has faded out, and is replaced by a nervous disposition, very much as is the case in meaning (q.v.). See APPREHENSION.

Recognition has performed a very important biological function in the history of the race. It is one of the means by which the organism adapts itself to its environment. Like many of the more important emotions—fear, anger, sympathy—it is deeply rooted in instinct. The animal learns to trust that which is familiar, that which has stood the test of acquaintance, and to show distrust in the face of the novel and untried. Thus have developed side by side a pleasant aggressive mood of confidence in presence of the known and an unpleasant shrinking mood of diffidence and dislike in presence of the unknown. The refined and modified successors of these instinctive attitudes persist in our feelings of familiarity and unfamiliarity.

Bibliography. Harald Höffding, *Outlines of Psychology* (Eng. trans., New York, 1891); William James, *Principles of Psychology* (new ed., 2 vols., ib., 1905); Oswald Külpe, *Outlines of Psychology*, English translation by E. B. Titchener (new ed., London, 1909); E. B. Titchener, *Text-Book of Psychology* (New York, 1910); Ebbinghaus and Dürr, *Grundzüge der Psychologie* (Leipzig, 1911–13). Important experimental articles upon recognition are those by Bentley and by Whipple in *American Journal of Psychology*, vols. xi, xii, xiii (Worcester, 1899–1901); by Wolfe, Lehmann, and Höffding in *Philosophische Studien*, vols. iii, v, vii, viii (Leipzig, 1886–93); and by Gamble and Calkins, Fischer, and Heine in *Zeitschrift für Psychologie*, vols. xxxii, xxxiii, l, lxii, lxviii (Leipzig, 1903–14).

RECOGNITION MARKS. The bars and stripes of various animals which Wallace thinks serve for recognition by animals of their own species. He claims that color for recognition is "a totally distinct category, to some extent antagonistic or complementary" to protective coloration (q.v.). Recognition colors and markings are prevalent among butterflies and moths, and among them "its chief function may have been to secure the pairing together of individuals of the same species." Recognition marks during flight are very important for all birds which congregate in flocks or which migrate together, and they usually consist of well-contrasted markings on the wings and tail. These markings occur in pigeons, hawks, finches, warblers, ducks, etc., and are illustrated graphically in *Bird Lore*, vol. iii (New York, 1901). Recognition marks occur in many mammals, such as the zebra, many antelopes, gazelles, and allied African forms, including the eland, koodoo, etc.

On the other hand, objectors assert that such stripes and spots are for protection, i.e., concealment (see PROTECTIVE COLORATION), and that they represent "spots or streaks of sunlight passing through foliage or reflected from leaves." Consult A. R. Wallace, *Darwinism* (2d ed., London, 1890), and Pocock, "Antelopes and their Recognition Marks," in *Nature*, vol. lxii (ib., 1900).

RECOGNIZANCE, rē-kŏg'nĭ-zans *or* rē-kŏn'ĭ-zans (ML. *recognoscentia*, from Lat. *recognoscere*, to know again). An obligation entered into by a person with a court of record, whereby he binds himself under a penalty to do or not to do a particular thing required of him by the court, and which is made a part of the record. Recognizances differ but little in form from ordinary bonds, except that they need not be executed with the same formality, as they are entered into before the court, and that they are commonly given by persons under a criminal charge. In many jurisdictions recognizances need not be signed by the person binding himself, as the simple fact of his assent being made a part of the record by order of the court is considered sufficient.

Recognizances are commonly given by prisoners accused of trivial offenses to secure their temporary release, or even permanent release on probation, and, as the term indicates, they imply a recognition or acknowledgment of the offense. The most frequent conditions are that the recognitor keep the peace or appear at some adjourned hearing of his case. In such a case the prisoner is said to be discharged "on his own recognizance."

Recognizances differ from bail bonds in that the latter are usually required to be executed by sureties who can qualify as owning real estate of a certain value. A further distinction is that a recognizance is usually considered as a sort of conditional judgment, and on the default of the recognitor a *scire facias*, or order to show cause, issues to him, requiring him to show good reason why execution should not issue against him immediately for the amount named in the recognizance. In many of the United States bail bonds have entirely superseded recognizances. See BAIL; BOND.

RECOIL (from OF., Fr. *reculer*, from ML. *reculare*, to go backward, from Lat. *re-*, back again, anew + *culus*, posterior; connected with Ir. *cūl*, back). When a gun is discharged the projectile and the gun move in opposite directions with velocities inversely proportional to their weights. The retrograde movement of the gun is called the recoil and is measured in the

direction of motion. In order to reduce and equalize the strains on the mounting various devices are employed to absorb the energy of recoil. The recoil is limited to the least practicable distance, taking into account stability of the carriage and the strength and permissible weight of material that can be used to advantage in the construction of gun and carriage. Recoil may be controlled by any one of several different methods or by a combination of two or more, usually the latter. 1. *Raising a weight.* In the Buffington-Crozier seacoast carriage the energy of recoil is partly absorbed by raising a counterweight. 2. The *friction of solids,* between the top carriage and the chassis in which it slides. 3. The *resistance of liquids* or the *resistance of air.* The resistance of liquids is used in most field-artillery carriages. A hydraulic buffer, a long cylinder filled with a viscous material like oil, is attached to the gun. In this cylinder works a piston provided with openings or ports. The piston rod, attached to the piston, is in turn attached to the carriage. On recoil the cylinder moves backward, drawing out the piston rod, the oil being forced through the ports, thus absorbing energy. The French carriage employs a pneumatic buffer. 4. The *compression of springs,* surrounding the piston rod, absorbs a small part of the recoil, the stored energy being used to return the gun to the firing position. 5. In automatic and semi-automatic guns the energy of recoil is partly absorbed *in doing work,* such as opening and closing the breach block, extracting and ejecting the cartridge case, firing the gun, etc. 6. Stability of the carriage is of the utmost importance in field-artillery equipments. With a given muzzle energy and limited weight of gun and carriage, stability has been retained by increasing the length of recoil to about 4 feet for 3-inch guns and by lengthening the trail and lowering the centre of gravity of the system Such systems are spoken of as "long recoil guns." 7. *Differential recoil* is a system intended to decrease the recoil energy by opposing to it the forward movement and energy of the gun at the moment of firing. Before firing the first time the gun is hauled back against the resistance of powerful springs. Released, the gun moves forward, is fired by a tripper, and, owing to the energy of discharge, recoils in the opposite direction, thus securing a resultant recoil velocity equal to the difference between the normal recoil velocity and the forward velocity imparted by the springs. See BALLISTICS; FIELD ARTILLERY; MACHINE GUN; ORDNANCE.

REC'OLLET (OF. *recollet,* Fr. *récollet,* from Lat. *recollectus,* pp. of *recolligere,* to recollect, from *re-,* again + *com-,* together + *legere,* to gather). A name given to the members of certain reformed bodies of monastic orders, whether of men or women, in the Roman Catholic church. Among orders of men, an offshoot of the Augustinian hermits, which, under Louis de Montaya, in 1530, obtained considerable popularity in Spain, was called by this name, and the order still exists at Medina-Sidonia, León, and Pamplona. The name is also used for the Reformed Franciscans, who were established in France under Henry IV and Louis XIV and spread thence into Belgium, their houses in these countries and Germany becoming so numerous that they reckoned no less than 10 provinces. A reform of the Cistercian Order of nuns in Spain was called by the same name.

RECONNOISSANCE, rē-kŏn'ĭ-sans (Fr. *reconnaissance,* recognition). The military term used to designate the work of troops or individuals when gathering information in the field. Military information may be considered under two general heads, viz., (1) that collected by the general staff in time of peace, and (2) that obtained by troops in the field after the outbreak of hostilities. Reconnoissance begins as soon as the theatre of possible operations is entered and continues throughout the campaign. No matter what other sources of information of the enemy may be available, reconnoissance must be depended upon to obtain the information upon which all tactical movements of troops should be based.

Aëro Squadron. In forces of the strength of a division or larger the aero squadron will operate in advance of the independent cavalry in order to locate the enemy and to keep track of his movements. Contact with the enemy once gained will be maintained thereafter continuously. This of course presents its special problems which are discussed somewhat fully under *Information* in the article MILITARY AËRONAUTICS.

Cavalry. Reconnoissance in the theatre of operations is best made by the cavalry, which from the beginning of the campaign seeks to determine the enemy's strength and dispositions. *Independent cavalry.* Reconnoissance by the independent cavalry will give, in a general way, the enemy's location for several hours or even days preceding contact of the main bodies. On very wide fronts an army is generally covered by two or more bodies of independent cavalry. *Divisional cavalry.* The cavalry attached to an infantry division is called divisional cavalry. When the division forms part of a field army, the divisional cavalry is known as advance cavalry. It usually enters into the composition of advance, flank, rear, and outpost guards (q.v.), and when so employed is known as advance guard, flank guard, rear guard, and outpost cavalry, as the case may be, and performs such reconnoissance as the situation demands. Though its reconnoissance is more restricted than that of the independent cavalry, advance cavalry goes more into detail and gathers information as to the resources of the country, roads, camping places, etc. As combat becomes more imminent the advance cavalry must be active to guard against surprise, gain information of the enemy's movements, and prevent incursions of his patrols.

Infantry. The extent of the infantry reconnoissance will not be so great when the aëro squadron and the cavalry are able to perform the service efficiently. In no case, however, can infantry reconnoissance, preceding or during combat, be dispensed with. Infantry and artillery must conduct their own close in reconnoissance for their own security and for immediate tactical dispositions. Reconnoissance immediately preceding combat is of vital importance as combat orders are based on the information then obtained. The strength of the force employed is determined by the character of the information desired and by the strength of the hostile screens. To obtain the information may require a reconnoissance in force, which may then become the opening phase of the attack itself. In an advance the advance guard (q.v.) must be relied upon to make the enemy disclose his strength and position as soon as possible. A strong force of artillery is most

useful for this purpose as it clears up the situation in a way that cannot be done by other troops except by incurring heavy losses. Reconnoissance during combat is kept up by the infantry to maintain contact with the enemy, to acquaint itself with the terrain in its front, and especially to protect its flanks and rear. The field artillery continues the reconnoissance called for by its tactical employment. Reconnoitring patrols (see PATROL) are used to insure effective work.

Military air craft of all kinds are employed under the direction of the commander of the forces. (See MILITARY AËRONAUTICS.) Free balloons are little used. Captive balloons may be used for tactical reconnoissance, for operation of artillery fire, and for signaling. Large dirigible balloons are of practical value for strategical reconnoissance; they are also suitable for carrying a number of observers, radio equipment, machine guns, and explosives. Aëroplanes are more dependable for field service with a mobile army. Reconnoissance by aeroplane includes strategical and tactical reconnoissance and the observation of artillery fire. Aeroplanes are also used to prevent hostile aërial reconnoissance. Strategical reconnoissance by aëroplane is effective within a radius of 150 miles from the starting point and is for the purpose of determining strength, position, and direction of advance of hostile forces. Aeroplanes are safe from fire at altitudes of 4000 feet or more. The information obtained by reconnoissance may be transmitted (1) by wire (telegraph, buzzer, telephone), (2) by visual signaling (flag, helio, night lamp), (3) by radio telegraph, (4) by messenger (foot, mounted, cycle, motor car, flying machine). Consult *Field Service Regulations of the United States Army, 1914*.

Topographical Reconnoissance includes suitable means for obtaining and recording all needful information of a terrain in the shortest possible time and within the limits of accuracy required for the operations of troops in the field. The term also technically includes the interpretation of a record, when made, to determine from it the favorable or unfavorable effect of the terrain for the purpose of directing military operations with reference thereto. The information to be obtained in a topographical reconnoissance may be grouped under the headings of time, cover, resources, and nomenclature. The map should permit a determination of the time which a column will require to pass between any two given points by showing the distance between them and the condition of the road or country which must be traversed, as regards its effect on the rate of march; the accidents of ground which will afford cover to the army or to the enemy; the location, quantity, and quality of water, fuel, grass, etc., and should give to each feature its local name. The last requirement is of great importance and is the one most often neglected. Consult *Engineer Field Manual*, published by the United States War Department (Washington, 1904 et seq.).

RE'CONSTRUC'TION (from Lat. *re-*, back again, anew + *com-*, together + *struere*, to heap). In American history, the process by which, after the Civil War, the seceded States were restored to their normal relations with the Union. The only provision of the Constitution that seemed to have any bearing on the matter was that which makes it the duty of the United States to guarantee to every State in the Union a republican form of government. Even this was not explicit, for it was not stated which branch of the government, whether the Executive or Congress, was charged with the execution of the constitutional mandate. Among the views as to the status of the States at the close of the war several deserve a brief explanation. First, there was the Southern view, based on the assumption that the acts of secession were invalid and of no effect. Its cardinal doctrine was the indestructibility of a State, either by its own act or by act of the United States government. All that was necessary, therefore, to the reëstablishment of normal relations with the Union was for the State governments to cease their resistance to the government of the United States and to repeal all measures passed in furtherance of secession and rebellion. Second, there was the view of President Lincoln, based on the assumption that the act of rebellion in each State was the act not of the State itself, but of combinations of disloyal persons who had unlawfully subverted the loyal State governments. The States, therefore, continued to exist as members of the Union, though they were out of their "proper practical relations" with it. According to this view the problem of reconstruction consisted simply in placing the loyal element in the seceded States in control of the State governments which had been subverted by the disloyal element. Furthermore, President Lincoln regarded the problem as one devolving upon the Executive rather than upon Congress, for the work of creating a loyal element necessarily involved the exercise of the pardoning power, which alone was vested in the President, and the support by the military arm of the loyal governments so established. Thirdly, there was the congressional view, which held that reconstruction was a legislative problem; that as a result of rebellion the Southern States were "deprived of all civil government" and that all de facto governments set up during the war were illegal. This view has been called the forfeited-rights theory. The States continued to exist, but as disorganized communities subject to the paramount authority of the United States This was a compromise theory and was the one which finally predominated. The theory differed chiefly from Sumner's by insisting that the States still existed, but with power and rights suspended, and from the presidential theory by leaving the task of reconstruction entirely to Congress In pursuance of this view Congress passed an Act in July, 1864, which was fathered by Henry Winter Davis in the House and Benjamin F. Wade in the Senate and which provided a remedy for the defects of the presidential scheme as understood by the supporters of the congressional view. The view embodied in this measure differed from that of President Lincoln, first, in regarding the problem of reconstruction as a legislative problem; second, in requiring the loyalty of a majority of the adult white males of the State for the basis of the reconstructed government instead of the loyalty of one-tenth, as required by President Lincoln's plan; thirdly, in requiring the abolition of slavery as the starting point in the process of reconstruction. President Lincoln refused to sign the bill before the expiration of the session, thus indirectly defeating it. A fourth view was the so-called State suicide theory of Charles Sumner, enunciated by him in a series of resolutions offered in the Senate in 1862. The gist of these resolutions was that the attempt of a State to secede from the Union,

involving as it did an attempt to exclude the Constitution of the United States from the territory of the State, was, if successfully sustained by force, equivalent to a practical forfeiture by the State of all rights under the Constitution. It involved, furthermore, the immediate extinction of the State sovereignty and its reduction to the position of a Territory under the exclusive jurisdiction of the government of the United States. Sumner was supported by many able men, and his theory was in line with the doctrine of strong nationality to which the war gave a decided impulse. Finally, there was the view ably expounded by Thaddeus Stevens, who was more severe towards the South than Senator Sumner, and popularly called the conquered-province theory, according to which rebellion against the national authority by a State of the Union not only put an end to its existence as a State, but even forfeited its rights as a Territory under the Constitution. The inhabitants of such a community were remanded to the status of an unorganized province owned by the national government and subject to its dominion without the restraint of constitutional limitations. The advocates of this theory appealed to the actual facts of the case to show that at the close of hostilities the Southern States were in the condition of dependent provinces subject to the absolute dominion of the conqueror.

Of the several theories advanced that held by President Lincoln was the first to receive favorable attention. In 1862, portions of Louisiana, Arkansas, and Tennessee having been recovered by the Federal armies, the President appointed military governors in those districts with somewhat vague and undefined powers. In general they were to take the initiative in the movement to reëstablish civil governments and prepare the way for representation in Congress. In his third annual message (Dec. 8, 1863) the President announced a more definite and systematic plan of reconstruction, to which was appended a proclamation of amnesty offering a full and complete pardon to all who would take an oath to support the Constitution of the United States and the Union of the States thereunder, as well as all acts of Congress passed during the war and all proclamations of the President with reference to the slaves. From the benefits of the amnesty were excluded certain classes of men who had held high military or civil offices under the Confederate government or who had left the service of the United States to engage in the rebellion. He then proposed to restore the State governments in the seceded States to the amnestied class by declaring that whenever a number of persons not less than one-tenth of those who had cast votes in such State at the presidential election in 1860 had taken the oath, if they were qualified voters by the State law in force at the time of secession, and had reëstablished a State government republican in form, such government should be recognized by the Executive as the true government of the State, and presidential support would be given to its measures to regulate the life of the freedmen, provided emancipation was recognized. He said, however, that whether members sent to Congress from any State so reconstructed should be admitted to their seats rested exclusively with the two Houses. The proclamation did not apply to Virginia, both the President and Congress having from the first recognized the loyal Pierpont government at Alexandria as the true government; nor did it apply to Missouri and Kentucky. Ten per cent governments, so called, were accordingly established in Louisiana and Arkansas in the following year. In the former State 13 parishes, including New Orleans, were in Union hands. In December two districts elected Congressmen who were allowed seats in the House. In 1864 Arkansas established a reconstructed government like that of Louisiana. In Tennessee the President's plan of reconstruction was put into operation early in 1865. Representatives were chosen to Congress, but they were refused admission to their seats in December, 1865. In the meantime Congress had assumed the right to take in hand the matter of reconstruction and had passed the Wade-Davis Bill, to which reference has already been made. In February, 1865, it also passed a resolution which prohibited the counting of any electoral votes for President or Vice President in the election of 1864 from States restored under Lincoln's plan. Congress also passed the Twenty-second Joint Rule, by which the consent of each House was necessary to count the disputed electoral vote of a State. This measure gave the radicals a strong grip on the presidential elections and remained in force until 1867. The refusal of the President to sign the Wade-Davis measure, and his proclamation in regard to the subject in which he stated his objections to the setting aside of the constitutions and governments in Louisiana and Arkansas, made a breach between the President and Congress inevitable.

After the assassination of President Lincoln President Johnson took up the policy of his predecessor without material change, and on May 29 issued a proclamation of amnesty and pardon to all persons who had neglected to avail themselves of the benefits extended by the amnesty proclamation of President Lincoln. His proclamation of amnesty differed from that of President Lincoln only in the enlargement of the classes of excepted persons. Besides those who had held high rank in the Confederate military and civil service and those who had resigned positions in the service of the United States to enter the rebellion and a few other classes, President Johnson excluded all who had voluntarily taken part in any capacity in the Confederate service and who were the owners of taxable property of the value of more than $20,000. Persons excluded from the benefits of the amnesty were allowed to make special application to the President, who promised that such clemency would be extended as appeared to be consistent with the facts of the case and the peace and dignity of the United States. By subsequent proclamations the President appointed provisional governors for the States of North Carolina, Mississippi, Georgia, Alabama, South Carolina, and Florida, and directed them to call constitutional conventions in their respective States for the purpose of restoring the said States to their constitutional relations with the United States. The heads of the several executive departments were at the same time directed to put the laws of the United States into operation in these States, and the United States judges were required to open the courts and to proceed with the business on their dockets. President Johnson regarded the States of Virginia, Louisiana, Arkansas, and Tennessee as already reconstructed, and therefore provisional governors were not appointed for those

States. During the summer and autumn of 1865 conventions were held in all the States not yet reconstructed, except Texas, which acted in the spring of 1866; and when Congress assembled in December of that year they all had passed ordinances either repealing the ordinances of secession or pronouncing them null and void *ab initio;* they all had abolished slavery by constitutional amendment, and all but South Carolina had passed ordinances repudiating State debts incurred in aid of the rebellion. These steps were taken by advice of the President, who declared that they were necessary to satisfy the North. They had, moreover, held elections for members of the Legislature, for State officers, and for members of Congress, and the Legislatures had met and with two or three exceptions had chosen United States Senators and, with the exception of Mississippi, had ratified the Thirteenth Amendment to the Constitution of the United States. When, therefore, Congress met in December, the President was able to inform that body that all the States except Texas, whose convention did not meet until March, 1866, "had been reconstructed and were ready to resume their places in the two branches of the national Legislature."

Congress, however, did not accept the view of the President, but appointed a joint committee of nine Representatives and six Senators to inquire into the condition of the seceded States and to report by bill or otherwise whether any of them were entitled to representation in Congress. Pending the report of the committee and the action of Congress thereon, it was resolved that no member should be received into either House from any State lately in arms against the United States. The chief reason for the rejection of the President's plan was the character of the police legislation passed by several of the Southern Legislatures in the autumn of 1865. On account of the general demoralization of the freedmen after emancipation, together with their habits of improvidence and shiftlessness, all the Southern States passed stringent police measures to prevent disorder and pauperism among them. These new black codes did not grow out of a feeling of hostility to the blacks, but out of a deep-rooted view of social life. To the Southerners such provisions were absolutely necessary for bringing into orderly relations a mass of crude and disorganized people. One of the chief objections urged against these laws was that in most cases they applied only to the negro race. In Mississippi, e.g., negroes were prohibited from renting or leasing land in incorporated towns and they were allowed to be competent witnesses only in cases at law in which they were parties. Other Southern Legislatures followed the example of Mississippi, though none of them went quite so far in repression. The Republicans in Congress professed to see in these measures an attempt to reënslave the freedmen of the South. In the meantime the Thirteenth Amendment, abolishing slavery, had secured the ratification of the requisite number of States and had been promulgated by the Secretary of State as the law of the land. In March, 1866, Congress passed the Civil Rights Bill (q.v.) conferring the rights of citizenship upon the freedmen. This Act established complete equality in the enjoyment of civil rights for all citizens without respect to color or race. On March 27 President Johnson vetoed the bill, but early in April Congress passed it over his veto. About the same time Congress passed a measure to enlarge the powers of the Freedmen's Bureau (q.v.). It too was vetoed, and was not passed over the veto. In July another measure for the same purpose was passed, was vetoed by the President, and passed over his veto. In the meantime Congress was debating a proposition to amend the Constitution so as to place beyond the reach of any subsequent Congress the provisions of the Civil Rights Bill. In June the proposed amendment secured the necessary two-thirds majority of both Houses and was sent to the State Legislatures for ratification.

In the same month the Joint Committee on Reconstruction made its report declaring that the seceding States had deliberately abolished their State governments and constitutions so far as these connected them with the Union and were consequently disorganized communities, and that guarantees of future security should be required as an essential condition of restoration to normal relations with the Union. The committee recommended denial of representation to these communities until "sufficient guarantees were provided which would tend to secure the civil rights of all citizens, temporary restoration of suffrage to those not guilty of participation in the rebellion, and the disqualification from office of at least a portion of those whose crimes have proved them to be the enemies of the Union and unworthy of public confidence." During the period intervening between the report of the joint committee and the reassembling of Congress a riot had occurred between the white and black races in New Orleans, resulting in the death of 40 or 50 persons and the wounding of 160 others, and the President in the course of a journey to Chicago had used indiscreet language in his criticism of Congress. Perhaps if he had accepted the Freedmen's Bureau Bill he would have drawn to his side the more conservative of his opponents and reduced the power of the radicals into safe bounds. When Congress met in December, 1866, it made an unsuccessful effort to impeach the President, and then, in order that the President might be prevented from carrying out his policy of reconstruction, enacted a law requiring the new Congress, which contained a large majority opposed to the Executive policy, to meet on March 4, 1867. Next it passed the Tenure of Office Act (q.v.) to limit the President's power of removal. It then passed acts establishing negro suffrage in the District of Columbia and in the Territories. Finally it practically deprived the President of his power of command over the army and vested it in General Grant, whose position was further made irremovable.

Meantime Congress was spurred on by the action of all the Southern States except Tennessee in rejecting by votes nearly or quite unanimous the proposed Fourteenth Amendment. It now took up the work of reconstruction in earnest, showed little or no disposition to yield to the views of the President, and in February passed an "Act to provide for the more efficient government of the seceded States," assigning as a reason that "no legal State governments or adequate protection of life, liberty, or property existed in those States, and that it was necessary that peace and good order should be enforced in them until loyal and republican State governments could be legally established." The bill was promptly vetoed by the President, and on the same day was passed over his veto. The Act divided the 10 seceding States into five

military districts, as follows: (1) Virginia; (2) North and South Carolina; (3) Georgia, Florida, and Alabama; (4) Mississippi and Louisiana; (5) Arkansas and Texas. Tennessee was not in this arrangement, for in 1866 it accepted the Fourteenth Amendment and was recognized in full fellowship. Each district was to be under the command of an army officer not below the rank of brigadier general, appointed by the President and charged with the duty of protecting all persons in their rights of person and property, of suppressing insurrection, disorder, and violence, either by military commission or through the local courts. In the meantime the existing civil governments were to be deemed as provisional only and subject to the authority of the United States. The Act also contained provisions for the calling of a convention by all the people of the State, regardless of race or color, with a view to restoration in the Union. By a supplementary Act passed March 23 by the new Congress, the voluntary action of the States was anticipated and the process of reconstruction hastened. This measure directed the district commanders to cause to be registered as voters all persons, without regard to race or color, not disqualified by participation in rebellion; to hold an election for delegates to a State convention; and if a majority of the registered voters were in favor of holding a convention, to call it together for the purpose of adopting a new constitution. As soon as the constitution was ratified by a majority of the registered voters it was to be transmitted to Congress, and if it were approved by that body, the State was to be readmitted to representation in Congress. The President promptly vetoed the Act on the ground that some of its provisions were without constitutional warrant, that it purposed to disfranchise the great body of respectable whites, and that it conferred the suffrage on the mass of ignorant freedmen. With equal promptness the measure was passed over the executive veto. The President, despite his hostility to the Act, at once appointed the district commanders, his first appointees being Generals Schofield, Sickles, Ord, Thomas, and Sheridan. These officers with military commands assumed control of their respective districts and immediately put into operation martial law. Orders were issued in every district for the regulation of various matters of private law and for the prevention of discrimination against the blacks. Boards of registration were appointed in each county and the work of registering the new electorate was soon in full progress. Existing State officials who obstructed the registration of the negroes were promptly removed. In 1868 Governor Jenkins, of Georgia, and Governor Humphreys, of Mississippi, were removed for opposing reconstruction. The body of existing laws were continued unless they conflicted with reconstruction acts. Military tribunals, however, were freely created for various kinds of crime. In November, 1867, General Hancock supplanted General Sheridan in the fifth district, the administration of the latter having been unduly strict. In the early winter of 1867 elections were held in all the military districts, and by February, 1868, conventions were in session in every Southern State that had seceded from the Union. The constitutions drafted by these bodies reflected the views of the delegates, a majority of whom in most instances were freedmen and Northern Republicans who had emigrated to the South after the war and who came to be called in derision carpetbaggers. The constitutions drafted by them provided equality in civil rights and in some cases undertook to secure social advantages for the blacks. They established negro suffrage and in most cases disfranchised those whites whom the proposed Fourteenth Amendment would disqualify from holding office. In several States those who had violated the rules of civilized warfare or had voted for secession were likewise disfranchised. Everywhere except in Mississippi, Texas, and Virginia reconstruction constitutions were promptly ratified by the new electorates. In Mississippi, on account of several provisions of a proscriptive character in the new constitution, a determined and systematic campaign was undertaken by the whites for the purpose of defeating ratification. By the aid of a considerable proportion of the colored voters they were successful, and the State was left to continue for a while longer under military rule In Texas and Virginia the obnoxious features of the constitutions created such strong opposition that the reconstructionists were induced to delay indefinitely the submission of those instruments, and these States likewise continued under military rule. In the other States, the constitutions having been duly ratified and the Fourteenth Amendment adopted by the newly constituted Legislatures, Congress on June 22, 1868, readmitted Arkansas into the Union, and on June 25 Georgia, North Carolina, South Carolina, Florida, Alabama, and Louisiana. The Fourteenth Amendment was also declared by the Secretary of State to have been adopted by the requisite number of States and was accordingly promulgated as a part of the Constitution. In the meantime the Georgia Legislature had rejected the negro members elected to that body, and the United States Senate thereupon refused admission to the Senators from that State after the Act of June 25 had declared the State reconstructed. Thus at the time of the accession of General Grant (1869) to the presidency four of the States were still unrestored to their full places in the Union. He at once recommended to Congress the submission of the constitutions of Virginia and Mississippi to the people in such a manner as to enable them to vote separately upon the obnoxious provisions. Congress acted upon the President's recommendation and the constitutions were promptly ratified without the objectionable clauses. By the same Act Congress authorized the President to submit the constitution of Texas to the voters, which was done, and it too was ratified. In the cases of these three States, however, Congress imposed an additional condition which had not been required of the other reconstructed States, viz., the ratification of the Fifteenth Amendment. In January, February, and March, 1870, respectively, Virginia, Mississippi, and Texas were restored to their full positions in the Union, but subject to certain conditions which to some extent impaired their equality with the original States. Finally, after being twice reconstructed, Georgia complied with the new conditions imposed by Congress, and by an Act of June 24, 1870, was again restored to her place in the Union and military government was withdrawn.

From the technical point of view reconstruction was now complete, but the consequences of what has come to be generally recognized as a mistaken policy were destined during the en-

suing years to be far-reaching in their effects upon the reconstructed States. As a result of the disfranchisement of large classes of whites and the enfranchisement of the negro race, which outnumbered the whites in some of the Southern States, the local and commonwealth governments fell into the hands of unscrupulous adventurers from the North and West, who controlled the colored vote and excluded the native whites from participation in the administration of the government. Negroes who but a few years earlier were in slavery now filled up the Legislatures, held many of the executive offices, many of the minor judicial positions, and in some cases occupied seats on the benches of the higher courts. An era of extravagance, amounting to outright plunder in some States, now set in. Legislative sessions were frequent and long drawn out, the members voting themselves a large per diem as compensation for their services. Bulky codes were enacted and numerous offices, amounting to sinecures in many cases, were created for the benefit of the carpetbaggers, who now came in great numbers to the South. The rate of taxation everywhere was increased out of all proportion to the ability of the people to pay in their then impoverished condition. In Mississippi the rate rose from 1 mill on the dollar to 14, and resulted in the confiscation of one-sixth of the entire land of the State for nonpayment of taxes In most of the States large debts were created for projected improvements, many of which were never carried out. In Louisiana and South Carolina a wholesale system of plunder was inaugurated. Soon disorders began to arise in all the Southern States, and presently the Ku-Klux Klan (q.v.) was organized to terrorize the negroes and exclude them from the enjoyment of their newly acquired political rights. The disorder became so great that Congress was called upon to take action to preserve order and protect the blacks. By the so-called Enforcement Act of 1870 the Federal courts were given jurisdiction of a series of offenses committed with the intention of denying equal rights to any citizen of the United States. The Federal district attorneys now bestirred themselves throughout the South, and many indictments were found under the Act, but few convictions followed. In the following year Congress passed the so-called Ku-Klux Act, which authorized the President to suspend the writ of habeas corpus and employ military force for the suppression of violence in any community. At the same time a committee of Congress was appointed to investigate "affairs in the late insurrectionary States." A mass of evidence, taken by subcommittees, who visited the South, was published in 12 volumes. One result was that the Klan was soon generally abandoned. Acts were also passed providing for Federal supervision of elections, and finally, in 1875, an Act was passed to secure equality of treatment to negroes in theatres, railway cars, hotels, and other public places. This Act, however, as well as the chief provision of the Ku-Klux Act, was declared by the Supreme Court to be unconstitutional, not being within the power of Congress. As the extravagance and corruption of the carpetbag governments increased, the determination of the whites to regain control of affairs became fixed. The withdrawal of the military forces from the South left the reconstruction governments without power to maintain themselves. Already by 1870 North Carolina, Tennessee, Texas, Georgia, and Virginia had been reclaimed from the Republicans. Meantime the wholesale removal of political disabilities by Congress restored to public life many old and respected citizens of the South. This, together with the division of the Southern Republicans into conservative and radical wings, the former coalescing with the Democrats, made possible Democratic success. In 1874 Alabama and Arkansas went Democratic, and the carpetbag governments in those States came to an end. In the following year a great campaign was waged in Mississippi, not unaccompanied by violence, intimidation, and even riots, but which resulted in the defeat of the Republicans. The Mississippi plan was applied with success, in 1876, to the three remaining States of Louisiana, South Carolina, and Florida. The redemption of the Southern States was now complete and was followed by a general emigration of the carpetbaggers to the States of the North and West. The subsequent virtual disfranchisement of the negro race in the South marks the final recession from the status established by the process of reconstruction.

REC'ORD (OF. *record, recort*, from ML. *recordum*, witness, record, judgment, from Lat. *recordari, recordare*, to remember, call to mind, from *re-*, back again, anew + *cor*, heart), JUDICIAL.

A written history or account of the entire proceedings in a case. The importance of keeping such records was not recognized until long after regular tribunals of justice had been established. It seems to be undisputed that William the Conqueror introduced the practice into England. At the early common law it was the custom for the proper court official to enter upon pieces of parchment the pleadings and a brief account of all the steps and proceedings taken in the action, including the judgment. These various pieces were attached together in regular order and wound into a spiral roll for convenient safekeeping. This was known as the judgment roll, and this term is still applied to the various pleadings and papers, including the judgment, when filed together as a part of the record. Afterward the records were kept by writing them in books instead of on parchment, and in a few jurisdictions to-day every item of a judicial record is entered in books which become the public records of the court. However, in many jurisdictions the record of a case is composed partly of entries in the clerk's books and partly of the original pleadings and judgment filed in the proper office.

A complete judicial record of an action should contain, in some form, the date of issue, the pleadings, the various necessary steps taken before trial, a minute of the fact of the trial, the appearances for the parties, the name of the judge before whom the cause was tried, the verdict of the jury or disposition by the court, and the final judgment. Under most practice acts the successful party, in order to enforce his rights under the determination of his case by the court, must attend to the entry of judgment by presenting to the clerk of the court an instrument containing a statement of the determination of the action and an order for the proper relief, which is then signed by a judge or a clerk for the court and entered. The record of a court is conclusive evidence of the facts which it sets forth as between the parties thereto, and cannot be attacked collaterally. See PLEADING; PROCEDURE; RES JUDICATA; and consult the authorities referred to under PLEADING, PRACTICE.

REC'ORDE, ROBERT (c.1510–58). A British mathematician, born at Tenby, Wales. He was educated at Oxford and was elected fellow of All Souls in 1531. He graduated in medicine at Cambridge in 1545. In London he is said to have become court physician. He became comptroller of the mint at Bristol (1549) and general surveyor of the mines and money (1551). He died while imprisoned for debt in King's Bench Prison, Southwark. Recorde was one of the first in England to adopt the Copernican system, then in its infancy. He was the first to introduce algebra into England, and his views of the science were very advanced for the time. His invention of the sign of equality, =, given in his *Whetstone of Witte,* and his method of extracting the square root of polynomials, are the only evidences of originality generally recognized by mathematicians. The equality sign may have been suggested to him from its use as a mediæval abbreviation for *est.* His chief works were: *The Grounde of Artes* (c.1540, and frequent editions until 1699); *The Whetstone of Witte, or the Second Part of Arithmetike* (1557), a work on algebra; *The Pathway to Knowledge, or the First Principles of Geometry* (1551); *The Castle of Knowledge: A Treatise on Astronomy and the Sphere* (1551).

RECORD'ER. In England, the sole judge of a borough court of Quarter Sessions and frequently judge of a borough civil court of record. The recorder does not take charge of the administrative duties of the Court of Quarter Sessions (q.v.). In most boroughs he may practice law, as his salary is often merely nominal. He is appointed by the Home Secretary in the name of the crown. The title of recorder is also applied to the chief judge of the Lord Mayor's Court (q.v.) of London and to one of the judges of the Central Criminal Court.

The title is now seldom employed in the United States. The principal instance of note is in New York, where one of the judges of the Court of General Sessions is called the recorder. He devotes his entire time to his duties, just as the other criminal judges, not being allowed to practice. It is an elective office.

RECORDER. The name of a musical instrument formerly in use in Great Britain, somewhat like a flageolet, but with the lower part wider than the upper and a mouthpiece resembling the beak of a bird. Its pitch was an octave higher than the flute and it had a pleasing tone. Its compass was about two octaves, from f^1 to f^3. Consult Christopher Welch, *Six Lectures on the Recorder* (London, 1911).

RECORDING ACTS. See RECORDING OF DEEDS; TITLE, REGISTRATION OF.

RECORDING OF DEEDS. The public registration of instruments of title. At common law the transfer of title to real property by livery of seisin (q.v.) was a public and notorious act, making unnecessary any formal public record of the transaction. The modern practice of recording transfers of property on public records was therefore unknown to the common law. The Statute of Uses (27 Hen. VIII, c. 10), which made permissible the conveyance of real estate by deed privately executed, gave rise to the necessity of some method of publicly recording all instruments of conveyance. The first step in this direction was taken by the Statute of Enrollments (27 Hen. VIII, c. 16), which provided for the recording of all deeds of bargain and sale. As the statute did not in terms apply to leases of real estate, the lawyers of the time speedily invented a method of evading the statute by means of conveyance by lease and release (q.v.). The Statute of Enrollments thus became practically inoperative almost from the time of its enactment. A later statute (7 Anne, c. 20) required the recording of deeds of all real estate located in the County of Middlesex, and this was followed by some other acts of Parliament having a purely local application. There is, however, no statute in England of general application requiring that deeds be recorded, and the practice of recording deeds has never become common in that country.

In the United States from the earliest time statutes have been enacted providing for the recording of conveyances of real estate, and now in all the States there are statutes providing for the recording of all deeds or instruments affecting the title to real estate, and in certain cases of instruments affecting the title to personal property. Thus, generally, deeds, leases, mortgages, assignments, and releases of mortgage, wills, *lis pendens,* mechanics' liens, and liens upon or affecting real estate may be recorded. And in many States mortgages and conditional sales of personal property may also be recorded. The method of recording is usually prescribed by statute. Generally the document

is transcribed at length on public record books provided for the purpose. The designated place of record is usually, in case of real estate, the county clerk's, or register's, office of the county in which the property is located, or, in case of personal property, the corresponding office of town or city in which the property is located or where the mortgagor or owner resides, or both; and there are numerous special provisions governing the recording of instruments affecting transitory property, as vessels, canal boats, and the like. To be entitled to record an instrument must be properly executed, and it is generally required that it shall be acknowledged before a notary or a corresponding public officer. It is generally deemed to be recorded from the time it is filed in the office of the public officer whose duty it is to record the instrument.

The effect of recording a deed or conveyance in accordance with the various recording acts is to give constructive notice of the deed or conveyance to all who deal with the property. Recording a deed is not necessary to determine the rights of those who are parties to it and their privies; but if the deed is not recorded a subsequent purchaser who has recorded his deed and who had no notice of a prior conveyance will be deemed to have title rather than the first purchaser who did not record his deed. In other words, as between two innocent parties claiming from the same grantor he who first records his deed has the better title.

Unless the recording act specifically otherwise provides, creditors levying on property or those buying with notice of a prior conveyance will not be protected by the recording act, but will acquire only such rights as the debtor or grantor had at the time. The effect of the recording acts, therefore, is to make the public record the conclusive record of the ownership or interest in real property to all who rely upon it, and any one who deals with the property, except a creditor or one having actual notice of an unrecorded instrument affecting the property, may rely upon the state of the public record on the date of taking a deed or conveyance as determining completely the right or interest which he acquires. In England, owing to the practice of not recording instruments of conveyance, it is usual to give the buyer of real estate who is entitled to receive them all the conveyances affecting the property as muniments of title. In the United States this is not necessary or usual, as the public record is sufficient evidence of the title, and the buyer is entitled only to the grantor's deed of conveyance.

RECORDS, PUBLIC. In the broadest sense, a public record is a written account, history, or memorandum of a fact or event of general public interest, made by a public official in the performance of his duties and intended to be preserved as permanent evidence of the matters to which it relates. However, the term is usually confined to authenticated accounts of legislative acts and proceedings, the judgments and records of proceedings of courts of law, and the originals or copies of wills, mortgages, and conveyances, preserved in a public record office.

The nations of remote antiquity had very little idea of preserving these memorials for the public benefit. Accounts of the doings of the rulers were indeed preserved, as by the clay tablets of Nineveh and Babylon, but they recorded merely military expeditions or the splendor of the monarch, rather than laws or other matters affecting the general public. However, with the progress of civilization, it became customary to promulgate laws and preserve them in writing in some royal repository, and these were the first true public records. No provision was made for their inspection by the public, and where it was desirable to promulgate a law affecting the people in general, it was usually written upon parchment or some more indestructible substance and posted in a public place, or communicated to those in authority in various districts and proclaimed by them, through their subordinates or deputies, to the people in their respective districts. Thus, in 303 A.D. the principal laws of Rome were painted on 12 wooden boards, known as the Twelve Tables and exhibited in the Forum. During the mediæval ages the laws were usually written on parchment and preserved by certain public officials, but no systematic record of judgments or conveyances was kept. The French were probably the first nation to keep judicial records in the sense in which we employ the term now, and the Normans introduced the practice into England.

Under the feudal system the method of conveying land was by feoffment with livery of seisin, a sort of dramatic ceremony on the land itself, and written conveyances were not generally employed until after the Statute of Uses, 27 Hen. VII, c. 10. By 27 Hen. VIII, c. 16, known as the Statute of Enrollments, it was provided that conveyances by bargain and sale should be enrolled. This Act was the basis of the recording acts in England and the United States.

England has the most complete collection of public records of all of the older nations of the world. However, until 1838, these records were so negligently kept that many valuable ones were destroyed or lost. The oldest English records are the tallies in exchequer, which were made by means of wooden sticks marked on one side with notches to indicate the sum for which the tally was an acknowledgment, while on the other two sides were written the amount, the name of the payer, and the date of the transaction. This rude contrivance was probably of Norman-French origin, the name being derived from the French *tailler* (to cut). This practice continued until 1783, when the Statute of 23 Geo. III, c. 82, abolished the office of tally cutter and substituted indented paper checks as receipts for payments into exchequer.

During the Norman period the parliamentary records were in the Norman-French language and were written on parchment. This language continued to be used for parliamentary records until the fifteenth century, and Latin was in common use in judicial records until the reign of George II. One of the most noted ancient records is the Domesday Book (q.v.). Such records as had been kept by the Saxons prior to the Conquest had been preserved by the clergy in monasteries and religious houses, and this practice was continued as to many important records for centuries. Many copies of the Magna Charta were put under the great seal and delivered to the archbishops for safe keeping.

During the reign of the Conqueror and his immediate successors great progress was made in the matter of keeping public records. The elaborate system of feudal tenures introduced by William necessitated records in order to protect the King in his rights to military and other services, taxes, etc., and also in the interests of the great lords of the realm. The early court records were scattered about in the various pal-

aces where the kings sojourned during their visits to the different parts of the Kingdom. This was due to the fact that the principal court, the Curia Regis, followed the King's person. Upon the permanent establishment of the higher courts at Westminster the court records were deposited in the cellars of Westminster Hall, which were damp and ill adapted for the purpose. A large number of valuable records were also deposited in the Tower. At various times since the thirteenth century the preservation, arrangement, and indexing of the records has been agitated in England. In 1800 a parliamentary committee accomplished a great deal in the way of discovering and arranging ancient public records. Various commissions supplemented this work, between the latter date and 1835, when a parliamentary committee, appointed for the purpose, made a complete investigation of all that had been previously done in this regard, and their report was the basis of subsequent legislation. The statute of 1 and 2 Vict., c. 94, restores to the Master of the Rolls his ancient authority as chief custodian of the court records, giving him in addition the charge of all the records of the Kingdom. The Act also provided for the establishment of a public record office and for the erection of suitable buildings and authorized the Master of the Rolls to appoint deputies and assistants and to take all necessary steps for the careful preservation of all public records. Provision has been made for the reasonable inspection of records, and authenticated copies may be obtained, which will be received as evidence by the courts.

The United States started with the English methods of keeping public records from its beginning, and no nation pays more attention to the preservation of these muniments of private rights. In all States deeds, mortgages, etc., are required to be recorded to protect a title to land, and practically all instruments affecting property, real or personal, must be recorded in most States. Judicial records are kept by the clerks of the various courts. The statutes, etc., are kept by the State officials, and are open to public inspection. The Federal government carefully preserves the Declaration of Independence and all Federal papers and documents. Each State, county, and municipality makes provisions for the safe-keeping of its own records.

By the common law the general public had no absolute right to examine records preserved by the governmental authorities. For example, a person could not demand to see a record of title to real estate simply because he desired to make an abstract thereof out of curiosity or for historical research. Only such persons as had an interest in the property or expected to acquire an interest in it could, as a matter of right, demand to see the records. This has been carried to the extent of refusing to title-guaranty companies the privilege of examining records of titles to land for the purpose of making abstracts thereof for use in their offices. This rule is also true as to judicial and other public records by the common law, and it still obtains in some of the United States. However, in England and in most of the United States it is provided by statute that public records may be inspected by any one, with reasonable regulations as to time and manner of examination.

A public record is good evidence of the matter to which it relates, and most jurisdictions provide that copies of a record, duly authenticated by the official custodian, shall be received in evidence with the same force and effect as the originals. This saves the public inconvenience of having records in daily use transported to the courts during a trial. The printed statutes of a State are deemed to be official, and must be accepted as such by the public and the courts. See CONVEYANCE; JUDGMENT; LIEN; MECHANIC'S LIEN; RECORDING OF DEEDS; RECORD, JUDICIAL.

R. Scargill-Bird, *A Guide to the Various Classes of Documents Preserved in the Public Record Office* (3d ed., London, 1908); G. F. Kunz, *The Imperishable Records of the Ancients* (New York, 1911).

RECOUPMENT, rē-kōōp'ment (OF., Fr. *recoupement*, from *recouper*, to recoup, cut off or again, from *re-*, back again, anew + *couper*, to cut, from *coup*, cut, from Lat. *colpa*, from Gk. *κόλαφος*, *kolaphos*, blow with the fist, from *κολάπτειν*, *kolaptein*, to strike). The right of a defendant in an action at law to reduce the amount of the plaintiff's recovery by the amount of any damage which he has suffered by the act or omission of the plaintiff growing out of the contract or other transaction sued upon. The term originally signified a mere reduction of the amount of the recovery because of partial payment or former recovery, but in modern practice it denotes any affirmative claim for damages growing out of the cause of action brought which the defendant asserts as a defense for the purpose only of reducing the amount of the plaintiff's recovery, although he might at his option assert the claim in an independent action. Thus, in an action upon contract for the purchase price of goods the defendant may recoup damages which he has suffered because of the plaintiff's breach of a collateral warranty of the quality of the goods, or in an action by a common carrier to recover freight money the defendant may recoup for loss or injury to the goods resulting from a violation of the plaintiff's obligation as a common carrier. In an action upon contract damages recouped may be for tort, or vice versa provided the recoupment grows out of the transaction sued upon.

Recoupment is a common-law doctrine and has become established in the several States of the United States by judicial decision. The exact limits of the application of the doctrine vary considerably in the different States. In many States, particularly those having codes of civil procedure, there are statutory forms of counterclaim which include both recoupment and set-off. See COUNTERCLAIM; SET-OFF.

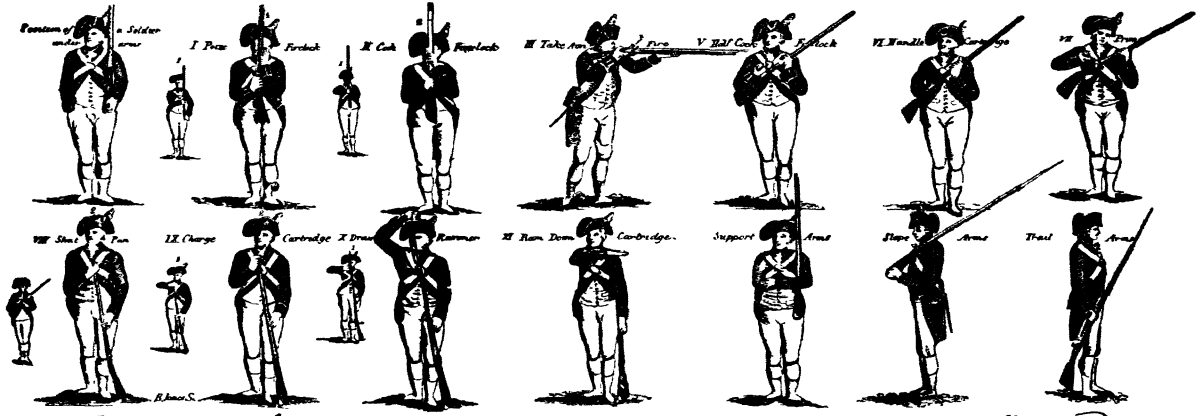
RECOVERY. See COMMON RECOVERY.

REC'REA'TION PIERS. In several American cities, wharves reserved for the use of the public and designed to supplement the park system of the city as breathing places for the inhabitants of the congested districts. For New York City recreation piers were first authorized by legislative act of 1892, the first pier being opened in 1896. The piers are fireproof structures, and entertainments such as music and dancing are provided at public charge.

RECRUIT'ING OFFICER, THE. A comedy

TO ALL BRAVE, HEALTHY, ABLE BODIED, AND WELL DISPOSED YOUNG MEN,

IN THIS NEIGHBOURHOOD, WHO HAVE ANY INCLINATION TO JOIN THE TROOPS, NOW RAISING UNDER



GENERAL WASHINGTON,

FOR THE DEFENCE OF THE

LIBERTIES AND INDEPENDENCE OF THE UNITED STATES,

Againſt the hoſtile deſigns of foreign enemies,

TAKE NOTICE,

THAT Thursday, Wednesday Thursday Friday and Saturday at Sholswood in Middlesex county, attendance will be given by Lieutenant Reading with his muſic and recruiting party of Captain Stubbs company in Major Thatcher's Battalion of the 11th regiment of infantry, commanded by Lieutenant Colonel Aaron Ogden, for the purpoſe of receiving the enrollment of ſuch youth of SPIRIT, as may be willing to enter into this HONOURABLE ſervice.

The ENCOURAGEMENT at this time, to enliſt, is truly liberal and generous, namely, a bounty of TWELVE dollars, an annual and fully ſufficient ſupply of good and handſome cloathing, a daily allowance of a large and ample ration of proviſions, together with SIXTY dollars a year in GOLD and SILVER money on account of pay, the whole of which the ſoldier may lay up for himſelf and friends, as all articles proper for his ſubſiſtance and comfort are provided by law, without any expence to him.

Thoſe who may favour this recruiting party with their attendance as above, will have an opportunity of hearing and ſeeing in a more particular manner, the great advantages which theſe brave men will have, who ſhall embrace this opportunity of ſpending a few happy years in viewing the different parts of this beautiful continent, in the honourable and truly reſpectable character of a ſoldier, after which, he may, if he pleaſes return home to his friends, with his pockets FULL of money and his head COVERED with laurels.

GOD SAVE THE UNITED STATES.

FACSIMILE OF RECRUITING NOTICE USED IN THE REVOLUTIONARY WAR

by George Farquhar, produced in 1706. The military scenes are sketches from life, drawn from Farquhar's experience in the army.

RECRUIT'MENT (Fr. *recrutement*, from OF. *recruter*, Portug. *recrutar*, *reclutar*, from ML. *reclutare*, to recruit, patch, mend, from Lat. *re-*, back again, anew + AS. *clūt*, from Welsh *clwt*, Ir., Gael. *clud*, Manx *clooid*, clout, patch), MILITARY. The raising of men for military service. Recruitment of armies is by voluntary enlistment (the method adopted by the United States and Great Britain) or by conscription, or compulsory enlistment (the system in use on the continent of Europe). The voluntary system used by the United States in the Civil War of 1861–65 (see CONSCRIPTION) and the same system used by Great Britain in the Great War of 1914 proved unsatisfactory and inadequate in those two great wars. The recruiting system of Germany is the model for nations adopting compulsory service, and proved most effective in the War of 1914, leading to rapid and efficient mobilization. The country is divided geographically into as many corps districts as there are army corps (the latter are more or less permanently located), and these are subdivided into division, brigade, regimental, battalion, and company districts. Each company is recruited in its own geographical district. Each brigade district has also from two to six Landwehr (the reserve of the active army on the war footing) districts, which are the units of recruitment for this body. The recruits are examined by a commission of civil and military officers. Those physically, mentally, or morally unfit are rejected; the rest draw lots, the lower numbers being taken to fill the annual contingent, the higher passing to the Ersatz Reserve (a reserve of recruitment). Normally the young men are not called out till they are 20 years of age nor after they are 40. Between 17 and 20 and over 40 they belong to the Landsturm, the last reserve of the Empire. After completing his term of service in the ranks the soldier passes into the reserve of the active army, retaining his place in his regiment, borne on its books, and liable to recall till about 26 years old; he then passes to the Landwehr battalion of the district, the Landwehr command keeping the register of names and addresses. The special method of recruitment for an army in the field, now adopted by all nations except the United States, whatever the general system of recruitment may be, is by so-called depot battalions, etc., which remain in the home country and receive and train all the recruits for a particular regiment, etc. The methods for recruitment used in the United States will be found discussed under ENLISTMENT, where information as to the qualifications of recruits is given. The accompanying illustration shows a circular used in the American Revolution to obtain recruits. See ARMIES, and the paragraph *Army* in articles on the various countries; ARMY ORGANIZATION; DEPOT; ENLISTMENT; OATH; ETC.

REC'TANGLE (OF., Fr. *rectangle*, from Lat. *rectangulum*, right-angled, from *rectus*, right, straight + *angulus*, angle). A parallelogram having four right angles. See MENSURATION; PARALLELOGRAM.

REC'TIFI'ER. A device for obtaining direct or continuous electric currents from a source of alternating-current supply. The mercury-arc rectifier consists of a vacuum tube containing a small quantity of mercury forming one of the terminals. Its operation is based on the fact that a vacuum tube containing mercury vapor under low pressure requires a much higher voltage applied to send a current through the tube in one direction than in the other, provided current has been established by tilting the tube so as to form an arc between the mercury and the other terminal. It is used for charging storage batteries and for supplying certain types of arc lamps where only alternating electric current is available. Its efficiency is about 78 per cent, improving as applied voltage increases, since the arc itself has a constant counter E. M. F. of from 14 to 15 volts and very little heat has to be dissipated in the tube. At high voltages the losses are in the transformer and reactance coils. Mercury-arc rectifiers have been built for voltages as high as 6000 and large enough to furnish a current of 40 amperes.

Kenotron rectifiers consist of a bulb or tube exhausted to a high degree of vacuum and containing as the cathode an incandescent filament, heated by an independent circuit, and as the anode a surface of considerably greater area, usually of molybdenum. When such a device is attached to an alternating-current supply, it allows electricity to pass in one direction only. Kenotrons have been made to supply current voltages up to 180,000, and the maximum amount of current rectified is as high as 2.5 amperes. It is preferable to make the device in units of about 10 kilowatts capacity when used to supply more than 25,000 volts. Actual energy losses are not more than 2 per cent of the total energy rectified. This device can replace the large static machines commonly used for Röntgen ray work; and as several may be placed in parallel, it is considered to be entirely feasible to transmit 1000 kilowatts at 50,000 volts by means of 100 kenotrons working in parallel.

Electrolytic rectifiers using electrodes of aluminium and steel in a solution of ammonium phosphate, when connected to a source of alternating current, allow a current to pass in one direction only. As they develop much heat and have other losses, they are used only for the rectification of small currents. Consult: *General Electric Review* (Schenectady, N. Y., January, March, and May, 1915). See ELECTRIC ARC; DYNAMO-ELECTRIC MACHINERY; ELECTRICITY; WIRELESS TELEGRAPHY.

REC'TIFYING. See DISTILLED LIQUORS.

REC'TOR (Lat., ruler, director). An ecclesiastical and academic title, meaning in the former sense a clergyman who has the charge of a parish and full possession of all the consequent rights and privileges. In the Church of England a rector differs from a vicar in that the latter is entitled to only a certain portion of the ecclesiastical income specially set apart to the vicarage. The office of rector as developed in England was carried over to the American Colonies, where, however, a unique development came about. Under the American civil church law (q.v.) the parishes of the Protestant Episcopal church, like the religious societies of other denominations, received civil incorporation, and the American rector, instead of continuing to be regarded, like the English, as a corporation sole, became ex officio the president of a corporation constituted of the rector, wardens, and vestrymen. To the rector belong the possession and use of the temporalities of the parish, but only for the service of the church. In the Roman Catholic church the title of rector is frequently given to a parish priest or to the superior of a college or a religious house, more especially the superior of a Jesuit seminary or college. A mis-

sionary rector in this church is a priest appointed by the bishop to certain parishes in England, and in the United States to the charge of any parish. Some few are known as irremovable rectors; these cannot be transferred to other parishes or removed for any other cause than proved misconduct.

In academic usage the title of rector is given in many places to the head of a college or of a university, as at Louvain. In this sense it was employed by the Colonial institutions of America until the middle of the eighteenth century; e.g., the head of Yale College was called rector.

REC'TUM (abbrev. of Lat. *rectum intestinum*, straight intestine). The lowest (or, in animals, the most posterior) part of the large intestine. Some anatomists include the sigmoid flexure of the large gut as a part of the rectum. In this view the first part of the rectum consists of a loop beginning in the left iliac fossa and ending opposite the third piece of the sacrum. When unfolded this loop resembles the Greek capital letter omega, and is about 17½ inches in length. It lies wholly within the pelvis, and is attached by a mesocolon to the abdominal and pelvic wall. The remaining part of the rectum extends from the middle of the third piece of the sacrum to the anus. The term "rectum" should be limited to this portion, free of mesocolon, lying in the hollow of the sacrum to the tip of the coccyx, thence curving backward and downward to the anal orifice. The portion that lies against the sacrum is about 3½ inches long, the remaining part about 1½ inches long. The upper part of the rectum proper is covered with the peritoneum, which ceases at a point 5 inches above the anus. The structure of the rectum is considered under INTESTINE (q.v.).

RECTUM, DISEASES OF THE. The rectum is the seat of a number of congenital deformities. Imperforate anus, or entire absence of the anus, is sometimes found in newly born children. Occasionally the rectum opens into the vagina or urethra These conditions have to be met with prompt surgical measures. An imperforate anus is punctured or incised and kept open by bougies until healing takes place, and a preternaturally narrowed rectum or anus is dilated with rectal sounds or with the finger. Sometimes an artificial anus has to be made, either at the natural site or farther up in the inguinal region. In feeble or ill-nourished children prolapse of the rectum or anus is apt to occur from diarrhœa and excessive straining at stool, or in connection with worms, stone in the bladder, or other irritation. Prolapse is reduced by the application of cold compresses and gentle replacement of the protruding tissue with the fingers. It is then retained by a pad, and recurrence is combated by the use of astringent and antiseptic injections. A perfect cure, however, is to be secured only by the removal of the causative condition.

Adults are subject to numerous disorders of the rectum. Inflammation (proctitis) results from constipation and from chronic diarrhœa and dysentery. Infection may extend through the rectal walls into the surrounding loose tissue and set up periproctitis, or the more serious ischiorectal abscess. Ulceration of the rectum may be caused by abrasions from hardened fæcal masses, by syphilis, or by tuberculosis; it may be single or multiple. Ulcers are treated locally by cleansing and astringent injections, with constitutional remedies adapted to the individual case. Spasm of the rectum (proctospasm) or sphincter ani is a not uncommon manifestation of neurasthenia and hysteria, but its most usual causes are anal fissure and hemorrhoids. Stricture, which may result in complete occlusion, may be simple or malignant. The simple form is caused by contraction of scar tissue arising from ulcerations, syphilitic, dysenteric, or postoperative. When due to cancer the pain is intense and lancinating and the patient becomes emaciated. The stools are often flattened out like ribbons, and contain blood and mucus. Stricture of the rectum is best treated by laxatives, cleansing injections, and by gradual dilation with soft rubber bougies. In the case of cancer, however, these measures are only palliative. Here it is often necessary to remove a part or all of the rectum and stitch the colon to the edges of an artificial opening in the abdominal wall at the groin, thus forming a new anus. Patients can thus live in comparative comfort.

Fissure of the anus is a crack at the anal opening, producing spasm of the sphincter muscle. It causes violent burning pain during defecation, and the dread of this suffering results in voluntary inaction of the bowels and habitual constipation. Intense itching often accompanies fissure. Strict cleanliness and the application of healing ointments usually suffice to cure this condition. Touching with the point of a stick of lunar caustic is a valuable remedy Fistula in ano consists of the unhealed track of an abscess adjacent to the lower part of the rectum on the verge of the anus An abscess in this region heals with great difficulty, because of the constant movement of these parts and the passage of fæces, which reinfect and irritate it. Fistula is not uncommonly associated with hemorrhoids, cancer, or stricture. These are the varieties of fistula: the blind external terminates in a cul de sac near the bowel and opens at or near the margin of the external sphincter; the blind internal fistula opens into the bowel and has no external orifice; the complete has both an internal and an external opening The symptoms are passage of wind and fæces through the opening and of a discharge which stains the clothing. Repeated attacks of inflammation ensue and new abscesses form. Treatment in all varieties of fistula is free incision and cutting out of the fistulous tract. See FISTULA.

Hemorrhoids or piles are venous tumors situated either within, without, or on the margin of the anus and are caused by congestions and inflammation of the abundant vascular areas of the rectum. (See PILES.) Polypus of the rectum is a tumor attached by a narrow pedicle and originating in a relaxed fold of the mucous membrane, or in granulation tissue springing from an ulcer, or in a mass of hemorrhoids. The only remedy is removal.

Pruritus of the anus is a symptom of many diseases, both local and distant. It may and often does accompany such widely diverse affections as piles, fissure, seat worms, eczema, nerve disturbances, Bright's disease, jaundice, constipation. The itching is almost unbearable and is worse at night. The general treatment will depend on the exciting cause. Locally sedative lotions and ointments are employed and strict cleanliness observed. Eczema (q.v.) often affects this region. Consult J. M. Lynch, *Diseases of the Rectum and Colon* (Philadelphia, 1914).

REC'USANT (OF. *recusant*, Fr. *récusant*, from Lat. *recusare*, to reject, from *re-*, back again, anew + *causa*, cause). In English ecclesiastical legislation, any person who refuses to attend the services of the Established church.

Laws against recusants have borne most heavily upon Roman Catholics, who in earlier times were generally suspected of plotting against the government and the person of the sovereign. The first of such laws was passed in 1562, but the culmination of such legislation was under Elizabeth in 1593. A law passed in that year read that all Popish recusants over 16 years of age must "repair to their places of dwelling where they usually heretofore made their common abode, and shall not, at any time after, pass or remove above 5 miles from thence." If they did remove, their goods were forfeited to the crown. If they had no property they were required to leave the country, upon penalty of being treated as felons. If they made public submission they were to be absolved. Consult the act in Gee and Hardy, *Documents Illustrative of English Church History*, pp. 498–508 (London, 1896). The Popish recusants still being considered a source of danger after Elizabeth's reign, additional and more stringent laws were passed against them during the reign of James (1606), Charles II (1685), William and Mary, and Anne. All such legislation was abrogated in the reign of Victoria.

RED. One of the three primary colors, the rays of which are least broken and which is, consequently, at the end of the spectrum. It is much used, as well in the fine arts as in dyeing and other applied arts. The mineral world furnishes vermilion and the red ochres; the animal, carmine, scarlet, and others; and the vegetable, the different madder pigments (qq.v.). Since 1848 the term "red," as being the color of blood, has been applied by their opponents to the radical parties, especially in France. The red flag has been adopted as the emblem of their creed by the Social Democrats the world over.

RED ADMIRAL. See ADMIRAL; and Colored Plate of BUTTERFLIES.

RED ALGÆ. See HYDROPHYTES; RHODOPHYCEÆ.

REDAN, rē-dăn' (OF. *redan, redent*, Fr. *redan*, from Lat. *re-*, back again, anew + *dens*, tooth). A work in fortification which consists of two parapets whose faces join in forming a salient angle, usually about 60°, towards the enemy, like a letter V, in which the apex is to the front. The rear is usually open or only partially closed. The redan is mainly used to secure a flanking fire along the front of a line of parapets or a cross fire on important ground. The method of construction and dimension of the parapet are similar to those of a redoubt (q.v.). See FORTIFICATION; SIEGE AND SIEGE WORKS.

RED ANT. See HOUSE ANT.

REDBACK. See DUNLIN.

RED-BACKED MOUSE, or WOOD MOUSE. A small meadow mouse (*Evotomys gapperi*) of the wooded regions of Canada and the eastern United States, numerous in boggy regions. The color of the back is bright reddish chestnut, lightening below into buffy white. There is also a Northern gray variety. These mice have the general habits of meadow mice, but those of southern New Jersey inhabit exclusively the *Sphagnum* bogs, where they burrow deeply in the moss, making tunnels and nests below the frost line.

RED-BACKED SANDPIPER. A shore bird, the dunlin (qq.v.), also known to American gunners as winter snipe and blackbreast.

RED BANK. A borough in Monmouth Co., N. J., 26 miles south of New York City, with which it has steamboat connection, on the Shrewsbury River and on the Pennsylvania and the Central of New Jersey railroads (Map: New Jersey, D 3). It is a popular summer resort. There are in Red Bank Shrewsbury Academy and public and high school libraries. The leading manufactories include carriage shops, a clothing factory, boat works, a catchup factory, sash and blind factory, concrete block works, a large canning factory, boiler works, and gold-beating establishments. Pop., 1900, 5428; 1910, 7398; 1915 (State census), 8631.

RED BAT. A small North American bat (*Lasiurus borealis*), 4.4 inches long and 11 inches in expanse of wing. Its fur varies from bright rust red to gray, with a whitish patch on each side of the breast. Those of the Northern States migrate southward in winter. It was formerly called the New York bat.

RED-BELLIED SNAKE. A common harmless snake (*Storeria occipitomaculata*) of the eastern half of the United States, allied to the garter snakes, but shorter and more robust; it is also called wampum snake. It is chestnut or grayish brown; a paler line, about three scales wide, runs along the spine; the hindhead shows three pale blotches, and the abdomen is salmon red. Another small red-bellied snake in the Mississippi valley is Kirtland's (*Tropidoclonium*, or *Clonophis, kirtlandi*), but its head is shining black, and lines of round black spots mark its whole length. A much larger species is the red-bellied water snake (*Natrix*, or *Tropidonotus, erythrogaster*), which is found in the Southern States and northward to Michigan. It reaches a length of 4 feet.

REDBIRD. A local name for birds of red plumage. In the United States given to the tanagers and to the cardinal bird (qq.v.).

RED BLUFF. A city and the county seat of Tehama Co., Cal., 137 miles north of Sacramento, on the Sacramento River, affording water transportation, and on the Southern Pacific Railroad (Map: California, C 2). It is a commercial and residential place, with wheat, wool, lumber, and fruit interests. The city has the Herbert Kraft Public Library and the Academy of Our Lady of Mercy. There are flour mills, canneries, a fruit-drying plant, and a packing house. Pop., 1900, 2750; 1910, 3530.

RED BOX. See EUCALYPTUS.

REDBREAST. See ROBIN.

RED-BREASTED (or ROBIN) **SNIPE.** A dowitcher (q.v.).

RED BUG. A heteropterous insect (*Dysdercus suturellus*) which damages cotton and oranges in the southern United States; also called cotton stainer. (See COTTON INSECTS.) The term "red bug" is also applied in parts of the southern United States to the larvæ of certain harvest mites, also called jigger.

RED CEDAR RIVER. See CEDAR RIVER.

RED CHARCOAL. See CHARBON ROUGE.

REDCLIFFE, VISCOUNT STRATFORD DE. See STRATFORD DE REDCLIFFE.

RED CLOUD (trans. of his native name, *Maqpeya-luta*) (c.1825–1909). A chief of the Ogalala Sioux. He rapidly rose to the first rank in his band by his bravery and success upon the warpath and wisdom in council. He was active in wars with the Crow, Blackfoot, and other tribes, and fought against the government in the war which began in 1863 and lasted almost continuously until 1868. With Sitting Bull he opposed the sale of the Black Hills in 1876, and also the agreement of 1889, by which the Sioux surrendered half of their remaining country. He supported the Messiah doctrine and the ghost

dance in 1890. In his warrior days, according to his own statement, he "counted *coup*" 80 times, i.e., performed 80 separate deeds of valor against the enemy, any one of which entitled him to some distinguishing badge of honor. As a delegate for his people he made numerous visits to Washington. He was succeeded by his son Jack Red Cloud.

RED CROSS, ORDER OF THE. 1. A Russian order with two classes, established in 1878 at the close of the Turkish War. It is conferred on women only and is bestowed by the Empress. 2. An English order founded by Queen Victoria, in 1883, for women who have distinguished themselves in the care of sick soldiers. It is conferred on foreigners as well as on Englishwomen. The decoration is a golden cross inscribed with the words Faith, Hope, Charity, and bearing the date 1883.

RED CROSS KNIGHT, THE. The hero of the first book of Spenser's *Faerie Queene*, typifying holiness and secondarily St. George, also the Church of England. At first an awkward clown, when armed he becomes the champion of Truth (Una) against the dragon.

RED CROSS SOCIETIES. International associations whose purpose is to mitigate the horrors of war by alleviating the sufferings of the sick and wounded. They are the result of an agitation begun by M. Jean Henri Dunant (q.v.), a philanthropic citizen of Geneva, Switzerland. On June 24, 1859, he chanced to be present at the battle of Solferino and was an eyewitness to the vast amount of unnecessary suffering that resulted from the inability of the regular surgical corps to care for the thousands of wounded who lay upon the field. Three years later he published the widely read book, *Un souvenir de Solférino*, in which he vividly described the horrors he had witnessed and proposed that societies should be formed in every country in time of peace for the purpose of training nurses and collecting supplies, so that if war should break out the work of the regular military surgical corps could be supplemented. M. Dunant's proposal was well received by the Genevan Society of Public Utility, and an agitation was begun which resulted in an international conference at Geneva in October, 1863. A provisional programme was agreed upon by the delegates of the 16 nations that were represented, and in the following August a more formal diplomatic congress, composed of representatives from the same number of nations, was held in the same city. On the twenty-second of that month was signed what is known as the Geneva Convention (q.v.). Contrary to generally received opinion the convention makes no direct provision for the organization of Red Cross societies, but it renders such societies possible; and at the previous conference it had been stipulated that each nation that should ratify the convention should have one national committee or society, civil in its character and functions, which should alone have the right to authorize the sending of surgical corps to a war. The convention was quickly ratified by 14 nations, a number that has now been increased to 43, and thus its provisions have come to be a recognized part of international law. During the Servian War of 1876 the Turkish government notified the signatory powers that it had adopted the crescent instead of the red cross as the badge of its societies.

The American Red Cross Society was formed in 1881 under the leadership of Clara Barton (q.v.), who acted as its first president. Congress, recognizing the important relations between the Red Cross and the army and navy in time of war, and the importance of a thoroughly national society, by special Act, approved Jan. 5, 1905, dissolved the society then existing and incorporated a new organization to be operated under government supervision. The accounts of the new organization are audited annually by the War Department. This Act provides also that the governing body shall be a central committee of 18 members, 6 of whom shall be appointed by the President of the United States. The American Red Cross has expended about $10,000,000 in relief since its reorganization in 1905.

A few of the larger items of this amount are—1906: Japanese famine, $245,855.67; San Francisco earthquake and fire, $3,087,469.44; 1907: Chinese famine, $325,725.43; 1908: Italian earthquake, $985,300.21; 1909: Cherry Mine disaster, $97,247.11; Turkish-Armenian relief, $30,500; 1910: Paris flood, $44,942.03; Chinese famine, $251,677.55; Minnesota forest fires, $95,114.24; Taal volcano (Philippines), $16,050; Washington Place factory fire (New York City), $70,000; 1912: Balkan War, $75,631.60; *Titanic* wreck, $125,993.75; Mississippi floods, $27,486.24; 1913: Mexican insurrection, $20,451.79; Mississippi River floods, $20,000; Ohio and interior storm and flood, $2,472,287.61; 1914: second Balkan War (Bulgaria), $18,000; Ohio and interior flood, $23,465.56; Chinese River conservancy work, $75,000; 1915: European War relief (expended and obligated for), $1,400,000.

It was soon found that the convention of 1864 was in certain respects inadequate and that some revision was desirable. In 1867 the first International Red Cross Conference, held at Paris, proposed such a revision, and in the following year a diplomatic congress convened at Geneva to consider the matter. This congress agreed to add a few supplementary clauses, one of which provided that the principles of the convention should be applied to naval warfare Owing to the Franco-Prussian War and to other causes, however, the clauses were not ratified by the Powers and consequently had no binding force as international law. It was not, in fact, until The Hague Peace Conference of 1899 that it was agreed to apply the principles of the convention to war upon the seas. At other international conferences of the Red Cross societies—at Berlin in 1869, Geneva in 1884, Karlsruhe in 1887, Rome in 1892, Vienna in 1897, St. Petersburg in 1902, London in 1907, and Washington, D. C., in 1912—other subjects for amplification were discussed. Among these were the relations of the Red Cross to the army, the means that should be taken to impress upon the soldiers the necessity of respecting the red cross, and the measures that would best prevent the abuse of the emblem by persons who might make use of it to cloak hostile or unworthy designs. An international conference was held at Geneva in 1906 for the revision of the Treaty of Geneva, the revised treaty to be submitted to Congress for ratification.

The various national Red Cross associations are not intimately connected, but the International Committee at Geneva is regarded as the central committee of all. Through it all international communications are made, and by it an international bulletin is published. The president of the Geneva committee is Gustave Ador.

In 1915 the officers of the American National Red Cross were: Hon. Woodrow Wilson, president; Maj. Gen. George W. Davis, U.S.A., retired, chairman central committee; Ernest P. Bicknell, national director; Charles L. Magee, national secretary.

RED DEER. A town and the capital of Red Deer electoral district, Alberta, Canada, on Red Deer River, a divisional point on the Canadian Pacific and Canadian Northern railways, 110 miles by rail south of Edmonton (Map: Alberta, G 6). It possesses a Presbyterian Ladies College, Roman Catholic Convent, two opera houses, and a Dominion Lands Office. Its industrial establishments include ironworks, a brick and tile plant, a saw mill, stone quarry, creamery, and manufactories of concrete blocks, mattresses, homogenized milk, etc. Red Deer is governed by a commission. Pop., 1901, 323; 1911, 2118.

RED DEER. The common deer of Europe, the males of which are the stags hunted in Scotland and elsewhere. See DEER; STILL-HUNTING

RED'DING. A city and the county seat of Shasta Co., Cal., 170 miles north of Sacramento, on the Sacramento River and on the Southern Pacific Railroad (Map: California, C 2). The courthouse, Carnegie library, and sanatorium are noteworthy. Redding is situated in a gold and copper mining and lumbering region, has five large copper smelters near by, and manufactures lumber, foundry and machine-shop products, etc. Pop., 1900, 2946; 1910, 3572.

RED'DITCH. A town in Worcestershire, England, on the Arrow, 13 miles southwest of Birmingham (Map: England, E 4). It is the centre of the needle-manufacturing industry, and pins, fishhooks, fishing tackle, and automobiles also are largely made. Pop., 1901, 13,493; 1911, 15,463.

REDEEM'ER, ORDER OF THE. A Greek order founded in 1829 and reorganized by King Otto in 1833. Its membership consists of persons distinguished in the War of Liberation and in commerce, industry, science, or art. The decoration is a white cross on a green wreath of oak and laurel; on the medallion is an image of the Saviour. The reverse bears the Greek cross. See Plate of ORDERS.

REDEMP'TION (Lat. *redemptio*, from *redimere*, to buy back, redeem, from *red-*, *re-*, back again, anew + *emere*, to buy). In English and American law, the determination of a creditor's right in property, real or personal, by the discharge of the obligation for which the property is held. Strictly speaking, the term refers to the right which equity confers on a debtor who has made default in paying the amount of his debt when due, to recover his pledged or mortgaged property by a subsequent payment. The right of the creditor having become absolute at law through the debtor's default, equity required a reconveyance of the property to the latter on such subsequent performance. . This is no longer necessary, the payment or sufficient tender thereof having the effect of revesting the title or right of immediate possession ipso facto in the debtor. See CONDITION; EQUITY OF REDEMPTION; FORECLOSURE; PLEDGE; ETC.

REDEMPTIONISTS. See TRINITARIANS.

REDEMP'TORISTS (Fr. *rédemptoriste*, from Lat. *redemptor*, redeemer, from *redimere*, to buy back, redeem), also called LIGUORIANS. A congregation of missionary priests founded in 1732 by St. Alphonsus Liguori (q.v.). The members of the Congregation of the Most Holy Redeemer were bound to seek their own perfection by the obligations and rules of a religious life and to devote themselves to apostolic work among the most neglected and forsaken souls, especially in country places. The instructions given by the members are of the simplest and plainest character. The congregation was originally founded in Naples, but, being approved by Benedict XIV in 1749, spread rapidly throughout Italy and afterward extended into Germany and Switzerland. The suppression of the Jesuits in 1773 left a hiatus in missionary fields which the Redemptorists were called upon to fill. By the end of the eighteenth century the congregation had spread throughout most of the countries of Europe, and in the early part of the nineteenth century houses were established in North and South America and in Australia.

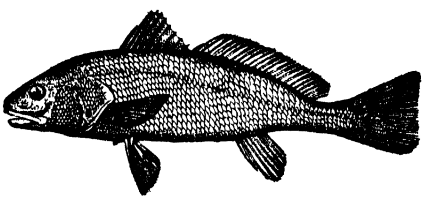
St. Alphonsus founded also an order of nuns called Redemptoristines. This is a strictly contemplative order with a number of convents in Italy, three in Austria, four in Belgium, three in Holland, two in France, and one in Ireland. For their constitution and early history, see Dumortier, *Les premières Rédemptoristines* (Lille, 1884).

The Redemptorists are noted for their faculty of doing effective missionary work among the uncultured classes of the population. Their missionary system includes frequent "renovations" in order effectively to secure the good already done, and the frequent reception of the sacraments is recommended for the perpetuation of the fruit of the missions. In 1910 there were 19 provinces and 10 vice provinces of the congregation. Altogether there were, in 1910, 218 houses, with 3300 members, of whom 1620 were priests, 489 clerical students, 150 choir novices, 733 professed lay brothers, and 300 lay novices. In the United States there were, in 1914, 2 colleges, 2 novitiates, and 41 convents; priests 367, professed students 105, novices 34, lay brothers 121, and 326 students in preparatory colleges. Consult, for the history

of the order in America: Joseph Wuest, *Annales Provinciæ Americanæ* (Ilchester, Md., 1888); O. V. R. Phillips, *Life of Father Hofbauer* (New York, 1893); C. W. Currier, *History of Religious Orders* (ib., 1894); Berthe, *Saint Alphonse de Liguori* (2 vols., Paris, 1900; Eng. trans., St. Louis, 1906); *New Mission Book of the Congregation of the Most Holy Redeemer* (ib., 1911).

REDESDALE, rēdz'dāl, JOHN FREEMAN-MITFORD, first BARON (1748–1830). An English barrister and politician, born in London. He became a barrister at the Inner Temple in 1777, was elected a member of Parliament in 1788, was appointed a Welsh judge in 1789, became Solicitor-General and was knighted in 1793, and six years later was made Attorney-General. In 1801 he was chosen Speaker of the House of Commons and appointed a Privy Councilor, and in the following year was made Lord Chancellor of Ireland and created Baron Redesdale. Dismissed from the chancellorship in 1806, he was thereafter an active member of the House of Lords. He published, with the aid of Samuel Tyler, *Pleadings and Practice in Equity*, a standard authority; also *A Political View of the Roman Catholic Question* (1829).

RED'FIELD. A city and the county seat of Spink Co., S. Dak., 40 miles south of Aberdeen, on the Chicago and Northwestern and the Chicago, Milwaukee, and St. Paul railroads (Map: South Dakota, F 3). It is the seat of Redfield College (Congregational), opened in 1887, and of the Northern Hospital for the Feeble-Minded, a State institution, and contains a Carnegie library. Pop., 1900, 1015; 1910, 3060



REDFIELD, EDWARD WILLIS (1868–). An American landscape painter. He was born at Bridgeville, Del., and studied at the Pennsylvania Academy and under Bouguereau and Fleury in Paris. A Realist, rendering nature with fidelity and virility, he became a leader in the modern American movement in landscape. His work, at first somewhat hard and dry, became increasingly individual and his color richer and more vibrant. His favorite subjects were winter scenes in the Delaware valley country, where he made his home. He is represented in the Luxembourg (Paris), Corcoran Gallery (Washington), Boston Museum, Pennsylvania Academy, Brooklyn Institute, and other galleries. Redfield became a National Academician in 1904 and received many prizes and medals.

REDFIELD, WILLIAM C (1789–1857). An American meteorologist and railroad projector, born at Middletown, Conn. In 1820 he became interested in steam navigation, and, after studying the causes of numerous boiler explosions which had been alarming the public, he founded a line of safety barges towed by a steamer plying between New York and Albany. These barges were later utilized for the carriage of freight only, the line being the first of the sort. Redfield was also active in projecting the early railroads in New York and Connecticut. In science, though he devoted some attention to geology, his principal contributions were in meteorology. He sought to demonstrate that all violent gales are whirlwinds and have a rotary and progressive movement, that the direction of revolution is uniform, and that the velocity of rotation increases from the margin towards the centre. The American Association of Naturalists and Geologists he reorganized as the American Association for the Advancement of Science and was its first president in 1848. His papers appeared mostly in the *American Journal of Science*. Consult D. Olmsted, *Scientific Life and Labors of William C Redfield* (New Haven, 1857).

REDFIELD, WILLIAM COX (1858–). An American manufacturer and cabinet officer, born in Albany, N. Y. In 1885 he entered the employ of J. H. Williams and Company of Brooklyn, manufacturers of steel drop forgings. Of this firm he became president in 1905. Redfield greatly developed the plans of the founder of the firm, who had been an early exponent of scientific business management. From 1905 to 1913 he was director of the Equitable Life Assurance Society. In politics a Democrat and opponent of the protective tariff, he was defeated for Congress in 1896, but from 1902 to 1903 he served as commissioner of public works of New York under appointment of Mayor Seth Low, and in 1910 he was elected to Congress. In the House he made a national reputation by a powerful speech in advocacy of a reduced tariff. Of this speech 3,000,000 copies were distributed. After his appointment (1913) as Secretary of Commerce in President Wilson's cabinet Redfield worked for the expansion of American shipping, advocated the Ship Purchase Bill, and sought to increase safety at sea. He was the author of numerous articles on commerce, industrial combinations, and foreign trade, and of *The New Industrial Day* (1912).

RED'FIN'. The name given to two or three dace or minnows which have notably red fins and especially to the common shiner (*Notropis cornutus*), found in almost every small stream east of the Rocky Mountains and north of Georgia. It exhibits many local varieties of form and color, some never exceeding 4 inches, while others reach 8 inches in length. It may be distinguished from other shiners by its large size, steel-blue back, with a gilt line along the spine and another along each side, and the rosy tint of the lower fins. Cf. SHINER; and see Plate of DACE AND MINNOWS.

RED'FISH'. 1. The red drum or channel bass (*Sciænops ocellatus*). It is a rich iridescent gray in color, often washed with coppery

REDFISH OR CHANNEL BASS.

red, and reaches a length of 5 feet and a weight of 75 pounds, but is usually much smaller. It is to be found along the whole southern coast of the United States, is everywhere valuable as a food fish, and on the Texas coast is said to exceed in economic importance all other fishes found there. 2. In southern California, a large and handsome fish (*Pimelometopon pulcher*) related to the doncellas. The body is somewhat deep and compressed, and the blunt forehead in the adult carries a very prominent fatty hump, whence the fish is frequently called fathead. In the males the head, dorsal, anal, and caudal fins are purplish black, and the rest of the body varies from clear

crimson to blackish purple. The females are dusky rose color. This handsome fish, which reaches a length of 3 feet and a weight of 13 to 15 pounds, is caught abundantly with hook and line in the kelp beds along the shore and is a favorite with the Chinese, who salt and dry its flesh. 3. One of the most important and richly colored of the Californian rosefishes (*Sebastes marinus*). (See ROSEFISH.) 4. The Alaskan name for the red or blue-back salmon (*Oncorhynchus nerka*). It is known in two forms, one large and one small. See SALMON.

RED GAME, or GROUSE. The common moor fowl or ptarmigan (*Lagopus scoticus*) in its summer dress See GROUSE; PTARMIGAN.

RED'GAUNT'LET. A novel by Sir Walter Scott (1824). The hero, Sir Arthur Redgauntlet, is brought up as Darsie Latimer.

RED'GRAVE, RICHARD (1804–88). An English genre and landscape painter and author, born in London. He was admitted to the schools of the Royal Academy in 1826 and first achieved success in 1844 with the "Seamstress" In 1851 he was made Royal Academician. He was head master of the government school of design in 1848 and art superintendent in 1852. In 1857 he was made inspector general of art schools at South Kensington and surveyor of crown pictures, holding the latter position until 1880. Ten of his paintings are in the South Kensington Museum, including "Gulliver on the Farmer's Table" (1837), "Ophelia" and "Cinderella." Redgrave is author of *An Elementary Manual of Colors* (1863). His brother SAMUEL (1802–76) studied architecture at the Royal Academy in 1833, but is best known as a manager of a number of important art exhibitions and especially as an author on art topics He published *A Century of Painters of the English School* (1866), with his brother Richard, and a *Dictionary of Artists of the British School* (1874). These, like the *Memoir* made from the *Diary of Richard Redgrave* by F. M. Redgrave (London, 1891), are valuable and interesting.

RED GUM. See MILIARIA.

RED GUM. See EUCALYPTUS.

REDHEAD. A numerous and widespread American duck (*Aythya*, or *Marila, americana*), closely allied to the canvasback, but differing from it in having the head chestnut red and

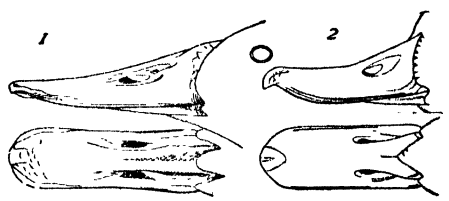


FIG 1. BEAK OF CANVASBACK.

FIG 2. BEAK OF REDHEAD.

in other particulars given under CANVASBACK (q.v.); also in the shorter bill, as illustrated herewith. They appear in great numbers in spring and autumn, especially about fresh-water marshes, assembling in large migratory flocks and keeping close together; they are strong, hardy birds and swift fliers. Early in March they hasten northward to breeding places in Canada. Consult: D. G. Elliot, *Wildfowl of the United States and British Possessions* (New York, 1898); H. K. Job, *Among the Waterfowl* (ib., 1902); and books relating to shooting.

RED-HEADED LINNET. See HOUSE FINCH.

RED'HOUSE, SIR JAMES WILLIAM (1811–92). An English Orientalist and diplomat, born near London and educated at Christ's Hospital (1819–26). He was early employed by the Turkish government as a draftsman and in 1838, after various travels, became translator and confidential interpreter to the Grand Vizier. In 1854 he was appointed Oriental translator to the British Foreign Office, and in 1857 at Paris he took a prominent part in the treaty with Persia. His great work, a dictionary of Persian, Turkish, and Arabic, was left unfinished. His published works include: *Grammaire raisonnée de la langue Ottomane* (1846); *A Dictionary of Arabic and Persian Words Used in Turkish* (1853); *English-Turkish and Turkish-English Dictionary* (1856); *Lexicon of English and Turkish* (1861; 3d ed., 1884); *Diary of the Shah of Persia during his Tour through Europe in 1873* (trans. from the Persian, 1874); *History, System, and Varieties of Turkish Poetry* (1880); a version of Merlâna's *Mesneri* (1881); and a translation of Hasan al Khazrajî, *The Pearl-Strings: A History of the Resuliyy Dynasty of Yemen*, edited by E. G. Browne, R. A. Nicholson, and A. Rogers (4 vols., Leyden, 1906–13).
